**Disclaimer:** The abstracts are presented here as they were submitted for inclusion in the proceedings of the 30th European Congress of Clinical Microbiology and Infectious Diseases (ECCMID). Outside of page layout and formatting, only the abstract titles have been proofed and edited by ESCMID. All other content entirely represents the work of the submitting author[s], and does not reflect the views of ESCMID, its staff, or its executive. ESCMID does not take responsibility for misspellings or misrepresentation of registered names, copyrights or trademarks.
Introduction

Welcome Address

Dear colleagues and friends,

It is our pleasure to present in this volume the scientific abstracts which were selected to appear at the 30th European Congress on Clinical Microbiology and Infectious Diseases (ECCMID).

While the on-site congress in Paris did not occur in April of 2020 as a consequence of COVID-19 pandemic, we would like to acknowledge the hard work that went into the planning of ECCMID, and the messages of support that have been received since the announcement of the on-site cancellation.

It was again another record-breaking year for the submission of ECCMID abstracts, with 6,980 pieces of scientific work being submitted in late 2019 for inclusion, as well as 181 abstracts that were received in February 2020 as latebreaker submissions. A big thank you to all submitters for being part of this record-breaking year!

The scientific abstracts are subject to a stringent review process, with each submission being viewed and rated by at least three ECCMID abstract reviewers. These reviewers represent the pre-eminent experts in various specialties from the fields of Clinical Microbiology and Infectious Diseases. As with every year, we thank them all for their outstanding and essential work in the abstract rating process.

Once the ratings were finalised, the ECCMID Programme Committee decided on the accepted abstracts by specific topic, and allocated them into abstract sessions, as presented herein.

The ECCMID Abstract Programme represents the latest studies and findings from the last year of Clinical Microbiology and Infectious Diseases, and we congratulate all of the authors who had their work included. We hope that the works included herein spark conversations and collaborations between scientists across disciplines and across the world.

We are also looking forward to receiving abstract submissions later this year for inclusion in the ECCMID 2021 abstract programme.

We hope that you enjoy reading the ECCMID 2020 abstracts, and we are looking forward to seeing you in person in Vienna for ECCMID 2021!
Important Addresses

ECCMID Programme Director
Prof. Winfried V. Kern
Freiburg University Hospital
Center for Infectious Diseases & Travel Medicine
Freiburg, Germany

ECCMID Deputy Programme Director
Prof. Jacob Moran-Gilad
Ben Gurion University of the Negev
Beer Sheva, Israel

ESCMID President
Prof. Jesús Rodríguez-Baño
Servicio de Enfermedades Infecciosas
Hospital Universitario Virgen Macarena
and Universidad de Sevilla
Seville, Spain

Acknowledgements

The ECCMID Programme Committee is proud to acknowledge the scientific input from the following organizations in setting up the scientific programme and/or organizing joint workshops and symposia:

ASM – American Society for Microbiology
EACS – European AIDS Clinical Society
EANM – European Association of Nuclear Medicine
ECDC – European Centre for Disease Prevention and Control
EF-CLIF – European Foundation For the Study of Chronic Liver Failure
EITaF – ESCMID Emerging Infections Task Force
ERS – European Respiratory Society
ESDPPP – European Society for Developmental, Paediatric and Perinatal Pharmacology
ESPID – European Society for Paediatric Infectious Diseases
EU Commission’s Directorate-General for Research and Innovation
EUCAST – European Committee on Antimicrobial Susceptibility Testing
EUCIC – European Committee on Infection Control
EU-JAV – European Joint Action on Vaccination
FEMS – Federation of European Microbiological Societies
GARDP – Global Antibiotic Research and Development Partnership
ISF – International Sepsis Forum
ISIRV – International Society for Influenza and other Respiratory Virus Diseases
MSF – Médecins Sans Frontières
WHO – World Health Organization
Future Congresses

31st ECCMID
VIENNA, AUSTRIA
10 – 13 April 2021
Reed Messe Vienna

32nd ECCMID
LISBON, PORTUGAL
23 – 26 April 2022
Altice Arena Lisbon / FIL Lisbon

ESCMID-ECDC Observerships

Visit ECDC and find out about the organization!

A group of 15 observers (ESCMID members) will participate in a five-day programme at the European Centre for Disease Prevention and Control (ECDC) in Solna, Sweden.

The application period for this five-day visit will be announced via the ESCMID website as well as the ESCMID social media channels.

Abstract Programme

1. Viral infection & disease

- HIV/AIDS (incl diagnostics & epidemiology, anti-retroviral drugs, treatment & susceptibility/resistance)

- Viral hepatitis (incl diagnostics & epidemiology, antiviral drugs, treatment & susceptibility/resistance)

- Influenza and respiratory viruses (incl diagnostics & epidemiology, antiviral drugs, treatment, excl vaccination)

- Herpesviruses (incl diagnostics & epidemiology, antiviral drugs, treatment & susceptibility/resistance, excl clinical studies in immunocompromised hosts)

- Emerging/re-emerging, vector-borne and zoonotic viral diseases (all aspects)

- Diagnostic virology (other than respiratory viruses, herpesviruses, hepatitis & HIV)

- Viral epidemiology – general, prevalence studies, molecular and genomic epidemiology (other than respiratory viruses, herpesviruses, hepatitis & HIV)

- Antiviral drugs, treatment, susceptibility/resistance (other than respiratory viruses, herpesviruses, hepatitis & HIV)

- Other
Abstract Categories 2020

Session accepted as Paper Poster Session

Clinical aspects of non-flu respiratory viruses

2414 Comparison of the clinical features of human metapneumovirus infections in children between paediatric patients with severe mental and physical disabilities and those without undergoing diseases at a children's hospital in Japan.

A. Shimizu* (Gunma, Japan)

2664 Baloxavir drug exposure after single-dose baloxavir marboxil is similar between children aged 1 to <12 years and adults: analysis of the miniSTONE-2 trial.

J. Baker, S. De Buck* (Brussels, Belgium), V. Duval, L. Macutkiewicz, S. Dimonaco, S. Wildum, N. Collinson, B. Clinch, B. Matharu

2775 Measles outbreak in Catania: a retrospective study and clinical revision.

A. Pampaloni* (Catania, Italy), L. Todaro, F. Cosentino, M. Locatelli, A. Marino, V. Moscati, D. Scuderi, V. Boscia, M. Gussio, G. Lupo, A. Donorante, A. Zagami, B. Celesia, B. Capocarro

8495 Human metapneumovirus infections among patients with haematological malignancies including haematopoietic stem cell transplant: analysis of a 6-year period.

L. Labate, E. Balletto, L. Magnasco* (Genoa, Italy), A. Raiola, F. Guolo, E. Angelucci, L. Roberto Massimo, C. Viscoli, M. Bassetti, M. Mikulska

Session accepted as Mini-oral ePoster Session

Constant threat of emerging infections

359 Resolving within-host, full length, dengue virus variants without haplotype reconstruction using Oxford Nanopore Technology.

3640 Antimicrobial stewardship intervention in FLU/ respiratory syncytial virus adult hospitalisations: major impact on antimicrobial management of a systematic epidemiological surveillance process including training and feed-back.

M. Bourgeois, N. Ausselet, E. Dupont, L. De Cannière, N. Scius, I. Michaux, T. Huang, P. Bogaerts, O. Denis* (Brussels, Belgium), B. Bihin, B. Delaere

5042 Respiratory syncytial virus and influenza virus infection in adult primary care patients: association of age with prevalence, diagnostic features and illness course.

R. Bruyndonckx, S. Coenen, C. Butler, T. Verheij, P. Little, N. Hens, P. Beutels, M. Ieven* (Edegem, Belgium), H. Goossens

5571 The variability of the lymphocyte populations in the cerebrospinal fluid of patients with tick-borne encephalitis.

S. Grygorczyk* (Bialystok, Poland), J. Osada, A. Moniuszko, J. Dunaj, S. Panczewicz

5715 Efficacy of ribavirin in post-exposure prophylaxis in Crimean-Congo haemorrhagic fever.

7219 Positive respiratory viral panel results moderately shorten antibiotic duration in patients with presumed respiratory tract infections.

J. Van Bulow* (Wall, United States), L. Rodriguez, S. Lee, K. Oto Sullivan, J. Gallagher

7730 In-hospital and midterm out-hospital complications of hospitalised respiratory syncytial virus-positive adults in France.

A. Descamps* (Paris, France), P. Loubet, N. Lenzi, F. Goitier, L. Fabrice, Z. Lesieur, P. Vonhems, X. Duval, F. Carrat, D. Launay

8495 Human metapneumovirus infections among patients with haematological malignancies including haematopoietic stem cell transplant: analysis of a 6-year period.

L. Labate, E. Balletto, L. Magnasco* (Genoa, Italy), A. Raiola, F. Guolo, E. Angelucci, L. Roberto Massimo, C. Viscoli, M. Bassetti, M. Mikulska
Meningitis due to Toscana virus: analysis of clinical and laboratory features of the cases observed in the period 2008-2018 at the Careggi University Hospital, Florence, Italy
M. Spinicci* [Firenze, Italy], P. Sponga, G. Corti, M. Pozzi, B. Sponga, L. Zammarchi, A. Bartoloni

Dealing with the current dengue viral fever outbreak: an experience from a tertiary care hospital in Karachi
S. Sarfaraz* [Karachi, Pakistan], F. Herekar, S. Iftikhar

Dengue virus infects HBMEC cell model and regulates proteins related to the blood-brain barrier function
J. Yu* [Guangzhou, China], X. He, X. Liu, W. Zhao

Dengue awareness in patients with acute febrile illness in Sindh province of Pakistan
J. Farooqi* [Karachi, Pakistan], M. Long, K. Barr, K. Imtiaz, E. Khan

Post-viral fatigue in dengue infection
C. Sigera* [Colombo, Sri Lanka], C. Rodrigo, S. Rajapakse, P. Alves, F. Luis Affonso Fonseca, F. Gehrke

Vimentin may inhibit dengue virus invasion of HBMEC cells
J. Yu* [Guangzhou, China], X. Li, X. He, X. Liu, W. Zhao

The first report of concurrent infections by two dengue serotypes among tribal population in central India
S. Malvi* [Jagdalpur, India], D. Majumdar

Molecular differentiation of dengue serotypes in the public health system in Santo André, Brazil
K. Gois* [Santo André, Brazil], S. Dos Chagas Mendes, B. Alves, F. Luis Affonso Fonseca, F. Gehrke

Safety of temporary interruption of anti-platelets in dengue fever with thrombocytopenia
P. Chia* [Singapore, Singapore], L. Htet, Y. Leo, D. Lye

Diagnosis of acute dengue infection in Navarra
E. Erviti, A. Aguinaga Perez, A. Navascués Ortega, I. Polo Vigas, I. Arregui, M. Adelantado Lacasa, M. Portillo, C. Ezpeleta Baquedano* [Pamplona, Spain]

Detection of dengue virus antibodies in febrile patients suspected of malaria attending a health centre in Jos, Nigeria
N. Miri* [Jos, Nigeria], J. Mawak, N. Chuwang, T. Ezekiel, S. Acheng, C. Chukwu

Evaluation of the impact of dengue infection in gestation and conception: an ecological study using time series analysis
O. Lupi* [Rio de Janeiro, Brazil], F. Meque, D. Villela, P. Brasil

High-resolution mapping reveals emergence and autochthonous transmission of dengue fever outbreak in a previously low-epidemic region in south-east China, 2019
Y. Zhang* [Shanghai, China], J. Ai, W. Zhang

Evaluation of the diagnostic accuracy of a rapid dengue NS1 antigen lateral flow immunochromatography test in UK returned travellers
B. Patterson, K. Macgregor* [Porton, United Kingdom], S. Wilmore, T. Brooks, R. Davidson, A. Mcgregor

Clinical dilemma in patients presenting with dengue viral infection
M. Irshad* [Karachi, Pakistan], S. Sethi, K. Habib, M. Mushtarq, F. Mahmood, B. Jamil

Dealing with the current dengue viral fever outbreak: an experience from a tertiary care hospital in Karachi

1143 Phylogenetic analysis of complete genomes reveals the circulation of multiple lineages of rabies lyssavirus in India
H. Pulleri Kandi Anuraj* [Bengaluru, India], C. Pattabiraman, G. Yale, A. Mahadevan, R. Mani

1817 Epidemiological investigation of newly detected highly lethal Borna disease virus 1 cases reinforcing indirect shrew contact as possible source of infection: results from in-depth interviews, Germany, 2019
P. Kirsten* [Berlin, Germany], C. Frank, H. Wilking, D. Rubenstruth, M. Böhmer

2155 Viral and immunologic factors associated with fatal outcome of patients with severe fever with thrombocytopenia syndrome in Korea
J. Kwon* [Seoul, South Korea], J. Kim, S. Ra, T. Kim, S. Park, M. Kim, S. Park, D. Kim, H. Cha, H. Lee, N. Jeon, M. Kim, Y. Chang, S. Lee, S. Choi, Y. Kim, J. Woo, K. Lee, S. Kim, S. Kee

2525 Disease course, management and predictors of fatality in hospitalised patients with real-time PCR confirmed Lassa fever in Nigeria: a prospective cohort study

2675 Predictors of worse outcome in patients with West Nile virus infection: a multi-centre study

2747 Rift Valley fever in pregnancy: a systematic review and meta-analysis of foetal outcomes
N. Kayem* [Oxford, United Kingdom], C. Benson, C. Aye, S. Baker, M. Tome, S. Kennedy, P. Ariana, P. Horby

5194 Neurodevelopment outcomes at 24 months of age in ZIKV-exposed and ZIKV-unexposed infants in French territories in the Americas: preliminary results from the ZIKA-DFA-BB cohort study
R. Grant* [Paris, France], O. Flechelles, B. Tressières, M. Dia, N. Elenga, N. Mediamolle, A. Mallard, J. Hebert, N. Lachoume, E. Couchy, B. Hoen, A. Fontanet

6399 Post-exposure prophylaxis for high risk contacts of Ebola virus using immunotherapies with monoclonal antibodies in the eastern DRC: a compassionate use program

6929 Toscana virus: clinical and biological studies based on 864 cases
N. Ayhan* [Marseille, France], R. Charrel

Session accepted as Paper Poster Session

A. Fall* [Dakar, Senegal], N. Ndiaye, N. Ndiaye, O. Kebe, M. Jollow, D. Kiori, S. Sy, D. Goudiaby, M. Dia, M. Niang, N. Dia

1115 Incidence of hospitalisation for respiratory syncytial virus in children aged 0-5 years in Ontario, Canada

1437 Multi-centre study of common pathogen epidemiology in hospitalised children with acute respiratory tract infection in winter from 2017 to 2018, China
L. Meng* [Shanghai, China], H. Zhang, X. Shao, J. Zhou

1710 Replication of MERS and SARS Coronaviruses in bat cells offers insights to their ancestral origins
J. Fung* [Hong Kong, Hong Kong], S. Lau, H. Luk, U. Wernery, P. Woo

2333 Proposing the spike gene of Coronavirus OC43 as a target for nosocomial outbreak investigation in long-term care facilities
H. Mistry* [Toronto, Canada], L. Yip, K. Bozek, H. Mbareche, A. Linkenheld-Sturk, R. Kozak, V. Williams, D. Pajak, J. Leis, S. Mubareka

2451 Impact of Point-of-Care testing on the surveillance of respiratory viral infections in West Midlands, England
D. Ironmonger* [Birmingham, United Kingdom], A. Bains, T. Hong, D. Todkill, J. Hawker, D. Edgehere

3369 Morbidity burden of different viral and bacterial pathogens in acutely ill children
H. Päyry* [Oulu, Finland], M. Kiviöneni, A. Raapanna, N. Paalanen, T. Pokka, P. Valmari, T. Tapiainen
Abstract Categories 2020

3985 Assessing Pharyngeal Respiratory virus Carriage in healthcare workers Over Time (APRICOT): a feasibility study
A. Melhuish, J. Mintan* [Leeds, United Kingdom]

3986 Comparative virulence of respiratory viruses on the winter seasons from 2017 to 2019: a southern European multi-centre cohort study
A. Almeida* [Lisbon, Portugal], M. Boattini, E. Christaki, T. Marques, I. Moreira, L. Cruz, V. Tosatto, D. Antao, G. Bianco, M. Iannaccone, C. Costa, G. Tsilolakis, E. Khattab, D. Kasapi, R. Cavallo, R. Corte Real

4046 Burden of viral pneumonia among patients with lung infiltrates undergoing bronchoalveolar lavage: a retrospective one-year study
C. Mouret* [Trieste, Italy], E. Gibbin, L. Segat, R. Luzzatti

4278 Respiratory syncytial virus bronchiolitis and recurrent wheezing: a 1-year follow-up study
P. Venkat Ramanan* [Chennai, India], K. Subbiah

4691 Respiratory pathogens detected in children with community-acquired sepsis-like syndrome in 6 European countries
V. Matheussen* [Edegem, Belgium], K. Loens, K. Jacobs, P. Horby, H. Goossens, M. Kohns Vasconcelos, M. Sharland, M. De Jong, M. Koopmans, P. Fraaij, M. leven

5169 Building a predictive score for local risk of respiratory syncytial virus hospitalisation: Normative Outcome Hospitalisation Assessment for Newborns (NOHAN)
C. Jean-Sebastien* [Lyon, France], M. Jourdain, R. Kramer, S. Couray-Targe, A. Myard-Dury, D. Plain, Y. Gillet, E. Javouhey, B. Lina, M. Benchaiba

5391 Comprehensive analysis of evolutionary dynamics of circulating strains and immunopathogenesis of respiratory syncytial virus-associated acute lower respiratory tract infections in children
S. Sarkar* [Chandigarh, India], R. Ratho, M. Singh, A. Singh, M. Singh

6025 Aetiology and outcome of children hospitalised for acute respiratory tract infections in Europe: findings from a multi-country combined case-control and cohort study
M. Kohns Vasconcelos* [London, United Kingdom]

6120 Comprehensive analysis of evolutionary dynamics of circulating strains and immunopathogenesis and co-infections of human metapneumovirus associated acute lower respiratory tract infections in children
R. Ratho* [Chandigarh, India], S. Sarkar, M. Singh, A. Singh, M. Singh

5649 Nanopore metagenomic sequencing to investigate nosocomial transmission of human metapneumovirus from a unique genetic group among haematology patients in the United Kingdom

6779 Clinical characteristics and outcomes of respiratory syncytial virus infection among hospitalised adult patients: risk factors of intensive care unit hospitalisation and 30-day mortality
C. Youngeun* [Seoul, South Korea], J. Kim, S. Kim, Y. Yoon, J. Sohn, M. Kim

6910 Viral respiratory tract infections in children: epidemiology and impact of the implementation of a multiplex PCR
A. Armine Khodja, B. Boufedi, B. Mespes, L. Landraud, M. Cotillon, R. Basmaci, F. Joannes* [Colombes, France]

7191 Epidemiology and outcomes of respiratory syncytial virus infection in haematopoietic cell transplant recipients: findings from a multinational respiratory viral infection consortium (RVIC)

7289 Comparison of humoral response against both haemagglutinin and neuraminidase after seasonal influenza vaccination
J. Mendez Legaza, I. Sanz, R. Ortiz De Lejarazu, L. Sanchez De Prada* [Valladolid, Spain]

7926 Nosocomial respiratory syncytial virus infections: a two-season European multi-centre cohort study
T. Moreira Marques* [Lisbon, Portugal], A. Almeida, M. Boattini, E. Christaki, R. Corte Real, M. Moreira, V. Tosatto, D. Antao, L. Cruz, G. Bianco, C. Costa, R. Cavallo, M. Iannaccone, G. Tsilolakis, D. Kasapi, E. Khattab

7932 Severe viral respiratory infections in paediatric intensive care unit: a 4-year experience in an Italian paediatric hospital

8010 A retrospective study of rhinoviruses molecular diversity in three Paris hospitals: differential behaviours of HRV groups?
G. Haddad, M. Bertein, N. Fidouh, D. Bouzid, X. Duval, V. Bunel, R. Borie, J. Lucet, D. Descamps, B. Visseaux* [Paris, France]

8295 A majority of adult hospitalised patients with community-acquired lower respiratory tract infections had viral infections
N. Sundell, L. Gustavsson, M. Lindh, L. Andersson, J. Westin* [Gothenburg, Sweden]

8919 Different expression of CD26 and CD66 receptors on PBMCs from MERS Coronavirus infected patients
A. Alheetheli* [Riyadh, Saudi Arabia], A. Albarraq, Z. Shakoor, A. Samiyl, M. Barry, M. Bakhrabah, M. Nassar, Z. Memish, A. Asiri
Abstract Categories 2020

9028 Medical software approach for French IL1 sentinel surveillance
L. Vaillant* [Paris, France], R. Pans, T. Lounay, D. Simon, C. Goupillon, C. Hervé, V. Roussel, C. Turbelin, T. Blanchon

Session accepted as Paper Poster Session

9595 Evolution of awareness and knowledge of congenital cytomegalovirus infection among healthcare providers in France between 2011 and 2018

Session accepted as 2-Hour Oral Session

Herpesviruses: old foes, new problems

1063 Diagnostics value of Epstein-Barr virus DNA load in whole blood and plasma from paediatric transplant recipients
B. Kasztelewicz* [Warsaw, Poland], J. Teisseyre, K. Janiszewska, J. Jankowska, P. Kaliczński, K. Dzierzanowska-Fangrat

1919 Anti-apoptotic role of human cytomegalovirus miRNAs, miR UL-70-3p and UL-148D on hydrogen peroxide-induced apoptosis in HEK 293T cells
S. Gosipatela* [Lucknow, India], A. Pandeya, S. Saxena

2660 Metagenomics next-generation sequencing for the identification of undiagnosed DNA and RNA viruses in adult allogeneic haematopoietic cell transplant recipients with steroid refractory graft-versus-host disease

Clinical validation of an ELISPOT-based in vitro diagnostic assay to monitor cytomegalovirus-specific cellular immunity in immunocompromised transplant recipients

Neonatal screening for congenital cytomegalovirus infection: identification of a viral DNA diagnostic cut-off value in saliva samples

Herpes simplex virus resistance testing: an automated interpretation platform linking genotype to phenotype
E. Gallagher* [London, United Kingdom], D. Bibby, D. Williams, J. Mbisa
Central nervous system infections caused by herpes simplex virus and varicella zoster virus in France, 2014-2018: a nationwide retrospective study

D. Boutolleau* [Paris, France], S. Burrel

Novel mutations found in UL56 terminase subunit and UL54 DNA polymerase after human cytomegalovirus infection treatment with letermovir M. Santos Bravo* [Barcelona, Spain], S. Sanchez-Palomino, M. Mosquera Gutiérrez, C. Martin Gandul, M. Rodríguez Hernandez, N. Piault, V. Gonzalo, E. Cordera Matias, S. Alain, M. Marcos

Detection of high rates of HIV-seropositivity in urban university hospital emergency department L. May* [Sacramento, United States], T. Chechi, S. Voang, N. Tran

Squamous cell carcinoma of the anus screening in people living with HIV: HPV genotyping is as important as cytology in anal cancer early diagnosis M. Digaetana, C. Rogati, M. Menozzi* [Modena, Italy], A. Bonazza, F. Spatapofora, A. Farinetti, R. Gelmini, M. Pecorari, S. Tagliazucchi, L. Reggiani Bonetti, R. Iachetta, R. Villani, C. Mussini

Sexual behaviour and incidence of sexually-transmitted infections in high-risk men who have sex with men following pre-exposure prophylaxis commencement Sophocles-P4G demonstration study M. Psychogiou* [Athens, Greece], M. Papadopoulou, V. Sypsa, S. Roussos, S. Chanos, N. Dedes, G. Daikos, J. Schneider, A. Hatzakis

Disclosure of high rates of HIV-seropositivity in urban university hospital emergency department L. May* [Sacramento, United States], T. Chechi, S. Voang, N. Tran

Squamous cell carcinoma of the anus screening in people living with HIV: HPV genotyping is as important as cytology in anal cancer early diagnosis M. Digaetana, C. Rogati, M. Menozzi* [Modena, Italy], A. Bonazza, F. Spatapofora, A. Farinetti, R. Gelmini, M. Pecorari, S. Tagliazucchi, L. Reggiani Bonetti, R. Iachetta, R. Villani, C. Mussini

Sexual behaviour and incidence of sexually-transmitted infections in high-risk men who have sex with men following pre-exposure prophylaxis commencement Sophocles-P4G demonstration study M. Psychogiou* [Athens, Greece], M. Papadopoulou, V. Sypsa, S. Roussos, S. Chanos, N. Dedes, G. Daikos, J. Schneider, A. Hatzakis

Disclosure of high rates of HIV-seropositivity in urban university hospital emergency department L. May* [Sacramento, United States], T. Chechi, S. Voang, N. Tran

Squamous cell carcinoma of the anus screening in people living with HIV: HPV genotyping is as important as cytology in anal cancer early diagnosis M. Digaetana, C. Rogati, M. Menozzi* [Modena, Italy], A. Bonazza, F. Spatapofora, A. Farinetti, R. Gelmini, M. Pecorari, S. Tagliazucchi, L. Reggiani Bonetti, R. Iachetta, R. Villani, C. Mussini

Sexual behaviour and incidence of sexually-transmitted infections in high-risk men who have sex with men following pre-exposure prophylaxis commencement Sophocles-P4G demonstration study M. Psychogiou* [Athens, Greece], M. Papadopoulou, V. Sypsa, S. Roussos, S. Chanos, N. Dedes, G. Daikos, J. Schneider, A. Hatzakis

Disclosure of high rates of HIV-seropositivity in urban university hospital emergency department L. May* [Sacramento, United States], T. Chechi, S. Voang, N. Tran

Squamous cell carcinoma of the anus screening in people living with HIV: HPV genotyping is as important as cytology in anal cancer early diagnosis M. Digaetana, C. Rogati, M. Menozzi* [Modena, Italy], A. Bonazza, F. Spatapofora, A. Farinetti, R. Gelmini, M. Pecorari, S. Tagliazucchi, L. Reggiani Bonetti, R. Iachetta, R. Villani, C. Mussini

Sexual behaviour and incidence of sexually-transmitted infections in high-risk men who have sex with men following pre-exposure prophylaxis commencement Sophocles-P4G demonstration study M. Psychogiou* [Athens, Greece], M. Papadopoulou, V. Sypsa, S. Roussos, S. Chanos, N. Dedes, G. Daikos, J. Schneider, A. Hatzakis

Disclosure of high rates of HIV-seropositivity in urban university hospital emergency department L. May* [Sacramento, United States], T. Chechi, S. Voang, N. Tran

Squamous cell carcinoma of the anus screening in people living with HIV: HPV genotyping is as important as cytology in anal cancer early diagnosis M. Digaetana, C. Rogati, M. Menozzi* [Modena, Italy], A. Bonazza, F. Spatapofora, A. Farinetti, R. Gelmini, M. Pecorari, S. Tagliazucchi, L. Reggiani Bonetti, R. Iachetta, R. Villani, C. Mussini
Abstract Categories 2020

1234 Factors associated with low uptake of HIV testing among middle aged 15-17 adolescent girls in Uganda
M. Rwetabi* [Kampala, Uganda], A. Lutaya

2532 Cascade of HIV care in three different settings in Mozambique
P. Magro, C. Cerini, A. Da Gioia, S. Tembe, F. Castelli* [Brescia, Italy], L. Tomasoni

3900 Would HIV infections and AIDS cases decrease in Japan? Time series analysis using Bayesian inference
K. Iwata* [Kobe, Japan], C. Miyakoshi

4216 Checkpoint Plus Freiburg: performance of an on-site integrated, low-threshold sexual transmitted diseases/HIV counselling and treatment service in Germany
M. Müller* [Freiburg, Germany], S. Usadel, S. Zimmermann, U. Hoffmeister, A. Fahrhöfer, W. Kern, S. Rieg

4813 Characteristics and trends of recently HIV infected individuals in Estonia in 2013-2017
E. Jõgeda* [Tartu, Estonia], R. Avi, P. Merit, P. Soolda, T. Põll, E. Kallas, H. Rajasaar, K. Rüütel, I. Lutsar, K. Huik

5305 Performance of the new random access molecular diagnostics analyser Alinity m
R. Ehret* [Berlin, Germany], J. Dhein, S. Breuer, M. Obermeier

5486 End-to-end Workflow for HIV-1 drug resistance genotyping of protease and reverse transcriptase in major group-M subtypes

5791 Implementation of a smartphone application intervention to increase linkage to and engagement with HIV care among people with tuberculosis and substance use in Irkutsk, Siberia

7381 Performance evaluation of a new screening and viral load monitoring HIV-1 assay on the NeuMoDx molecular system
A. Norwold, C. Couture* [Ann Arbor, United States], H. Lee, J. Bezenah, C. Nguyen, C. Butcher, M. Mastronardi, B. Wu, S. Brahmasandra

7721 Non-B subtypes are a major driver of clustered HIV-1 transmission in north Italy in recent years
L. Colagrossi* [Milan, Italy], M. Moioli, A. Nava, S. Carta, S. Chiappetta, V. Costabile, D. Motta, L. Chianura, R. Rossotti, D. Fanti, P. Carlo Federico, M. Puoti, C. Alteri

8037 Potential use of data from a national HIV testing surveillance system to improve community-based testing strategies, Ireland

8151 Prevalence of non-B HIV-1 subtypes in north Italy and analysis of transmission clusters based on sequence data analysis
G. Lorenzin* [Brescia, Italy], F. Gargiulo, A. Carusa, F. Caccuri, E. Focà, A. Celotti, M. Quires Roland, I. Izzo, F. Castelli, S. Corbellini, F. Gurnieri, G. Piccinelli, M. De Francesca

8667 Performances of a new random access system for human immunodeficiency virus RNA quantification
A. Maillard, C. Pronier* [Rennes, France], G. Lagathu, P. Comacile, C. Grañier, V. Thibault

8773 Implementation of a full-length HIV-1 NGS assay into clinical diagnostics

8804 Epidemiological profile, mortality and causes of death in the first year of newly HIV-diagnosed patients of a national referral centre in Costa Rica from January 2015 to December 2017
M. Brenes Madrigal* [San José, Costa Rica], M. Villalobos Zúñiga

8857 Evaluation of HIV-1 and hepatitis B and C viruses quantification by a new molecular system in comparison to established routine methods
L. Martinez Garcia* [Madrid, Spain], B. Romero, A. Sanchez Diaz, M. Rodriguez, R. Canton Moreno, J. Galán

Session accepted as 1-Hour Oral Session

HIV in 2020

4521 Evaluation of a dual therapy and a simplified, patient-centred monitoring strategy for the long-term management of HIV infection: a non-inferiority, randomised, controlled, open-label clinical trial (SIMPL’HIV)

5290 Risk of failure in dual vs. triple therapy in naive HIV patients: a meta-analysis
A. Russo* [Naples, Italy], M. Pisaturo, L. Onorato, S. Martini, S. Signoriello, P. Maggi, N. Coppola

6541 Unravelling HIV proviral latency by comparing HIV-1 and HIV-2 expression and reactivation with single round, double reporter constructs
A. Bruggemans* [Leuven, Belgium], G. Vansant, Z. Debyser

8004 Exposure to maternal antiretroviral therapy in utero frequently differs between twins
M. Louchet, H. Didelot, G. Peytavín, M. Le, A. Bourgeois-Moine, L. Carbillon, D. Luton, I. Matheron, L. Rigonnett, L. Mandelbrot* [Bagnolet, France]

L. Pencolé* [Colombes, France], M. Le, F. Bouchet Crivat,  
D. Duro, G. Peytavin, L. Mandelbrot |

**Session accepted as Paper Poster Session**

**Influenza epidemiology and clinical aspects**

| 244 | Hospital-acquired influenza characteristics and its correlation with the population-based surveillance in a tertiary care centre in Istanbul  
H. Bilgin* [Istanbul, Turkey], E. Avci, G. Culha, N. Pazar,  
S. Guneytepe, I. Sagir, R. Can Sarmağlu, E. Baran, U. Sili,  
V. Kerten |
607 Flu isolation wards: does medical specialty matter? Comparison of three specialties on outcome and antibiotic usage in hospitalised influenza A infected patients in Vienna during the season 2018/19
M. Karolji* [Vienna, Austria], E. Pawelka, H. Kelani, G. Funk, B. Lindner, C. Porpaczy, S. Publig, T. Seitz, M. Traugott, A. Zaufal, C. Wenisch

2114 Incidence of medially-attended influenza and influenza-related hospitalisations by co-morbidities among a commercially insured population in the United States
A. Near, J. Tae, Y. Yound-Xu, L. Connolly, C. Reyes* [San Francisco, United States]

2610 The difference in mortality between adult patients with laboratory-confirmed influenza A and B, a single centre observational study
D. Mabayoje* [London, United Kingdom], T. Cutinamoguel, J. Haigh, M. Wilks, C. Welch, M. Melzer

3666 Estimating the burden of influenza on hospitals using severe acute respiratory infections in metropolitan France, 2012-2018
A. Bernadou* [Bordeaux, France], N. Fortin, B. Hubert

4416 Triaging influenza in patients attending fever clinical scoring system for a modified influenza case definition
W. Liguang* [Beijing, China], J. Zhao, Q. Zhou, X. Lu

4427 Prevalence and clinical outcomes associated with viral and atypical bacterial co-infections in a large global study of adults hospitalised with influenza [INSIGHT FLU003 Plus]
D. Dwyer* [Westmead, Australia], D. Wentworth, N. Gerry, M. Hoover, J. Neaton, R. Davey, M. Polizzotto, T. Clark, A. Poez, J. Paño Pardo, J. Lundgren, A. Babiker, S. Pett

4461 Hospital-based surveillance of influenza in Switzerland: a pilot study, season 2018/19
A. Iten, A. Thiabaud* [Geneva, Switzerland], N. Troillet, L. Senn, D. Flury, S. Kuster, C. Balmelli, C. Gardiol, A. Goncalves Cabecinhas, L. Kaiser, D. Keiser

4466 Epidemiology of influenza in Thailand: findings from near real-time laboratory-based influenza system, a network of 40 hospitals in Thailand, 2010-2019
T. Eamchotchawalit* [Bangkok, Thailand], P. Piyaraj, P. Narangdej, S. Charoensakulchai

4643 Laboratory-confirmed influenza infection and acute myocardial infarction
Y. Young-Xu, J. Smith* [White River Junction, United States], S. Mahmud, E. Russo, R. Van Aalst, E. Thommes, J. Lee, A. Chit

4651 Different age distribution of influenza B virus infection by lineage
Y. Kim, S. Han* [Seoul, South Korea], K. Lee

5894 Delayed diagnosis and increased length of stay in patients requiring hospitalisation with influenza who present without fever
B. Smith, M. Putland, B. Garbutt, D. Johnson, L. Irving, S. Tong* [Melbourne, Australia]

7769 Bacterial and fungal infections associated with influenza virus in hospitalised patients
F. Arnáiz De Las Revillas* [Santander, Spain], L. Gibert Hernandez, J. Garcia Polacios, P. Gonzalez Garcia, N. Puente Ruiz, M. Gozalo Margüello, C. Armiñanzas Castillo, M. Gutiérrez-Cuadra, M. Faninias

8102 Analysis of patients with severe complicated influenza in a hospital, 2015-2019
Y. Huang* [Taiichung, Taiwan]

8516 Multidisciplinary interventions to reduce nosocomial transmission of influenza
B. Warne* [Cambridge, United Kingdom], M. Reacher, M. Zambon, H. Jalal

8702 Aspergillosis complicating severe influenza in intensive care unit patients: a retrospective case-control study
C. Visek* [Chicago, United States], H. Nam, M. Ison

9125 Nosocomial influenza
E. Rothman* [Lund, Sweden], B. Bottiger, U. Karlsson

9288 Descriptive analysis of patients with influenza virus admitted to intensive care unit from 2010 to 2019
M. Valverdú, S. Carvalho Brugger* [Lleida, Spain], M. Miralbés, S. Iglesios, B. Balsera, J. Caballero

9399 Burden of influenza C in a paediatric population with severe respiratory disease
A. Wong, A. Presbitero, K. Pabbaraju, K. Fonseca, N. Zelyas, B. Berenger* [Calgary, Canada]
2403 Examining factors impacting influenza vaccination amongst healthcare workers in Asia and the Pacific
H. Seale* [Sydney, Australia], A. Thomson, R. Kaur

2748 Can adjuvanted influenza vaccine given as standard of care reduce the risk for influenza outbreaks in nursing homes: evidence from a cluster-randomized trial of 823 nursing homes
K. Mcconehgy* [Providence, United States], H. Davidson, L. Han, E. Saade, D. Canaday, V. Mor, S. Gravenstein

2751 EUCIC survey on influenza vaccination among infection control team: Action speaks louder than words
Ş. Keske, N. Mutters* [Heidelberg, Germany], C. Tsiooutis, Ö. Ergönül

3493 A quality improvement project to increase influenza vaccination uptake amongst inpatients in a tertiary care centre supported by Electronic Healthcare Records [EHR]

4092 Influenza vaccine in chronic obstructive pulmonary disease

4498 Effectiveness of influenza vaccine in preventing medically attended influenza virus infection among healthcare personnel: a test-negative case-control study in Bangkok, Thailand, 2018/19 season
T. Eamchatwalo† [Bangkok, Thailand], P. Piyaraj, P. Narongdej, S. Charoensakulchai

4832 A multi-centre analysis of the value of systematic screening of influenza virus and vaccination on emergent admissions to a cardiac intensive care unit

6039 Coverage of influenza vaccination in patients over 64 years hospitalised for severe acute respiratory infection according to their chronic diseases
L. Miriam* [Zaragoza, Spain], A. Larrauri, A. Gherasim, C. Mazagatos, N. Martínez Cameo, M. Hernández, Y. Gracia, V. Guerrero, A. Rezusta, A. Milagro Beamonte

6157 Chronic pluripathological patients in over 64 years old with flu or serious acute respiratory infection, according to flu vaccination status
L. Miriam* [Zaragoza, Spain], A. Larrauri, A. Gherasim, C. Mazagatos, N. Martínez Cameo, M. Hernández, Y. Gracia, V. Guerrero, A. Martínez-Sapiña, A. Rezusta, A. Milagro Beamonte

6193 Severity of chronic diseases in patients over 64 years old with flu or serious acute respiratory infection, according to flu vaccination status
L. Miriam* [Zaragoza, Spain], A. Larrauri, A. Gherasim, C. Mazagatos, N. Martínez Cameo, M. Hernández, Y. Gracia, V. Guerrero, A. Martínez-Sapiña, A. Rezusta, A. Milagro Beamonte

6492 Study of the humoral response against adjuvanted and non-adjuvanted influenza vaccine in the elderly by age groups
L. Sanchez De Prada* [Valladolid, Spain], I. Sanz, S. Tamames, A. Lopez, J. Méndez-Legaza, S. Rojo, R. Ortiz De Lejarazu, J. Eiros

6586 Study of the serological efficacy of influenza vaccine along 28 consecutive seasons
L. Sanchez De Prada* [Valladolid, Spain], I. Sanz, S. Tamames, A. Lopez, J. Méndez-Legaza, S. Rojo, R. Ortiz De Lejarazu, J. Eiros

7072 Public health impact of the introduction of a high dose quadrivalent inactivated influenza vaccine in France
M. Costa, F. Bianic, N. Larseran, F. Alvarez, M. Levant, M. Uhart* [Lyon, France]

7189 Neuraminidase antibody response in a population vaccinated with split and adjuvant influenza vaccines
J. Mendez Legaza, I. Sanz, R. Ortiz De Lejarazu, L. Sanchez De Prada* [Valladolid, Spain]

8352 Immunodominance Hierarchy after seasonal Influenza vaccination
L. Sanchez De Prada* [Valladolid, Spain], I. Sanz, R. Ortiz De Lejarazu, J. Eiros, A. Garcia-Sastre, T. Aydillo

J. Kubes, J. Jacob* [Atlanta, United States]

**Session accepted as Paper Poster Session**

**Influenza: diagnostics**

603 Nasopharyngeal viral load determinants among influenza-infected patients receiving primary care in France: 2010-2018
R. Gueneau* [La Tranche, France], S. Behilili, E. Vincent, M. Yoann, S. Van Der Werf

666 Cost-benefit analysis of rapid influenza testing in German emergency rooms
R. Diel, A. Nienhaus, J. Becker* [Kornwestheim, Germany]
Impact of a routine molecular Point-of-Care test-and-treat strategy for influenza in adults hospitalised with acute respiratory illness: a pragmatic, multi-centre, randomised controlled trial (FluPOC) T. Clark* [Southampton, United Kingdom], K. Beard, N. Brendish, A. Malachira, S. Mills, C. Chan, S. Poole, S. Ewings, N. Cortes

Evaluation of the FebriDx host response Point-of-Care test to differentiate viral from bacterial aetiology in adults hospitalised with acute respiratory illness during influenza season K. Beard* [Southampton, United Kingdom], N. Brendish, S. Poole, C. Chan, S. Mills, T. Clark

Performance of two rapid influenza diagnostic testing compared to real-time PCR Y. Oh* [Yongin, South Korea], S. Jin, S. Yoon, S. Park, H. Bae

Can a combination of several biological markers help to diagnose influenza co-infections? N. Delettre* [Rouen, France], A. Schrapp, A. Baron, L. Joly, V. Brunel

Serum IFI27 mRNA as a novel host response biomarker of monitoring the influenza A virus infection W. Dong* [Shanghai, China], D. Yu, D. Zhang, G. Shi, X. Zhang

Performance evaluation of the STANDARD F Influenza A/B FIA for detection of influenza A/B virus infection K. Choi* [Daejeon, South Korea], H. Kim, M. Koo, J. Kim, S. Koo

Assessment of the performances of the second generation of the ID NOW influenza A&B and comparison with the GeneXpert E. Farfour* [Suresnes, France], A. Roux, M. Ballester, M. Vasse

Influenza and respiratory syncytial virus antigen diagnostic tests: do they still have a place in a routine diagnostic laboratory? B. Vanmassenhove* [Östend, Belgium], A. Hervent, L. Persijn, L. Vynckier, G. Alliet

Suspected reverse zoonosis of influenza A[H1N1] pdm09 virus infection found in Allouroopoda melanoleuca in Hong Kong Oceanarium C. Chang* [Hong Kong, Hong Kong], Y. Fong, J. Teng, S. Lau, P. Woo

Laboratory-confirmed seasonal influenza virus infection in Qatar: 2016-2018 national surveillance data J. Daghfal Nader* [Doha, Qatar], A. Omrani, M. Al-Maslamani, P. Coyle, M. Shebash, A. Hashim

Rapid diagnosis of seasonal influenza virus and cohorting of hospitalized patients on a ‘flu ward’: a prospective analysis of outcomes B. O’Kelly* [Dublin, Ireland], A. Kelly, A. Conway, S. Mcconkey, C. McNally, E. De Barra

Evaluation of Genomera CDX system for influenza and respiratory syncytial virus infections E. Choquet, C. Chessa, M. Prat, A. Lanivière, A. Beby Defaux, N. Lévêque, M. Pichon* [Poitiers, France]

Clinical benefits of Point-of-Care rapid molecular influenza test at a hospital emergency service J. Nordh* [Växjö, Sweden], H. Janson

Comparison of Illumina and nanopore sequencing methodologies for whole genome sequencing of influenza A virus from clinical isolates J. Heaney* [London, United Kingdom], D. Frampton, H. Gliddon, M. Byott, P. Grant, R. Mckendry, E. Nastouli

Next generation sequencing of influenza A virus from environmental samples at the human-animal interface N. Bell* [Toronto, Canada], B. Kwok, L. Yip, C. Bekking, Y. Berhane, K. Prost, M. Oaidir, S. Mubareka

Cost analysis of a Point-of-Care diagnostic test for detecting influenza A/B and respiratory syncytial virus in the ER setting in Norway J. Mewes, A. Voermans, T. Østfold* [Oslo, Norway], T. Halvorsen, K. Eresk, L. Steuten

Laboratory diagnosis and circulation of respiratory syncytial virus (A and B subgroups) and influenza virus A [H1 and H3 subtypes] and B in a three-winter season (2016-17 to 2018-19) hospital-based survey in northern Italy M. Arcangeloletti, C. Maccari* [Parma, Italy], F. De Conito, F. Ferraglia, F. Pinardi, P. Montagna, C. Chezzi, A. Calderaro

Impact of influenza Point-of-Care testing in the emergency department on clinical care of adult patients at three hospitals in Lanarkshire, Scotland: an observational study A. Hao, P. Anstey, H. Black, E. Kerr, J. Mcllister, C. Mullen, M. Tate* [Glasgow, United Kingdom], D. Cramie, I. Mccormick, S. Whitehead

Influenza: therapeutics

Treatment of influenza and influenza-like illnesses with antiviral having anti-inflammatory efficacy N. Pshenichnaia* [Moscow, Russian Federation], V. Bulgakovskaya, E. Volchkova, E. Kareva, V. Gorodin, A. Grekova

Five-day versus ten-day oseltamivir chemoprophylaxis to prevent hospital influenza transmission: a non-inferiority randomised open-label study L. Lepen, M. Velušček, R. Blagus, A. Hadžič, M. Mavrič, R. Saletinger, D. Stupica* [Ljubljana, Slovenia]

Nucleoside analogue for the treatment of influenza N. Lvov* [St. Petersburg, Russian Federation]
Abstract Categories 2020

4000 Template RNA loops determine aberrant RNA synthesis and innate immune activation during influenza virus infection
H. French* [Cambridge, United Kingdom], A. King, A. Te Velthuis

4819 Protection against H9N2 Influenza A(H9N2) virus induced by recombinant M2e-HA2 fusion protein
M. Moghadaszaadeh* [Tabriz, Iran], M. Zeinalabedin, M. Golchin, R. Ghanbarpour, H. Tavakkoli

5126 Preclinical efficacy, pharmacokinetics and safety of CD377, a novel antiviral Fc-conjugate against influenza

5707 CD377, a novel antiviral Fc-conjugate, demonstrates a lower resistance potential than baloxavir and oseltamivir against pandemic influenza A(H1N1)
A. Almaguer* [San Diego, United States], A. Borchardt, W. Jiang, Z. Chen, T. Brady, J. Locke, L. Tari

5788 Antiviral treatment in severe influenza pneumonitis
Y. Pai, Y. Huang* [Taipei City, Taiwan], C. Su, K. Tsao, C. Hung, Y. Hsieh, K. Kao, C. Huang, A. Dutta, C. Huang

5793 Efficacy of CD377, a novel antiviral Fc-conjugate against seasonal influenza in lethal mouse models
J. Levin* [San Diego, United States], K. Amundson, K. Shathia, A. Borchardt, T. Lam, W. Jiang, Z. Chen, T. Brady, S. Döhrmann, V. Ong, L. Tari

6009 Efficacy of CD377, a novel antiviral Fc-conjugate, against influenza A(H1N1) in a lethal mouse model of Severe Combined Immunodeficiency (SCID)
J. Levin, K. Amundson, K. Shathia, A. Borchardt, T. Lam, W. Jiang, Z. Chen, T. Brady, S. Döhrmann, V. Ong, L. Tari* [San Diego, United States]

7868 Adjuvants that contain saponin may be an important component of influenza peptide vaccines to induce broadly reactive functional antibodies
C. Sei* [Gaithersburg, United States], N. Rikhi, R. Schuman, K. Muema, L. Daum, G. Fischer

8820 Fc-mediated Fcγ receptor engagement of CD377, a novel antiviral Fc-conjugate, translates into potent antibody-dependent cellular phagocytosis and antibody-dependent cellular cytotoxicity activity
S. Döhrmann* [San Diego, United States], R. Grewal, E. Abelovski, T. Brady, W. Jiang, Z. Chen, A. Borchardt, J. Cole, L. Tari

8832 CD377, a novel antiviral Fc-conjugate, demonstrates potent broad-spectrum activity in multiple in vitro assays against influenza A and B
S. Döhrmann* [San Diego, United States], A. Almaguer, N. Dedec, T. Brady, W. Jiang, Z. Chen, A. Borchardt, J. Cole, J. Locke, L. Tari

Session accepted as 1-Hour Oral Session
Innovative therapeutic approaches against influenza

2693 Baloxavir treatment of ferrets infected with influenza A virus reduces transmission

7514 Comparative effectiveness of combined favipiravir and oseltamivir therapy versus oseltamivir monotherapy in critically-ill patients with influenza virus infection
Y. Wang* [Beijing, China]

8045 Influenza immunoglobulin in hospitalised patients with serious influenza A
A. Dahl* [Winnipeg, Canada], M. Ison, T. Babinchat, C. Hall, D. Anderson

8839 CD377, a novel antiviral Fc-conjugate, demonstrates superior reduction of viral burden and cytokine levels compared to oseltamivir in a lethal mouse model of influenza A(H1N1) infection

Session accepted as Paper Poster Session
Neurotropic flaviviruses

856 Treatment of flaviviruses in solid organ transplant recipients with intravenous immunoglobulin and interferon alpha-2b: a Mayo Clinic Arizona experience
S. Kasule* [Phoenix, United States], R. Patron, M. Grill

2380 An imported case of West Nile virus neuroinvasive disease in the UK
N. Khan* [London, United Kingdom], R. Lewis, P. Papineni, W. Lynn, G. Sandhu

3953 In vitro modeling of patient-specific susceptibility to neurotropic flavivirus infection by using induced pluripotent stem cells
S. Riccetti* [Padova, Italy], A. Sinigaglia, G. Desole, M. Pacenti, T. Smura, R. Kaint, O. Vapalahi, M. Trevisan, L. Barzon

5019 West Nile virus 2018 season in Italy: rapid spreading of West Nile neuroinvasive disease in northwest Italy
E. Burdino* [Turin, Italy], T. Allice, M. Milia, G. Gregori, G. Marleo, R. Cipriani, C. Pasqualini, P. Ferrero, V. Ghisetti
Abstract Categories 2020

7233 Characteristics of the initial phase of tick-borne encephalitis
P. Bogovic* [Ljubljana, Slovenia], S. Lotric-Furlan, K. Ogrinc, T. Avsic, F. Strle

7342 10 years surveillance of West Nile virus neuroinvasive disease

9540 Monitoring mosquito populations and detection of West Nile virus and Usutu virus in mosquito pools collected in Attica regional units, Greece, 2017-2018
E. Patsoula* [Athens, Greece], S. Beleri, G. Balatsos, V. Karras, N. Tegos, F. Sereti, D. Papachristos, A. Michaelakis

Session accepted as Paper Poster Session

Paediatric and perinatal infections

861 Comparison of immune function between T, B lymphocytes, Th17, Th22 and Treg cells in children with hand, foot and mouth disease caused by EV71 and other enterovirus infections
W. Song* [Hangzhou, China], S. Zhao, Y. Wei

3291 Mother-to-child transmission of curable sexually-transmitted infections in HIV-infected women in South Africa

3729 Congenital toxoplasmosis: outcomes of newborns from mothers with documented seroconversion out of a multi-centre cohort in two tertiary referral hospitals
V. Meron* [Pavia, Italy], A. Bonetti, A. Comelli, L. Tomasoni, F. Genca, A. Chiesa, F. Prefumo, V. Spinoni, S. Colagaris, C. Bonfanti

3754 Challenges in setting-up and conducting a global multi-centre prospective observational cohort of sepsis in hospitalised neonates: the NeoOBS study
A. Riddell* [London, United Kingdom]

4500 Uncovering the role of airborne transmission and asymptomatic contact shedding in outbreaks of scarlet fever
R. Cordery* [London, United Kingdom], A. Purba, L. Begum, E. Mills, M. Mosavie, E. Jauneikaité, P. Hoffman, T. Lamagni, S. Sriskandan

4576 A comparison of GenomEra GBS PCR and GeneXpert GBS PCR assays with culture of group B Streptococcus with and without broth enrichment
S. Nielsen* [Aarhus, Denmark], J. Kjølseth Møller, M. Khalil

5196 Vaccination uptake in sickle cell disease: results from a London teaching hospital
K. Isitt* [London, United Kingdom], A. Calvert, M. Haq, P. Heath, C. Cosgrove

5275 Modulation of the immune status in pyelonephritis caused by Pseudomonas aeruginosa in children with hydronephrosis
M. Svitlana* [Kharkiv, Ukraine], M. Maryna, I. Marchenko, V. Davydenko, Y. Mozgova

6306 Global multi-centre prospective observational cohort of sepsis in hospitalised neonates highlights complex case mix: the NeoOBS Study
A. Cook* [London, United Kingdom]

6481 Phylogenetic groups and virulence factors of uropathogenic Escherichia coli in pregnant and non-pregnant women in St. Petersburg, Russia
M. Razinkova* [St. Petersburg, Russian Federation], T. Khusnutdinova, E. Shipitsyna, D. Budilovskaya, A. Krysanova, K. Shalepo, A. Savitcheva

6497 Innovative diagnosis strategy for pneumococcal infections in children using an immunochromatographic test in respiratory specimens
C. Haddar* [Saint-Priest-En-Jarez, France], J. Joly, A. Carricajo, P. Verhoeven, G. Florence, O. Mary, E. Begaud, Y. Germani, A. Cantais, P. Bruno

6497 Global assessment of neonatal sepsis incidence and case fatality
C. Fleischmann-Struzek* [Jena, Germany], F. Reichert, A. Cossini, T. Harder, N. Kissoon, K. Reinhart, B. Allegranzi, T. Eckmanns

7115 Invasive pneumococcal disease in children: the risk of a moving target
M. Corcoran* [Dublin, Ireland], J. Mereckiene, S. Murchan, S. Cotter, R. Cunney, H. Humphreys

7145 Investigation of hypervirulent Group B Streptococcus ST17 clone by MALDI-TOF MS
M. De Fazio, A. Surace, D. Talarico, P. Minchella* [Catanzaro, Italy]

7145 Fast and reliable detection of group B Streptococcus during antepartum screening: evaluation of the PCR-based Simplexa GBS Direct assay in comparison to routine culture after Lim Broth enrichment and from ESwabs without enrichment
T. Alcaro, S. Nisticò, M. Colosimo, G. Panduri, G. Caruso, M. De Fazio, A. Surace, D. Talarico, P. Minchella* [Catanzaro, Italy]

8767 Outcome of a screening programme for the prevention of neonatal invasive early-onset Group B Streptococcus infection in a maternity unit of the University Hospital “Dr Dragisa Misovic” [Belgrade, Serbia]
M. Lacković, M. Gostimirović* [Belgrade, Serbia], S. Mihajlović
Vaginal carriage of *Enterobacter cloacae* and *Klebsiella pneumoniae* among pregnant women in Bukavu, Democratic Republic of Congo: prevalence, risk factors and adverse pregnancy outcomes

Re-evaluating and refining predictors of bacterial infection in children with cancer and febrile neutropenia

G. Haeusler* (Melbourne, Australia), K. Thursky, M. Slavin, F. Babi, R. De Abreu Lourenco, F. Mechinaud, B. Philips

Role of epitopes of four immunogenic Group B streptococci [GBS] proteins and their derivatives indistinguishability between pregnant GBS carriers and non-carriers

A. Dobrut, A. Malska-Wazniak, E. Brzozowska, S. Gorska, A. Gamian, M. Brzychczy-Wloch* [Krakow, Poland]

Diagnosing neonatal sepsis: question under discussion

Characterisation of the human cytomegalovirus genome diversity in longitudinally collected breast milk samples

Clinical diagnostic evaluation of a real-time PCR assay for the quantitative detection of cytomegalovirus from EDTA-plasma and urine samples

U. Egner* [Heidelberg, Germany], N. Hefner, M. Kolb, U. Betz

Validation of Simplexa HSV 1 & 2 Direct and Simplexa VZV Direct kits for herpes simplex virus and varicella zoster virus detection from low-volume cerebrospinal fluid samples

S. Burrel, O. Bomme, D. Roger, J. Pirot, B. Le Labousse, N. Henn, E. Chaicaud, D. Boutolleau* [Paris, France]

Transforming a multiplex laboratory developed real-time PCR for herpes simplex virus type 1 and 2 & varicella zoster virus into a sample-to-answer, cassette-based format

M. Dierckx, R. Cartuyvels, M. Raymaekers* [Hasselt, Belgium]

Design of a varicella zoster virus PCR combined with a herpes simplex virus PCR in a multiplex assay: a diagnostic evaluation study

B. Schmid* [Zurich, Switzerland], M. Affolter, A. Buttafuoco, M. Glatz, P. Bosshard

Quantitative detection of human cytomegalovirus and Epstein-Barr virus using the real-time PCR STAT-NAT CMV and STAT-NAT EBV assays

D. Rigamonti, A. Mancon, G. Ferri, A. Di Cosima, L. Spinelli, G. Torini, L. Bavagnoli, I. Merli, M. Incandela, M. Gismondo, M. Gramenga* [Milan, Italy], V. Micheli

Molecular detection of cytomegalovirus in intestinal tissue

N. Bastón Paz* [Las Palmas de Gran Canaria, Spain], M. Hernández-Betancor, M. peñate balaños, P. Hernandez Cabrera, T. Tosco-Núñez

A new approach for the quantification of clinical samples viral load based on virtual qPCR standard curves

A. Gani* [Padova, Italy], N. Paccognella, D. Corradini, C. Savio, A. Palacchini, D. Paladin, R. Costacurta

Characterisation of the human cytomegalovirus genome diversity in longitudinally collected breast milk samples

Clinical diagnostic evaluation of a real-time PCR assay for the quantitative detection of cytomegalovirus from EDTA-plasma and urine samples

U. Egner* [Heidelberg, Germany], N. Hefner, M. Kolb, U. Betz

Validation of Simplexa HSV 1 & 2 Direct and Simplexa VZV Direct kits for herpes simplex virus and varicella zoster virus detection from low-volume cerebrospinal fluid samples

S. Burrel, O. Bomme, D. Roger, J. Pirot, B. Le Labousse, N. Henn, E. Chaicaud, D. Boutolleau* [Paris, France]

Transforming a multiplex laboratory developed real-time PCR for herpes simplex virus type 1 and 2 & varicella zoster virus into a sample-to-answer, cassette-based format

M. Dierckx, R. Cartuyvels, M. Raymaekers* [Hasselt, Belgium]
### 3774 Automation in full genotyping of human papilloma viruses: evaluation of the analytical performance of Anyplex HPV28 assay
B. Vanmassenhove* (Ostend, Belgium), A. Hervent, L. Persijn, L. Vynckier, G. Alliet

### 4013 Prevalence of high-risk human papilloma virus genotypes responsible for cervical cancer in Blida, Algeria
S. Oukid* (Blida, Algeria), M. Dakhya, M. Boudjella, N. Sadouki, R. Beloumi

### 5295 Evaluation of the NeuMoDx HPV assay
B. Hesselink* [Amsterdam, Netherlands], S. Doorn, C. Meijer, D. Heideman, E. Craig, J. Zhu, S. Brahmasandra

### 6810 Diagnosis and sampling of human papilloma virus in men
J. Muehlberger* (Vienna, Austria), A. Stary, K. Schwarz

### 7268 Novel taxonomic and functional cervical microbiome biomarkers of persistency and histological progression to CIN2+ in women infected with high risk human papilloma virus
T. Iftner, F. Stubenrauch, A. Iftner, M. Willmann* (Tübingen, Germany)

### 7746 Human papilloma virus 16 viral load quantification using droplet digital PCR and correlation with cervical lesion
M. Martineili* [Mozza, Italy], C. Giubbi, R. Musumeci, F. Perdoni, F. Sina, R. Fiscico, F. Landoni, C. Cocuza

### 8198 Cost-effectiveness analysis for human papilloma virus mitigation strategies implemented since 2019 in the Republic of Moldova based on infectious disease modelling
A. Jarynowski* [Kishinev, Moldova]

### 8657 Identification of a clinically relevant anal HPV infection in HIV-positive men having sex with men: data from Czech anal cancer screening programme
J. Nemcova* [Plzen, Czech Republic], K. Cerna

### 9054 Prevalence of human papilloma virus 16, 18 and other high-risk genotypes in Baku, Azerbaijan
A. Gumral* [Baku, Azerbaijan], A. Agayev, L. Veliyeva, A. Mammadova, V. Narimanov, R. Bayramli, V. Huseynov

### 3774 Quantitative detection and impact of 5’ terminally deleted Group B enterovirus populations on type I IFN response in peripheral blood or heart tissue samples from acute myocarditis paediatric patients
M. Glenet, Y. N’Guyen, A. Mirand, C. Henguell, A. Lebreil, F. Berri, F. Bani Sadr, B. Lina, I. Schuffenecker, L. Andreoletti* [Reims, France]

### 5284 Perspective of the phase mini-antibodies for virus detection by using electro-acoustic sensor
D. Karavaeva* [Saratov, Russian Federation], O. Guliy, B. Zaitsev, I. Boradina

### 6373 Performance evaluation of a novel BKV Quant Assay in plasma and urine specimens
M. Gramegna* [Milan, Italy], G. Ferri, A. Di Cosimo, G. Torini, L. Gong, D. Krause, C. Butcher, M. Mastronardi, B. Wu, S. Brahmasandra

### 6509 Clinical application of polyomavirus detection by metagenomic next-generation sequencing in urinary tract infection
N. Li* [Shanghai, China], B. Hu

### 7050 Effect of brincidofovir on adenovirus and cellular transcriptome profile
M. Salomona* [Paris, France], L. Feghouli, S. Mercier-Delarue, E. Díaz, A. Armero, J. Dutrieux, J. Le Goff

### 7562 Study on the diagnostic value of serum amyloid A(SAA) in pathogen classification and clinical stage identification of hand, foot and mouth disease
W. Yidong* [Hangzhou, China], W. Yi

### 7795 Identification of DNA virus in conventional culture by MALDI-TOF MS
G. Martin* [Oviedo, Spain], S. Rojo, R. Campo Ramos, I. Costales, Z. Pérez, X. García, M. Alavarez-Arguéelles, S. Melón-García

### 8308 Diagnostic value of IgG avidity and/or Western blot test for the diagnosis of Rubella virus infection during pregnancy
G. Ofa, A. Chtaourou, S. Gargouri, H. Triki, B. Feiza, L. Fekri-Berarajah, A. Hammami* [Sfax, Tunisia], H. Karray-Hakim

### 9440 Comparison of different nucleic acid extraction methods for viral metagenomic analysis
M. Sabatier* [Lyon, France], A. Bal, G. Destrus, F. Morfin, B. Lina, V. Navratil, L. Josset

### 9497 Characterisation of the host lipidome in Enterovirus-infected cells: implications on pathogenesis and potential antiviral strategies
J. Chan* [Hong Kong, Hong Kong], B. Yan, Z. Zou, H. Chu, J. Tsang, S. Yuan, C. Yip, R. Kao, K. Sze, S. Lau, K. Yuen

- **Recent findings in diagnosis of viral infections**
- **Viral epidemiology**
Abstract Categories 2020

Molecular epidemiology and clinical features of human adenovirus: a 20-year retrospective observational study in Bern, Switzerland
J. Akello* (Bern, Switzerland), R. Kamgang, M. Barbani, F. Suter-Rinkler, S. Leib, A. Ramette

Human parechoviruses infections in northern of Spain, 2016-2019
A. Navascués Ortega, A. Aguinaga Perez, M. Cabreroza, M. Portillo* (Pamplona, Spain), C. Ezepeleta Baquedano

Seroprevalence of Coxsackievirus B1-6: retrospective study in an Italian population

Seroprevalences of ten ToRCH infectious pathogens in women residing in Europe, Latin America and China

National outbreak of norovirus genogroup II in a sushi restaurant chain associated with an internationally distributed seaweed product

Subtyping of adenovirus strains isolated from pre-diagnosed patients with keratoconjunctivitis
A. Güner* (Pendik, Turkey), A. Karahasan, R. Can Sannoğlu, F. Aydin, E. Toker, S. Akkaya Turhan

Molecular epidemiology of varicella zoster virus in Pitié-Salpêtrière University Hospital, Paris, France
M. Cheminet, S. Burrel, D. Boutolleau* (Paris, France)

Viral aetiology and epidemiology of acute paediatric gastroenteritis in southern region of Saudi Arabia with Yemen borders
A. Babiker* (Abha, Saudi Arabia), M. Hassan, A. Al-Hakami, A. Alghantani

Enterovirus surveillance in an Italian paediatric hospital
L. Piccioni, S. Ranno, L. Coltella, C. Auriti, G. Pizzichemi, S. Chiavelli, L. Lancella, L. Cursi, C. Concato* (Rome, Italy)

Genetic diversity and possible recombination of Rs-BatCoV HKU32 related viruses in southern China
C. Wong* (Hong Kong, Hong Kong), S. Lou, H. Luk, S. Ahmed, J. Cai, P. Zhao, J. Teng, K. Yuen, P. Woo

Enterovirus-C99 associated with cases of acute flaccid paralysis in the south-eastern region of Brazil
R. Carmona* (São Paulo, Brazil), B. Machado, J. Dias, A. Chirelli, L. Louzado, A. Luchs, C. Sousa, M. Timenetsky, M. Eduardo

Metagenomics analysis of novel viruses in dromedaries from the Middle East
H. Lee* (Hong Kong, Hong Kong), J. Teng, J. Fung, K. Yeong, K. Chan, S. Lau, P. Woo

Phylogenetic and geographical analyses of bat coronaviruses
T. Chan* (Hong Kong, Hong Kong), C. Wong, H. Luk, S. Lou, P. Woo

Impact of enteric viral co-infections on gastroenteritis among hospitalised children in Palermo, Italy, during a 10-year surveillance
S. De Grazia* (Palermo, Italy), F. Banura, L. Mangiaracina, C. Filizzolo, C. Bonura, V. Martella, G. Giannanco

Varicella zoster virus seroepidemiology in Caribbean Netherlands: implications for vaccine policy

Prevalence and quantity of parvovirus B19 DNA among blood donors
A. Uskudar Guclu* (Ankara, Turkey), S. Yilmaz, M. Baysal, I. Avci

Epidemiological and molecular characteristics of human parechovirus infection in children <6 months hospitalised with symptoms of sepsis-like illness: Milan 2015-2018
L. Pellegrinelli, S. Udèda Renteria* (Milan, Italy), C. Galli, A. Orlandi, S. Bindo, E. Pariani

Introduction and spread of the novel GII.P16 pandemic recombinant norovirus in Italy detected by a newly designed PCR primer pair
G. Giannanco* (Palermo, Italy), N. Urone, F. Bonura, C. Filizzolo, L. Mangiaracina, C. Bonura, V. Martella, S. De Grazia

Molecular investigation of a 4-year outbreak of human adenovirus A31 (HAdV-A31) infection on a paediatric haematopoietic stem cell transplantation ward

Changing seroprevalence of viral diseases among young adults in a tertiary care educational university hospital? Experience with 1993 cases
M. Isikgöz Tasbakan, D. Akyol* (Izmir, Turkey), A. Yezitinoğlu, H. Pullukcu

Session accepted as Paper Poster Session

Viral hepatitis A and E

New freeze-dried multiplex one-step real-time qPCR assay with room temperature storage for hepatitis A virus and and norovirus detection in clinical and food/environmental samples
C. Pilotti* (Lodi, Italy), C. Casali, M. Savoldi Boles
Abstract Categories 2020

3138 Presence and persistantce of hepatitis E virus PCR in patients with specific IgM positivity
C. Mendoza Lopez* (Zaragoza, Spain), J. Gil, A. Rivero-Juarez, A. Legva, R. Benito

4664 An outbreak of hepatitis A among young adult men in Cyprus
P. Dimitriou, C. Flourou, G. Nikolopoulos, M. Koliou, E. Constantinoú, C. Azino, M. Papagiotou, E. Christaki*
(Thessaloniki, Greece)

4741 Hepatitis E virus infection is a risk for liver transplant recipients in Sweden
M. Karlsson* (Göteborg, Sweden), C. Skoglund, M. Karlsson, M. Logging, M. Castedal, H. Norder

5642 Seroprevalence of hepatitis E virus among blood donors in the Qassim Region, Saudi Arabia
B. Alhatlani* (Unayzah, Saudi Arabia), W. Aljabr, M. Almarzuqi, S. Alhatlani, A. Almusallam

8642 Development of a methodology for reverse transcription and amplification of small RNA amounts in serum for whole genome sequencing of hepatitis A virus
P. Bardon, S. Tapia, L. Mara, E. Martínez, E. Clavijo*
(Malga, Spain)

6145 Hepatitis B and hepatitis D virus infection in immigrants living in south Italy: epidemiological and virological characteristics
M. Pisaturu* (Naples, Italy), L. Onorato, L. Alessio, C. Monari, L. Gualtieri, C. Minichini, G. Di Caprio,
M. Starace, M. Caraprese, L. Occhiello, G. Scotto, M. Mocera, E. Sagnelli, N. Coppola

6153 Effects of mutations in the hepatitis B virus genome on viral loads testing
(Be'er Sheva, Israel)

7262 Evaluation of the whole blood spot on plasma separation card as a sample type for serological screening for hepatitis B and hepatitis D infection
F. Velasquez* (Barcelona, Spain), A. Rando Segura, P. Salmerón, U. Aldama, A. Najarro, A. Esteban, G. Ruiz,
M. Rivero-Barciela, M. Buti, E. Marins, F. Rodriguez Frias
Evaluation of the whole blood spot on plasma separation card as a sample type for hepatitis B virus viral load quantification on the COBAS 6800 system
F. Velasquez* (Barcelona, Spain), A. Rando Segura, P. Salmerón, U. Aldama, A. Esteban, A. Najarro, G. Ruiz,
M. Rivero-Barciela, M. Buti, E. Marins, F. Rodriguez Frias
MALDI-TOF MS as new tool for the identification of serological biomarkers for diagnosis of hepatitis B and C viruses infections
A. Calderaro, M. Buttrini* (Parma, Italy), S. Montecchini, F. Ferraglia, F. Pinardi, M. Arcangeletti, F. De Conto,
C. Chezzi

7760 Construction and investigation of IncRNA-associated ceRNA network in chronic hepatitis B infection
S. Wang* (Chengdu, China), Y. Wei, J. Chen
Performances of a new random access system for hepatitis B and C viral load quantification
J. Besombes, C. Pronier* (Rennes, France), A. Maillard, G. Lagathu, P. Camacle, C. Grolhier, V. Thibault
Detection of hepatitis B virus reactivation and near complete sequencing of the viral genome by high-throughput sequencing in a kidney transplant
M. Etoundi, S. Aherfi, A. Motte, V. Moal, P. Calson*
(Marseille, France)

Longitudinal assessment of liver fibrosis rates using non-invasive APRI and Fib-4 scores in HIV, HBV and HIV-HBV co-infected patients
D. Iacob* (Bucharest, Romania), M. Luminos, B. Otilia, A. Tudor, S. Iacob, C. Olariu, A. Tudor, I. Arin, S. Ruta

Session accepted as Paper Poster Session

Viral hepatitis B

1070 Performance evaluation of the Xpert HBV Viral Load assay for the quantification of hepatitis B virus DNA in plasma samples
H. Lam* (Hong Kong, Hong Kong), B. Tang

1071 Performance evaluation of the Alinity m HBV assay for the quantification of hepatitis B virus DNA in plasma samples
H. Lam* (Hong Kong, Hong Kong), M. Ng, B. Tang

1629 Cardiovascular Disease risk in liver transplant recipients for hepatitis B, C and delta virus-associated cirrhosis
P. Cirilo* (Caserta, Italy), F. Calò, G. Stornaiuolo, G. Gaeta, P. Maggi

3721 HBV RNA and HBcAg: two new biomarkers for monitoring chronic hepatitis B virus infection
G. Roncarati* (Bologna, Italy), S. Galli, A. Moroni, G. Furlini

4047 Use of chemiluminescence and electrophochemistry in the diagnosis and monitoring of hepatitis B viral infection
D. Velcheva, A. Gotseva* (Soﬁa, Bulgaria), Y. Slaveyкова

5897 Hepatitis B virus epidemiology among chronic kidney disease patients under haemodialysis
L. Villar* (Rio de Janeiro, Brazil), K. Frajo, J. Miguel, E. Da Silva, B. Marques, A. Da Fonseca Mendonça,
L. Lewis-Ximenez
Abstract Categories 2020

Session accepted as Paper Poster Session

Viral hepatitis C

503  Dried blood spots tested with the Abbott m2000 sp/rt system perform well to identify patients with active HCV infection in Vietnam
T. Tran, B. Nguyen, T. Nguyen, T. Pham, T. Nguyen, T. Mai, B. Pham, T. Nguyen, H. Phan, N. Do, M. Ait Ahmed, F. Taiseb, M. Yoan* [Paris, France]

5288  Serore prevalence of anti-HCV antibodies in the Bulgarian population
D. Velcheva, A. Gotsева* [Sofia, Bulgaria], G. Popov

2789  Detection and quantification of hepatitis C Virus in cadaveric tissue donors’ blood using different molecular kits
V. Stadler Tasca Ribeiro, S. Raboni, P. Suss, J. Cieslinski, L. Kraft, J. Santos, L. Pereira, J. Telles, L. Arent* [Curitiba, Brazil], F. Tuon

3087  Treatment of hepatitis C with direct-acting antiviral (DAA) agents: sustained virological response rate in a real care setting in the state of Ceará, north-eastern Brazil
R. Pires Neto* [Fortaleza, Brazil], E. Bomfim Hypolito, J. Milton De Castro Lima, E. Antonio Gomes De Arruda, F. Sérgio Rangel De Paula Pessoa

3227  Applicability of dried blood spot for molecular epidemiology of HCV in coagulopathy patients
L. Villar* [Rio de Janeiro, Brazil], A. Da Fonseca Mendonça, B. Marques, J. Barbosa, J. Colares, D. Lima

3852  Extreme short course therapy for chronic hepatitis C infection
G. Stroffolini* [Turin, Italy], L. Baglione, T. Lupia, G. Cariti, G. Di Perri

3992  The Caserta Model: an hepatitis C virus way out in persons who use drugs in Italy
G. Di Caprio* [Caserta, Italy], V. Messina, A. Russo, E. Parente, G. Russo, T. Raimondo, A. Salzillo, F. Simeone, M. Pisaturo, N. Coppola

4244  Direct-acting antiviral failure in hepatitis C virus genotype 3: virological features and efficacy of re-treatment

4509  Effect of antiviral therapy against hepatitis C virus on gut microbiota
B. Pinchera* [Naples, Italy], R. Scotto, E. Zappulla, A. Buonomo, A. Maranola, N. Schiano Mariello, F. Gison, F. De Filipps, D. Ercolini, I. Gentile

4763  The future of hepatitis C virus nucleic acid amplification techniques standardization?
J. Fryer* [Potters Bar, United Kingdom], P. Rigsby, J. Hockley, C. Morris

503  Direct-acting antivirals failure in HCV genotype 3: virological features and efficacy of re-treatment

503  Using dried blood spots in drug dependency treatment centres to diagnose active hepatitis C infection
M. Lara, D. García Martínez De Artola* [Santa Cruz de Tenerife, Spain], J. Alcaba Flores

503  Reliable HCV genotyping and resistance associated substitutions identification by a new next-generation sequencing approach

503  Real-world drug resistance profile of hepatitis C patients who failed direct-acting antivirals: SHARED

503  Detection of antibodies to hepatitis C virus using the Ortho VITROS: evaluation of the signal-to-cutoff ratio
G. Colomba, N. Urone, C. Mascarella, D. Ferrara* [Palermo, Italy]

503  Patients related barriers for delay in seeking confirmatory test and treatment of hepatitis C in treatment naïve patients visiting a tertiary care hospital in Karachi, Pakistan
H. Ashraf* [Karachi, Pakistan], N. Mahmood, U. Shujat, N. Baig-Ansari, S. Iftkhur, R. Ansari

503  Goal achieved! Elimination of hepatitis C in three penitentiary centres
S. García Martín* [Puerto Real, Spain], C. Freyre, F. Téllez Pérez, I. Virto, M. Martinez Rubio

503  Hepatitis C reflex testing in Spain in 2019: a story of success
F. García García* [Granada, Spain], A. Aguilara, J. Calleja Panero, J. Eiros, A. Blasco Bravo, P. Lazaro, F. Garcia-Samaniego Rey, J. Crespo

503  An optimised strategy for linkage to care of patients newly diagnosed of active hepatitis C infection
A. Fuentes* [Granada, Spain], F. García García, E. Ruiz, F. Sousa, F. Garcia Garcia
Abstract Categories 2020

Session accepted as Mini-oral Flash Session

Viral hepatitis in the real world

2897 Changes in the characteristic of the population with chronic hepatitis C receiving treatment with direct acting antivirals in a referral centre during the post-interferon era

4403 Virological patterns of HCV-patients with failure to second-generation direct-acting antivirals

Identification of mutations in hepatitis B virus reverse transcriptase associated with a tenofovir-resistant phenotype in South African adults

Whole genome sequencing to investigate genetic diversity in HBeAg-positive and HBeAg-negative hepatitis B virus infection

Progress towards the targets for the elimination of viral hepatitis in the European Union
E. Duffell* [Stockholm, Sweden], A. Mozalevskis, T. Noori

Direct-acting antiviral based treatment for HCV-infected persons who inject drugs: a multi-centre real-life study
L. Onorato* [Naples, Italy], G. Di Caprio, A. Russo, C. Caruso, V. Rosato, E. Claar, V. Iovinella, V. Messina, N. Coppola

Direct-acting antivirals-based treatment for HIV/hepatitis C virus co-infected patients: analysis of factors of virological sustained response in a real-life study

HEV infection as an emergent public health issue: is it a concern for Italian blood donors?
L. Colagrossi* [Milan, Italy], M. Mercuri, A. Nava, E. Matarazzo, D. Campisi, P. Carlo Federico, D. Fant

Prevalence of Hepatitis E Virus in allogeneic-haematopoietic stem cell transplant recipients from Portugal
S. Cruz* [Rebordosa, Portugal], N. Santos-Ferreira, M. Nascimento, C. Pinho Vaz, F. Campilho, L. Leite, R. Branca, A. Campos Jr, R. Medeiros, H. Sousa

Micro-elimination of hepatitis C in HIV co-infected persons in Slovenia: analysis of HCV infection in a national HIV cohort
J. Ceronsa* [Smarje pri Jelsah, Slovenia], J. Tomášič, T. Vovko, B. Pecavar, G. Turel, M. Kordiš, M. Pleško, B. Ulan, J. Meglič, M. Poljak, J. Lazarus, M. Maticic

High-resolution influenza mapping of a city reveals socioeconomic determinants of transmission within and between urban quarters

Too much of a good thing? Evaluation of respiratory viral panel usage in paediatric bone marrow transplant patients
M. Precit* [Los Angeles, United States], M. Glucoft, K. Mongkolrattanothai, J. Dien Bard

Predictors of mortality of influenza virus infections in a Swiss hospital during four influenza seasons: role of quick sequential organ failure assessment
M. Papadimitriou Olivergis* [Lausanne, Switzerland], N. Gkikopoulos, M. Wust, A. Balif, V. Simonin, M. Maulini, C. Nusbaumer, L. Bertaiola Monnerat, J. Tschapp, E. Kampouri, P. Wilson, E. Huplain

EnteroVirus D68: biennial circulation and molecular epidemiology in New York, USA, 2014-2018
G. Wang* [Valhalla, United States], V. Gilrane, J. Zhuge, W. Huang, C. Yin, C. Salib, S. Nolan, A. Dhand, J. Fallon

Effect of rapid influenza detection tests on antibiotic prescriptions
A. Berwa* [Meylan, France], M. Gallouche, S. Larrat, J. Fauconnier, J. Bossard, C. Landelle

Measurement of influenza antibodies in a cohort of vaccinated patients admitted to a cardiac intensive care unit: are they clinically relevant?

Nanopore metagenomic sequencing of influenza virus directly from respiratory samples: diagnosis, drug resistance and nosocomial transmission
F. Fouad, M. Lemaître, A. Bessou, F. Carrat, P. Crépey, J. Gaillot* [Fringy, France], G. Gavazzi, D. Launay, A. Masnier, M. Levant, M. Uhart

8890 Evaluating the performance of a host-protein signature for distinguishing between bacterial and viral disease in adults with Lower Respiratory Tract Infection (LRTI): results from the OBSERVER clinical study

Session accepted as Paper Poster Session
Viruses and transplantation

615 Survival outcome in allogeneic haematopoietic stem cell transplant recipients with multiple, sequential cytomegalovirus, Epstein-Barr virus, BK virus and respiratory viral infections
S. Tia* [Parkville, Australia], M. Slavin, D. Ritchie, L. Chee, A. Bajel, J. Sosadeusz, C. Malpas, M. Yong

824 International survey on diagnosis and management of human herpes virus-8 infection in solid organ transplant recipients
A. Mularoni* [Palermo, Italy], L. Adamioli, M. Mikulska, M. Giannella, P. Grossi

1006 In vitro evaluation of the influence of immunosuppressive agents on human polyomavirus BK replication
S. Lucia* [Milan, Italy], E. Favi, M. Ferrareso, M. Dolci, R. Ticozzi, F. Ferrante, S. Delbue

1522 Do cytomegalovirus infection and valganciclovir exposure increase the risk of BK viremia and associated nephropathy after kidney transplantation?

1990 Optimisation of a series of salicylamide derivatives of niclosamide as potent antiviral agents against human adenovirus

2382 Cidofovir-associated nephrotoxicity in adult allogeneic haematopoietic cell transplant recipients

5029 Impact of letermovir (LTV) on utilisation of pre-emptive therapy for cytomegalovirus after allogeneic haematopoietic cell transplantation: a single-centre experience
J. Fang* [New York, United States], P. Zavras, Y. Su, A. Stern, T. Nawar, M. Perales, G. Papanicolaou

5402 Retrospective study of cytomegalovirus infection in orthotopic liver transplantation recipients receiving low dose valganciclovir prophylaxis
M. Lucey* [Dublin, Ireland], S. Fitzgerald, S. Mcdermott

5685 Kaposi sarcoma herpes virus infection in solid organ transplant recipients
L. Adamoli, F. Todaro, E. Conoscenti, D. Di Carlo, M. Miele, M. Di Bella, A. Gallo, P. Grossi, P. Conaldi, A. Mularoni* [Palermo, Italy]

5830 Cytomegalovirus in intensive care unit immunocompetent patients: mortality and clinical aspects
A. Lazo, C. Ramírez* [San Jose, Costa Rica], J. Castro, M. Somagyi, J. Villalobos, L. Montero, R. Arguedas

7069 Impact of letermovir and associations of antivirals in vitro and in ex vivo first-trimester placenta model
D. Andouard* [Limoges, France], B. Gastineau, C. El Harel Bellili, S. Hantz, S. Alain

7776 Letermovir reduces rehospitalisations among cytomegalovirus-seropositive allogeneic haematogenous stem-cell transplant recipients
Y. Golan* [Boston, United States], Y. Tang, S. Mt-Isa, H. Wan, V. Teal, C. Basdshah, S. Dadwal

7948 Evaluation of association between immune modulation and incidence of cytomegalovirus reactivation in sepsis-induced immunosuppression
G. Lambe* [Maharashtra, India], F. Kapadia, C. Rodrigues, A. Shetty, S. Khodaiji, D. Mansukhani

8039 Cytomegalovirus reactivation as a diagnostic and prognostic indicator of increased risk of cardiovascular diseases
V. Centa, L. Colagrossi* [Milan, Italy], A. Nova, E. Matarazzo, M. Mercuri, F. Pansera, E. Piccinelli, I. Bossi, D. Armenia, P. Paba, F. Marcuccilli, D. Campisi, D. Fantì, F. Oliva, F. Cecherini Silberstein, C. Giannattasio, P. Carlo Federico

8079 Letermovir pre-existent mutations in human cytomegalovirus UL56 terminase in solid organ and haematopoietic stem cell transplant recipients
M. Santos Bravo* [Barcelona, Spain], S. Sanchez-Palomino, N. Plaut, M. Masquera Gutiérrez, V. Gonzalo, F. Fernández, M. Sudrez-Lledó, M. Rovira, F. Cofan, M. Moreno Camacho, L. Linares, M. Bodro Marimont, S. Alain, M. Marcos

8320 Evaluation of clinical safety and efficacy of letermovir for cytomegalovirus infection prevention in allogeneic hematoopoietic cell transplant recipients
M. Korostelev* [Paris, France], D. Michanneau, I. Madelaine, T. Sophie
Relevance of EBV load monitoring in renal transplant recipients: a retrospective cohort study

Session accepted as Paper Poster Session
Viruses causing hemorrhagic syndromes

Crimean-Congo hemorrhagic fever in an emergency department in Spain

Seroprevalence of anti-CCHF IgG in population in different districts of endemic region and Crimean-Congo hemorrhagic fever morbidity
N. Pshenichnaia* [Moscow, Russian Federation], N. Golovchenka, L. Ermakova, E. Volchkova, A. Zhuravlev, A. Grekova

Forecasting of Crimean-Congo hemorrhagic fever outcome
N. Pshenichnaia* [Moscow, Russian Federation], G. Abuava, F. Berdalieva, B. Khodzhabekov, L. Ermakova, A. Zhuravlev

Lassa fever infection and prevention control availability and use at healthcare facilities in South-Western Nigeria
I. Usman* [Osogbo, Nigeria], S. Usman

The ultrastructural visualisation of Severe Fever with Thrombocytopenia Syndrome (SFTS) virus in human PBMC sample
Y. Lee, H. Lee, E. Park, H. Kim, S. Kim, C. Lee, S. Jun* [Daejeon, South Korea]

Geographical clustering of hantavirus isolates from Apodemus agrarius identified in the Republic of Korea indicates the emergence of a new hantavirus genotype
D. Kim* [Gwangju, South Korea], J. Sehrish, C. Kim, S. Jun-Won

Hantavirus registry (HantaReg): a novel worldwide platform for epidemiological and clinical studies of hantavirus diseases
F. Köhler* [Cologne, Germany], M. Späth, J. Hoyer-Allo, M. WanKen, O. Corneli, V. Di Cristanziano, F. Schaefer, R. Müller, V. Burst

Crimean–Congo haemorrhagic fever in pregnancy: a systematic review and meta-analysis of clinical presentation and maternal and foetal outcomes
N. Kayem* [Oxford, United Kingdom], C. Aye, C. Benson, S. Baker, M. Tame, S. Kennedy, P. Ariana, P. Horby

Safe and high-throughput screening of natural compounds using pseudo-virus expressing SFTSV glycoprotein
H. Cha* [Seoul, South Korea], J. Kim, S. Park, I. Kim, S. Kim
Abstract Categories 2020

2730 A marked decrease in HIV-1 acquired drug resistance in Italy over the last decade

4724 Evaluation of analytical and clinical performances of four commercial HIV-1 viral load assays on a wide panel of HIV-1/M and HIV-1/O
M. Gueudin* (Rouen, France), P. Cappy, E. Alessandri-Gradl, F. Diamond, J. Moriceau, D. Descamps, A. Vabret, S. Laperche, J. Plantier

7150 Early, potent and sustained virus-specific antibody-dependent complement-mediated inactivation activity in HIV-2 infection

8101 The N-terminus of APOBEC3C regulates the antiviral activity against HIV-1
K. Balakrishnan* (Düsseldorf, Germany), A. Jaguva Vasudevan, A. Sangwimon, S. Banerjee, C. Münk

9109 Conservation in p24 capsid protein regions in HIV-1 groups M, O, P and H
P. Tragana Hernandez* (Alcalá de Henares, Spain), R. Reina, A. Holguin

Session accepted as 2-Hour Oral Session
What’s new in viral hepatitis?

1032 Prospective evaluation of serological and virological response in chronic hepatitis B genotype E treated with tenofovir or entecavir
I. De Benedetto* (Turin, Italy), L. Boglione, T. Lupia, G. Cariti, G. Di Perri

4164 Eliminating mother-to-child transmission of hepatitis B virus in Namibia: a cost-effectiveness analysis
C. Tamanjou Tchuem* (Cape Town, South Africa), M. Andersson, J. Mufenda, C. Wiysonge, D. Diergaardt, C. Tamandjou Tchuem* (Cape Town, South Africa), W. Preiser, S. Cleary

4340 Virological features and efficacy of re-treatment in hepatitis C virus patients: a real-world experience in southern Italy

4884 Chronic hepatitis C care cascade in France: substantial impact of direct-acting antivirals but the path to elimination is still long

4922 Characteristics of Resistance Associated Substitutions (RASs) in “unusual” HCV subtypes: a worldwide network of HCV resistance database

5068 HCV resistance patterns in a large international cohort of DAA-naïve and -experienced patients with GT3a infection

5141 Hepatitis E virus genotype 3 subtype-dependent clinical outcomes in Belgium 2010-2018

5592 Innovative procedures for micro-elimination of hepatitis C virus infection in a high-risk population of undocumented migrants and low-income refugees

Session accepted as Paper Poster Session
Yellow fever, Zika, and Chikungunya

672 Clinical manifestations of hospitalised chikungunya fever cases during epidemic in the state of Ceará, Brazil, from 2017 to 2019
R. Pires Neto* (Fortaleza, Brazil), F. Liliyyn Christyan Nunes Beserra, J. D’Arc Rocha Damasceno, D. Mendes De Melo, E. Girão

2950 Clinical outcomes of 3-day course of adjunctive oral ivermectin for the patients with chikungunya virus infection: a preliminary study
S. Chusri* (Songkhla, Thailand), T. Hortivakul, P. Surasombatpatana, K. Silpopajakul

3210 Clinical evaluation of the mosquito-borne virus panels of Genematrix based on multiplex real-time PCR
J. Ju, S. Cho, S. Yang, K. Lee* (Gyeonggi-Do, South Korea), S. Hong, S. Kim
Malaria outbreak investigations reveal high seroprevalence of arbovirus infections among febrile cases in Baringo County, Kenya
T. Nzama* (Nairobi, Kenya), R. Abdi

Chikungunya positive reference material based on lentiviral vector system for RT-qPCR assays
C. Escolar* (Zaragoza, Spain), S. Valledor, E. De Tomas Mateo

Epidemiology of dengue, chikungunya, Zika and West Nile diseases from 2012 to 2019: data from an Italian regional reference centre
N. Zanchetta, A. Rizzo, C. Bassi, C. Pontariero, R. Grande* (Milan, Italy), G. Venturi, M. Gismondo

Epidemiology and differential diagnosis of chikungunya and O’nyong-nyong virus: many gaps of knowledge to be filled
L. Pezzi* (Marseille, France), I. Diarra

Results of a Zika virus screening programme in asymptomatic pregnant women in Spain
C. Castelló-Abietar, I. Costales* (Oviedo, Spain), S. Rojo, M. Alavarez-Argüelles, S. Melán-García, M. Rodríguez-Perez

Zika virus: a global health threat and current situation in Pakistan
K. Imtiaz, J. Farooqi, D. Prakoso, K. Barr, M. Long, E. Khan* (Karachi, Pakistan)

First vector-borne cases of Zika virus diseases in Europe: a seroprevalence survey
H. Noël* (Saint-Maurice Cedex, France), F. Franke, G. Durand, J. Paireau, S. Giron, G. Grard, P. Chaud, A. Decoppet, S. Cauchemez, M. Paty, H. De Valk

Characterisation of ZIKV NS1 protein and development of ZIKV-specific monoclonal antibodies for rapid diagnosis
H. Kim* (Cheongju-Si, South Korea), S. Jun, E. Park, S. Kim

Detection of Zika and Chikungunya viruses circulation in Pointe Noire district (Republic of Congo) during the 2019 Chikungunya outbreak

Chikungunya virus: neuromotor evaluation of infants born to infected mothers
R. Freire, C. Gaspari* (Rio de Janeiro, Brazil), L. Albuquerque

A new menace emerges in South America: yellow fever outbreak looms in Venezuela

Can HLA type I and II alleles presence be associated with the clinical spectrum of chikungunya virus infection

The impact of Zika virus epidemic on maternal mental health in Brazil

Zika, dengue and chikungunya viruses seroprevalence among adolescents in Brazil

Accuracy of chikungunya case definition in patients with arbovirus illness seeking care in an urban emergency department in Rio de Janeiro, Brazil
H. De Paula, C. Lamas* (Rio de Janeiro, Brazil), J. Moreira, R. Santana De Aguiar, S. Carodozo

Who should we test for arboviral infection? Rational diagnostic testing in an era of increased global prevalence
R. Ryan* (London, United Kingdom), I. Milligan, S. Logan, E. Nastouli, A. Checkley, T. Ramping

What does the space-time dynamics of arboviral diseases epidemic in Curaçao tell us? Unravelling potential factors of disease persistence and spread
M. Vincenti-Gonzalez* (Groningen, Netherlands), Y. Halabi, I. Gerstenbluth, A. Duits, A. Friedrich, M. Grillet, A. Tami

“Tell me and I forget, involve me and I learn”: citizen science for mosquito management in a Dutch Caribbean island
M. Vincenti-Gonzalez* (Groningen, Netherlands), D. De Kort, D. Haarsma, R. Haan, D. Van Der Leest, B. Sagel, A. Duits, E. Schoop, M. Kelie, Y. Halabi, M. Braks, L. Tromp, A. Friedrich, M. Grillet, A. Tami

Clinical evolution of yellow fever patients in the 2017-2018 outbreaks in Minas Gerais, Brazil: preliminary analysis of risk factors for death
C. Rodrigues* (Belo Horizonte, Brazil), W. Clemente, C. Bonis, P. Mourão
Abstract Programme

2. Bacterial infection & disease

- Tuberculosis and other mycobacterial infections (incl antimycobacterial drugs, treatment & susceptibility/resistance, diagnostics & epidemiology)

- Severe sepsis, bacteraemia & endocarditis (incl host bio-markers)

- Community-acquired respiratory infections

- Community-acquired abdominal/gastrointestinal, urinary tract & genital infections

- Skin, soft tissue, bone & joint (excl prostheses) & central nervous system infections

- Zoonotic bacterial diseases (incl foodborne and waterborne pathogens and One Health aspects)

- Other intracellular or rare bacteria

- Other

A. Thornberg* [Carlsbad, United States], N. Whitfield, D. Traizer, J. Reid

Clinical characteristics and prognosis of Staphylococcus aureus Bloodstream Infections in a French General Hospital
S. Nguyen* [Béthune, France], P. Wallard, O. Oddoux, M. Anastay, D. Descamps

Distinguishing clinical characteristics and outcomes in patients with polymicrobial Staphylococcus aureus bacteraemia
C. Kelsom* [Pasadena, United States], E. Minejima, K. Tan, P. Nieberg, A. Wong-Berenger

Healthcare-associated Staphylococcus aureus bloodstream infection (HA-SABSI): clinical practice variation in its management
M. Garcia-Gasalla* [Palma de Mallorca, Spain], C. Collado Giner, A. Villoslada Gelabert, L. Ventajol-Aguiló, M. Perez-Seco, M. Arrizabalaga Asenjo, M. Gallegas Alvarez

Septic shock and age are risk factors for mortality in bacteraemia by multidrug-resistant pathogens in a Brazilian cohort of critical patients
L. Campos, C. Rizek, M. Farrel Cortés, S. Santos, A. Marchi, G. Gonçalves, S. Figueiredo Costa* [São Paulo, Brazil]

Characterising the incidence and outcomes of endogenous endophthalmitis in hospitalised patients with Staphylococcus aureus bacteraemia
L. Wardlow* [Columbus, United States], M. Sobhanie

Secular trends in the epidemiology and clinical characteristics of Enterococcus faecalis infective endocarditis in a referral centre [2007-2018]
L. Escolà-Vergé, N. Fernandez-Hidalgo* [Barcelona, Spain], N. Larrosa, B. Almirante

Development of a predictive score for Enterococcus spp. in biliary tract-related bloodstream infections: Results from the PROBAC study

Impact of infectious diseases consultation and appropriate empirical antibiotic therapy on mortality in patients with Staphylococcus aureus bloodstream infection: a two-year retrospective analysis
A. Cona* [Milan, Italy], L. Gazzola, O. Viganò, R. Castoldi, A. Renzelli, T. Bini, G. Marchetti, A. D’Arminia Monforte

Recurrent bacteraemia with Enterococcus faecalis is predominantly caused by the same clone
C. Tellapragada* [Stockholm, Sweden], H. Östlund, P. Naucler, M. Rasmussen, C. Giske, A. Berge

Bloodstream infections caused by Enterococcus spp.: incidence, clinical features, and outcomes
T. Lupia, L. Scaglione, A. Curtoni, R. Cavallo, F. De Rasa, S. Corcione* [Turin, Italy]

Delayed diagnosis and increase mortality in native vs prosthetic/device-related coagulase-negative staphylococci infective endocarditis

Clinical practice variation in the management of Staphylococcus aureus bacteraemia among infectious disease specialists in Latin America: an international study
Usefulness of the 16S rRNA gene PCR and sequencing in the diagnosis of prosthetic joint infections

Necrotising external otitis (NEO): analysis of risk factor for relapse in 66 patients managed during a 12 year period in a reference centre

Total knee and hip arthroplasty after septic arthritis: retrospective analysis of 53 cases managed in a reference centre for bone and joint infections
E. Portier, V. Zeller* (Paris, France), S. Godat, Y. Kerroumi, B. Heym, V. Meyssonnier, S. Marmor, P. Chazerain

Particularities of brucellar spondylodiscitis
F. Hammami, M. Makram, A. Zayni, K. Rekik, F. Smoufi, E. Elleuch, C. Marrakchi, M. Ben Jemaa* (Sfax, Tunisia)

Should serum D-dimer be added as a first-line screening test for prosthetic joint infection?
M. Fernandez Sampeda* (Santander, Spain), I. Sanliés González, C. García Ibarbia, N. Fariñas Rodríguez, D. Pablo-Marcos, G. Menendez Solana, C. Fariñas

Oral versus intravenous antibiotics in the treatment of osteomyelitis in adults: a systematic review and meta-analysis
R. Larrazabal, H. Chiu, M. Arcegono* (Manila, Philippines), C. Abad

Metagenomic antimicrobial resistance prediction from nanopore sequencing of orthopaedic implant-related infections: can we do more than detect species from sonication fluids?
T. Street* (Oxford, United Kingdom), C. Kolenda, N. Sanderson, C. Taunt, S. Oakley, B. Atkins, M. McNally, J. O’Grady, D. Crook, D. Eyre

Vertebral osteomyelitis in patients with Staphylococcus aureus bloodstream infection: evaluation of risk factors for failure

Diagnostic utility of a novel Point-of-Care test of calprotectin for periprosthetic joint infection in total knee arthroplasty patients
8001 Efficacy and safety of intravenous fosfomycin in patients with periprosthetic joint infection: preliminary results from the PROOF study: a prospective multi-centre study
S. Karbysheva* (Berlin, Germany), P. Morovic, D. Margaryan, L. Johannsen, A. Trampuz

8053 Comparison between Bedside Blind Bone Biopsy (B4) and Basic Bone Biopsy (B3) in the management of diabetic foot osteomyelitis

8154 Retrospective analysis of spinal infections over a 10-year period (2008-2018) in tertiary care hospital
A. Kan, E. Vyronis* [Coventry, United Kingdom], V. Cajic

8261 Comparison of the molecular-based test system hyborg Dx and culture for the diagnosis of prosthetic joint infections
A. Boesl* (Feldkirch, Austria), H. Dirschmid, C. Ohmayer, A. Neugebauer, A. Brachner, B. Ronacher, F. Offner

8281 Intra-osteoblastic activity of dalbavancin during treatment of Staphylococcus aureus bone and joint infection
C. Pierre, L. Abad, A. Souche, C. Dupieux, J. Josse, T. Ferry, F. Laurent, F. Valour* (Lyon, France)

8285 Extended-spectrum ß-lactamase-producing/carbapenemase-producing Enterobacterales prosthetic joint infection in patients with positive rectal screening

8379 Risk factors for mortality in diabetic foot infections
P. Sen, T. Demirdal* (Izmir, Turkey)

8487 Granulicatella sp. and Abiotrophia sp. as a rare cause of osteoarticular infections

8545 Epidemiology, complications, and outcomes of vertebral diskitis/osteomyelitis among patients with Staphylococcus aureus bacteremia
H. Ishaq, R. Ramesh* (Hyderabad, India), J. H. Kralove, Czech Republic, L. Baddour, M. Sauh, V. Baratharaj Palraj

8686 Osteomyelitis in sickle cell adults: descriptive study in a high-income country
C. Pierre-Louis* (Saint-Mandé, France), O. Steichen, A. Santin, C. Bachmeyer, P. M. Bappe, F. Lionnet, S. Mattioni

8694 Performance of EUCAST’s rapid antibiotic susceptibility testing on sterile body fluids in blood culture bottles
S. Zimmermann* (Heidelberg, Germany), J. Jasuja, I. Burckhardt

8715 Perioperative administration of cefepime-daptomycin combination during prosthetic joint replacement is associated with high bone and synovial concentrations

8893 Risk factors for amputation in diabetic foot infections
T. Demirdal* (Izmir, Turkey), P. Sen

9021 Acinetobacter baumannii-complex related osteomyelitis
P. Oliveira* (Sao Paulo, Brazil), E. Saconi, V. Carvalho, J. Silva, A. Munhoz

9119 Cotrimoxazole in bone and joint infections is the “old” antibiotic still relevant
M. Baroud, P. Seng* (Marseille, France), A. Stein

9429 Diabetic foot osteomyelitis: an epidemiological retrospective analysis in a Portuguese university hospital
A. Cipriano* (Loulé, Portugal), D. Guerra, M. Abreu, A. Carvalho, M. Matos Dias Reis

Session accepted as Paper Poster Session
BSI: new spectrum, new data

Misuse of tampons and menstrual toxic shock syndrome in France: a community-based case-control study
A. Billon, M. Gustin, A. Tristan, C. Gustave, P. Vanhems, G. Lina* (Lyon, France)

Daptomycin decreased mortality in methicillin-resistant Staphylococcus aureus bacteremia compared to vancomycin: a monocentric retrospective study of 96 cases
A. Froment, R. Guiheneuf, C. Mobille, J. Lanoix* (Amiens, France)

Focus on nuclear imaging and other complementary exams for bacteremia in early post-operative cardiac surgery
M. Thy* (Paris, France)

Efficacy and safety of cefazidime-avibactam in adults with Gram-negative bacteremia from five phase III randomised clinical trials

Can we use sepsis scores to predict bacteremia in the elderly?
S. Subbarao* (London, United Kingdom), S. Subba Rao, M. Andrews, Y. Milner, C. Nicitiogortaigh

Rising incidence and mortality of bloodstream infections in Finland: a nation-wide population-based study during 2004–2018
K. Kantula* (Helsinki, Finland), K. Skogberg, J. Ollgren, O. Lyytikainen, A. Järvinen
Impact of positive blood culture occurring in early post-operative cardiac surgery: a retrospective study  

Ceftaroline fosamil for the treatment of methicillin-resistant Staphylococcus aureus bacteraemia: a real-world comparative clinical outcomes study  
J. Hammond, M. Benigno, R. Chambers, N. Patino, W. Ansari* [New York, United States], J. Nguyen

Escherichia coli bloodstream infections: a multinational population-based perspective  
M. Mackinnon* [Guelph, Canada], S. McEwen, O. Lytikainen, G. Jacobsson, P. Callignon, D. Gregson, K. Laupland

Clinical features and outcomes of patients with Staphylococcus aureus bacteraemia of unknown origin  
E. Minejima, E. Chan* [Los Angeles, United States], K. Tan, C. Kelsom, P. Nieberg, A. Wong-Beringer

Early-onset of bloodstream infections in a burn unit  
S. Scabini* [Turin, Italy], A. Pensa, S. Mornese Pinna, C. Filippini, A. Curtoni, M. Stella, F. De Rosa, S. Corcione

Comparative effectiveness of empiric antistaphylococcal penicillins versus cefazolin in methicillin-susceptible Staphylococcus aureus bacteraemia  
J. Cusumano* [Warwick, United States], H. Appaneal, V. Lopes, K. Laplante, A. Caffrey

Outcomes of bacteraemic and non-bacteraemic patients presenting to the emergency department  
R. Sparks* [Neutral Bay, Australia], R. Chavada, C. Trehewy, A. Harada

Antibiotic combination versus monotherapy for the treatment of Pseudomonas aeruginosa bacteraemia: a multi-centre retrospective study  

The relationship between clinical outcomes and empirical antibiotic therapy in patients with community-onset Gram-negative bloodstream infection: a cohort study from a large teaching hospital  
A. Aryee* [London, United Kingdom], P. Rockenschaub, M. Gill, A. Hayward, L. Shallcross

Predictors of 30-day mortality rate in patients with Pseudomonas aeruginosa bacteraemia  
W. Rose* [Madison, United States], L. Bagnell, L. Pazniak, L. Schulz

Short-term and long-term mortality rates among patients with bloodstream infections receiving appropriate antibiotic therapy: a multi-centre, prospective cohort study  

Enterococcal bacteraemia: epidemiology, clinical characteristics and causes of inappropriate treatment  

Sepsis-3: a prospective clinical study of the clinical diagnosis and blood culture performance  

Risk factors for mortality, intensive care unit admission, and bacteraemia of patients admitted with suspected infection in the emergency department  
V. D’Onofrio* [Genk, Belgium], A. Meersman, S. Vijgen, P. Messiaen, R. Cartuyvels, I. Gysens

Community-Acquired Bacteraemia (CAB) in senior adults: risk factors, outcomes and correlation with frailty  
S. Ahmed* [Leeds, United Kingdom], D. Kehlenbeck, S. Yaseen, G. Saigad, J. Minton

Central nervous system infections

Determination of pentraxin 3 levels in cerebrospinal fluid during central nervous system infections  
M. Zatta* [Trieste, Italy], S. Di Bella, B. Bottazzi, F. Rossi, L. Segat, P. D’Agoara, M. Fabbiani, A. Montovani, R. Luzzati

Multiplex detection of meningitis and encephalitis pathogens: a study from laboratory to the clinical  
Y. Zhou* [Chengdu, China], W. Min Jin, T. Wu, S. Guo, Z. Meng, T. Wu, B. Ying

Clinical utility of syndromic meningitis/encephalitis testing in children  
R. Yee* [Los Angeles, United States], U. Pandey, C. Holifield, J. Flores, M. Fahit, S. Naccache, J. Dien Bard

Rapid molecular diagnosis of Neisseria meningitidis, Streptococcus pneumoniae, Listeria monocytogenes, Enterovirus and parechovirus from blood in patients of the paediatric emergency department of a tertiary hospital  
1884 Viral meningitis in adults: what are we missing? The use of viral capture sequencing to detect pathogens in the cerebrospinal fluid of adults with meningitis

2484 Encephalitis in elderly patients in France, 2016-2019
A. Mailles* [Saint-Maurice, France], M. Martinot, E. Piet, C. Biron, G. Amandin, G. Isabelle, X. Argemi, S. Patrat-Delon, J. Stahl

2642 Unexpectedly high false positive Haemophilus influenzae rates using a meningoencephalitis syndromic PCR panel in two tertiary centres

2842 Cerebrospinal fluid metabolomics profile in herpes virus type 1 encephalitis
A. Mastrangelo* [Campobasso, Italy], D. Franciotta, C. Preziosi, [Rome, Italy], M. Zingaropoli, M. Iannetta

3282 Monitoring enterovirus human infections in Italy: molecular analysis of two recent outbreaks due to Echovirus 30
S. Fontana* [Rome, Italy], D. Franciotta, C. Preziosi, [Rome, Italy], M. Zingaropoli, M. Iannetta

3550 Monitoring enterovirus human infections in Italy: molecular analysis of two recent outbreaks due to Echo virus 30
S. Fontana* [Rome, Italy], D. Franciotta, C. Preziosi, [Rome, Italy], M. Zingaropoli, M. Iannetta, D. Rodio, M. Altieri, A. Conte, V. Vullo, M. Ciardi, A. Polamarà, V. Pietrapaola

3813 Comparison of three commercial sample-to-result platforms to an established real-time PCR assay for the detection of herpesviruses in cerebrospinal fluid
R. Schuurman, E. Fries* [Utrecht, Netherlands], S. Safak, N. Plantinga

5015 Human parechovirus 3 “outbreak” at a tertiary hospital
M. Urrutikoetxea-Gutierrez* [Bilbao, Spain], M. Imaz Perez, B. Elgoibar Alvarez, J. Remerentiera Radigales, M. Cabreroz, J. Diaz De Tuesta

5527 Do we really have to worry about acyclovir-induced nephrotoxicity?
I. Hasanoglu* [Ankara, Turkey], A. Kaya Kalem, B. Kayaaslan, Z. Atlay Alttinkaynak, R. Guner

5742 Profile of neurological manifestations related to varicella zoster virus reactivation

5786 The frequency and clinical implications of Epstein-Barr virus DNA in the cerebrospinal fluid of immunocompetent and immunodeficient patients diagnosed with meningoencephalitis
N. Papic* [Zagreb, Croatia], J. Begovac, A. Vince, S. Zidovec Lepej

6243 Characteristics and outcome of acute viral encephalitis in an infectious disease unit
S. Hela* [Kalaat Sghira, Tunisia], M. Wafa, I. Kooli, A. Toumi, A. Aouam, M. Chakroun

6612 Rapid syndromic panel for the diagnosis of infectious meningitis and encephalitis: a systematic review and meta-analysis of accuracy
G. Menchinelli* [Rome, Italy], B. Posteraro, M. Sanguevetti, T. Spanu, G. De Angelis

68 61 Two-year experience of meningitis/encephalitis multiplex PCR assay on cerebrospinal fluids in comparison with conventional methods: advantages and disadvantages
A. Calderaro, M. Butrini, M. Martinelli* [Parma, Italy], S. Montecchini, S. Covari, A. Ruggieri, M. Antonaci, F. Casula, M. Dell'Anna, S. Larini, F. Ferraglia, F. Pinardi, M. Montagna, M. Arcangeletti, F. De Cona, C. Chezzi

7032 Rapid syndromic panel for the diagnosis of infectious meningitis and encephalitis: a systematic review and meta-analysis of accuracy
G. Menchinelli* [Rome, Italy], B. Posteraro, M. Sanguevetti, T. Spanu, G. De Angelis

7283 Two-year experience of meningitis/encephalitis multiplex PCR assay on cerebrospinal fluids in comparison with conventional methods: advantages and disadvantages
A. Calderaro, M. Butrini, M. Martinelli* [Parma, Italy], S. Montecchini, S. Covari, A. Ruggieri, M. Antonaci, F. Casula, M. Dell’Anna, S. Larini, F. Ferraglia, F. Pinardi, M. Montagna, M. Arcangeletti, F. De Cona, C. Chezzi

7576 Performance of the rapid molecular assay BioFire FilmArray Meningitis/Encephalitis for the diagnosis of CNS infections: a one-year evaluation in a tertiary care hospital
G. Opota* [Lausanne, Switzerland], Z. Naseri, R. Brouillet, L. Senn, G. Prad’Hom, G. Greub, K. Jatan

7822 Does tigecycline have a place in therapy for rickettsial infections of the central nervous system?
A. Mastroianni* [Cosenza, Italy], G. Guadagnino, S. Greco, V. Vangeli, S. De Santis, G. Apuzzo

44 ABSTRACT BOOK – 30th ECCMID 2020
Abstract Categories 2020

9135 Centre experience. Pneumonia: a prior events rate ratio analysis in a large primary care database
F. Hamilton* [Bristol, United Kingdom], D. Arnold, W. Henley, R. Payne

9463 Evaluation of on-site polymerase chain reaction technology for cerebrospinal fluid samples at Cork University Hospital versus referral to reference laboratories in suspected cases of meningitis or encephalitis
W. Henley, R. Payne

9544 Using a syndromic meningitis/encephalitis panel in children without cerebrospinal fluid pleocytosis
W. Henley, R. Payne

9764 Screening for community-acquired meningitis
W. Henley, R. Payne

Session accepted as Paper Poster Session

Community-acquired respiratory infections

174 Primary care re-consultation after hospitalisation for community-acquired pneumonia in England: a large population-based cohort study
V. Baskaran* [Nottingham, United Kingdom], W. Lim, T. Mckeever

193 Antimicrobial susceptibility of Streptococcus pneumoniae strains, isolated from children carriers after PCV10 in Bulgaria
M. Malcheva* [Sofia, Bulgaria], I. Simeonovski, K. Vladeva, T. Kostadiev

235 Effects of previous antibiotic exposure on the clinical course of pneumonia in the elderly: a single-centre prospective observational study
S. Surme, I. Balkan, O. Bayramlar, R. Kara Ali, R. Mete, G. Can, F. Tabak, N. Saltoglu* [Istanbul, Turkey]

652 Correlation between serum C-reactive protein levels and CURB-65 in elderly patients with community-acquired pneumonia
W. Nseir* [Poriya, Israel], A. Amara, R. Farah, T. Saidahmad

The optimal strategy of empirical antibiotic therapies for non-severe community-acquired pneumonia: a bayesian network meta-analysis of randomised controlled trials
J. Lee, S. Moon* [Jeju, South Korea]

1578 Aspirin reduces cardiovascular events in patients with pneumonia: a prior events rate ratio analysis in a large primary care database
F. Hamilton* [Bristol, United Kingdom], D. Arnold, W. Henley, R. Payne

1591 Impact of a multiplex PCR in the management of viral meningitis
G. Pean De Poncelet* [Paris, France], A. Chauvin, H. Benmansour, E. Lecoreche, F. Mougari, A. Munier, S. Temim, J. Le Goff, E. Cambou, H. Jacquier

937 The optimal strategy of empirical antibiotic therapies for non-severe community-acquired pneumonia: a bayesian network meta-analysis of randomised controlled trials
J. Lee, S. Moon* [Jeju, South Korea]

925 Challenges in the management of community-acquired pneumonia

1936 Borderetella holmesii in suspected cough: a frequent pathogen?
S. Trombert Paolantonio* [Saint Ouen L’auomme, France], S. Guillot, S. Briese, J. Toublanc

9135 Centre experience. Pneumonia: a prior events rate ratio analysis in a large primary care database
F. Hamilton* [Bristol, United Kingdom], D. Arnold, W. Henley, R. Payne
2005 Single-shot azithromycin in treatment of *Legionella pneumophila*: 18-year experience at the Vienna General Hospital, Austria

M. Karer* [Vienna, Austria], M. Kussmann, M. Obermüller, H. Burgmann, H. Lagler

2253 Prevalence and clinical characteristics of *Mycoplasma pneumoniae* in Navarra [Spain], 2014-2018

Á. Ana Isabel, A. Navascués Ortég, A. Aguinaga Perez, J. Castilla Catalan, C. Ezpeleta Baquedano* (Pamplona, Spain)

2342 Comparative effectiveness of macrolides, fluoroquinolones or combination therapy for the treatment of Legionnaires’ disease in the US Department of Veterans Affairs health system

V. Stevens* [Salt Lake City, United States], S. Gamage, A. Jasper, G. Roselle, N. Safdar

2364 In vitro activities of ceftaroline and comparator agents against bacterial pathogens frequently causing community-acquired respiratory tract infections in patients from Latin America: ATLAS surveillance programme 2016-2018

J. Karlowsky, M. Hackell* [Schaumburg, United States], S. Bouchillon, G. Stone, D. Sahm

2390 High burden and undetected clusters of pneumococcal disease in long term care in Ontario, Canada

A. Mcgee* [Toronto, Canada], W. Rudnick, W. Demczuk, W. Gold, I. Kitai, S. Kjærden, R. Lovinsky, I. Martin, M. Muller, J. Powis, N. Rau, G. Tyrell, A. Simor, I. Tibdin

2395 Shorter duration of antibiotic therapy in super-infection pneumopathy occurring in viral infection

S. Bessis* [Paris, France], M. Trichet, A. Beresteau, A. Matt, B. Davido, A. Dinh

2517 Surveillance for epidemic of *Mycoplasma pneumoniae* and macrolide resistance [A2063G and A2064G] using consecutive multiplex real-time PCR in Korea

K. Roh* [Goyang, South Korea], J. Park, Y. Yang, Y. Kim, H. Lee, S. Hong

2551 Ceftaroline for severe community-acquired pneumonia: a real-world two-centre experience in Italy and Spain

M. Bassetti, A. Russo* [Pisa, Italy], C. Cilloniz Campos, D. Giacobbe, A. Vena, R. Amaro, E. Graziano, A. Sorião, A. Torres

2600 Concordance of early and late endpoints for community-acquired bacterial pneumonia (CAP) trials

S. Bart* [Silver Spring, United States], S. Nambiar, R. Gopinath, D. Rubin, J. Farley

2753 Methicillin-susceptible *Staphylococcus aureus* in community-acquired pneumonia: risk factors and outcomes

C. Cilloniz Campos* [Barcelona, Spain], E. Moreno, C. Domíneñ, D. García Vidal, C. Vargas, A. Gabarrus, J. Becerrí, C. Cardozo, D. Tovar, A. Torres

2806 Incidence and risk of hospitalised pneumococcal pneumonia among Catalonian adults with distinct underlying medical conditions

O. Ochoa-Gondar* [Tarragona, Spain], A. Vila-Córrcoles, I. Hospital-Guardiola, A. Vila-Rovira, C. De Diega, E. Satue

Antibiotic treatment for paediatric outpatients with community-acquired pneumonia: findings from 10 years of prescribing habits in Italy

P. Costenaro* [Marostica, Italy], A. Cantarutti, E. Barbieri, A. Scamarcio, A. Diletto, P. Sacerdotti, R. Lundin, L. Cantarutti, C. Giaquinto, D. Dana

Pneumococcal serotypes distribution in older adults hospitalised with CAP using the UAD Test (The CAPA study)

Evolution of pneumococcal serotypes causing CAP in adults by co-morbidities in Spain using the UAD test (the CAPA study)

P. España, R. Menendez, A. Torres* [Barcelona, Spain], J. Fernández Villar, J. Marimon, A. Martínez De La Fuente, J. López-Hontangas, F. Marco Reverte, F. Vassalo Vidal, M. Ercibengoa, I. Cifuentes, C. Méndez

Effectiveness of the 23-valent pneumococcal polysaccharide vaccine against vaccine serotype pneumococcal pneumonia in adults

Serotype, antimicrobial resistance and virulence profile of invasive *Streptococcus pneumoniae* isolates in a nation-wide surveillance study in Lebanon

L. Reslon* [Beirut, Lebanon], S. Khafaja, M. Moumneh, M. Finianos, M. Darwish, C. Boutros, A. Araij, G. Matar, G. Dbaibo

Accuracy of emergency department diagnosis of community-acquired pneumonia

A. Bloch* [Brunswick, Australia], V. Sundarajan, G. Wawryzk, A. Siddiqui, A. Attreya, K. Visvanathan

If breaking a hip feels like a concern for the elderly, then getting pneumonia should be twice as concerning!

L. Grammatico-Guillón* [Tours, France], H. Coralie, C. Gaborit, J. Mizgerd, A. Guillon

The effect of live attenuated influenza vaccine on pneumococcal colonisation densities among children aged 24-59 months in Gambia

Abstract Categories 2020

3995 Legionella pneumophila sqPCR in serum and respiratory samples as a marker of Legionnaires’ disease severity
C. Allam* [Lyon, France], N. Fessy, C. Ginevra, L. Beraud, J. Chastang, F. Ader, G. Descours, S. Jarraud

4257 Burkholderia spp. and Gram-negative non-fermenters in cystic fibrosis patients in Belgium: 2012-2018
F. Echahidi, C. Peetters, E. De Canck, I. Wybo, D. Pierard* [Brussels, Belgium], P. Vandamme

4441 Resistance trends among the common bacterial causes of community-acquired lower respiratory tract infection in the UK and Ireland, 2008-2018
C. Horner* [Birmingham, United Kingdom], S. Mushtaq, D. Livermore

4505 Invasive pneumococcal disease in the Comunidad Valenciana, Spain, 2011-2019
M. Garrido Jareño* [Valencia, Spain], A. Gil Brusala, N. Lozano Rodríguez, O. Sabalza, J. Frasquet, J. López-Hontangas

4684 Population-based incidence and mortality of community-acquired pneumonia in Germany

5355 Nocardia infection over 10 years (2008-2019) in a Greek tertiary university hospital
E. Kalogeropoulou, F. Kontas* [Athens, Greece], S. Damianidou, P. Tsilikis, K. Orlandou, B. Basilopoulou, P. Vorda, M. Kostoula, S. Pournaras

5702 An audit of community-acquired pneumonia antimicrobial compliance using a mobile audience response system (ARS) care bundle in an Irish hospital
B. O’Kelly* [Dublin, Ireland], M. Regan, A. Rueda Benito, K. Finan

5836 Evaluation of the clinical economic efficacy of the antibiotic therapy of inpatients with community-acquired pneumonia
A. Demchuk* [Vinnytsia, Ukraine], Y. Mostovoy

5869 Does herd immunity from conjugate vaccines alter the epidemiology of invasive pneumococcal disease in adults?

6444 Persistence of serotype 19F and the importance of non-vaccine serotypes in paediatric non-invasive pneumococcal pneumonia in Portugal: 2015-2018
C. Silva-Costa, J. Gomes-Silva, M. Ramírez* [Lisbon, Portugal], J. Melo-Cristino

6450 Impact of recent vaccine schedule changes on pertussis epidemiology in France

6480 Improving antibiotic prescribing for community-acquired pneumonia in resource-limited settings: pilot implementation of quality standards in a provincial hospital in northern Vietnam
N. Do* [Hanoi, Vietnam], R. Li, H. Dinh, H. Nguyen, M. Dao, T. Nghiem, B. Nadjin, N. Luong, T. Cao, D. Le, F. Cluzeau, C. Ngo Ouy, H. Chu, Q. Vu, C. Roberts, H. Rogier Van Doorn

6577 Epidemiology of serotypes of Streptococcus pneumoniae in patients older than 18 years in Russia
R. Kozlov* [Smolensk, Russian Federation], A. Muraviy, A. Chagaryan, A. Kurkova, N. Ivanichik

7041 Trends in invasive pneumococcal disease in Italy, 2010-2018

7644 An extreme chain reaction-based multiplex assay for detection of group A/C/G streptococci directly from throat swab specimens
L. Gong* [Ann Arbor, United States], B. Keusch, M. Olson, M. Carey, A. Ripley, B. Green, D. Kolk, M. Mastronardi, B. Wu, S. Brahmasandra

7655 Aging influences effector functions of neutrophil granulocytes in Pseudomonas aeruginosa lung infection
S. Charline, N. Cramer, L. Müller, D. Danov* [Hannover, Germany], B. Tümmers, A. Braun, K. Sewald, C. Brandenberger, S. Dehmel, S. Wranski
8012 Prevalence of *Mycoplasma pneumoniae* infections during six years (2014-2019) in two hospitals of Saint Petersburg
O. Kameneva, S. Morazova, N. Kameneva, V. Zhukova, K. Kasyakova* (Saint Petersburg, Russian Federation)

8030 The role of procalcitonin as a predictor of severity, prognosis and appropriate empirical antibiotic therapy in community-acquired pneumonia of bacterial aetiology
A. Milia* (Florence, Italy), L. Suardi, C. Nazzoli, F. Pieralli

8393 Impact of the use of C-reactive protein in micro-methods on the prescription of antibiotics in case of suspected respiratory infection in children and adults in ambulatory care in France
R. Touitou, C. Levy, S. Béchet, E. Pinto, A. Laplante, J. Lion-Altmayer, B. Trincard, C. Jung, R. Cohen* (Créteil, France)

8506 Excessive antibiotic use and costs in hospitalised adults with chronic heart failure
O. Zorya, S. Rachina* (Moscow, Russian Federation), A. Babylev, G. Hewathanthirige

8697 Treatment outcome and clinical characteristics of patients with community-acquired pneumonia treated in an infectious disease intensive care unit
M. Popovic* (Zagreb, Croatia), R. Novak, M. Kutlesa, M. Santini, B. Barșić, V. Krajinovic

8875 New trends in microbial aetiology of severe community-acquired pneumonia in intensive care unit
A. Chillek* [Nîmes, France], C. Paris, R. Stephan, C. Roger, S. Barber, J. Lefrant, H. Marchandin, J. Lavigne, L. Muller

8990 Severe community-acquired pneumonia in the Czech Republic
H. Bartos* [Usti nad Labem, Czech Republic], O. Drupova

9104 Secretion of TNFα by human macrophages is dependent of the sequence type of clinical *Legionella pneumophila* isolates
J. Guillomet* [Villeurbanne, France], C. Ginevro, P. Doubet, A. Chapalain, S. Jarraud

9681 Levels of evidence supporting European and American community-acquired pneumonia guidelines
J. Ferreira Freitas Caímbraga* [Porto, Portugal], S. Tejada Magraner, L. Campogiani, J. Rello

---

**Session accepted as Paper Poster Session**

### Diagnosis of tuberculosis and drug resistance

**1699**
One day detection of live *Mycobacterium tuberculosis* from sputum by measuring heat-induced MT64 secretion with ultra-sensitive ELISA
R. Takeuchi* [Izunokuni-shi, Japan], W. Wang, S. Jain, Y. Jiang, S. Watanuki, Y. Ohtaki, K. Nakaiishi, S. Watabe, P. Lu, E. To

**1725**
Interim analysis: a large-scale clinical evaluation of QMAC-DST for rapid drug susceptibility testing of *Mycobacterium tuberculosis*
K. Seok, S. Kim* [Seoul, South Korea], J. Na, S. Lee, E. Jo, H. Kim, D. Kim, S. Kwon

---

**1902** Application of matrix-assisted laser desorption ionisation: time of flight mass spectrometry for *Mycobacterium tuberculosis* Beijing and Non-Beijing genotyping
F. Yi* (Chengdu, China)

**2125**
Evaluation of the cobas MTB and MTB RIF/INH assays on samples from Sierra Leone and Germany at a supranational reference laboratory for tuberculosis serving both low-incidence and high-burden settings
D. Nadarajan* [Sülfeld, Germany], D. Sievert, M. Kernbach, R. Kamara, L. Faray, M. Merker, A. Kuchta, J. Lau, M. Njoga, S. Krishnamurthy, A. Witt, K. Kranzer, F. Maurer

---

**2347**
Evaluating the effectiveness of current microbiological tools on time to diagnosis of pulmonary tuberculosis
D. Umerah* [Leicester, United Kingdom], H. Patel, R. Verma, N. Perera, M. Barer, G. Woltmann, P. Haldar

*New research, novel approaches and new diagnostic tools: methods for rapid and accurate detection of antibiotic resistance in *Mycobacterium tuberculosis***

---

**2588**
A novel standardised artificial sputum for external quality control of the whole TB-diagnostic workflow
M. Beutler* [Gauting, Germany], U. Antonenko, F. Gerbl, M. Mihalic, S. Plesnik, E. Ramancenco, S. Hofmann-Thiel, H. Hoffmann

**2612**
Multiplex detection of SNPs conferring rifampicin resistance in *Mycobacterium tuberculosis*
F. Nazé* [Gembloux, Belgium], B. Gicquel, P. Mertens, L. Avrain

**3111**
Head-to-head comparison of analytical sensitivities of BD MAX MDR-TB, Xpert MTB/Rif Ultra and FluoroType MTB using human and artificial sputum
M. Beutler* [Gauting, Germany], S. Plesnik, M. Mihalic, L. Olbrich, N. Heinrich, S. Schumacher, M. Lindner, I. Koch, W. Grasse, C. Metzger-Boddien, S. Hofmann-Thiel, H. Hoffmann

**3335**
Contaminating microflora during examination for tuberculosis: saprophytes or potential pathogens?
A. Lyamin* [Samara, Russian Federation], D. Ismatullin, A. Zhestkov, A. Kovalyov, T. Persiyantseva, D. Davydova, A. Kozlov

**3381**
Clinical evaluation of a cartridge-based DNA extraction method for the whole molecular TB-diagnostic workflow
M. Beutler* [Gauting, Germany], M. Mihalic, S. Plesnik, A. Homann, N. Paust, M. Eckart, V. Allerheiligen, D. Czurratis, B. Maharjan, B. Shrestha, S. Hofmann-Thiel, H. Hoffmann

**3630**
DNA thermo-protection facilitates whole genome sequencing of mycobacteria direct from clinical samples by ONT MinION

Analyzing of analytical performances of the new MDR/MTB ELItē MGB kit for the detection of *Mycobacterium tuberculosis* complex and rifampicin- and isoniazid-associated mutations in comparison with the MTB ELItē MGB kit
S. Svraka-Latifovic* [Hilversum, Netherlands], L. Bakker, C. Timmerman, J. Dorgo-Zetsma
CRISPR-based rapid and ultra-sensitive diagnostic test for smear-negative or sputum-scarce tuberculosis using bronchoalveolar lavage fluid: a prospective, multi-centre study in China

N. Mvelase, K. Swe Swe Han

Evaluation of BD MAX multidrug-resistant tuberculosis assay for detection of Mycobacterium tuberculosis complex in clinical specimens and identification of genetic resistance markers

S. Hofmann-Thiel, S. Plesnik, M. Mihalic, M. Beutler, H. Hoffmann

Improved detection of acid-fast bacteria using an automated slide scanner with integrated deep learning analysis

L. Harvath, S. Haenselmann, H. Mannsperger, S. Degenhardt, K. Last, S. Zimmermann, B. Burchhardt

Evaluation of the performance of CSF pyrosequencing in the diagnosis of TB meningitis- a single-centre retrospective diagnostic accuracy study

K. Aljan, M. Kazi, U. Agrawal (Mumbai, India), R. Soman, A. Shetty, A. Sunavala, C. Rodrigues

MYCO-TB kit: rapid and efficient digestion and decontamination method for the detection of mycobacteria in extrapulmonary specimens

F. Bisognin, S. Felici, G. Lombardi, C. Vocale, G. Biundo, M. Re, P. Dal Monte

Identification and discrimination of Mycobacterium tuberculosis and Mycobacteroides abscessus complex species directly from Mycobacteria Growth Indicator Tube (MGIT) culture media by Orbitrap ultra high-resolution mass spectrometry

A. Bajaj, J. Freeke (Vantaa, Finland), M. Hutchins, B. Stiell, A. Barker

From DNA to diagnosis: a rapid, next-generation sequencing pipeline for detecting multidrug-resistant Mycobacterium tuberculosis mutations

L. Daum* (San Antonio, United States), M. Agonafir, J. Eicher, I. Wright, N. Wood, S. Travers, J. Rodriguez, B. Fourie, G. Fischer

Time to positivity for mycobacterial culture as a measurement of bacillary load in clinical practice

M. Jonsson Nordvall, A. Bornefall, V. Khald, B. Andersson, K. Niward, T. Schön

Routine use of genotype Genotype MTBDRsl assay on clinical samples in a high TB burden setting in South Africa: a descriptive analysis

K. Lutchminarain* (Durban, South Africa), A. Kajee, N. Mvelase, K. Swe Swe Han

Rapid simultaneous detection of TB and first line drugs gene mutations onto direct paediatric samples

C. Russo* (Rome, Italy), L. Gentile

Xpert MTB/RIF Ultra: multi-centre evaluation of result “TRACE” in tuberculosis diagnosis

S. Torri* (Milan, Italy), C. Farina, P. Cicera, A. Lombardi, F. Marini, E. Spata, F. Guerrieri, V. Ragnoni, C. Perna, E. Mazzola

Evaluation of Myco-TB kit for decontamination of urine and stool specimens to detect mycobacteria

R. Grossi* (Rome, Italy), A. Careddu, R. Nicotra, M. Sanguinetti, M. Sali

One-year evaluation of Genelead VIII combined to Deepex-MycTB to detect rapidly the genotype and the resistance profile of Mycobacterium tuberculosis complex directly from clinical samples

Performance assessment of MDR/MTB ELITE MGB Kit for tuberculosis diagnosis

Performance of XpertMTB/RIF Ultra assay on respiratory and extra-respiratory specimens in a high-resource setting with a low TB prevalence

C. Martín Higuera* (Madrid, Spain), M. Ruiz Serrano, C. Toro-Diez, M. Toto, M. Simon, D. Domingo, P. Lopez-Roa

The concordances of genotypic and phenotypic drug susceptibility testing of Mycobacterium tuberculosis isolates from MDR TB patients

C. Nelly* (Chisinau, Moldova), S. Alexandru, A. Codreanu, N. Turcan, E. Nistor, V. Vilc, A. Donica, E. Chesov, D. Chesov, V. Crudu

Direct detection of Mycobacterium tuberculosis complex in clinical specimens from patients in Norway by two different polymerase chain reaction tests

I. Szpinda* (Oslo, Norway), J. Kaur, M. Hagbø, S. Hamsund, D. Wold, T. Tanum
1517 Five versus seven days nitrofurantoin for urinary tract infections in women with diabetes: a non-inferiority study
K. Hendriks-Spoor* {Hilversum, Netherlands}, T. Ten Doesschate, F. Wille, T. Verheij, M. Bonten, C. Van Werkhaven

1717 The effectiveness of nitrofurantoin, fosfomycin and trimethoprim for cystitis in relation to renal function
T. Ten Doesschate* {Utrecht, Netherlands}, E. Van Haren, R. Wijma, B. Koch, M. Bonten, C. Van Werkhaven

2049 Antimicrobial treatment and treatment duration for urinary tract infections in adult males

4678 Clinical and bacteriological outcome in urinary tract infections caused by ESBL-producing Enterobacterales and characterisation of isolated pathogens: a prospective, multi-centre study
H. Montelin* {Uppsala, Sweden}, A. Camporeale, A. Hallgren, M. Voding, G. Giske, T. Tängdén

3255 The urinary pharmacokinetics of nitrofurantoin in patients with uncomplicated urinary tract infections: interim analysis
R. Wijma, B. Koch, T. Van Gelder, E. Van Haren, H. Karim, S. Croes, A. Muller* {The Hague, Netherlands}

7980 Examining the urinary tract infection patient journey to identify opportunities to enhance the role of community pharmacists
N. Peiffer-Smadja* {Paris, France}, R. Allison, L. Jones, D. Lecky, C. McNulty, R. Ahmad

Session accepted as Paper Poster Session
Emerging Gram-negative infections: from A to S

3132 Piperacillin-tazobactam versus carbapenem for the treatment of bloodstream infection caused by CTX-M-type ESBL-producing Enterobacteriaceae

3255 Comparison of pneumonia and bacteremia caused by Stenotrophomonas maltophilia: analysis of risk factors, clinical outcomes and impact on antibiotic resistance
W. Lee* {Taipei, Taiwan}, F. Chen

3516 Non-carbapenem beta-lactams for the treatment of Acinetobacter baumannii bacteremia: a multi-centre retrospective analysis
G. La Martire* {Paris, France}, V. Fihman, A. Galy, D. Le Puu, L. Nourissair, A. Lecapitaine, E. Canou, A. Munier, C. Richaud, R. Lepeule

5232 Use of N-acetylcysteine in critically ill patients with septic shock caused by carbapenem-resistant Klebsiella pneumoniae and Acinetobacter baumannii: a case-control study
A. Oliva* {Rome, Italy}, A. Bianchi, A. Russo, G. Cecarelli, F. Aloj, D. Alunni Fegatelli, C. Mastroianni, M. Venditti

7214 First case of osteomyelitis caused by hypervirulent Klebsiella pneumoniae spread within a family in Korea
J. Chae* {Seoul, South Korea}, C. Lee, W. Choe, H. Lee, Y. Sohn

7501 Surveillance culture-guided empirical therapy for febrile neutropenia: low prevalence of inappropriately treated Gram-negative bloodstream infections
J. De La Court* {Amsterdam, Netherlands}, J. Heijmans, J. Janssen, K. Sigaloff, R. Schade

8089 Ceftazidime-avibactam monotherapy for 7 days as treatment of KPC carbapenemase-producing Enterobacteriaceae bacteremia in severely immunosuppressed patients

8729 Differences in clinical characteristics and prognosis of patients with AmpC-producing Enterobacteriaceae versus Escherichia coli bloodstream infection

Session accepted as 2-Hour Oral Session
Endocarditis: what’s new?

2898 One-stage extraction and replacement of infected cardiac implantable electronic devices

3049 Does early de-escalation to anti-staphylococcal beta-lactams impact the duration of bacteremia in patients with methicillin-susceptible Staphylococcus aureus endocarditis?
M. Wungwattana* {Portland, Maine, United States}, M. Mangino, G. Ben, P. Stogsdill, A. Casapao

3150 Clinical and epidemiological characteristics of infective endocarditis with negative blood cultures: a multi-centre case-series in the south of Spain
L. Suardi* {Florence, Italy}, L. Lopez-Cortes, L. Rafael, J. Ruiz Morales, A. Plata Ciezar, J. De La Court* {Amsterdam, Netherlands}, J. Heijmans, A. Mugimura, A. Casapao

3678 First case of osteomyelitis caused by hypervirulent Klebsiella pneumoniae spread within a family in Korea
J. Chae* {Seoul, South Korea}, C. Lee, W. Choe, H. Lee, Y. Sohn

5232 Use of N-acetylcysteine in critically ill patients with septic shock caused by carbapenem-resistant Klebsiella pneumoniae and Acinetobacter baumannii: a case-control study
A. Oliva* {Rome, Italy}, A. Bianchi, A. Russo, G. Cecarelli, F. Aloj, D. Alunni Fegatelli, C. Mastroianni, M. Venditti

5728 Surveillance culture-guided empirical therapy for febrile neutropenia: low prevalence of inappropriately treated Gram-negative bloodstream infections
J. De La Court* {Amsterdam, Netherlands}, J. Heijmans, J. Janssen, K. Sigaloff, R. Schade

6442 Ceftazidime-avibactam monotherapy for 7 days as treatment of KPC carbapenemase-producing Enterobacteriaceae bacteremia in severely immunosuppressed patients

7192 Differences in clinical characteristics and prognosis of patients with AmpC-producing Enterobacteriaceae versus Escherichia coli bloodstream infection

8089 First case of osteomyelitis caused by hypervirulent Klebsiella pneumoniae spread within a family in Korea
J. Chae* {Seoul, South Korea}, C. Lee, W. Choe, H. Lee, Y. Sohn

8220 Surveillance culture-guided empirical therapy for febrile neutropenia: low prevalence of inappropriately treated Gram-negative bloodstream infections
J. De La Court* {Amsterdam, Netherlands}, J. Heijmans, J. Janssen, K. Sigaloff, R. Schade

8729 Ceftazidime-avibactam monotherapy for 7 days as treatment of KPC carbapenemase-producing Enterobacteriaceae bacteremia in severely immunosuppressed patients

9445 Differences in clinical characteristics and prognosis of patients with AmpC-producing Enterobacteriaceae versus Escherichia coli bloodstream infection
Comparative outcomes of cefazolin versus anti-staphylococcal penicillins for treatment of methicillin-susceptible Staphylococcus aureus endocarditis: a prospective multi-centre cohort study
R. Lecomte* [Nantes, France], A. Bourreau, D. Colin, N. Issa, P. Le Tourneur, B. Gabarit, M. Chauveau, T. Le Tourneur, N. Asseray Madani, F. Raffi, F. Camou, D. Boutaille

Anaemia is associated with mortality in patients with left-sided endocarditis: a POET sub-study
M. Pries-Heje* [Copenhagen, Denmark], N. Ihlemann, N. Bruun, E. Fosbøl, N. Tønder, C. Moser, K. Iversen, H. Bundgaard

Mural endocarditis from a prospective national registry: the GAMES series

Analysis of the practices of the multidisciplinary consultation meeting on infectious endocarditis
L. Sauvat* [Clermont-Ferrand, France], M. Rosburger, A. Mulliez, F. Rabin, M. Farhat, G. Clerfond, M. Vidal

Contrast-enhanced ultrasound for the detection of abdominal complications in infective endocarditis

Early experience with percutaneous vegetation suction (Penumbra) versus valve replacement surgery for right-sided infective endocarditis in people who inject drugs
M. Veve* [Knoxville, United States], Y. Akhtar, P. McKeown, M. Morelli, R. Shorman

Impact of referral bias on prognostic assessment in infective endocarditis: insights from a population-based cohort
M. Collannaz* [Vandoeuvre Les Nancy, France], M. Erpelding, F. Alla, F. Goethring, F. Delahaye, B. Jung, V. Le Moing, B. Hoen, C. Selton-Suty, N. Agrinier

Kingella endocarditis in children: a distinct entity or not?

External validation of the NOVA and DENOVA scores for clinical prediction of endocarditis in patients with Enterococcus faecalis bacteremia
P. Danneels* [Angers, France], F. Chabrun, A. Beaudron, C. Riher, C. Vannier, M. Kempf, V. Dubee

Clinical and microbiologic factors associated with infective endocarditis among patients with Staphylococcus aureus bacteremia
M. Papadimitriou Olivergeris* [Lausanne, Switzerland], P. Monney, C. Ting, C. Soldini, N. Ciocca, S. Giulieri, B. Guery

Clinical and echocardiographic predictors of embolism in infective endocarditis
M. Papadimitriou Olivergeris* [Lausanne, Switzerland], C. Ting, C. Soldini, N. Ciocca, M. Kirsch, S. Giulieri, B. Guery, P. Monney

Delayed diagnosis of infective endocarditis: retrospective analysis conducted at an university hospital in the south of Italy
A. Spera* [Salerno, Italy], R. Benveniga, G. Galasso

Clinical experience of dalbavancin in infectious endocarditis: stratifying its impact on treatment

 Infective endocarditis in older adults: distinguishing features

Haemodialysis-associated infective endocarditis

Challenges in infective endocarditis: valvular infective endocarditis in patients with cardiac implantable electronic devices: clinical characteristics and outcome: analysis on a national cohort

Clinical features of late prosthetic valve endocarditis in a cardiac referral centre [2006-2019]
L. Ribeiro-Da-Silva, L. Lemos, M. Correa, D. Menezes, J. De Andrade, R. Garrido, B. Zappa, G. Barbosa, C. Weksler, W. Golebiowski, C. Lamas* [Rio de Janeiro, Brazil]

A multi-national study for the treatment of enterococcal endocarditis with ampicillin-daptomycin combination therapy
M. Sierra Hoffmann, R. Deliz, A. Sekhon* [Tamball, United States], A. Gollapalli, K. Saddler, M. Stevens, M. Castro-Lainez, J. Pericas

Risk factors for in-hospital mortality in a prospective contemporary cohort of adult patients with infective endocarditis in a cardiac surgery hospital
Cardiac 18F-fluorodeoxyglucose Positron Emission Tomography (18-F-FDG-PET/CT) use in infective endocarditis: a 10-year multi-centre cohort study

Abstract Categories 2020

5491  Definite prolonged antibiotic treatment in complicated prosthetic valve endocarditis with absolute contraindication to surgery: a single-centre retrospective analysis
N. Cesta* [Grottaglierata, Italy], T. Mulas, V. Malagnino, M. Iannetta, M. De Masi, G. Ruvolo, M. Andreoni, L. Sarmati

5613  Short- and long-term outcomes of infective endocarditis admission in adults: a population-based registry study in Finland
E. Ahtela* [Turku, Finland], J. Oksi, T. Vahlberg, P. Routava, J. Sipilä, V. Kyto

5652  Predictive value of sepsis scores for in-hospital mortality in patients with left-sided infective endocarditis
B. Leal De Almeida* [Sao Paulo, Brazil], T. Strabelli, M. Sammer Bittencourt, A. Mansur, M. Ribeiro Fuxiao, L. Zoboli Posebon, D. M. Gualandra, F. Goldeberg, R. Focaccia Siciliano

5673  Examining the modified Duke criteria in infective endocarditis: a comparison of outcomes for ‘typical’ and ‘atypical’ bacteria
R. Mehta* [London, United Kingdom], P. Pabari, A. Hartley, Y. Razvi, B. Rana, A. Ghazy, M. Shehata, A. Abbara

7251  Epidemiology, characteristics and outcomes of bacteraemia and endocarditis caused by Staphylococcus aureus in cancer patients

7511  Impact of the anti-coagulant therapy before hospitalisation on cerebrovascular complications and mortality in infectious endocarditis
J. Solera Rallo* [Madrid, Spain], F. Galván Román, L. Domínguez Pérez, S. De Cossio Tejida, F. Lopez-Medrano

8072  Daptomycin or vancomycin for methicillin-resistant Staphylococcus aureus infective endocarditis complicated by septic pulmonary emboli
L. Vuong, T. Trinh* [San Francisco, United States]
Abstract Categories 2020

2166 Risk factors of severe dehydration among children under five
A. Mkhaygan* [Yerevan, Armenia], A. Demirchyan

2513 Role of enteropathogenic Escherichia coli in people with diarrhoea in Gipuzkoa
M. Gómez Ruiz De Arbulu* [Salvatierra, Spain], P. Vallejo Recuna, M. Arrasti Erviti, D. Grandioso Vas, T. Martín Peñaranda, M. Alkorta Gurutxaga

3126 Heat wave-associated Vibrio infections in Germany 2018 and 2019
T. Brehm* [Hamburg, Germany], L. Berneking, H. Rohde, M. Christner, S. Schmiedel

3276 Characterisation of prevalence and resistance of Aeromonas isolated from patients with acute diarrhoea in Zhejiang province from 2010 to 2017
X. Chen* [Hangzhou, China], W. Ruoran, Z. Diaoqun

3473 Prevalence and genetic characterisation of Shiga toxin-producing Escherichia coli isolates from cattle in Portugal
H. Oliveira* [Braga, Portugal], A. Balem, S. Gonçalves, I. García-Meniño, S. Flament-Simon, J. Blanco Alvarez, C. Pinto, J. Blanco, G. Almeida, C. Almeida

3474 A case of recurrent Campylobacter cured by faecal microbiota transplant in an immunosuppressed patient with common variable immune-deficiency

4173 The frequency of diarrhoeagenic Escherichia coli isolates in children with acute diarrhoea under five years
A. Koc, H. Turk Dagi* [Konya, Turkey]

4368 Rapid increase of CTX-M-producing ST152 Shigella sonnei isolates in Switzerland
E. Campos-Maduena, O. Bernascini, C. Casanova, M. Elzi, C. Maffioli, T. Bodmer, A. Kronenberg, A. Endimiani* [Bern, Switzerland]

4512 Evaluation of commercial multiplex real-time PCR panels to detect bacterial, parasitic and viral gastrointestinal pathogens in clinical specimens
P. Bird* [Leicester, United Kingdom], C. Holmes

4610 Emergence of CTX-M-producing Salmonella enterica serotype Typhimurium in Greece
E. Protonotariou, G. Meletis, G. Kagkalou, D. Papadopoulou, A. Tychala* [Thessaloniki, Greece], F. Netsika, O. Vasilaki, P. Mantzana, M. Kachrimanidou, L. Skouras

4969 Treatment responses to azithromycin and ciprofloxacin in uncomplicated Salmonella Typhi infection: a comparison of clinical and microbiological data from a controlled human infection model
M. Gibani* [London, United Kingdom], C. Jin, S. Pennington, X. Liu, A. Ardrey, G. Aljayyoussi, M. Moore, B. Angus, C. Parry, G. Biagini, N. Feasey, A. Pollard

5032 Escherichia coli serotype O55:H9 as a new multidrug resistant hybrid pathotype producing Shiga toxin and carrying extra-intestinal virulence plasmid
A. Cointe* [Paris, France], P. Mariani, B. Philippe, A. Birgy, S. Lefèvre, S. Delannoy, P. Fich, F. Weill, S. Bonacorsi

5080 Whole genome sequencing of Salmonella enterica from Spanish hospitals with resistance to third generation cephalosporins
X. Vázquez* [Oviedo, Spain], V. García Menéndez, M. De Toro, N. Rodríguez, M. Bances, M. Alkorta, J. Rodríguez-Lozano, J. Calvo-Montes, J. Fernández, M. Rodicio

5211 Epidemiology and comparative genomics of clinical isolates of Salmonella enterica serotype Typhimurium carrying the virulence-resistance plasmid pSU-StVR2
N. Rodríguez, I. Montera, X. Vázquez, M. Bances, M. De Toro, J. Fernández, M. Rodicio, M. Rodicio* [Oviedo, Spain]

5364 Antimicrobial drug resistance, molecular typing and whole genome sequencing of Salmonella enterica serovar Derby from human clinical samples and pork products
V. García Menéndez* [Lugo, Spain], X. Vázquez, R. Garcia-Fierro, P. Quiroso, R. Granda, C. Cuervo, M. Bances, M. Rodicio, M. Rodicio

5730 Epidemiological study of main enteropathogens causing infectious gastroenteritis in a Madrid tertiary hospital
A. Yarci Carrión, L. Fontan, S. Gómez De Frutos, E. Navarro Lara, A. García, T. Alarcon Caverò* [Madrid, Spain]

6069 Comparison of clinical spectrum and outcomes of patients with extremely drug-resistant Salmonella enterica with multidrug-resistant strains
F. Herekar* [Karachi, Pakistan], S. Sarfaraz, S. Shahid, M. Mahesar, N. Ghouri

6664 Detection rates of the bacterial causes of gastroenteritis using a multiplex molecular assay in the South-African private sector
C. Kingsburgh* [Pretoria, South Africa], K. Strydom

6669 Yersinia enterocolitica-associated diarrhoea: descriptive epidemiology in a low-prevalence setting
L. Goterris Bonet* [Barcelona, Spain] from January 2016 to October 2019

7653 Entericaggregative Escherichia coli in mid-Norway
I. Haugan* [Trondheim, Norway], M. Husby, D. Aamnes Mostue, A. Brun, H. Lange, R. White, L. Vold, J. Afset
Abstract Categories 2020

7689 The burden of enteric fever from three urban centres: a multi-centre, multi-component prospective epidemiological study with 626,219 person years of observation

8214 Slovenian national outbreak of Salmonella Paratyphi B variant Java between 2014 and 2016
Š. Klemen, M. Trkov, A. Storman, Z. Petrovic, A. Jurcetic Dadic, I. Berce, M. Ravnik, M. Pirš*[Ljubljana, Slovenia]

8548 Epidemiology of bloody diarrhoea in Georgia and haemolytic-uraemic syndrome associated with it
M. Atskverel*[Tbilisi, Georgia], K. Gvantsa, N. Shulaia

8588 Diagnostic impact of molecular detection of enteropathogenic bacteria compared to stool culture
S. Rodríguez-Pollare*[Cádiz, Spain], A. Ruiz-Castillo, P. Pánes-Ortega, F. Arroyo Navarro, F. Galan-Sanchez, M. Rodríguez-Iglesias

8608 Rise in Campylobacter jejuni antimicrobial resistance in Split-Dalmatia County, Croatia: 2013 - 2018
S. Oureshi*[Karachi, Pakistan], F. Noz, A. Naveed, T. Yousafzai

8775 Should we change our diagnostic strategy for the detection of verotoxigenic Escherichia coli infection?
S. Illescas*[Ciudad Real, Spain], S. Sanchez, V. Carmona, J. Martinez-Alarcon, M. Vidal

9114 Therapeutic response of meropenem and azithromycin in the treatment of extensively drug-resistant (XDR) typhoid fever in a lower-middle income country
S. Oureshi*[Karachi, Pakistan], F. Noz, A. Naveed, T. Yousafzai

9185 Etiology of viral and bacterial gastroenteritis in a third-level hospital in Spain in relation to age
E. Léon, M. Gasca Santiago, B. Palop*[Málaga, Spain]

9589 Listeriosis in Avila, Spain: a real warn amongst immunocompromised hosts
M. Pedramingo Kus*[Madrid, Spain], T. Meiras Arriaga, A. San Pedro Garrido, O. Fraile Santos, N. Iglesias Nuñez, R. Sanchez Arroyo, J. Barragan Casas, A. Antoli Royo

Session accepted as 1-Hour Oral Session

Hot topics in central nervous system infection

2766 Treatment of community-acquired bacterial brain abscess: an international multi-centre survey
J. Bodilsen*[Aalborg, Denmark], P. Tattievin, S. Tang, M. Brouwer, D. Van De Beek, P. Nacler, H. Nielsen

3274 Normocellular bacterial meningoitis in adults: a prospective nationwide cohort study
H. Vestergaard*[Aalborg, Denmark], J. Bodilsen, H. Nielsen

6754 Recurrent community-acquired bacterial meningitis in adults
L. Ter Horst*[Amsterdam, Netherlands], M. Brouwer, A. Van Der Ende, D. Van De Beek

6769 Clinical features and prognostic factors in adults with community-acquired pneumococcal meningitis
D. Koelman*[Amsterdam, Netherlands], M. Brouwer, L. Ter Horst, M. Bijlsma, A. Van Der Ende, D. Van De Beek

Session accepted as Paper Poster Session

Implications of Gram-negative infections

634 The potential benefit of a second C-reactive protein measurement in patients with Gram-negative bacteraemia presenting to the emergency medicine department

715 Excluded versus included patients in a randomised controlled trial of infections caused by carbapenem-resistant Gram-negative bacteria: relevance to external validity

2057 Comparative efficacy of piperacillin-tazobactam versus third-generation cephalosporins or carbapenems against susceptible ampc-bearing Enterobacteriaceae

2210 Relation of risk factors and mortality in carbapenem-resistant Klebsiella pneumoniae ST11 bloodstream infections
T. Xiao*[Zhejiang, China], X. Yonghong

2628 Risk factors for functional decline among survivors of Gram-negative bloodstream infection

2827 No negative conversion at follow-up blood culture (FUBC) is significant predictors of early (1-week) mortality in carbapenem-resistant Enterobacteriaceae or vancomycin-resistant enterococci bacteraemia patient: univariate and multivariate analysis
S. Hygejin*[Seoul, South Korea], H. Choi, Y. Cho, J. Eom
Accuracy of predicting early mortality of severity indicators among carbapenem-resistant Enterobacteriaceae or vancomycin-resistant enterococci bacteremia patient: univariate and multivariate analysis
S. Hyejin* [Seoul, South Korea], H. Choi, Y. Cho, J. Eom

Combination empiric treatment is equivalent to monotherapy in 317 sepsis episodes due to carbapenemase-producing Klebsiella pneumoniae in critically ill patients
M. Papadimitriou Olivieris* [Lausanne, Switzerland], C. Bartzaval, A. Lambropoulou, V. Karamouzos, A. Georgakopoulou, F. Kolonitsiou, F. Filgou, M. Christofidou, M. Marangos

Carbapenem-resistant Escherichia coli causing neonatal sepsis: NDM-5 gains prominence
A. Bhattacharya, S. Mitra, S. Naha, B. Saha, S. Dutta, S. Basu* [Kolkata, India]

Escherichia coli bloodstream infections in a university hospital of northern Italy: resistance pattern and prognostic factors
G. Volpata* [Milan, Italy], D. Pocaterra, G. De Nadai, F. Tardato, B. Varisso, L. Canziani, F. De Fazio, M. Casana, M. Morelli

Risk factors and mortality for patients with bloodstream infections of Klebsiella pneumoniae during 2014-2018: clinical impact of carbapenem resistance in a large tertiary hospital of China
J. Wei, C. Haiyan, Y. Chen, C. Wu* [Nanjing, China]

Clinical profile of patients with bacteremia caused by Enterobacter cloacae and Klebsiella aerogenes: more similarities than differences

Meliodosis in an Indian intensive care unit: the enigma of a “Silent Killer”
T. Shaw* [Manipal, India], V. Kalwaje Eshwara, C. Mukhopadhyay

Outcome of community-onset extended-spectrum β-lactamase-producing Escherichia coli bacteremia and urinary tract infection: a historical population-based cohort study
R. Richelsen* [Aalborg, Denmark], P. Mariadas, J. Smit, H. Schønheyder, J. Rodriguez-Baño, H. Nielsen

C-reactive protein patterns by age, sex and pathogen in patients with Gram-negative bacteremia

Evaluation of carbapenem-resistant Enterobacteriaceae treatment outcomes in a quaternary hospital in the United Arab Emirates
A. Ali* [Abu Dhabi, United Arab Emirates], R. El Lababidi, M. Balkis, R. Ismail, F. Kablaoui

Ceftolozane-tazobactam for the treatment of bloodstream infection due to Pseudomonas aeruginosa in neutropenic cancer patients: a real-life experience (ZENITH study)

Clinical characteristics, aetiology and risk factors for mortality of neutropenic patients with bloodstream infection presenting with septic shock

Clinical management of serious infections attributable to carbapenem-resistant Gram-negative pathogens in Spanish hospitals

Amikacin or colistin monotherapy for complicated urinary tract infections by extensively drug-resistant Pseudomonas aeruginosa
I. López Montesinos* [Barcelona, Spain], S. Gómez-Zorrilla, N. Prim, D. Echeverría-Esna, M. Gracia-Amilllas, M. Montero, L. Sorlí, E. Padilla, S. Grau, J. Harcajada

Are carbapenems a choice in OXA-163 carbapenemase-producing Enterobacteriaceae infections? Clinical outcomes of 29 OXA-163 infections in a general hospital in Argentina
M. Jaume, M. Flor Mantero, M. Amaya, A. Sisto, L. Abusomra, L. Errecalde, F. Fuster* [Buenos Aires, Argentina], L. Guelfand, M. Rolón

Delayed treatment response in healthcare-associated infections by OXA-48 carbapenemase-producing Enterobacteriaceae
M. Amer, D. Helmy* [Cairo, Egypt], H. El-Mahallowy, M. Amin

Session accepted as Paper Poster Session
Increasing knowledge on NTMs
L. Fallico, L. Salvador, S. Mondino, R. Cazzaro
A novel celecoxib-derivative kinase inhibitor, AR-12 (OSU-03012), is active against Mycobacterium abscessus complex in vitro
B. Li* [Shanghai, China], Y. Zou, S. Zhang, H. Chu

Contact effect of a Myceliobacterium sp. extract on biofilm of a Mycobacterium chimaera strain isolated from a 3T heater-cooler system
I. Pradal, J. Esteban-Moreno* [Madrid, Spain], J. Aguilera-Corra

Prevalence of non-tuberculous mycobacteria in a tertiary hospital in Beijing, China, January 2013 to December 2018
J. Huang* [Beijing, China], M. Xiao, T. Kudinha

Pattern of osteoarticular infections caused by non-tuberculous mycobacteria: 9 years’ experience
A. Bleibtreu* [Paris, France], I. Bonnet, S. Jauréquiberry, B. Fautrel, E. Caumes, J. Robert, E. Fourniols, A. Aubry

Performances comparison between rapidly growing mycobacteria medium for direct-isolation of non-tuberculous mycobacteria, and its industrial version
M. Vignaud* [La Balme les Grottes, France], E. Déleâge, S. Orenga, D. Stephenson, J. Perry

Differential drug susceptibility patterns of Mycobacterium avium complex isolates recovered in Greek university hospitals
F. Kontos* [Athens, Greece], G. Movromanolakis, S. Pouranaras

In vitro antimicrobial susceptibility testing of rapidly growing mycobacteria isolated in a university hospital, Athens, Greece
F. Kontos* [Athens, Greece], S. Pouranaras

Decontamination strategies used for AFB culture significantly reduce the viability of Mycobacterium abscessus in sputum samples from patients with cystic fibrosis
D. Stephenson, A. Perry, A. Nelson, A. Robb, M. Thomas, S. Bourke, J. Perry* [Newcastle upon Tyne, United Kingdom], A. Jones

Genomic analysis of cardiac surgery-associated Mycobacterium chimaera infections in Italy
A. Ghoudosti* [Pessano con Bornago, Italy], M. Peracchi, E. Borroni, G. Fallico, V. Quaresima, V. Manfrin, M. Rassu, V. Monzella, R. Manganeli, E. Tortoli, D. Cirillo

Antimicrobial susceptibility of non-pigmented rapidly growing mycobacteria
S. Girod, V. Dejardin, A. Raveau, K. Deledalle, E. Caumes, J. Robert, L. Felten

Compatibility of the new NTM Elite agar with MALDI-TOF for direct isolation and identification of non-tuberculous mycobacteria
M. Vignaud* [La Balme les Grottes, France], E. Déleâge, L. Devigne

Identification and clinical significance of Mycobacterium avium complex isolates in a university hospital in a 13-year period
F. Kontos* [Athens, Greece], G. Skyllas, I. Kouva, I. Korbila, E. Manali, A. Antoniadou, S. Papiris, S. Pouranaras

Efflux pumps contribute to intrinsic clarithromycin resistance in clinical Mycobacterium abscessus isolates
Q. Gao* [Shanghai, China], B. Li, H. Chu

New lean preparation method for identification of mycobacteria by MALDI Biotype
M. Timke, A. Pranada* [Dortmund, Germany], M. Kostrzewa

A novel deep sequencing platform for genotyping and drug resistance detection of Mycobacterium leprae
S. Braet* [Antwerp, Belgium], P. Suffys, S. Ezidio Gonçalves Vasconcellos, G. Bisch, A. Ferre, E. Hasker, Y. Assoumani, A. Mzembaba, P. Supply, B. De Jong

A new high-resolution melting PCR assay for a rapid detection of linezolid-resistance-associated mutations in Mycobacterium avium complex
R. Musumeci* [Monza, Italy], L. Molteni, E. Mazzola, S. Torri, D. Fanti, A. Nova, M. Martinelli, F. Perdoni, C. Villa, P. Carlo Federico, C. Cocuzza

Optimization of Mycobacterium avium complex therapy with synergistic and bactericidal drug combinations
V. Sonawane* [Nijmegen, Netherlands], M. Ruth, L. Pennings, J. Van Ingen

Next-generation microscopically-observed drug susceptibility assay (NG-MODS) allows more rapid and precise phenotypic drug-susceptibility testing: preliminary results for Mycobacteroides abscessus
W. Chiu* [Leuven, Belgium], C. Foo, P. Leysens, E. Andre

Genomic identification of clinically relevant Mycobacterium species by target sequencing
V. Collin* [La Balme les Grottes, France], F. Allard, M. Rumigny, F. Joverialat

A radiologic score for pulmonary non-tuberculous mycobacterial infection: preliminary results
M. Colaneri* [Pavia, Italy], A. Lombardi, A. Di Matteo, M. Fabbiani, S. Vancheri, A. Valentini, V. Monzillo, R. Bruno

Intact bacteria species-specific lipid profiling using the MALDI Biotype Sirius can identify mycobacteria in one step
B. Agnieszka, X. Gonzalo, M. Kostrzewa, F. Drabniewski, G. Larrouy-Maumus* [London, United Kingdom]

Cluster of invasive Mycobacterium chimaera infection in a single cardiac surgery unit: clinical features and management
N. Riva* [Reggio Emilia, Italy], L. Cavazzuti, L. Pescarolo, G. Marini, G. Magnani, M. Massari

Detection of antimicrobial resistance in Mycobacterium abscessus complex by MALDI-TOF MS
A. Godmer* [Paris, France], N. Veziris, C. Eckert, S. Gallah, A. Aubry, L. Benzerara

Routine use of MALDI-TOF MS for identification of non-tuberculous mycobacteria species in the clinical laboratory
D. Rodriguez-Temporari* [Barcelona, Spain], N. Vila, E. Garcia, M. Mas, F. Alcaide
Abstract Categories 2020

Is Mycobacterium lentiflavum “the new” Mycobacterium avium?
S. Gómez De Frutos* [Madrid, Spain], A. Fraile Torres, A. Yarci Carrió, T. Soler Maniega, L. Cardeñosa, R. Girán, D. Domingo

Identification of Mycobacterium species with MALDI-TOF mass spectrometry
Z. Saribas, O. Koksalan, H. Gur* [Ankara, Turkey], S. Demirici, A. Alp

Mycobacterium mucogenicum in hospital water: a potential source for human infection
J. Ory* [Nîmes, France], C. Aumeran, O. Traore, E. Lecorche, C. Enault, E. Cambau, J. Lavigne, A. Pantel

Identification by proteomic (MALDI-TOF MS) of non-tuberculous mycobacteria from liquid medium in clinical practice
R. Sainz Rodriguez, M. Mediavilla Gradelph, F. Ana Maria, B. Palop* [Málaga, Spain], A. Correa, M. Bermúdez Ruiz

Long lasting outbreak of severe Mycobacterium chimaera infection among cardiac surgery patients operated with contaminated heater-cooler devices: Italy, 2010 to 2019

Monitoring and control of the heater-cooler unit colonisation by Mycobacterium chimaera and other NTMs used during open-heart surgery
B. Casini* [Pisa, Italy], B. Tuvo, G. Privitera

Evaluation of the MGIT 960/EpiCenter TB eXiST system for drug susceptibility testing for Mycobacterium abscessus group
N. Carvalho, S. Bombara, S. Leão, R. ArbeIt, E. Chimara* [Sao Paulo, Brazil]

Epidemiology of non-tuberculous mycobacteria in bronchiectasis and non-bronchiectasis patients in a university teaching hospital in Madrid
S. Gómez De Frutos* [Madrid, Spain], L. Fontan, E. Navarro Lara, N. Zurita Cruz, L. Cardeñosa, J. Garcia Pérez, D. Domingo

Prevalence of non-tuberculous mycobacteria in patients with cystic fibrosis in a tertiary hospital
D. OrtégA Larrea* [Zaragoza, Spain], E. López, M. Moreno Hijazo, S. Mormeneo Bayo, S. Nabal Díaz, E. Valverde, M. Arias, B. Fortuño, M. Elu, J. Viñuelas

Evaluation of the FluoroType mycobacteria assay for the detection and differentiation of clinically relevant mycobacteria
C. Niccolae* [Florence, Italy], A. Bartolesi, F. Marcelli, A. Andreini, R. Mannino, A. Antonelli, E. Tortoli, G. Rossolini

Non-tuberculous lymphadenitis in children: epidemiology and management strategy in France during the last decade

Characterisation of the unique contributions of bedaquiline and rifabutin against actively-growing and nutrient-starved populations of Mycobacterium abscessus
J. Lee, N. Ammerman* [Baltimore, United States], E. Nuernberger

Rapid detection of Mycobacterium abscessus complex and associated antibiotic resistance directly in cystic fibrosis samples
A. Bordin* [Brisbane, Australia], C. Coulter, J. Clark, S. Pandey, S. Bell, C. Wainwright, G. Nimmo, A. Jennison, M. Syrnis, C. Pardo, H. Hackett, D. Whiley

Using whole genome sequencing to assess M. leprae transmission in French overseas Territories
E. Lecorche* [Paris, France], B. Violaine, M. Dahiia, A. Charlotte, K. Elise, F. Mougari, H. Benmansour, V. Jarlier, E. Cambau

Surveillance of Mycobacterium leprae in Analamanga region of Madagascar
D. Randriariimanana* [Antananarivo, Madagascar], M. Andrinarison, T. Rasamoelina, F. Rakotomalala, A. Charlotte, L. Ramarazatovo, B. Cauchoux, J. Berland, F. Rapolana Rabenja

Complete genome sequencing and identification of Mycobacterium chimaera by MALDI-TOF MS: a modified approach to discriminate Mycobacterium chimaera and Mycobacterium intracellulare
J. Bagnarino, V. Monzillo, D. Barbarini, A. Pirallo* [Pavia, Italy], A. Ghoudaoui, E. Tortoli, P. Marone

Infections in the prism of One Health

Comparison of multidrug-resistant Salmonella enterica serovar I 4,[5],12:i:- and Salmonella enterica serovar Typhimurium isolated from swine in the USA
S. Gonzalez* [College Station, United States], K. Norman, R. Harvey, H. Scott, S. Lawhon, J. Vinasco

Comprehensive proteomics and active immunisation reveals that extracellular vesicles derived from Streptococcus equi subspecies equi as an effective candidate for vaccine platform
H. Lee* [Cheongju, South Korea], S. Kim, L. Sang-Yeop, S. Yun, S. Jun, H. Ro

Healthy people in Zanzibar are frequently colonised at intestinal level with MDR Enterobacteriaceae identical to those detected in poultry and retailed chicken meat
T. Büdel, E. Kuenzli, O. Bernasconi, E. Campos-Madueno, J. Zinsstag, C. Hatz, A. Endimiani* [Bern, Switzerland]

Genetic diversity evident from comparative genome analysis of ESBL-producing Escherichia coli isolated from swine microbiomes in Cameroon and South Africa
L. Njoungang Yontchoung Epse Founou* [Yaounde, Cameroon], R. Founou Zangue, S. Essack

Session accepted as Paper Poster Session
2424 Molecular evidence of bacteria with medical relevance in fleas parasitising cats and dogs
G. Doupas* [Athens, Greece], A. Tsaikris, A. Mageropoulou, A. Priftis, T. Lytras, S. Beleri, E. Patsoula, M. Linou, C. Billinis, J. Papaparaskevas

2556 Antibiotic and biocide resistance among staphylococci causing skin and soft tissue infections in companion animals in Portugal
S. Santos Costa* [Lisbon, Portugal], R. Ribeiro, V. Oliveira, M. Serrano, C. Ferreira, C. Morais, M. Pomba, I. Couto

2991 Detection and antibiogram of Escherichia coli O157 from Oreochromis niloticus [Tilapia] sold in Ibadan, Nigeria
S. Ogunleye* [Ibadan, Nigeria], O. Adedeji, O. Ishola, O. Okunlade

4048 First report of CCS-methicillin-resistant Staphylococcus aureus IV-SCCFus “Maitese clone” in bat guano
M. Assia, A. Touati, A. Pantel, A. Sotto, C. Dunyach-Remy, J. Lavigne* [Nimes, France]

4128 Analysis of resistance transmission among humans and livestock using microbiome profiling
H. Pai* [Seoul, South Korea], M. Rho, J. Kim, S. Lim, M. Seo, B. Kim

4273 Incidence rates of multidrug-resistant indicator pathogens increase in hospitalised horses during stay
A. Kauter* [Berlin, Germany], A. Lübbe-Becker, D. Kopp, S. Stäckle, L. Epping, K. Semmler, H. Gehlen, B. Walther

4374 Recreational waters: a reservoir for Shiga toxin-producing Escherichia coli?
L. O’Connor, C. Brehony, B. Hooban, K. Fitzhenry, N. Cahill, L. Burke* [Galway, Ireland], P. Hickey, S. Keane, A. Mcnamara, M. Cormican, D. Morris

4524 Fast Point-of-Care biomimetic receptor-based biosensor for detection and quantification of zoonotic Campylobacter
M. Heyndrickx* [Melle, Belgium], S. Givanoudi, A. J. Robbens, P. Cornelis, G. Wackers, K. Hertogs, D. Yongabi, M. Heyndrickx* [Melle, Belgium]

5334 Piglets as a potential reservoir of atypical enteropathogenic Escherichia coli (aEPEC) with serotypes of human enterohemorrhagic Escherichia coli (EHEC), including the O80:H2-A-ST301 (CH27-54) eae-ξ clone

5555 Atelerix algirus as host of Salmonella species in Tenerife, Spain
E. Izquierdo Rodríguez, N. Martín Carrillo* [San Cristobal de La Laguna, Spain], E. Baz-Gonzalez, P. Faranda Rodriguez

6314 Genomic investigation of Klebsiella pneumoniae complex isolates recovered from pigs and humans in Thailand
T. Leangapichart* [Oslo, Norway], K. Lunha, J. Jiwakanan, S. Angkititrakul, J. Järhult, U. Magnusson, M. Sunde

First report of colistin resistance in Salmonella spp. isolated from fresh minced meats and poultry faeces from primary production phase in Bosnia and Herzegovina
M. Ibrahimagic* [Zenica, Bosnia and Herzegovina], A. Fetaha-agic, J. Dizdarević, E. Idrizović, S. Uzunovic, A. Kapidžić, A. Šanjta-Reis, M. Gladan

Cefotaxime-resistance in Escherichia coli strains isolated from fleas parasites in primary production phase
M. Fetaha-agic* [Zenica, Bosnia and Herzegovina], A. Ibrahimagic, J. Dizdarević, S. Uzunovic, A. Šanjta-Reis, A. Kapidžić, M. Gladan

Antibiotic resistance in Staphylococcus pseudintermedius associated with skin and soft tissue infections in dogs and cats
M. Morais* [Lisbon, Portugal], S. Santos Costa, P. Abrantes, M. Pomba, I. Couto

Development of a ery-C recombinant protein-based ELISA approach for differentiating brucellosis infected cattle from vaccinated ones
W. Abdelwahhab* [Cairo, Egypt], M. Salah El-Din Diab, A. Amin Samy, J. Abd Elhalm Eljaky

One Health investigation of Chlamydia psittaci in Denmark in 2019
R. Petersen* [Copenhagen, Denmark], S. Uldum, Ø. Angen

Genomic insights into the dynamic of OXA-48-producing Enterobacteriaceae in a veterinary hospital
M. Haenni* [Lyon, France], H. Boulouis, C. Pierre, E. Hirchaud, J. M. Macé

Microbiome ecology drives the epidemiology of antibiotic resistance and the efficacy of antibiotic stewardship interventions: a mathematical modelling study
D. Smith* [Paris, France], L. Temime, L. Opatowski

Public health impact of similar ESBLs/pAmp-producing Escherichia coli causing urinary tract infections in non-related companion animals and humans
A. Belas* [Lisbon, Portugal], J. Menezes, L. Tejo Da Gama, J. Carriço, M. Pomba

Development of bovine herpesvirus 4-based vaccines as an antibiotic-free strategy to control bacterial infection in livestock
H. Nichols* [Plymouth, United Kingdom], M. Jarvis, A. Murphy, T. Mauch, S. Henderson, Y. Wezel

Resistance and virulence determinants of faecal Salmonella spp. isolated from slaughter animals in Benin
V. Dougnou* [Abomey-Calavi, Benin], E. Deguenon, L. Baba-Moussa

Development of attenuated bovine herpesvirus 4 as a safe, inexpensive, single-dose vaccine to control Streptococcus suis infection in domestic pigs
K. Sealey* [Plymouth, United Kingdom]
Abstract Categories 2020

9395 Global spread of poultry-associated Campylobacter jejuni genotypes to the Peruvian Amazon
B. Pascoe* [Both, United Kingdom], M. Kasek, S. Sheppard
9529 Identification of meticillin resistance in Staphylococcus spp. of dogs with pyoderma
L. Guimarães, I. Silva, M. Antunes, C. Fonseca, C. Pesset, I. Teixeira, A. Santos, B. Penna* [Rio de Janeiro, Brazil]

Session accepted as Paper Poster Session

Intra-abdominal infections

267 Acute cholangitis secondary to choledocholithiasis in older population: subtle presentation and severe illness
A. Hamdi* [Rochester, United States], S. Khalil, M. Fida, E. Beam
507 Evaluation of efficacy of antibiotic prophylaxis in case of paraprostitis
S. Zyrjanov, G. Rodoman, M. Ivzhits* [Moscow, Russian Federation], D. Ramashov, M. Chenkurov, G. Putsman
1377 Pyogenic liver abscess: predictive factors of unfavorable course
1458 A retrospective cohort study investigating the clinical features, outcomes and risk factors leading to a poor unfavorable course
J. Widdrington, B. Tomlinson, J. Williams, I. Kubelka, M. Kalra, J. Cheaveau* [Middlesbrough, United Kingdom], O. Romashov, M. Chenkurov, G. Putsman
1684 A retrospective study of pyogenic liver abscess caused by Klebsiella pneumoniae as a primary pathogen: computed tomography and clinical differentiation as a primary pathogen:
S. Hong, Y. Jang* [Incheon, South Korea], J. Eom, Y. Cho
2309 Microbiology and molecular characterisation of Enterobacterales from children enrolled in global, prospective, controlled paediatric clinical trials for complicated intra-abdominal and urinary tract infections for ceftazidime-avibactam
R. Mendes* [North Liberty, United States], T. Doyle, G. Stone, A. Gardner, M. Castanheira, J. Bradley
2940 What is the optimal timing and technique for the source control in the subgroup of septic shock patients with intra-abdominal infections?
3352 Optimal antimicrobial therapy duration for patients with acute cholangitis after successful drainage by Endoscopic retrograde cholangiopancreatography (ERCP)

6406 Outbreak of Arcobacter butzleri? An emerging enteropathogen
C. Ruiz De Alegria Puig* [Santander, Spain], M. Fernández-Martínez, O. Pablo-Marcos, J. Aguero, J. Calvo-Montes

Session accepted as 2-Hour Oral Session

JARMILA JELÍNKOVÁ MEMORIAL SESSION - Early life infections: what, when and how?

1044 No benefit with empiric aminoglycosides in paediatric febrile neutropenia: analysis of a nationwide cohort study
B. Mcmullan* [Randwick, Australia], G. Haeusler, L. Hall, C. Blyth, C. Jones, P. Konecny, K. Thursky
5352 Feasible approach to reduce antibiotic overuse in preterm neonates
J. Arnmann* [Dresden, Germany], L. Mense, B. Seippol, M. Rüdiger, R. Berner

Impact of the FILMARRAY gastrointestinal polymerase chain reaction panel on the clinical management of children with suspected acute bacterial-diarrhoea
J. Truong* [Paris, France], E. Leroux, M. Michel, J. Boize, P. Mariani, A. Cointe, M. Desmarest, L. Titomanlio, A. Faye, S. Bonacorsi

Preliminary data on initial antimicrobial regimen from a prospective cohort study of sepsis in hospitalised neonates: the NeoOBS study
W. Stöhr* [London, United Kingdom]

Initial clinical features from preliminary analyses of a global multi-centre prospective observational cohort of sepsis in hospitalised neonates: the NeoOBS study
N. Russell* [London, United Kingdom]

Epidemiology and mortality of neonatal Group B streptococcal meningitis and sepsis in the Netherlands: a 30-year nationwide surveillance study
M. Van Kassel* [Amsterdam, Netherlands], D. Jamrozy, S. Teeri, S. Bentley, M. Brouwer, A. Van Der Ende, D. Van De Beek, M. Blijisma

Evaluation of T2MR for the diagnosis of bloodstream infections in paediatric patients
B. Lucignano, L. Mancinelli, M. Öner, M. Agosta* [Rome, Italy], E. Masiello, L. Lancellia, A. Onetti Muda, P. Bernaschi

Type I interferon in viral and bacterial infections in children

Impact of intra-partum azithromycin on carriage of group A Streptococcus in Gambia: an ad hoc analysis of a double-blind randomised trial
Session accepted as Paper Poster Session

Session accepted as Paper Poster Session

Abstract Categories 2020

8783 Contribution of vaginal culture to predict early-onset neonatal infection in case of preterm premature rupture of membrane before 34 weeks’ gestation
I. Ben M Barek* [Colombes, France], K. Sallah, L. Landraud, M. Schneider, C. Couffignal, L. Desfrère, L. Mandelbrot

4685 Differentiate diagnosis active TB infection and latent TB infection by using Interferon-γ released from CD8+ T cell and HBHA antigen
Y. Ma* [Xi’an, China], J. Tang

4767 Quantifier-TB Gold Plus: comparison of interferon-γ detection by ELISA and CLIA assay
G. Lambardi, F. Bisognin, S. Felici, P. Monari, E. Gatti, M. Re, F. Dal Monte* [Bologna, Italy]

5410 Low interferon gamma release assay conversion rate in healthcare workers after exposure to laryngeal tuberculosis
K. Wissel* [St. Gallen, Switzerland], E. Lemmenmeier, B. Mani, M. Schlegel

5662 Identification of recently acquired tuberculosis infection using Quantiferon-TB Gold Plus: an exploratory study

6329 Reporting of interferon gamma release assay results close to cut-off value
D. Falkvardsen, Y. Holicka, T. Lillebaek, V. Nikolayevsky* [London, United Kingdom]

6755 Latent tuberculosis infection among household contacts of pulmonary tuberculosis cases in Nairobi, Kenya
S. Odera* [Nairobi, Kenya], M. Mureithi, O. Anzala, J. Oyugi

7033 Evaluation of STANDARD E TB-Feron ELISA for the diagnosis of latent tuberculosis infection in healthcare workers
M. Lee* [Seoul, South Korea], O. Kweon, Y. Lim, H. Kim, T. Kim

7253 Evaluation of IP-10 as a potential biomarker for the diagnosis of latent tuberculosis infection in vulnerable populations at high risk of TB
Performance evaluation of the new automated chemiluminescent immunoanalyzer-based interferon-gamma releasing assay in comparison with the Quantiferon-TB Gold Plus to detect latent tuberculosis infection
H. Benmansour* [Paris, France], S. Boger, E. Bernard, F. Mougari, E. Lecorche, J. Gehanno, S. Pramil, M. Pestel-Caron, E. Cambau
Latent tuberculosis infection screening in persons with new diagnosis of HIV infection in Italy: a multi-centre study promoted by the Italian Society of Infectious and Tropical Diseases

Screening, diagnosis and treatment of latent tuberculosis infection in rheumatic patients candidate to biological therapy: experience of a tertiary tuberculosis control unit
X. Martinez Lacaosa* [Terrassa, Spain], S. Martinez, G. Salvador, M. Pujol, R. Font I Canals, G. Grau, E. Padilla, E. Cuchi Burgos, T. Pribic

Mycobacterium tuberculosis serostatus in patients with multiple sclerosis treated with anti-CD20/52: effects of treatment and lymphocytic asset on QuantiFERON assay results
E. Zappulo* [Naples, Italy], A. Buonomo, R. Colicchio, G. Scalia, C. Russo, M. Petruzzo, M. De Angelis, B. Pinchera, R. Scotta, V. Bresciamorara, P. Salvatore, I. Gentile

Prevalence of latent tuberculosis in the adult population of the National Institute of Respiratory Diseases in the period 2016-2019 through an interferon-gamma release assays
E. Becerril Vargas, M. Mujica Sánchez, M. Segura Del Pilar* [Mexico city, Mexico], L. Narváez Díaz, J. Martinez Orozco, Á. Sanchez Tinajero, A. Delgado Cueva, J. Gallardo Reyes, E. Flores Perez

Failure to complete treatment for latent tuberculosis infection in Portugal, 2013-2017: geographic, socio-demographic and medical associated factors
A. Sentís Fuster* [Badalona, Spain], P. Asconcelos, R. Sá Machado, J. Caylà, M. Guxens, V. Ricoca Peixoto, R. Duarte, I. Carvalho, C. Carvalho

Interferon gamma release assay and tuberculin skin test agreement in latent tuberculosis infection diagnosis among healthcare workers at a tertiary hospital in western Saudi Arabia
F. Farahat* [Jeddah, Saudi Arabia], J. Ossenkopp, M. Abdalaziz, M. Alshamrani, A. Alsaedi

Current management of latent tuberculosis in multiple sclerosis patients treated with disease-modifying therapies
M. Zingaropoli* [Rome, Italy], P. Pasculi, M. Iannetta, V. Perri, F. Pauri, M. Altieri, A. Conte, C. Mastroiani, M. Ciardi

Inappropriate use of interferon gamma release assays in a UK teaching hospital
R. Mills* [Manchester, United Kingdom], R. Bazaz, J. Wingfield Digby

Lyme disease: epidemiology, detection, therapy

Risk of mood-affective disorders and use of psychoanaleptics in Lyme Neuroborreliosis patients
M. Tetens* [Copenhagen, Denmark], R. Haahr, R. Dessau, K. Krogfelt, J. Bødilsen, N. Skaarup Andersen, J. Kjelseth Møller, C. Bangsberg, K. Hansen, T. Nørkjeld, C. Østergaard, N. Obel, A. Lebech, L. Omland

Screening, diagnosis and treatment of latent tuberculosis in multiple sclerosis patients treated with anti-CD20/52: negative interferon gamma release assays
M. Velušček, A. Gomišček, R. Blagus, T. Cerar Kšek, K. Boršič, M. Nahtigal Klevišar, E. Ruzic-Sabljic, D. Stupica* [Ljubljana, Slovenia]

Increasing incidence of Lyme borreliosis in France: Surveillance results from 2005 to 2018
J. Figoni* [Saint Maurice, France], L. Fournier, E. Moutengau, A. Septfons, C. Bonnet, H. De Valk, B. Jaulhac, T. Blanchon

Detection of Borrelia burgdorferi cell-free DNA in human plasma samples for improved diagnosis of early Lyme borreliosis
J. Branda* [Boston, United States], J. Lemieux, L. Blair, A. Ahmed, D. Hong, S. Bercovici, T. Blauwkamp, D. Holleman, C. Ho, K. Strie, N. Damle, T. Lepore, N. Pollock

Descriptive study of Lyme disease suspected patients with discordant serological tests: negative enzyme immunoassay and positive immunoblot
Y. Hansmann* [Strasbourg, France], C. Sauton, N. Lefebvre, D. Christmann, E. Talagrand-Reboul, P. Boyer, B. Jaulhac

Plasma levels of hepcidin, a potential biomarker during septic shock
J. Olinder* [Helsingborg, Sweden], C. Rydén Rubin, H. Herwald
Abstract Categories 2020

1829 Human endogenous retroviruses as markers of severity in sepsis

1947 Characterisation of the kinetics and LPS dose-response profiles of presepsin, procalcitonin and sTREM-1 as potential biomarkers for severe infections and sepsis in a human endotoxemia model
L. Lulin* [Leiden, Netherlands], A. Kleijburg, P. Hameeteman, H. Hjima, P. Van Der Graaf, M. Moerland, C. Van Hasselt

4009 Is the modified quick SOFA scale superior to quick SOFA in patients with diagnosed septic shock?

4375 Comparison of different sepsis scoring systems and pathways: qSOFA, SIRS, Shapiro Criteria and CEC SEPSIS KILLS pathway in bacteraemic and non-bacteraemic patients presenting to the emergency department
R. Sparks* [Neutral Bay, Australia], R. Chavada, C. Tretewy, A. Harada

5932 Phenotype or genotype: association between mortality and minimum inhibitory concentration or beta-lactamase genes for patients with ceftriaxone non-susceptible Escherichia coli or Klebsiella spp. treated with meropenem

6223 Endotoxin activity assay as a better predictor for septic shock in critically ill cirrhotic patients
V. Khilnani* [New Delhi, India], P. Badhan, R. Maiwall, P. Kale

6239 The REAnimation Low Immune Status Markers study: phenotypic and functional alterations of adaptive immune response in critically ill patients

8043 Lower concentrations of immunoglobulins (IgM, IgG and IgA) in patients with septic shock compared with sepsis
D. Lendak* [Novi Sad, Serbia], D. Mihajlović, M. Ubavić, A. Novakov Mikic, J. Boban, I. Mitić, S. Brikic

9433 Superior discriminatory capacity of qSOFA over SIRS criteria for predicting mortality and extensiveness of organ failure in sepsis
S. Adamovic* [Novi Sad, Serbia], D. Becejac, S. Mitic, M. Drijača, A. Vukelic, D. Lendak

Session accepted as Mini-oral Flash Session

Multi-resistance: a new hope

1093 Effectiveness of IV fosfomycin in critically ill patients with CRE infection and analysing the impact of variables on mortality in Indian setting
S. Puriti* [Mumbai, India], P. Sathe, A. Bulle, S. Shah, S. Bhagat, H. Barkate

1824 Influence of empirical piperacillin-tazobactam on 30-day mortality in bacteraemia due to ESBL-producing versus non-ESBL-producing non-AmpC Enterobacteriaceae

Use and impact of aminoglycoside empirical combination therapy in intensive care unit patients with ESBL-producing Enterobacteriaceae bloodstream infections: a multi-centre retrospective observational cohort

A systematic literature review of the efficacy and tolerability of polymyxins in resistant Gram-negative infections
R. Dillan, A. Colasio, S. Khan, C. Masaquel, E. Mccann* [Rahway, United States]

Phenotype or genotype: association between mortality and minimum inhibitory concentration or beta-lactamase genes for patients with ceftriaxone non-susceptible Escherichia coli or Klebsiella spp. treated with piperacillin/tazobactam compared with meropenem
### Abstract Categories 2020

| Session accepted as Paper Poster Session | 667 | The clinical and molecular epidemiology of non-carbapenemase-producing carbapenem-resistant Enterobacteriaceae: a case-case-control matched analysis |

3846  Dissecting the single-cell heterogeneity and subpopulation dynamics of quiescence in Mycobacterium tuberculosis
L. Singh* [Paris, France], C. Chica, N. Pietrosemoli, G. Manina

3858  Serum C-reactive protein: a useful tool in the diagnosis of tuberculosis?
T. Sullivan* [London, United Kingdom], A. Brown

3935  Tuberculosis in the elderly: a current challenge
P. Gijón, B. Alvarez Romasanta* [Madrid, Spain], A. Valera, M. Veintimilla Yanez, S. Rodriguez, M. Ruiz Serrano, D. Garcia De Viedma

3984  Culture-negative „tuberculosis”: which patients are at risk of misdiagnosis?
O. Collas* [London, United Kingdom], I. Suchett-Kaye, J. Barrett, T. Corrah

4191  Neutrophil extracellular traps and matrix metalloproteinases are increased in TB meningitis patients with contrast enhancement, ventricular dilatation and poor neurological outcome: findings from a paediatric cohort
X. Poh* [Singapore, Singapore], J. Hong, Q. Miow, Y. Wang, P. Thong, S. Tiang, M. Fukushima, K. Wong, S. Fong, T. Lim, T. Yeo, C. Ong

4692  Gene expression pattern analysis using dual-color RT-MLPA and integrative genome-wide association studies of expression quantitative trait loci (eQTL) for tuberculosis susceptibility
J. Ai* [Shanghai, China], H. Zhang, W. Zhang

5335  Pathogenic determinants of the Mycobacterium kansasii complex: an unsuspected role for distributive conjugal transfer
F. Tagini* [Lausanne, Switzerland], T. Pillonel, C. Bertelli, K. Jaton, G. Greub

5343  The diagnostic impact of adding a molecular-based algorithm to routine mycobacterial testing for non-respiratory samples at a reference Saudi Arabian laboratory
A. Binjomah* [Riyadh, Saudi Arabia], A. Alvim, S. Zareah, K. Alasmar, S. Alharbi, A. Aljubran, A. Alshammar, S. Alharbi, K. Aldosari

5428  Diabetes and tuberculosis: the new emerging problem in middle-low-income countries like Colombia
J. Garcia-Goez* [Cali, Colombia], N. Romero-Rosas, L. Parra-Lara, R. Rivera, M. Peña

5709  Analyzing the public health impact of human immunodeficiency virus and tuberculosis co-infections in Brazil
H. Pai* [London, United Kingdom], A. Susanne, O. Butt

6565  Inhibition of metabolic signalling pathways controls inflammatory tissue destruction in tuberculosis
R. Asher* [London, United Kingdom], J. Friedland

7046  T cell immunomonitoring of pulmonary tuberculosis treatment using mass cytometry: a multi-centre prospective study in high-burden countries

7432  Genital tuberculosis in a low prevalence setting: an unsuspected cause of infertility and severe gynaecological disease

7958  Tuberculosis in elderly patients
P. Caraux Pax* [Villeneuve Saint Georges, France], A. Belkacem, M. Fernanda, A. Raffetin, K. Diallo, D. Jaafar, J. Naturel, O. Patey

8353  Identification of risk factors for extrapulmonary tuberculosis
G. Aydin* [Afyonkarahisar, Turkey], I. Akdemic, A. Azap, K. Memikoglu

8403  Burden of tuberculosis in Nepal: where do we stand?
P. Shrestha* [Kathmandu, Nepal]

8478  Diabetes and obesity reduce weight gain on tuberculosis treatment
R. Banerjee* [Paranaque City, Philippines], P. Guevarra, M. Gler

9005  Collaborative organised database for extrapulmonary tuberculosis (CODE TB): common protocol for collecting data for characterisation of extrapulmonary tuberculosis: prevalence, demographics and risk factors
R. P. Paranaque City, Philippines, P. Guevarra, M. Gler

9442  Tuberculosis (TB) and cancer: why a previous TB infection may not alert us in a near future
M. Pedromingo Kus* [Madrid, Spain], J. Barragan Casas, A. Antoli Royo, T. Meiras Arriaga

9623  Neutrophilia is associated with lung tissue damage in pulmonary tuberculosis
M. Miranda De Melo* [Rio de Janeiro, Brazil], A. Rezende Moreira, C. Da Silva Monteiro, C. Lalucha, A. Almeida Silveira, T. Dutra, E. Costa Da Silva, A. Kritski

Session accepted as Paper Poster Session

Mycobacterium tuberculosis genomics and evolution

822  Pinpointing the genetic intra-host diversity of Mycobacterium tuberculosis and its determinants
C. Genestet* [Lyon, France], E. Hadille, A. Barbry, J. Berland, L. Jacob, G. Lina, S. Dray, S. Venner, O. Dumitrescu
Abstract Categories 2020

1389 Extreme levels of diversity of *Mycobacterium tuberculosis* across a large genomic dataset: a map to disease pathogenesis and stress survival
D. Papakonstantinou* [Birmingham, United Kingdom], S. Dunn, A. Cunningham, M. O’Shea, A. McNally

2088 Evaluating the usefulness of whole genome sequencing in tuberculosis treatment decisions in a low-incidence clinical setting
M. Park* [London, United Kingdom], G. Satta, O. Kan

2770 Classifying the *Mycobacterium tuberculosis* complex into the main phylogenetics lineages [Seville, Spain, 2015-2019]: is something changing?
V. Gonzalez Galan, M. Torres Sanchez, L. Rafael, N. Veronica, M. Juan Francisco, R. Valencia, B. Eduardo, J. Aznar* [Seville, Spain]

3524 Costs and impact of whole genome sequencing on tuberculosis diagnostics in a high prevalence and high MDR-TB burden country
M. Vogel* [Gauting, Germany], A. Iskakova, C. Utpatel, C. Corbett, H. Hoffmann, S. Niemann

4256 Stopping exposing rifampicin-resistant *Mycobacterium tuberculosis* to further rifampicin may lead to reversion to wildtype, preventing the evolution of compensating mutations
P. Fowler* [Oxford, United Kingdom]

4483 *fabG1 L203L*: clinical and public health impact of detecting a synonymous mutation conferring isoniazid resistance in routine WGS
A. Telford* [London, United Kingdom], H. Farooq, V. Nikolajevskyu, D. Wyllie, R. Myers, T. Walker, G. Smith, E. Robinson, E. Alexander

5424 Epidemiology of pyrazinamide-resistant tuberculosis in a low-incidence setting
C. Martin Higuera* [Madrid, Spain], E. Prieto Ávalos, B. Velazquez-Gonzalez, M. Ramírez-Vela, I. Muñoz Gallego, L. Perez-Roa

5620 Whole genome sequence-based country-wide study reveals a high ongoing transmission of multidrug-resistant *Mycobacterium tuberculosis* in southern Brazil
R. Salvato* [Porto Alegre, Brazil], A. Reis, S. Schiefelbein, S. Salvato, R. Barcellos, E. Dalla Costa, P. Almeida Da Silva, J. Perdigao, A. Kritski, M. Rosa Rossetti

5669 Molecular characterisation of multidrug-resistant *Mycobacterium tuberculosis* strains circulating in the state of Santa Catarina, Brazil from 2013 to 2017
L. Nunes, M. Valmorbida, D. Roveris, L. Lima, M. Scheffer* [Florianópolis, Brazil], M. Bazzo

5907 Standardization of a *pncA* gene complementation in *Mycobacterium tuberculosis* pncA-knockout: tool for the study of the relationship between mutations in *pncA* and phenotypic parameters
Y. Cauna* [Lima, Peru], M. Zimic, P. Sheen

6494 Discovery of convergent mutations associated with *Mycobacterium tuberculosis* clinical and microbiological characteristics
O. Lebedenka* [Saint Petersburg, Russian Federation], M. Rotkevich, V. Zhuravlev, E. Chernyaeva, P. Yablonsky

6525 Genomic and structural protein characterisation of mutations conferring bedaquiline resistance in *Mycobacterium tuberculosis* clinical strains
A. Spitaleri, S. Battaglia, J. Carter, A. Ghodousi* [Pessano con Barnago, Italy], A. Cabibbe, P. Fowler, S. Hoosdally, D. Cirillo

6811 Efficient long-term storage of mycobacteria using conventional laboratory reagents
F. Schramm* [Strasbourg, France], E. Talagrand-Reboul, P. Boyer, A. Chabaud, B. Jaulhac, C. Koebel

7271 Genetic mutations in drug-resistant paediatric tuberculosis: experience from a paediatric tertiary care centre in north India
P. Khurana* [Delhi, India], K. Saigal, A. Ghosh

7480 Genomic analysis of multi-resistant *Mycobacterium tuberculosis* strains in France: evolution from 2006 to 2018

8103 Assessment of the performances of the novel BioNumerics-7.6 MTBC plugin for phylogenomic analysis and drug resistance prediction from *Mycobacterium tuberculosis* whole genomes
W. Sougakoff* [Paris, France], F. Morel, G. Millot, A. Aubry, J. Robert

8350 *Mycobacterium tuberculosis* genotypes’ landscape in HIV-negative and HIV-positive tuberculosis patients in Russia
A. Panova* [Moscow, Russian Federation], G. Kaminski, A. Vinokurov, A. Shemetova, M. Shulgina, I. Vasilyeva

9066 Evaluation of PrimeStore molecular transport medium for long-term preservation of mycobacterial RNA at ambient temperature and subsequent detection of *Mycobacterium tuberculosis* Ag85B
S. Matsukane, B. Fourie* [Pretoria, South Africa]

9626 Structural study of new KatG mutations selected on isoniazid-resistant strains of *Mycobacterium tuberculosis* in vivo
A. Bastanaru* [Iasi, Romania], M. Mares

Session accepted as Mini-oral Flash Session

**New interventions for NTMs: from diagnosis to treatment**

1395 Pathogen Box screening identifies novel antimicrobials that target *Mycobacterium chimaera*
D. Cantillon* [Brighton, United Kingdom], A. Goff, S. Taylor, S. Stoneham, S. Waddell

2453 Benzimidazole SPR719/720 is a potent new candidate for treatment of non-tuberculous mycobacterial infections
L. Pennings* [Nijmegen, Netherlands], T. Lister, D. Melnick, N. Cotroneo, I. Critchley, M. Pucci, T. Parr, S. Stokes, J. Van Ingen

4307 Performance of RealAccurate Quadruplex *Mycobacteria* PCR for detection of non-tuberculous mycobacteria in clinical samples
J. Cappens* [Edegem, Belgium], S. Van Goethem, K. Bergs, M. Michiels, L. Rigouts, H. Goossens, H. Jansens, V. Mattheussen
ECOFFs for non-tuberculous mycobacteria: towards a EUCAST reference method and clinical breakpoints for antimicrobial susceptibility testing

Transglutaminase 2 inhibitors as a future intervention against non-tuberculous mycobacteria

I. Palucci* (Rome, Italy), A. Salustri, M. Sali, F. De Maio, L. Petrone, G. Fimia, M. Sanguinetti, D. Goletti, M. Piacentini, G. Delogu

Synergistic activity of a three-drug combination against clinical isolates of Mycobacterium abscessus complex

M. Fernandez* (Barcelona, Spain), M. Monte, A. Raman, E. Portell Buj, A. Lópezc, G. Tudó, J. Gonzalez

Preclinical evaluation of liposomes carrying bioactive lipids as an immune therapeutic tool in vitro and in vivo infection with Mycobacterium abscessus

C. Riva* (Sorèina, Italy), N. Poerio, M. Rossi, F. De Santis, E. Tortoli, M. Fraziano, D. Cirillo

Amikacin resistance mechanisms in Mycobacterium abscessus

M. Sandermelle* (Paris, France), G. Sbaa, E. Lecorche, H. Benmansour, F. Mougari, E. Cambau

Blocking mycobacterial efflux pumps might potentiate efficacy of antimycobacterial drugs in vitro

M. Ruth* (Nijmegen, Netherlands), L. Pennings, J. Schildkraut, V. Koeken, H. Wertheim, J. Van Ingen

Investigation of the prevalence of Verocytotoxigenic Escherichia coli [VTEC] contamination of private groundwater wells in Ireland

Characterisation of methicillin-resistant Staphylococcus aureus strains isolated from porcine subcutaneous lesions of food-producing rabbits

Emergence of multiple ESBL-producing Salmonella enterica serovars in hospitalised horses due to an epidemic spread of a CTX-M-3 plasmid pSIEL-3

Z. Doo, A. Shnaiderman-Torban, K. Konratjyeva, M. Dovdovich, A. Rokney, A. Steinman, S. Novon-Venezia* [Ariel, Israel]

Genomic evidence that the recurrence of Salmonella enterica serovar Weltevreden in human salmonelloses in Asia is triggered by the aquatic environment

Y. Hounmanou* [fredenskibsg, Denmark], A. Dalsgaard, T. Sapacua, G. Uddin, P. Leekitcharoenphon, R. Hendriksen, M. Larsen

The transmission risk of multidrug-resistant organisms between pets and humans: n exploratory case control study protocol

C. Hackmann* [Berlin, Germany], P. Gornaer, D. Gruhl, B. Laos De Henner, A. Lübbe-Becker, S. Schwarz, R. Leistner

Presence and zoonotic potential of Escherichia coli ST131 recovered from wildlife and food-producing animals, with high prevalence of mcr-1 within porcine isolates

One Health in practice: longitudinal screening of antibiotic residues, antibiotic resistance genes and zoonotic bacteria in soils fertilised with pig manure

M. Heyndrickx* [Melle, Belgium], T. Van Der Meersche, E. Daelesteire, E. Van Collie, G. Rasschaert

Antimicrobial resistant and enteropathogenic bacteria in ‘filth flies’: a cross-sectional study from Nigeria

M. Onwugbula* [Münster, Germany], A. Mellmann, N. Oluahegbual, F. Schauburg

Detection of pathogenic Vibrio species in estuary water samples in southwest Spain

T. Trujillo-Soto* [Cádiz, Spain], J. Ruiz-Cayusa, I. Guerero Lozano, F. Galan-Sanchez, S. Papaspyrou, M. Rodriguez-Iglesias

Investigation of the prevalence of Verocytotoxigenic Escherichia coli [VTEC] contamination of private groundwater wells in Ireland

An ultrasensitive rapid single molecule counting method detects Bacillus anthracis lethal factor directly in blood samples

D.Straus* [Chelmsford, United States], A. Tempesta, S. Gite, S. Schulz, B. Walsh, L. Bowers

A rocky road: lessons learned from a case of disseminated Rhodococcus haagi infection

R. Hoffmann* [Bellville, South Africa], C. Van Der Westhuizen, M. Newton-Foot

Streptococcus pneumoniae: the chameleon of ocular diseases

C. Andre* [Chatou, France], J. Rouhana, M. Gilmore, P. Bispo

Lawsonella clevelandensis: an emerging cause of vascular graft infection

R. Ramesh* [Hradec Kralove, Czech Republic], Z. Esquer Garrigos, K. Rodina, B. Pritt, M. Sohail

Chlamydia psittaci / C. abortus detection in respiratory samples [England and Wales, 2012-2018]

S. Mayet* [London, United Kingdom], J. Day, L. Vaghji, A. Peace, D. Ready, V. Chalker, M. Chand, B. Afshar

A study of Bartonella bacilliformis bacteriemia in asymptomatic individuals during an inter-outbreak period in an endemic region

H. Biasizzo* [Postojna, Slovenia], P. Ventosilla, C. Augusto Ugarte Gil, D. Moore
3079 *Bacillus subtilis* as a causative of true bacteraemia in patients with peritonitis
C. Sassa* (Tokyo, Japan), K. Sonobe, N. Ichimura, Y. Hadana, S. Tohda

3930 Failure to perform a repeat ascitic tap at 48 hours is associated with poor outcome in patients with spontaneous bacterial peritonitis
J. Tan* (London, United Kingdom), J. King, J. Ryan, M. Morgan, R. Westbrook, E. Wey

5753 An eight years-long experience of *Nocardi*a spp. infection in Italy: does immunosuppression matter?
M. Colaneri* (Pavia, Italy), V. Monzilla, B. Mariani, A. Lombardi, E. Brunetti, M. Sambro, E. Seminari

6649 *Toxigenic Corynebacterium ulcerans* isolated from an Italian hunter
G. Zambolin* (Brescia, Italy), B. Saccani, G. Tomasoni, A. Lombardi, E. Brunetti, M. Sambo, E. Seminari

6796 *Moraxella keratitis*: investigating emerging pathogenicity through clinical and microbiological findings and whole genome sequencing for virulence determinants

7302 *Streptococcus suis* infection: a series of 37 cases from a community-based hospital, Thailand
S. Pinsai* (Bangkok, Thailand)

7390 Clinical features and outcomes of patients with *Elizabethkingia meningoseptica* infection: an emerging pathogen
N. Nasir* (Karachi, Pakistan), A. Umair

7472 *Corynebacterium ulcerans* spp.
A. Ang* (Singapore, Singapore), K. Chew

7648 *Meliodosis* in patients suspected with recurrent tuberculosis: a disease in disguise
R. Garg* (Manipal, India), T. Shaw, C. Mukhopadhyay

7884 Impact of early infectious diseases intervention and microbiologically led antimicrobial therapy in patients with idiopathic granulomatous mastitis

8056 Low incidence of Gram-negative infections in people who inject drugs in Tennessee
M. Veve* (Knoxville, United States), G. Cooksey, B. Nabors, Z. Smith, M. Sherman

8356 Comparison of clinical characteristics and mortality between patients with pulmonary nocardioses and patients with pneumonia
I. Margalit* (Petah Tikva, Israel), E. Goldberg, K. Muhisen

9565 *Corynebacterium ulcerans*: lessons learned from a rare emerging infection
R. Huq* (Manchester, United Kingdom), R. Shortern, A. Jha, A. Cardozo, I. Chaudry, L. White, A. Muir, G. Amirthalingam, M. Chand, P. Jumaa

9662 Outbreak of mixed cases of gastrointestinal and cutaneous anthrax in the rural village of northern Luzon, Philippines, March 2017
K. Lonogan* (Baguio City, Philippines), A. De Guzman, V. De Los Reyes, N. Sucaldito, F. Avellana

Session accepted as Paper Poster Session
Sepsis: an ever evolving story

1314 Community and nosocomial sepsis in older adults with bacteremia: a retrospective study in a geriatric ward
M. Saotetti, G. Orlando* (Modena, Italy), O. Moioli, C. Mussi, M. Menozzi, M. Meschiari, E. Franceschini, C. Pizzolante, A. Bedini, M. Digaetano, C. Mussini, M. Bertolotti

1362 Bloodstream infections caused by strong biofilm-producing bacteria increase the risk of end-organ disease and mortality in patients with haematologic malignancies

Clinical and microbiological characteristics and outcomes for community-onset sepsis patients in a teaching hospital in Latvia: a retrospective, single-centre, cohort study
L. Puceta* (Riga, Latvia), A. Grāmatniece

Clinical characteristics and outcome of bloodstream infections in HIV-infected patients with febrile neutropenia: A case-control study

Characteristics of bloodstream infections in patients with liver cirrhosis in a general hospital
S. Nguyen* (Béthune, France), P. Wallard, O. Oddoux, M. Anastay, D. Descamps

Assessing the contribution of sepsis to mortality in Oxfordshire
E. Pritchard* (Oxford, United Kingdom), A. Walker, T. Petoe, D. Crook, L. Petto, N. Fawcett, A. Brent

Analysis of causes of death and mortality risk factors in extreme elderly patients with sepsis
J. Delgado Correal* (Rio de Janeiro, Brazil), R. Rufino, M. Fornasario, C. Albuquerque, M. Martins, P. Damasco

Analysis of *Escherichia coli* phenotypes and known sepsis-causing sequence types in UK sewage reveals a direct link between sepsis rates and carriage of pathogenic sequence types in the community
M. Toleman* (Cardiff, United Kingdom), J. Mathias, A. Almusallam, D. Babenko
Prospective evaluation of septic shock patients in a tertiary care educational university hospital: a series of 739 cases

Epidemiological changes in bloodstream infection in southern Spain during the last ten years: results from the PROBAC study

Epidemiology, risk factors and treatment of anaerobic bloodstream infections: a 7-year study
R. Figueroa-Cerón, M. Macha, A. Gonzalez Sarria* [Bilbao, Spain], C. Aspichueta, M. Urrutia-Koethea-Gutierrez, F. Calvo Muro, J. Díaz De Tuesta

Hospital admission for sepsis and mortality in Brazil from 2009 to 2018: analyzing 10 years of government database (Datasus) information
R. Fleury, W. Freitas* [Rio de Janeiro, Brazil]

Epidemiology and risk factors for mortality in patients with Pseudomonas aeruginosa bacteraemia
I. Perez-Camacho* [Malaga, Spain], J. Ruiz-Mesa, I. Márquez Gómez, L. Caballero Martinez, B. Sobrino, L. Valiente De Santis, A. Plata Ciézar, J. Reguera Iglesias

Clinical characteristics and treatment outcome of patients with sepsis treated in an infectious disease intensive care unit
R. Novak* [Zagreb, Croatia], M. Popović, B. Baršić, M. Santini, M. Kutlesa, V. Krajnović

Dynamics and distribution of attributable and non-attributable mortality in Staphylococcus aureus bacteraemia

The effect of mesenchymal stem cells on the mortality of severe sepsis and septic shock: a promising therapy
E. Alp Mese, Z. Gonen, K. Gundogan, A. Esmaeili, L. Kaynar, A. Cetin, M. Korakucku, M. Cetin, G. Kalin Ünüvar* [Kayseri, Turkey], M. Doganay

A randomised prospective clinical trial to assess the role of procalcitonin-guided antimicrobial therapy to reduce long-term infections’ sequelae [PROGRESS]

Impact of rapid molecular detection of sepsis on time to optimal antimicrobial therapy in paediatric cancer patients at the National Cancer Institute, Egypt
H. El-Mahallawy, E. Ebeid, S. Hassan, F. Naguib, R. Khedr* [Cairo, Egypt]

The global burden of sepsis in adults: updated systematic review and meta-analysis
C. Fleischmann-Struzek* [Jena, Germany], L. Mellhammer, N. Rose, A. Cassini, K. Rudd, P. Schlattmann, B. Allegranzi, K. Reinhart

Genetic characterisation of co-circulating community Staphylococcus aureus and Streptococcus pyogenes causing skin and soft tissue infections in Gambia

Effectiveness of implementing a locally developed antibiotic use guideline for community-acquired cellulitis at a large tertiary care university hospital in Thailand
R. Sirijatuphat* [Bangkok, Thailand], P. Nookeu, V. Thamilkitkul

Characterisation of Staphylococcus aureus in soft tissue infections: relevance of PVL producers
N. Leal, G. Vieira, N. Osório, C. Antunes Chaves, F. Rodrigues, A. Rodrigues* [Coimbra, Portugal]

Impact of underlying comorbidities on outcomes of patients treated with ceftaroline fosamil for complicated skin and soft tissue infections: pooled results from three phase III clinical trials
M. Wilcox* [West Yorkshire, United Kingdom], M. Kantecki, J. Yan, M. Dryden

Actinotignum schaali in breast abscesses, an emerging pathology? Report on five cases
L. Deroche* [Poitiers, France], C. Nadeau, V. Huguier, M. Pichon, L. Brouin, P. Chioè, C. Burucoa, A. Michaud

Comparison of genetic diversity in Streptococcus pyogenes isolates from Gambia and United Kingdom causing skin and soft tissue infections
S. Bah* [Sheffield, United Kingdom], A. Keeley, E. Armitage, E. Senghore, J. Manneh, L. Tilley, S. Darboe, A. Sesay, T. De Silva, C. Turner

Exclusive oral post-surgical antibiotic therapy is effective for infectious flexor hand tenosynovitis: a study of 127 patients
C. Dujeux, A. Fournier, M. Malherbe, F. Guérin, G. Rochcongar, A. Baldelli, R. Verdon, J. Michon* [Caen, France]
2481 Self-reported health status in ambulatory acute bacterial skin and skin structure infection patients who inject drugs, who received oral therapy with omadacycline or linezolid
K. Lapensee* [King of Prussia, United States], S. Chitra

5500 Acute rheumatic fever in children in Morocco: a prospective study
S. Himri* [Fes, Morocco], B. Oumakhtar, S. El Fakir, S. Atmani

6260 An epidemiological description of Panton-Valentine leukocidin-positive Staphylococcus aureus (PVL-SA) at ambulatory health units of the Rhine-Ruhr metropolitan region in North Rhine-Westphalia, Germany
C. Tellez-Castillo* [Bochum, Germany], M. Griego, P. Göcke, R. Rujbr, U. Scharmann, C. Scharmann

6327 Cutaneous lesions due to Staphylococcus aureus in inflammatory bowel disease patients undergoing anti-TNFα treatment: molecular characteristics and strains comparison in different niches
H. Hač, C. Dunyach-Remy* [Nîmes, France], E. Schowb, O. Dereure, R. Altwegg, A. Du-Thanh, J. Lavigne

5650 MRSA from skin and soft tissue infections in Poland
M. Orczykawska-Kotyna* [Warsaw, Poland], D. Żura, M. Orczykowska-Kotyna* (Warsaw, Poland), D. Żura, M. Orczykowska-Kotyna* (Warsaw, Poland), D. Żura, M. Orczykowska-Kotyna* (Warsaw, Poland)

6994 Dalbavancin use in the United Kingdom: a multi-centre, retrospective evaluation of real-world use of an extended dosing interval lipoglycopeptide

8111 Biomarker profiles in streptococcal skin and soft-tissue infections with or without necrosis or shock: a prospective multi-centre study

8645 Characteristics and management of skin and soft tissue infections caused by Panton-Valentine leukocidin-producing Staphylococcus aureus (PVL-SA): a retrospective study of 99 cases
A. Assaf* [Lille, France], C. Loiez, M. Chapin, S. Panaget, A. Dozier, E. Faure, K. Faure, F. Vuotto

9238 Clinical characteristics and treatment of 255 patients hospitalised with bacterial cellulitis
L. Lucić* [Zagreb, Croatia], M. Mudrovčić, M. Puljiz, I. Puljiz

9419 Factors contributing to the duration of hospitalisation of patients with bacterial cellulitis
M. Mudrovčić* [Zagreb, Croatia], L. Lucić, M. Puljiz, I. Puljiz

Session accepted as Paper Poster Session
STIs: epidemiology, diagnosis, treatment

146 Sexually-transmitted infections in soldiers: a cross-sectional assessment and a review of literature
C. Gottwald, N. Schwarz, H. Frickmann* [Hamburg, Germany]

1066 Triple site versus urine only N. gonorrhoea/C. trachomatis testing among Israeli MSM in the condom fatigue era: a prospective study
D. Zoker, D. Turner, R. Ben-Ami, A. Adler, I. Singer, Y. Dizitzer, T. Halperin* [Tel Aviv, Israel]

1267 Mycoplasma genitalium infections in men who have sex with men: prevalence and macrolide resistance in north-east Italy
L. Clemente* [Monfalcone, Italy], M. Drabeni, G. Moise, F. Fontana

2001 Streptococcus pneumoniae: an uncommon possible cause of male urethritis?
F. Menotti, S. Cornini, C. Croccoli, R. Sparti, G. Amaru, C. Solimine, A. Cuffini, V. Allizond, G. Banche* [Turin, Italy]

2332 Detection and genotyping Lymphogranuloma venereum in Tenerife, Spain
B. Pino-Calm, D. García Martínez De Artola* [Santa Cruz de Tenerife, Spain], J. Alcoba-Florez, O. Diez Gil

2339 Prevalence of Mycoplasma genitalium and frequency of resistance to macrolides and fluoroquinolones in Tenerife, Spain
B. Pino-Calm, D. García Martínez De Artola* [Santa Cruz de Tenerife, Spain], J. Alcoba-Florez, O. Diez Gil

2345 Opportunistic screening for sexually-transmitted infections in young men with leukocyturia and negative urine culture in primary care
I. Angulo López, A. Gonzalez Sarria* [Bilbao, Spain], J. Aragón-Diez, M. Imaz Perez, L. Hernandez Raga, J. Alava Menica, J. Díaz De Tuesta

2632 Rapid detection of ciprofloxacin susceptible strains of Neisseria gonorrhoeae: an important guide for treatment
C. Cox* [Belfast, United Kingdom], J. Mckenna

2993 Genetic relatedness of ceftriaxone-resistant multidrug-resistant Neisseria gonorrhoeae isolates in Singapore
N. Abdul Rahman* [Singapore, Singapore], M. Chio, S. Goh, A. Tan, T. Koh, K. Ko

3039 The rapid method for detecting Neisseria gonorrhoeae and antimicrobial susceptibility
J. Sakai* [Moroyama-cho, Japan], N. Tarumoto, K. Imai, T. Maeda, S. Maekawa

3089 Inflammatory changes on routinely-performed Papancilou smear are more frequently associated with bacterial vaginosis
S. Baka* [Athens, Greece], A. Chasiakou, S. Demeridou, G. Kaparos, E. Kouskouni, V. Gennimata, A. Tsakris

3110 Trichomonas vaginalis trends for women and men in a national reference laboratory database
E. Marlowe* [San Juan Capistrano, United States], R. Kagan
Abstract Categories 2020

3916 Prevalence of Mycoplasma genitalium and macrolide resistance in Israel
O. Treigerman* {Tel-Aviv, Israel}, G. Prajgrod, D. Shasha

4229 High prevalence of sexually-transmitted infections among at-risk HIV-positive patients

4262 Reduced clinical improvement after treatment for urethritis in men with azithromycin resistant Mycoplasma genitalium
J. Braam* {Amsterdam, Netherlands}, A. Van Dam, S. Bruisten, M. Van Der Loeff, M. Van Rooijen, H. De Vries, C. Vergunst

4314 Experimental evolution of high-level azithromycin resistance in Neisseria gonorrhoeae during morbidostat culture

4597 Active search through multiplex PCR method for sexually-transmitted infections in patients with sterile pyuria
H. Gil Campesino, L. Sante* {San Cristobal De La Laguna, Spain}, M. Callejón Fernández, E. Callejas Castro, M. Lecuona

4962 Mycoplasma genitalium resistance against antibiotics in a Berlin MSM cohort tested with the Allplex MG & AziR Assay and Allplex MG & MixIR Assay
M. Obermeier* {Berlin, Germany}, S. Breuer, R. Ehret

4992 Prevalence of Chlamydia trachomatis and Neisseria gonorrhoeae at extragenital sites in the north metropolitan area in Catalonia
C. Casan, G. Fernández Rivas, A. Hernández Rodríguez, M. Carrasco, G. Linares, B. Rivaya Sanchez* {Badalona, Spain}, N. Romani Radés, A. Fernández Navarro, L. Matas Andreu

5100 Haemophilus influenzae as the causing pathogen of epididymo-orchitis: a case report
T. Demuyser* {Brussels, Belgium}, K. Vandoorslaer, S. Jacobs, L. Van Dijck, D. Pierard

5138 Incidence and predictors of Chlamydia trachomatis, Ureaplasma urealyticum, Mycoplasma hominis and Mycoplasma genitalium in patients with sterile pyuria
A. Aggarwal* {New Delhi, India}, B. Dhawan, N. Wig, N. Vikram, M. Soneja, R. Chaudhry, A. Kapil

5341 Microbiological features of vulvovaginitis in prepubescent girls
M. Damala, A. Nikolakopoulou, C. Anthoulaki* {Athens, Greece}, I. Koumpi, E. Prifti, L. Michala, N. Loukapoulou

5441 Neisseria gonorrhoeae transcriptome analysis: profiling molecular determinants of resistance
H. Machado, G. Toledo-Silva, J. Martins, M. Schörner, L. Goijetta, R. Mazzan, M. Pozzo* {Florianópolis, Brazil}

5482 Mycoplasma genitalium infections can comprise mixtures of both quinolone-susceptible and quinolone-resistant strains
E. Sweeney* {Herston, Australia}, K. Lowry, C. Bletchly, G. Nimmo, D. Whiley

5518 Association between the detection of human papilloma virus and pathogens causing sexually-transmitted infections in woman in reproductive period
I. Hadji Petrusheva Meloska* {Skopje, Macedonia}, K. Icse, A. Hadji-Petrusheva Jankijevik

5616 Epidemiology of Neisseria gonorrhoeae antimicrobial resistance and evaluation of alternative antibiotics
J. Yan* {Hangzhou, China}, S. Van Der Veen

5664 Bacterial STI-testing in the private sector in France, 2006-2018

5696 Detection rates of bacterial vaginosis and sexually-transmitted pathogens associated with genital discharge syndrome in the South-African private sector
C. Kingsburgh* {Pretoria, South Africa}, K. Strydam, M. Kock

5727 The natural history of gonorrhoea infection: an illustrative review
J. Whelan* {Amsterdam, Netherlands}, E. Beck

5764 Epidemiology and treatment outcome of Neisseria gonorrhoeae infections
J. Parke-Smith, C. Palmer, A. Jennison, V. Hicks, L. Ariotti, S. Bell, D. Whiley, A. Walker, G. Playford, A. Henderson* {Brisbane, Australia}

5793 Does trichomonas hurt? A five-year comprehensive full-region study
M. Berends* {Groningen, Netherlands}, D. Scoop, J. Weel, T. Schuurs

5820 Lactobacillus crispatus as a marker of cytolytic vaginosis in women under 45-years old?
L. Fontan, A. Yarci Carrión, S. Gómez De Frutos, A. Fraile Torres, L. Cardenal* {Madrid, Spain}, A. García

5851 High prevalence of Lymphogranuloma venereum in men who have sex with men in Alicante, south-east Spain
V. Ortiz-De La Tabla* {Alicante, Spain}, G. Gázquez, A. Infante

6902 Determination of prevalence of Chlamydia trachomatis in pregnant women between 15 to 25 years old at Hospital Universitario La Paz, Madrid, Spain B. Gómez Arroyo* [Madrid, Spain], P. González Danapetery, C. Fabra Garrido, M. Darado Criado, C. González Arboleya, E. Merino San Martín, C. Calvo Rey, M. De La Calle Fernández-Miranda, I. Quiles, J. García Rodríguez

7009 The role of using the UBU (Urethritis Basic Unit) and the FVU (First-Void Urine) in the quick diagnosis and adjustment of treatment in urethritis T. Martín Peñaranda* [Donostia/San Sebastian, Spain], I. De La Caba, D. Grandioso Vas, M. Gómez Ruiz De Arbulo, P. Idigoras

7075 Haemophilus influenzae parainfluenzae as triggers of urethritis in men: risk factors and characteristics of this emerging problem L. Fontan, A. Yarci Carrión, E. Navarro Lara, N. Zurita Cruz, L. Cardénoso* [Madrid, Spain], A. García

7425 Evaluation of ResistancePlus GC assay for the detection of Neisseria gonorrhoeae and markers associated with ciprofloxacin-susceptibility and resistance P. Salmerón* [Barcelona, Spain], P. García, M. Viñado, B. Romero, J. Colomina Rodríguez, O. Martínez, G. Martín-Saco, N. Sanchez Oliver, E. Alcoceba, L. Villa, A. Torreblanca, T. Pumarola-Suñé, Y. Hoyos-Mallecot, J. Serra Pladevall

7450 Resistance to azithromycin in Mycoplasma genitalium from patients of a tertiary hospital from Madrid, Spain P. García Clemente, V. Guédez López, S. Román Soto* [Madrid, Spain], J. Bernardino, E. Sendagorta, I. Quiles

7506 Antimicrobial susceptibility of Neisseria gonorrhoeae in southern Spain and co-infection with other sexually-transmitted pathogens L. Rojas, C. Gómez-Camara, A. De Salazar* [Granada, Spain], F. Ferrer, E. Serrano-Conde

7786 Fluoroquinolones and Macrolide resistance-associated mutations in Mycoplasma genitalium M. Oggioli* [Milan, Italy], S. Uceda Renteria, L. Tartaglione, C. Melchianno, M. Maddea, A. Orlandi, M. Cusini, G. Lunghi

7849 Genomic epidemiology and antimicrobial resistance surveillance of gonococci in Spain C. Francés-Cuesta* [Valencia, Spain], J. Serra, A. Fabregat-Boluyfer, B. Romero, T. Pumarola-Suñé, J. Colomina Rodriguez, J. Golán, F. Gonzalez-Candelas

7904 Mycoplasma genitalium: evaluation of macrolide resistance in a very large setting of sexually-transmitted infections A. Nava, E. Matarazzo, L. Colagrossi* [Milan, Italy], P. Carlo Federico, D. Fantino

7958 Distribution of minimum inhibitory concentration of ceftriaxone to gonococcal strains in a reference sexually-transmitted disease clinic in Madrid, Spain C. Lejarraza* [Madrid, Spain], B. Menendez, E. Tello, F. Geriz, O. Ayerdi, T. Puerta, M. Garcia, J. Ballesteros, P. Clavo, G. d’Elia, C. Rodríguez, J. Del Romero

8003 Characterisation of multidrug resistant Shigella sonnei isolated from men who have sex with men in Zagreb, Croatia J. Vranes* [Zagreb, Croatia], N. Prazic, B. Bedenic, B. Matica, G. Zarfel, I. Mareković

8081 Prevalence of resistance-associated mutations for ciprofloxacin in Neisseria gonorrhoeae and azithromycin and moxifloxacin in Mycoplasma genitalium R. Nijhuis* [Amersfoort, Netherlands], R. Duinsbergen, F. Godskałk

8114 Clonality and molecular resistance to tetracyclines of Neisseria gonorrhoeae among men who have sex with men using post-exposure prophylaxis with doxycycline B. Bercot* [Paris, France], A. Braille, D. Carrette, I. Charreau, N. Schnepf, C. Delaugerre, L. Cotte, C. Bébéar, P. Gilles, C. Capitant, R. Nijhuis, B. Roca

8271 Prevalence of resistance-associated mutations for ciprofloxacin in Neisseria gonorrhoeae and azithromycin and moxifloxacin in Mycoplasma genitalium R. Nijhuis* [Amersfoort, Netherlands], R. Duinsbergen, F. Godskałk

8300 Prevalence of resistance-associated mutations for ciprofloxacin in Neisseria gonorrhoeae and azithromycin and moxifloxacin in Mycoplasma genitalium R. Nijhuis* [Amersfoort, Netherlands], R. Duinsbergen, F. Godskałk

8505 Prevalence of resistance-associated mutations for ciprofloxacin in Neisseria gonorrhoeae and azithromycin and moxifloxacin in Mycoplasma genitalium R. Nijhuis* [Amersfoort, Netherlands], R. Duinsbergen, F. Godskałk

8523 Clonality and molecular resistance to tetracyclines of Neisseria gonorrhoeae among men who have sex with men using post-exposure prophylaxis with doxycycline B. Bercot* [Paris, France], A. Braille, D. Carrette, I. Charreau, N. Schnepf, C. Delaugerre, L. Cotte, C. Bébéar, P. Gilles, C. Capitant, R. Roffa, J. Molina

8557 Drug-resistant Neisseria gonorrhoeae and Mycoplasma genitalium identified in the private healthcare sector in South Africa L. Maduna, R. Peters, C. Kingsburgh, K. Strydom, M. Kock* [Pretoria, South Africa]
**Session accepted as Mini-oral ePoster Session**

STIs: risk factors, diagnosis and treatment across the globe

443 Prevalence and antimicrobial susceptibility of *Ureaplasma* species and *Mycoplasma hominis* in female patients in Korea: increasing trend of pristinamycin-resistant isolates
J. Lee* (Seoul, South Korea)

2858 Global prevalence estimates of syphilis among men who have sex with men: a systematic review and meta-analysis
M. Tsoubi* [London, United Kingdom], J. Evans, E. Davies, J. Rowley, T. Clayton, M. Taylor, D. Mobey, R. Chico

4178 High prevalence of azithromycin-resistant *Mycoplasma genitalium* in both urogenital and anal samples in men and women
J. Braam* [Amsterdam, Netherlands], D. Hetem, J. Brand, M. Van Roojjen, C. Vergunst, S. Kuizenga-Wessel, A. Van Dam, S. Bruisten

4347 Risk factors for *Chlamydia* and gonorrhoea infections and STI testing uptake amongst youth in Harare, Zimbabwe
K. Martin* [Brighton, United Kingdom], M. Marks, N. Buwu, E. Dauga, J. Muzangwa, I. Olaru, K. Kranzer, R. Ferrand

6004 Co-infection with *Mycoplasma* or *Ureaplasma* spp. among HIV-positive men who have sex with men in Taiwan
T. Lee* [Taipei, Taiwan], K. Lin, W. Liu, Y. Chen, H. Sun, Y. Chuang, U. Wu, S. Chang, C. Hung, P. Hsueh

6063 How long do patients with undiagnosed *Chlamydia* infection remain test positive? A lesson from the Finnish new variant of *Chlamydia trachomatis*
K. Rantakokko-Jalava* [Turku, Finland], N. Hieta, M. Havana, S. Jokiranta

6270 A retrospective analysis of ceftriaxone-resistant *Neisseria gonorrhoeae* isolated in Japan nationwide surveillance in 2013
H. Mami* [Tokyo, Japan], K. Aoki, Y. Ishii, K. Tateda

6853 Microbiology of tubo-ovarian abscess in a tertiary hospital in Spain
C. Aspichueta* [Bilbao, Spain], E. Lozano, M. Imaz Perez, F. Calvo Muro, J. Unzaga, M. Caceres, J. Diaz De Tuesta, M. Vidal-Garcia

7458 Alarming high occurrence of multidrug resistance of *Mycoplasma genitalium* in a cohort of men who have sex with men using pre-exposure prophylaxis in Belgium (Be-PreEP-ared study)
I. De Baetselier* [Antwerp, Belgium], C. Kenyon, H. Smet, V. Cuylaerts, K. Wouters, M. Laga, B. Vuylsteke, T. Crucitti

---

**Session accepted as Paper Poster Session**

The multiresistance strikes back

430 Multidrug resistant Gram-negative infections among critically ill patients: analysis of baseline characteristics and factors associated with mortality
E. Altawi* [Riyadh, Saudi Arabia], F. Aljannah, A. Almenam

1074 Mortality outcome in critically ill CRO infection patients treated with polymyxin-B and its prediction based on morbidity and mortality scores
S. Patil* [Mumbai, India], B. Jibkhate, K. Shah, K. Parikh, A. Bhattacharya, N. Shinde, S. Bhagat, H. Barkate

1486 Colistin resistance increases fatality in bloodstream infections due to carbapenem-resistant *Klebsiella pneumoniae*
I. Balkan* [Istanbul, Turkey], M. Alkan, A. Gokhan, M. Kuskucu, A. Karagoz, S. Sen, H. Yasar, M. Biçer, R. Kora Ali, B. Mete, N. Saitaglu, F. Tabak

Comparing outcomes and clinical characteristics associated with carbapenemase-producing and non-carbapenemase-producing carbapenem-resistant *Enterobacteriaceae* bacteraemia
M. Hovan* [Piscataway, United States], N. Narayanan, V. Cedarbaum, T. Bhowmick, T. Kim

A mortality prediction model for adult intensive care unit patients infected with *Klebsiella pneumoniae* in a tertiary hospital: a retrospective cohort study
T. Tran* [Antwerp, Belgium], D. Vu, H. Nguyen, T. Nguyen, N. Tran, G. Nguyen, H. Pham, D. Hong Gam, T. Trinh, S. Abrams, R. Bruyndoncks, S. Coenen

No attributable mortality due to third generation cephalosporin resistance but common risk factors for mortality in patients with infections due to *Enterobacteriaceae*
J. Wang* [Geneva, Switzerland], M. Zhou, J. Sauser, W. Zingg

Carbapenem resistance associated with outcomes of bloodstream infections caused by *Enterobacteriaceae* in Guangdong province, China
Y. Yang* [Guangzhou, China], G. Chen, Y. Yang, M. El-Sayed Ahmed, M. Lin, X. Wen, G. Tian

Clinical outcomes with the use of telavancin for methicillin-resistant *Staphylococcus aureus* bacteraemia with minimum inhibitory concentration >1 mcg/mL for vancomycin
B. Garcia, J. Gonzalez* [Piscataway, United States], Y. Kuo, S. Chaudhry

Predictors of mortality in patients with bloodstream infections caused by metallo-β-lactamases *Enterobacteriales*
M. Falcone* [Pisa, Italy], G. Tiseo, S. Barnini, C. Giordano, A. Leonardi, E. Tagliferri, S. Sani, D. Bassoulis, G. Daikos, F. Menichetti
5484 Real-world multi-centre experience of meropenem-vaborbactam in patients treated for serious Gram-negative bacterial infections

6927 Increasing rates of antimicrobial resistance in Escherichia coli and Klebsiella sp. bacteraemia are not associated with a proportional increase in mortality
A. Crawford, A. Breathnach, P. Riley* [London, United Kingdom]

7154 Outcomes and predictors of outcomes of serious infections attributable to carbapenem-resistant Gram-negative pathogens in southern European hospitals

7163 Resource utilisation associated with infections attributable to carbapenem-resistant Gram-negative pathogens in southern European hospitals

7170 Clinical characteristics and outcome of patients with plasmid-borne AmpC β-lactamase-producing Klebsiella pneumoniae bacteraemia at a tertiary medical centre
Y. Huang* [Taipei, Taiwan], S. Chou, Y. Cheng, Y. Lin

4030 How we achieved improvement in diagnosis and management of sepsis at County Durham and Darlington Foundation Trust, UK
J. Malkin* [Durham, United Kingdom], A. Robinson, L. Ward, C. Stacks, P. Latimer

4965 The external validity of an investigator-initiated randomised controlled trial comparing 7 versus 14 days for Gram-negative bacteraemia
F. Koppel* [Hajfa, Israel], E. Baum, E. Khazem, R. Nassar, A. Turjemam, D. Yahav, L. Leibovici, A. Neuberger, M. Paul

6224 The Red Flag Sepsis Screening tool and Sepsis Six. defining the New Zealand Red Flag Sepsis population and introducing the change
K. Wolland* [Hamilton, New Zealand], P. Huggan, O. Paul, R. Morell, A. Gwynne, S. Munroe, M. Neville

6417 High rate of microbiological clearance using intravenous fosfomycin combined regimes in infections caused by multidrug-resistant non-fermenting Gram-negative bacilli: clinical experience in an intensive care unit in Rome
A. D’Avino* [Roma, Italy], S. Mazzocchetti, E. Piacicioni, D. Menghetti, A. Schiattarella, D. Grande, P. Dionisi, A. Mastromatteo

7555 Improved prediction of mortality in sepsis using peripheral capillary oxygen saturation to estimate the respiratory dysfunction score: a cohort study
J. Karlsson Valik* [Stockholm, Sweden], L. Ward, A. Henriksson, H. Dalianis, K. Stralin, P. Naucular

9323 Impact of out-of-hours results and infection specialist intervention on the time to the first appropriate antimicrobial therapy in patients with Gram-negative bacteraemia: the South London CLAHRC cohort experience
C. Suarez* [London, United Kingdom], E. Vitale, E. Galiza, S. Mathur, D. Jeyarathnam, S. Goldenberg, J. Edgeworth, T. Planche

1831 Detection of rifampin and isoniazid resistance using molecular testing to initiate an ethambutol-free 3-drug regimen in pulmonary tuberculosis: a French non-inferiority multi-centre randomised clinical trial

2027 Systematic validation of blood transcriptional biomarkers for active pulmonary tuberculosis in a high-burden setting: a prospective diagnostic accuracy study

Abstract Categories 2020

Are large cities at higher risk for tuberculosis drug resistance? A French appraisal
S. Chiesi* [Brescia, Italy], L. Guglielmetti, M. Bachir, A. Aubry, N. Veziiris, N. Lemaître, J. Robert

Telehealth use in tuberculosis: results from a systematic review and focus group interviews in six countries worldwide
M. Ioana* [Groningen, Netherlands], D. Akkerman, C. Louka, Y. Stienstra, J. Alffenaar

Therapy directly observed by video for the supervision of tuberculosis treatment: experience in a series of patients from Cali, Colombia, 2019
M. Tello-Cajiao, J. Garcia-Goez, N. Romero-Rosas, S. Ardila-Giraldo* [Cali, Colombia], J. Mosquera-Hernández, L. Parra-Lara

Quality of life and its determinants among pulmonary tuberculosis patients taking direct observation therapy in Kabul, Afghanistan
A. Azizi* [Kabul, Afghanistan], K. Hashemi

Drugs repurposing: in vitro testing of licensed drugs to assess role against MDR/XDR-TB
X. Gonzalo* [London, United Kingdom], F. Drabniowski

A model-based analysis identifies differences in phenotypic resistance between in vitro and in vivo: implications for translational medicine within tuberculosis
D. Clewe, A. Faraj* [Uppsala, Sweden], Y. Hu, A. Coates, U. Simonsson

Graphene oxide-linezolid combination as potential new anti-TB treatment
F. De Maio* [Rome, Italy], V. Palmieri, A. Salustri, G. Perini, I. Palucci, M. Sali, M. Sanguinetti, M. De Spirito, G. Delogu, M. Pap

Management of MDR-TB cases: roadmap towards TB elimination in Italy
V. Marchese* [Brescia, Italy], B. Formenti, G. Sotgiu, G. Pinsi, A. Mateuelli

Pharmacokinetic/pharmacodynamic informed assessment of pyrazinamide phenotypic resistance testing and pncA sequencing in multidrug-resistant tuberculosis

Evaluation of efflux pump inhibitor combination with fluoroquinolones and aminoglycosides in resistant clinical isolates of Mycobacterium tuberculosis
F. Pavan* [Araraquara, Brazil], C. Maringola, J. Grecco, D. Bellato

Development and validation of a questionnaire to explore tuberculosis knowledge, attitudes and practices in foreign-born subjects from high tuberculosis-incidence countries
M. Di Nuzzo, G. Valpiani, C. Marotti, E. Biagi, L. Massoli, M. Maritati, A. Grilli, A. Gallerani, N. Barp, C. Contini* [Ferrara, Italy]

The real-life impact of the Xpert MTB/RIF Ultra assay on the diagnosis of tuberculosis in a hospital in central Israel
O. Schwartz, O. Yosseppowitch, Y. Maor* [Holon, Israel]

A study to determine the frequency of QT interval prolongation in people treated with bedaquiline for drug-resistant tuberculosis
S. Israïls* [London, United Kingdom], J. Millard, K. Bailesy, E. Ngam, J. Der, A. Grant

Designing a feasible, locally-appropriate socioeconomic intervention for TB-affected households in Nepal: a mixed-methods study

Session accepted as Paper Poster Session

Uncommon pathogens: the ancient and contemporary

Meliodosis in French Guiana: Cases with a clinical isolate of Burkholderia sp., Cayenne, 2012 – 2018
Y. Lambert* [Cayenne, French Guiana], V. Sainte-Rose, C. Leborgne, B. Moreau, M. Demar

First case of Gemmiger formicilis bacteraemia identified using partial 16S rRNA gene sequencing
S. Tan* [Singapore, Singapore], I. Wee, Y. Coo, N. Abdul Rohman, A. Tan, K. Ko

First report of blaNDM-1 and blaOXA-181 harbouring P. vermicola from Nepal
K. Haque* [Narita, Japan], T. Matsumoto, T. Sekizuka, M. Kuroda, R. Sah

Genomic characterisation of Kersteria gyiorum, an isolate from a patient with acute otitis media
A. Kruglov, V. Gostev* [Saint Petersburg, Russian Federation], D. Likhaletova, O. Generalova, S. Sidorenko

Understanding the molecular history of an ancient Pseudomonas species isolated from a pharaonic Egyptian mummy: a genomic tale from the 11th dynasty of the middle kingdom
M. El-Sayed Ahmed* [Guangzhou, China], Y. Yang, C. Shen, X. Wen, Y. Yang, G. Tan

A novel pathogenic bacteria Scardovia wiggiae involved in early childhood caries: ultrastructural characterisation of biofilm by an original scanning electron microscopy protocol
G. Vrenna, R. Papa, M. Artini, G. Familiari, P. Spigaglia, F. Barbariti, A. Salucci, G. Di Giorgio, M. Bossu, M. Relucenti, A. Polimeni, L. Selan* [Rome, Italy]

Persistence of Tropheryma whippelii colonisation: a longitudinal study in Italy
A. Beltrame, L. Moro, G. Zavarise, G. Castagna, C. Piubelli, A. Ragusa, F. Formenti, F. Perandin, R. Silva, Z. Bisoffi* [Negrar, Italy]

A case of sepsis from a novel pathogen: Haematospiroplum jordaniae
P. Annamaraju, S. Wade, B. Varatharaj Palraj* [Rochester, United States]
3833 *Actinobacterium schaalii* bacteremia: a ten-year retrospective analysis in a tertiary hospital in Madrid, Spain
A. Rojas* [Madrid, Spain], L. Arrayo Pedrero, C. Sanchez-Carrillo, L. Alcalo, P. Muñoz

3891 *Actinomycosis*: a case series of 10 patients from an infectious diseases department
J. Coldas, R. Filipe, J. Nuak, C. Piñeira, C. Abreu, N. Rocha-Pereira* [Porto, Portugal], A. Silva-Pinto, A. Sarmento

Session accepted as Paper Poster Session

**UTI Dx and Rx**

954 Individualised autovaccination is a promising strategy for managing recurrent urinary tract infections in women
E. Esteve-Palau, E. Martinez Franco, A. Gonzalez-Cuevas, A. Capella, E. Moreno, M. Alvarez, M. Garro, M. Carreras, M. Cespedes, D. Cuadras, V. Diaz-Brito Fernande* [Sant Boi, Spain]

1439 Risk factors for hospital readmission following complicated urinary tract infection: a multinational, retrospective cohort study

1706 Extended spectrum beta-lactamase producing *Enterobacteriaceae* urinary tract infections: is cefoxitin an effective therapy?
W. El Nekidy* [Abu Dhabi, United Arab Emirates], M. Abdelsalam, A. Nusair, R. Dajani, R. El Lababidi, I. Ghazi

2167 Sensitivity of C-reactive protein and procalcitonin to diagnose urinary tract infections in nursing home residents
S. Kull* [Amsterdam, Netherlands], S. Hidad, J. Fischer, J. Harting, C. Hertogh, J. Prins, F. Van Leth, M. De Jong, C. Schneebberger

2362 Acute cystitis symptom score questionnaire for patient-reported outcome measure in female patients with acute uncomplicated cystitis: clinical validation as part of a phase III trial comparing antibiotic versus non-antibiotic therapy
J. Alidjanov, A. Overesch, D. Abramov-Sammariva, M. Höller, H. Steindl, F. Wagenlehner, K. Naber* [Straubing, Germany]

3187 Efficiency of antibiotic prophylaxis in recurrence of UTI among kidney transplant recipients
F. Runyo* [Paris, France], O. Aubert, P. Parize, H. Lecuyer, L. Amrouche, R. Sberro Soussan, C. Legendre, C. Charlier, A. Scemla

3191 Urinary tract infections in nursing homes in the era of multidrug resistance: a 4-year study
E. Riquelme-Bravo* [Albacete, Spain], L. Robles Fonseca, C. Sáinz De Baranda Camino, J. Porra Martínez, V. Solves Ferriz

3617 Presentation, treatment and natural course of severe symptoms of urinary tract infections measured by a smartphone app
A. Vellinga, K. Farrell* [Galway City, Ireland]

3710 *French Urinary Tract Infections in Healthcare Facilities (FURTIFH)*: an historic cohort
L. Grammatico-Guillon* [Tours, France], S. De Lafforest, A. Magnier, F. Saint, F. Bruyere

4171 Usefulness of escalation therapy in urinary tract infection caused by extended beta-lactamase-producing *Escherichia coli* with bacteremia
T. Shindo* [Kobe, Japan], H. Nishioka

4230 Acute bacterial prostatitis due to *Escherichia coli*: clinical characteristics and outcomes in patients treated with or without β-lactam antibiotics: a cohort study
L. Gisbert* [Barcelona, Spain], H. Monzon, B. Dietl, T. Moreno-López, L. Baix-Palap, M. Xercovins Valls, E. Calbo Sebastian

4279 Epidemiology and clinical characteristics of upper urinary tract infections in infectious diseases emergency department of a tertiary teaching hospital in Slovenia
K. Nadrah* [Ljubljana, Slovenia], M. Logar

4437 High utility of Gram-stain of urine specimens for guiding empiric clinical management of pyelonephritis
K. Oh* [Kobe, Japan], K. Egami, C. Nishio, H. Goshima, H. Kanishi

4474 Urinary tract infection caused by *Enterococcus* spp.: risk factors and mortality

4474 Phenotypic and genotypic comparison between *Escherichia coli* isolates causing recurrent and sporadic cystitis
V. Nicolas* [Rouen, France], S. Dabyot, M. Leaz, F. Caron, F. Grovey, S. Le Hella, R. Fabre, K. Alexandre, M. Pestel-Caron

4631 Methenamine: an audit of its use for recurrent UTIs in a large UK trust
N. Mcconn* [London, United Kingdom], M. Arias, N. Sweeney, P. Pansesar, M. Pakzad, S. Logan

4631 *In vitro* susceptibility of fosfomycin in *Aerococcus* spp. isolated from urine samples
I. Angulo López* [Durango, Spain], E. Ugalde Zarraga, J. Aragón-Díez, D. Fernández-Vecilla, L. Lasa Epelde, J. Díaz De Tuesta

4742 Differentiation of phenotypic and genotypic characteristics of uropathogenic *Escherichia coli* isolates in acute and recurrent phases of urinary tract infection
M. Pooya* [Tehran, Iran], M. Saleh, A. Abd, H. Mazaheri, E. Khosravi, A. Abdollahi, S. Bouzari, M. Mardani Dashti
Heroes and villains: the dynamics of antibiotic-uropathogens interactions during recurrent urinary tract infections management
M. Vallée* (Poitiers, France), P. Aldridge, A. Mz Tan, C. Mowbray, C. Walton, C. Harding, J. Hall

Prevalence of fosfomycin resistance among Escherichia coli and Enterococcus faecalis isolates causing urinary tract infection in 34 care units in Brazil
I. Van Der Heijden* [São Paulo, Brazil], A. Natario, C. Rodrigues, R. Beltrame, F. Fonseca, S. Figueiredo Costa

Clinical effectiveness of temocillin in a French university hospital
E. d’huart, F. Meyer, B. Demoré, A. Charmillon*
[Vandoeuvre lès Nancy, France]

Prevalence of ST131 in community-acquired Escherichia coli urinary tract infections in Gauteng, South Africa
K. Hoog, J. Pitout, E. Hoosien, M. Ehlers, M. Kock*
[ Pretoria, South Africa]

Bacteriological profile of urinary tract infection in a rural area in Uganda
F. Carrasco* [Madrid, Spain], J. Cuadros, D. Roca, M. Górgolas, R. Perez Tanoira

Identification, genotyping and antimicrobial susceptibility testing of Brucella spp. isolated from livestock in Egypt
A. Zóka* [Budapest, Hungary], M. Gónčzi, V. Babrai, R. Nikolova, E. Ujhelyi, Z. Kienle, G. Bekő

Spatiotemporal mapping of Bartonella bacilliformis in Peru and qualitative analysis of local perceptions and understanding of the disease
N. Kokkinos* [London, United Kingdom], D. Moore, C. Munayco Escate, C. Augusto Ugarte Gil

Leptospirosis registry: LeptoScope. A novel global registry for emerging leptospirosis infections
F. Köhler* [Cologne, Germany], M. Späth, J. Hoyer-Allo, D. Cornely, F. Schaefer, R. Müller, V. Burst

Neurological manifestations of rickettsiosis
F. Hammami, K. Makram, A. Zayni, K. Reik, F. Smaoui, E. Elleuch, C. Marrakchi, M. Ben Jemaa* [Sfax, Tunisia]

Clinical features of acute Q fever in Réunion Island: a retrospective cohort study
A. Aubin, C. Eldin* [Marseille, France], E. Braunberger, J. Jaubert, Y. Kouram, M. Moïton, P. Poubée, N. Zemali, P. Gerardin, A. Bertolotti

Lyme neuroborreliosis epidemiology in Denmark, 1996 to 2015
M. Tetens* [Copenhagen, Denmark], R. Haahr, R. Dessau, K. Kragfelt, J. Badilsen, N. Skaarup Andersen, J. Kjelseth Møller, C. Roed, C. Christiansen, S. Ellermann-Eriksen, J. Bangsborg, K. Hansen, T. Benfield, C. Østergaard, N. Obel, L. Omland, and A. Lebech

Serox levels of neutrophil elastase-associated lipocalin in acute brucellosis and brucellar spondylodiscitis
S. Sumer, N. Aktug Demir, L. Demir, D. Fındık, S. Kolgelier, O. Ural* [Konya, Turkey]

Coxiella burnetii DNA in cheeses and bulk milk samples of sheep and goats in Puglia and Basilicata, Italy
M. Basanisi, D. Rale, M. Caffiero, G. La Bella, G. Nobili, R. Sottili, S. Tola, G. La Salandra* [Foggia, Italy]

Serodiagnostic testing for Lyme borreliosis: should we believe what we see?
A. Zóka* [Budapest, Hungary], M. Gónčzi, V. Babrai, R. Nikolova, E. Ujhelyi, Z. Kienle, G. Bekő
7331 Limited value of fluorescence in situ hybridization for the detection of Coxiella burnetii in tissue samples of patients with chronic Q fever
S. Buijs* [Utrecht, Netherlands], T. Jensen, M. Hermans, M. Baye, P. Nooijen, A. Hoepelman, C. Bleeker-Rovers, J. Oosterheert, P. Wever

8413 Sero-prevalence and risk factors of brucellosis among suspected febrile patients attending a referral hospital in southern Saudi Arabia (2014-2018)
A. Alkahtani* [Abha, Saudi Arabia], M. Assiry, H. Chandramoorthy, A. Al-Hakami, M. Hamid

Rickettsiosis in southern Tunisia: serodiagnosis, epidemiology and severe cases
G. Olfa, N. Ben Ayed, A. Chtourou, B. Mnif, S. Mezghani, F. Rhimi, H. Karray-Hakim, A. Hammami* [Sfax, Tunisia]

Childhood brucellosis: characteristics and outcomes in a sample from an endemic country

Cat scratch disease in children and adults: what a difference?
C. Le Brun* [Tours, France], A. Lemoignen, A. Pastuszka, P. Lanotte, L. Mereghetti, Z. Maakaroun Vermesse

Rickettsiosis: a series of 80 cases
F. Larbi, M. Ben Azaiez* [Monastir, Tunisia], J. Chelli, S. Arfa, O. Berriche, M. Sfar

Study on Bartonella related to small mammals in the Canary Islands, Spain

Clinical profile and associated comorbidities to predict outcomes in patients with scrub typhus with acute kidney injury: a study from Central India
D. Jeswani* [Nagpur, India], B. Jeswani
Abstract Programme

3. Bacterial susceptibility & resistance

- Resistance surveillance & epidemiology: MRSA, VRE & other Gram-positives
- Resistance surveillance & epidemiology: Gram-negatives
- Susceptibility testing methods (incl assay validation and comparative studies, excl TB)
- Resistance mechanisms (excl TB)
- Resistance detection / prediction approaches (rapid and/or molecular assays, resistome analysis, inference methods)
- Other
Evolutionary insights into carbapenem-resistant and sensitive Acinetobacter baumannii isolates from India
K. Bansal* [Chandigarh, India], P. Patil, T. Saroha, A. Kaur, S. Kumar, S. Kaur, V. Gautam, P. Patil

Phenotypic and molecular characterisations of carbapenem-resistant Acinetobacter baumannii isolates collected within the EURECA study
T. Kostyanev* [Witriek, Belgium], B. Xavier, M. Garcia-Castillo, C. Lammens, J. Bravo-Ferrer Acosta, J. Rodriguez-Baraño, R. Canton Moreno, H. Goossens

Carbenepen-resistant Acinetobacter baumannii and its genotypic profile in a tertiary hospital South Sulawesi, Indonesia
R. Sjahrii* [Makassar, Indonesia], L. Tenriesa, A. Sultan, M. Muhammad, F. Hamid

Molecular characterisation of blaNDM-1 from an Acinetobacter baumannii outbreak in a German university hospital
K. Xanthopoulou* [Cologne, Germany], J. Wille, J. Zweigner, K. Lucassen, H. Seifert, P. Higgins

First outbreak of colistin-resistant OXA-23/NDM-1-producing Acinetobacter baumannii [France, 2019]
G. Mitgen, M. Bour, P. Triponney, O. Belmonte Garcia, M. Jaffar Bandjee, N. Lugagne, P. Plesiat* [Besancon, France], A. Patron

Investigating the contribution of the RND-type efflux pump AdeABC in tolerance to chlorhexidine digluconate in Acinetobacter baumannii ATCC 19606
C. Meyer* [Cologne, Germany], K. Lucassen, K. Xanthopoulou, T. Wille, H. Seifert, P. Higgins

Colistin hetero-resistance in Acinetobacter baumannii blood isolates
E. Kerbaj* [Ankara, Turkey], Ü. Liste, C. Özkuyumcu, B. Sancak

Antibiotic resistance and efflux pump inhibitor effect in Acinetobacter baumannii strains isolated from Cajamarca, Peru
I. Pena Tuesta, W. Silva Casa, N. Lopez-Chegne, M. Aguilar Luis, H. Carrillo-Ng, J. Bazan-Mayra, V. Zavaleta Gavidia, S. Blitchtein* [Lima, Peru], J. Del Valle-Mendoza

Multidrug-resistant A. baumannii beyond colistin era: in vitro synergy of ceftazidime/avibactam in combination with antibiotics
H. Moraitou* [Athens, Greece], V. Perdios, M. Makarana, A. Mavrommatis, K. Pontikis, S. Triantafyllou, M. Voutou, T. Kioussi, S. Karabela

Sublactam and colistin susceptibility pattern among multidrug-resistant Acinetobacter baumannii isolates from respiratory samples
M. Sengupta, S. Banerjee, N. Nagi* [New Delhi, India]

Characterising outer membrane permeability for β-lactam antibiotics in Acinetobacter baumannii strain HUMC1
Session accepted as Paper Poster Session

AMR surveillance: from data to methods

1040 Trends in resistance of bloodstream infection pathogens in Northwest Russia from 2015 to 2018

1448 Antimicrobial susceptibility of bacteria isolated from patients with pneumonia in Brazil, Argentina, and Mexico: results from the SENTRY programme in Latin America (2015-2018)
A. Gales* [São Paulo, Brazil], A. Streling, C. Silva Nodari, T. Rezende, C. Carvalhaes, H. Sader

1632 In vitro activity of tigecycline and comparator agents against Gram-negative and Gram-positive isolates from China in 2018
J. Karlowsky, M. Hackel* [Schaumburg, United States], S. Bouchillon, M. Dowzicky, D. Sahm

2674 Antimicrobial resistance monitoring through the ATLAS global surveillance programme 2004-2018
M. Hackel* [Schaumburg, United States], S. Bouchillon, M. Dowzicky, D. Sahm

3449 In vitro activity of fosfomycin against Escherichia coli and Klebsiella pneumoniae isolates recovered from bloodstream infections (2017-2018)

3517 Trends of emerging multidrug-resistant nosocomial strains and development of antimicrobial resistance in the years 2007 - 2018

3677 Antimicrobial susceptibility and resistance determinants in Enterobacteriaceae and Staphylococcus aureus among febrile patients hospitalised in the African region

3890 Use of a hospital-cumulative antibiogram to guide empirical antibiotics in Gram-negative bloodstream infections
C. Richardson* [London, United Kingdom], D. Mack

4234 Susceptibility of Gram-positive and Enterobacteriales clinical isolates isolated during 2018 from France, Germany, Italy, Spain and the United Kingdom
S. Hawser* [Monthey, Switzerland], I. Morrissey, N. Kothari, N. Redder

4462 Are resistance rates among bloodstream isolates a good proxy for other infections: analysis from the BSAC resistance surveillance programme
C. Horner* [Birmingham, United Kingdom], S. Mushtaq, D. Livermore

4795 Comparable resistance levels between regional networks in the Netherlands
W. Altorf - Van Der Kuij* [Bilthoven, Netherlands], A. Schoffenen, D. Melles, S. De Greeff

First paediatric antimicrobial resistance surveillance network, including community and healthcare settings, carried out by 13 hospitals in Catalonia (Spain)
M. Gimenez* [Badalona, Spain], M. Monsonis, N. Larrosa, P. Perez, A. Rivera, F. Gomez, A. Bernet, G. Trujillo, E. Clapes, J. Llaberia, M. Perez, C. Martí, R. Rubio Casino, V. Pineda

Prevalence and antibiotic resistance of ESKAPE pathogens isolated in the emergency department of a tertiary care teaching hospital in Hungary: a 5-year retrospective survey
R. Benko, M. Gajdacs* [Szeged, Hungary], M. Metuz, G. Soós, L. Andrea, E. Hujdú, P. Hanner, Z. Peto

Results from the 2019 antimicrobial susceptibility testing External Quality Assessment (EQA) exercise organised for EARS-Net participants
E. Fagan* [London, United Kingdom], S. Seaton, P. Shah, N. Bunkock, S. Bi, P. Chadwick

In vitro activity of commonly used antimicrobial agents against clinical Gram-negative bacterial isolates from ATLAS Indian centres in 2018
P. Hsueh* [Taipei, Taiwan]

Emerging piperacillin-tazobactam resistance in Indian hospital settings
M. Jayaprakasham* [New Delhi, India], K. Walia
Antibiotic resistance pattern and prevalence in occupied Palestinian territories (oPt): evidence for guiding empiric antibiotic therapy

Analysis of chloramphenicol susceptibility in metallo-beta-lactamase producing Enterobacteriales
A. Tuohy, N. Delapole, E. Mcgrath, W. Brennan, M. Maguire, M. Cormican* [Dranmore, Ireland]

Pan-bacterial cumulative antibiograms
A. Luzzati, M. Mary, J. Shapiro, G. Lina, F. Laurent, F. Vandenesch, D. Dauwalder, J. Rasigade* (Lyon, France)

Antimicrobial stewardship starts at home: in-house developed digital tool for real-time resistance surveillance
M. Gonzalez Sanz* [London, United Kingdom], N. Marshall, A. Claxton, K. Woods

Antibiotic resistance profile of ESKAPE pathogens in Limpopo, South Africa: A two-year retrospective analysis
M. Lekalakala* [Bendor, Polokwane, South Africa]

Dissemination of tet[(X4)]-positive Escherichia coli on duck farms in south-east China
Y. Yu* [Guangzhou, China], C. Cui, X. Kuang, C. Chen, X. Liao, J. Sun, Y. Liu

Epidemiology and antimicrobial resistance of methicillin-resistant Staphylococcus aureus isolates colonising pigs with different exposure to antibiotics
E. Lopes, T. Conceição, L. Poirel, H. De Lencastre, M. Aires de Sousa* [Lisbon, Portugal]

Comparison of the distribution of quinolone resistance markers in Escherichia coli in a human-animal health interface model
J. Silva-Sanchez* [Morelos, Mexico], G. Sanchez, C. Alpuce-Aranda, E. Tamayo, V. Gonzalez, U. Garza-Ramos, H. Barrios, D. Arellano

Triangulating the molecular epidemiology of carbapenem-resistant Enterobacteriales in humans,
food-producing animals and the environment in a One Health context
Y. Ramsamy* [Durban, South Africa], K. Misana, D. Gyanfi Amoako, M. Alham, A. Ismail, A. Luther King, R. Singh, S. Essack

Carriage of ESBL-producing Gram-negative bacteria by households captured in hospital and suburban surroundings in Ethiopia differs greatly

Global increase in antibiotic-resistant Escherichia coli in food-animal: a genomic public data approach
J. Pires* [Zurich, Switzerland], J. Huisman, S. Bonhoeffer, T. Van Boeckel

Nasal carriage of livestock-associated Staphylococcus aureus in Poland
A. Mrczkowska* [Warsaw, Poland], N. Marszałek, M. Orczykowska-Katyna, T. Tomczak, M. Brzozowska, J. Zmudzki, A. Skoczyńska, J. Empel

High-level AmpC beta-lactamase-producing Escherichia coli and Klebsiella pneumoniae in Dutch hospitals and livestock farms: results from the i-4-1-1-Health project
E. Den Drijver* [Breda, Netherlands], M. Kluytmans - Van Den Bergh, B. Diederen, S. Pas, J. Stohr, F. Velkers, J. Verhulst, J. Verweij, A. Stegeman, J. Kluytmans

Evaluation and monitoring of the prevalence of ESBL-producing Escherichia coli: result from the 1st year of Tricycle Project in Madagascar

Screening of bovine and human bacterial strains by diagnostic assays for detection of beta-lactamases
F. Cawez, F. Mercuri, M. Vandevenne, V. Guérin, D. Thiry, J. Moinil, M. Saulmont, F. Bogaerts, M. Galleni* [Liège, Belgium]

Metagenomic insights into the dynamics and transmission of resistance genes in poultry and human beings
Q. Luo* [Hangzhou, China], H. Fu, Y. Xiao

Global dissemination of multidrug-resistant E. coli co-expressing ESBL/pAmpC and mcr-1 genes in chicken farms in Lebanon
M. Mikhael* [Beirut, Lebanon], S. Leclercq, B. Doublet, D. Karam Sarkis

Comparative epidemiological study of MRSA in lactating animals, dairy products, environment and personnel of dairy processing facilities in Northern Greece
P. Papadopoulos, T. Papadopoulos* [Thessaloniki, Greece], A. Angelidis, C. Kottzamanidis, G. Filioussis, A. Zdogas, A. Papa, D. Sergelidis

Transmission of Tn1721-like transposon harbouring CTX-M-2? between Salmonella and Escherichia coli isolates from food-producing animals in China
Q. Zhao, Y. Zhang, Y. Lu, R. Cai, H. Jiang* [Guangzhou, China]

Limited genetic diversity of blaCMY-2-containing Incl1-ST12 plasmids from Enterobacteriaceae of diverse human and bovine origin in the Netherlands
E. Den Drijver* [Breda, Netherlands], J. Stohr, J. Verweij, C. Verhulst, F. Velkers, A. Stegeman, M. Kluytmans - Van Den Bergh, J. Kluytmans

Rural and urban dogs as a source of ESBL-producing Enterobacteriaceae in northwest Spain
Lamb meat as a source of dissemination of cephalexin-resistant \textit{Escherichia coli}

K. Gazi, L. Deus Aude, L. Kalir Pradela* (Sao Jose do Rio Preto, Brazil), M. Barrosa, C. Silva, M. Nogueira, T. Casella

Emergence of \textit{mcr}-1 among diverse multidrug-resistant \textit{Escherichia coli} in gulls from a coastal city uncoverts potentially underestimated transmission routes

\textbf{ESBL- and p\textsuperscript{AmpC}-producing \textit{Escherichia coli}} in imported broiler breeding birds for the Swedish broiler production

S. Börjesson* (Uppsala, Sweden), O. Nilsson, A. Landén, C. Greko, B. Bengtsson

\textbf{CREATE:Carbapenem-Resistant Enterobacteriaceae: Animal Testing and Epidemiology. A plan for veterinary medicine}

S. Cole, D. Oakley, S. Rankin* (Philadelphia, United States)

Complete genome sequencing of extended-spectrum \textit{beta-lactamase-} (ESBL) producing \textit{Escherichia coli} isolated from dairy cattle in Japan

H. Kudo* (Saitama, Japan), M. Usui, K. Oka, M. Takahashi, Y. Tamura

\textbf{Co-occurrence of \textit{mcr} and \textit{bla}CTX-M genes in \textit{Escherichia coli} from healthy pigs and humans in Thailand}

\textbf{Investigating the prevalence of ESBL-producing \textit{Escherichia coli} in rooks (\textit{Corvus frugilegus}) wintering in an urban area and comparing these isolates to contemporary human faecal and clinical isolates}

J. Nagy* (Debrecen, Hungary), B. Balázs, I. Damjanova, A. Toth, P. Gyüre, L. Kövér, G. Kardos

\textbf{Characterisation of a cfr gene variant in multidrug-resistant (MDR) livestock-associated methicillin-resistant \textit{Staphylococcus aureus} (LA-MRSA), isolated from Italian pig herds}

E. Diaconu* (Rome, Italy), P. Alba, M. Iurescia, V. Carfora, A. Caprioli, A. Franca, A. Battisti

\textbf{Manipulation of raw pig meat is a risk for transmission of carbapenem-resistant \textit{Pseudomonas fluorescens} to humans in the community}

M. Camoez* (Oeiras, Portugal), A. Botelho, O. Bouchami, H. Fernandes, N. Faria, D. Lawal, M. Fraqueza, M. Miragaia

\textbf{Genome analysis of \textit{mecC}-harbouring meticillin-resistant \textit{Staphylococcus aureus} and meticillin-sensitive \textit{Staphylococcus aureus} CC130 strains from different origins}

\textbf{Use of short- and long-read sequencing for the identification of antimicrobial resistance genes from pig oral fluid samples}

L. Schuele* (Boeblingen, Germany), G. Fleres, K. Strutzberg-Minder, C. Erdmann, C. Lambrecht, J. Hanlizius, S. Schütze, S. Löbert, N. Couta, J. Rossen

\textbf{Genomic characterisation of CTX-M-15/DHA-1/OXA-48-producing \textit{Klebsiella pneumoniae} of ST15/ST11/ST307 lineages from companion animals in France}

R. Garcia Sierra* (Lyon, France), A. Drapeau, M. Dazas, E. Saras, E. Hirchoud, C. Parada Rodrigues, S. Brisse, J. Madec, M. Haenni

\textbf{Co-existence of \textit{bla}NDM- and \textit{mcr}-1-producing \textit{Escherichia coli} isolated from human, poultry and environment water from Pakistan: a One Health problem}

M. Qamar* (Faisalabad, Pakistan), M. Rizwan, I. Bashiri, M. Rasool, S. Kariuki, G. Palmer

\textbf{Broiler farms and carcasses are an important source for dissemination of ESBL/mcr-1-producing \textit{Escherichia coli} in Ecuador}

\textbf{CTX-M-1/14/15/22-producing \textit{Escherichia coli and CTX-M-15/OXA-48-producing \textit{Klebsiella pneumoniae} from Mediterranean clams \textit{Ruditapes decussatus} at retail in Tunisia}

W. Mansour, Y. Mani, R. Grami, E. Saras, O. Bouallègue, M. Haenni* (Lyon, France), J. Madec

\textbf{Genetic relatedness, antimicrobial resistance, virulence and biofilm-forming abilities of \textit{Klebsiella pneumoniae} from healthy broilers and turkeys}

F. Franklin* (Oslo, Norway), M. Hetland, R. Bakksjø, L. Nesse, I. Lühr, A. Telke, M. Sunde

\textbf{\textit{bla}CTX-M-55/mcr-1/\textit{IncHI2 plasmids in \textit{Escherichia coli} from foodstuffs in Tunisia}

R. Grami, W. Mansour, C. Pierre, M. Dazas, A. Bouazizi, O. Bouallègue, R. Mzoughi, M. Haenni* (Lyon, France), J. Madec

\textbf{Extended-spectrum \textit{beta-lactamase in \textit{Escherichia coli} and \textit{Klebsiella pneumoniae} of chicken meat in butchers in Algeria, with detection of ESBL-CTX-M-55 and \textit{E. coli-B2/ST131}}

C. Safia, I. Carvalho, C. Redha Messai, Y. Titouche, A. Zitouni, A. Hakem, C. Torres* (Logroño, Spain)

Feedlot lambs, carcasses and nearby animals are implicated in the transmission of cephalexin-resistant \textit{Escherichia coli}

C. Silva, M. Barroso, K. Gozi, J. Froes, L. Kalir Pradela, J. Peiró, L. Nogueira Mendes, M. Nogueira, T. Casella* (Sao Jose do Rio Preto, Brazil)

\textbf{Phenotypic and genomic diversity of bacterial isolates from humans and healthy pigs in Thailand}

Antimicrobial resistance of Escherichia coli strains isolated from frugivorous (Eidolon hervum) and insectivorous (Nycteris hispida) bats in Southeast Nigeria, with detection of CTX-M-15-producing isolates
L. Obodochi, I. Carvalho, C. Safia, J. Nwanta, C. Kennedy, C. Torres* [Lagarto, Spain]

Genetic antimicrobial resistance determinants found in Escherichia coli and other environmental microorganisms isolated from raw vegetables expended in Ibarra, Ecuador
A. Plasencia, A. Pinto, S. Salazar, V. Olmedo, P. Barba* [Ibarra, Ecuador]

Presence of carbapenem- and colistin-resistant Gram-negative bacteria in illegally imported foods to Europe
D. Rodriguez-Lozaro, L. Casado, J. Santamaría, E. Pontille, R. Rodríguez-Pollan, M. Hernandez, I. Fernández-Natal* [León, Spain]

Screening and characterisation of multidrug-resistant Enterobacteriaceae in healthy companion animals in close contact with humans
J. Menezes* [Lisbon, Portugal], A. Belas, I. Cunha E Silva, P. Pinto Silva, M. Pomba

Multi-resistant Escherichia coli in long-distance migratory birds: how greylag geese (Anser anser) and pink-footed geese (Anser brachyrhynchus) can act as vectors for antimicrobial resistance
H. Mjelde* [Oslo, Norway], H. Kalibekken, T. Leangpichart, H. Sarum, C. Das Neves, M. Sunde

Deciphering resistome and virulome of Gram-negative bacteria isolated from farmed fish and molluscs
M. Riveros Ramirez, M. Pinedo Bardales* [Lima, Peru], G. Mitchell, E. Dyakova, K. Elena, N. Dmitrieva

Unexpected low antibiotic resistance of Klebsiella spp. isolated from childrens’ faeces, water samples, soil and animals from Andean rural homes in Cajamarca, Peru
M. Riveros Ramirez, M. Pinedo Bardales* [Lima, Peru], R. Alosilla, M. Medina Pizzali, D. Mausezahl, T. Ochoa

Deciphering the biochemical features of PDC-315, a ceftolozane-hydrolyzing Pseudomonas-derived cephalosporinase selected in vivo
J. Arca Suárez* [Cádiz, Spain], J. Vazquez-Ucha, P. Fraile Ribot, G. Cabot, C. Lasarte, M. Rodriguez-Iglesias, F. Galan-Sanchez, A. Beceira, A. Oliver, G. Bou Arevalo

In vivo acquisition of oxacillinase-mediated resistance to ceftolozane/tazobactam and ceftazidime/avibactam in Pseudomonas aeruginosa
J. Arca Suárez* [Cádiz, Spain], C. Lasarte, J. Vazquez-Ucha, I. Guerrero Lozano, M. Rodriguez-Iglesias, F. Galan-Sanchez, A. Beceira, G. Bou Arevalo

Evolution and adaptation of Pseudomonas aeruginosa in biofilms exposed to ciprofloxacin: beyond the resistance to antibiotic
M. Ahmed, A. Abdelsamad, T. Wassermann, A. Porse, J. Becker, M. Sommer, N. Haiby, O. Ciufu* [Copenhagen, Denmark]

Genomic analysis of VIM-2-conjugating megaplasmids in Pseudomonas spp. spread interregionally in Poland
P. Urbanowicz* [Warsaw, Poland], R. Izdebski, A. Baraniak, I. Bitar, J. Hrabak, D. Žabicka, W. Hryniewicz, M. Gniadkowski

Analysis of resistance mechanism affecting ceftolozane/tazobactam in Pseudomonas aeruginosa isolates using whole genome sequencing (STEP Study)

Predominant mechanisms of carbapenem resistance in Pseudomonas aeruginosa and Klebsiella pneumoniae and tools for their detection
P. Tirimba* [Moscow, Russian Federation], N. Bagirova, V. Aginova, I. Tereshchenko, Z. Grigoryevskaya, S. Dyakova, K. Elena, N. Dimitrieva

Interspecific transfer of a blaVIM-2-containing plasmid between Pseudomonas spp. during a nosocomial outbreak
J. Pirzadian* [Rotterdam, Netherlands], N. Streps, A. Heikema, W. Zandijk, H. Koene, W. Goessens, M. Vos, C. Kloassen, J. Severin

CrrP-like fluoroquinolone-modifying enzymes among Pseudomonas aeruginosa clinical isolates in Europe
J. Ortiz De La Rosa* [Fribourg, Switzerland], P. Nordmann, L. Poirel

Co-production of KPC and SPM carbapenemases by Pseudomonas aeruginosa in same hospital in northern Brazil
A. Quaresma* [Pará, Brazil], L. Guerra Dutra, M. Ferreira Ribeiro, R. Nazaré, D. Brasiliense

**Session accepted as Mini-oral Flash Session**

### Antimicrobial resistance in the community

| 3196 Bacteriophage control the prevalence of *Escherichia coli* ST131 in different countries J. Mathias* [Cardiff, Wales, United Kingdom], D. Babenko, A. Almusallam, R. Farzana, M. Toleman |
| 4075 Fluoroquinolone resistance in *Escherichia coli* isolates after exposure to non-fluoroquinolone antibiotics: a retrospective case-control study L. Chaname Pinedo, R. Bruyndonckx, B. Catry* [Brussels, Belgium], K. Lator, S. Abrams, H. Goossens, S. Coenen |
| 4146 Optimised positioning of carbapenem-sparing options for treatment of UTIs by molecular antibiotic susceptibility testing N. Adamakoh, N. Mahfouz, P. Harris, F. Franceschi, A. Henderson, S. Beisken, E. Littinringer, A. Posch* [Wien, Austria] |
| 4185 Clonal spread of *mcr*-3-carrying multidrug-resistant *ST34 Salmonella Typhimurium* and its monophasic from human globally L. Fang* [Guangzhou, China], R. Sun, W. Guo, J. Sun, X. Liao, Y. Liu |
5341  Population structure dynamics of *Escherichia coli* ST131 over time
G. Peirano* [Calgary, Canada], T. Lynch, R. Devinney, T. Finn, Y. Matsumura, J. Pitout

6705  Restriction modification systems affect the ability of *Escherichia coli* ST73 to acquire plasmids
J. Alves Gama* [Tromsø, Norway], J. Klaas, P. Johnsen, D. Samuelson

8075  SNP-based phylogeny revealing establishment of ciprofloxacin-resistant *Shigella sonnei* lineage in India
D. M. S.* [Vellore, Tamil Nadu, India], A. Pragasam, K. Vasudevan, D. Murugan, S. Anandan, V. Balaji

9632  Measuring and mapping the burden of antimicrobial resistance in enteric infections

**Session accepted as Paper Poster Session**

**Antimicrobial resistance in urinary tract infections**

911  High prevalence of antimicrobial resistance in community-acquired urinary tract infections in Harare, Zimbabwe
I. Olara* [London, United Kingdom], M. Chisenga, R. Ferrand, S. Yeung, H. Hopkins, R. Stabler, P. Chonzi, J. Bradley, K. Kranzer

1278  Antimicrobial resistance and genotypic markers of trimethoprim resistance in *Escherichia coli* and *Klebsiella* spp. isolated from patients with urinary tract infections
Y. Somorin* [Belfast, United Kingdom], N. Wei, M. Higgins, C. Hughes, D. Gilpin, M. Crockard, M. Tunney

1548  Comparison of antibiotic susceptibility of *Escherichia coli* between community-acquired and post-prostate biopsy acute bacterial prostatitis
G. Song* [Chuncheon, South Korea], J. Lee, M. Park, S. Kwon, H. Choi, K. Kim, S. Bae

3173  Prevalence of antibiotic resistance among *Enterobacteriaceae* isolates recovered from urinary samples in France

3319  Antimicrobial resistance in urinary tract infection cases submitted to a computerised decision support system for antibiotic prescribing in primary care in France
T. Delory* [Paris, France], P. Jeanmougin, S. Lariven, F. Tubach, P. Boëlle, E. Bouvet, X. Lescure, J. Le Bel

4061  Urinary tract infections in children: antibiotic resistance of major pathogens in Western Attika, Greece [October 2014 to October 2019]

4823  Resistance among urinary tract infection pathogens collected in Europe during 2018
I. Critchley* [Cambridge, United States], N. Coteonne, M. Pucci, A. Jain, R. Mendes

5684  Increase of *Escherichia coli* with reduced susceptibility to cepheime and OXA-1 compatible phenotype in urinary tract infections along the years
S. Nabil Diaz, J. Bueno, P. Pilar, S. Morneno Bayo, B. Sanz, C. Guererra, J. Garcia-Lechuz Moya, A. Rezusta, A. López-Calleja* [Zaragoza, Spain]

5854  Antimicrobial resistance among urinary *Enterobacteriaceae* from patient living in nursing homes
S. Thibaut* [Nantes, France], T. Coeffic, D. Boutoille, G. Birgand, J. Caillon, P. Network

6871  In vitro susceptibility of carbapenem-resistant *Enterobacteriaceae* urinary isolates to nitroxoline and other oral urinary antibiotics
A. Sonnevend* [Pécs, Hungary], A. Ghazawi, T. Pal

7433  Antimicrobial resistance among bacteria causing asymptomatic bacteriuria in pregnant women, rural Burkina Faso

9434  Retrospective analysis of antibacterial resistance among uropathogen *Escherichia coli* in a veterinary teaching hospital [Italy, 2014-2019]
P. Nebbia* [Turin, Italy], A. Bellata, A. Attili, M. Stella, F. Canavesi, P. Robino

**Session accepted as Paper Poster Session**

**Antimicrobials against Gram-positive bacteria**

1019  Activity of omadacycline and comparator agents against bacterial pathogens from the United States by infection type [2019]
M. Huband* [North Liberty, United States], M. Pfaller, J. Streit, L. Duncan, R. Flamm

1043  In vitro surveillance of eravacycline against Gram-positive pathogens, including resistant isolates, collected from European hospitals in 2018
S. Hwang, S. Hawser, I. Morrissley* [Monthey, Switzerland], F. Monti, E. Efimova, M. Olesky

1322  Resistance mechanisms associated with pleuromutilins among Gram-positive clinical isolates from the worldwide surveillance programme for lefamulin in 2018
R. Mendes* [North Liberty, United States], T. Doyle, M. Castanheira, R. Flamm, S. Gelone, S. Paukner, H. Sader
Abstract Categories 2020

1650 Distinct effectiveness of oritavancin against
tolerance-induced *Staphylococcus aureus*
L. Harven, V. Bingley, P. Kulkarni, S. Khaira, S. dey,
P. Smolenski, A. Bertii* (Detroit, United States)

1886 Longitudinal [2011-2018] activity of oritavancin
against Gram-positive isolates causing bacteremia
and endocarditis in Europe, including enterococcal
infections requiring adjusted daptomycin dosing
C. Goday Carvalhoes* (North Liberty, United States),
H. Sader, J. Streit, R. Flamm, R. Mendes

1887 Delafloxacin activity against drug-resistant
*Streptococcus pneumoniae*, *Haemophilus influenzae*,
*Haemophilus parainfluenzae*, and *Moraxella
catarrhalis* from European medical centres
(2014-2018)
D. Shortridge* (North Liberty, United States), J. Streit,
M. Huband, R. Flamm

2338 Evaluation of tedizolid and comparators activity
against Gram-positive bacterial isolates causing skin
and skin structure infections from paediatric patients
in Europe and surrounding countries [2015-2019]
C. Goday Carvalhoes* (North Liberty, United States),
H. Sader, J. Streit, R. Flamm, R. Mendes

2359 Tedizolid activity against a global collection of Gram-
positive bacterial isolates causing bone and joint
infections [2017-2019]
C. Goday Carvalhoes* (North Liberty, United States),
H. Sader, J. Streit, R. Flamm, R. Mendes

2367 European regional analysis of the *in vitro* activities of
delafloxacin and comparator agents against bacterial
pathogens frequently isolated from patients with
community-acquired respiratory tract infections:
ATLAS surveillance programme 2015-2018
J. Karlowsky, M. Hackel* (Schaumburg, United States),
S. Bouchillon, G. Stone, D. Sahn

2371 *In vitro* activity of ceftaroline and comparator agents
against bacterial pathogens collected from patients
with skin and soft tissue infections in Europe: a
regional analysis of results from the ATLAS
surveillance programme 2015-2018
J. Karlowsky, M. Hackel* (Schaumburg, United States),
S. Bouchillon, G. Stone, D. Sahn

2735 5-year surveillance of iferumig against Gram-positive
cocci collected from Adult Bacterial Skin and Skin-
Structure Infections (ABSSSI) and Bloodstream
S. Pauknner* (Vienna, Austria), S. Gelone, S. Arends,
H. Sader

2774 Ozenoxacin, a topical fluoroquinolone, demonstrates
activity versus methicillin-susceptible and methicillin-
resistant *Staphylococcus aureus*, and *Streptococcus
gyogenes* wound isolates including fluoroquinolone-, fucidic acid- and mupirocin-resistant strains
P. Lagacé-Wiens* (Winnipeg, Canada), H. Adam,
M. Baxter, J. Karlowsky, G. Zhanel

3010 *In vitro* activity of omadacycline against pathogens
isolated from mainland China during 2017-2018
Y. Guo, D. Dong, Q. Chen, Y. Zheng, Y. Yang, S. Wu, D. Zhu,
J. Deng* (Shanghai, China), P. Bradford, H. Reinhart, F. Hu

3561 Delafloxacin *in vitro* activity in skin and soft tissue
infections by methicillin-resistant and levofloxacin-
resistant *Staphylococcus aureus*
M. Liras Hernández* (Madrid, Spain), J. García
Rodríguez, R. Gmez

3606 Antimicrobial activity of XF-73 against clinically
relevant Gram-positive bacteria
I. Romeo-Melody* (Birmingham, United Kingdom),
D. Hynes, W. Rhys-Williams, B. Love, P. Lamb, T. Worthington

3840 Reporting antimicrobial susceptibilities and resistance
phenotypes in *Staphylococcus* spp.: a nation-wide
proficiency study
F. Fernández-Cuenca* (Seville, Spain), I. López-
Hernández, M. Canedo, N. Tormo, C. Gimeno Cordona,
E. Cercenado, A. Pascual Hernández

4060 Cefotiboprole susceptibility of European Gram-positive
and *Enterobacteriaceae* clinical isolates from different
infection sources collected in 2018
S. Hawser* (Monthey, Switzerland), I. Morrissey,
N. Kothari, N. Jenney

4292 Comparison of susceptibility of rifabutin and
rifampicin on *Staphylococcus* spp. isolated in bone and
joint infections
P. Thill, O. Bobineau, E. Senneville* (Tourcoing, France),
B. Nicolas

4704 In *vitro* activity of ceftaroline and comparators against
*Staphylococcus aureus* clinical isolates from a tertiary
hospital in Greece
A. Tychali* (Thessaloniki, Greece), M. Arhanti, F. Netsika,
G. Meletis, P. Mantzana, O. Vasilaki, G. Kagkalou,
E. Protonotariou, L. Skoura

4715 Increased fusidic acid resistance among
*Staphylococcus aureus* skin and soft tissue infections
in Portugal
T. Conceição* (Oeiras, Portugal), C. Ferreira, R. Luzio,
H. De Lencastre

4740 Antimicrobial activity of ceftobiprole against clinical
*Staphylococcus aureus* isolates from Germany
F. Layer* (Wannigerode, Germany), B. Strommenger,
I. Klare, G. Werner

5472 Therapeutic innovation in bone and joint infections:
evaluation of the activity of exebacase [CF-301 lysis]
on clinical strains belonging to *Staphylococcus
erdimeris* species
A. Souche* (Lyon, France), C. Kolenda, C. Dupieux,
R. Schuch, T. Ferry, F. Laurent, J. Josse

5738 Prevalence of antibiotic resistance in skin infections
among migrants compared to Danish-born patients
G. Köse* (Norrebro, Denmark), L. Sloth, R. Nielsen,
C. Østergaard, M. Nørredam

6951 *In vitro* activity of ceftaroline and ceftobiprole against
*Enterococcus faecalis* recovered from infective
endocarditis and/or bloodstream infections
R. Rodríguez García, I. Costales, A. Rodríguez-Esteban,
M. Telenti, E. Garcia, J. Fernández* (Oviedo, Spain)
6997 Distinct augmenting contribution of hyperbaric oxygen therapy to neutrophil function and antibiotic efficacy against Staphylococcus aureus
F. Schwartz* [Copenhagen, Denmark], L. Christophersen, P. Jensen, C. Johann Lerche, C. Moser

7007 Pleuromutilin resistance in methicillin-resistant Staphylococcus aureus at the human-animal interface, Denmark
J. Larsen* [Copenhagen, Denmark], A. Petersen, R. Sieber, A. Larsen, U. Sönksen

7217 In vitro activity of delafloxacin against high-level levofloxacin-resistant invasive isolates of Streptococcus pneumoniae
E. Cercenado* [Madrid, Spain], C. Laras, A. Cobos, J. Sanz

7328 Mupirocin exposure in the preceding year is associated with mupirocin resistance among methicillin-resistant Staphylococcus aureus in a tertiary care hospital in the United States of America
E. Drehs* [Tampa, United States], L. Holt, S. Lakshmi, J. Kalter, A. Abraham, K. Atrubin, P. Thompson, S. Silbert, A. Kumar

7377 Evolution of teicoplanin susceptibility pattern of Staphylococcus aureus and coagulase-negative Staphylococcus spp. related to orthopaedic infections
P. Oliveira, V. Carvalho, A. Anjos, J. Araujo* [Sao Paulo, Brazil], C. Panico, T. Vitoriano, L. Silva Neto, I. Marinho, V. Amorim, F. Rossi, A. Munhoz

8343 Prevalence of blaZ gene types and the inoculum effect with ceftazolin among bloodstream isolates of methicillin-susceptible Staphylococcus aureus
I. Guerrero Lozano, F. Galan-Sanchez* [Cádiz, Spain], J. Peñate, V. Andrade-Brazo, M. De La Rubia, M. Rodriguez-Iglesias

8944 Antibiotic resistance patterns of Staphylococcus aureus isolated in blood cultures in primary care patients with renal diseases
U. Ghoshal* [Lucknow, India], A. Pathak, S. Singh, C. Sahu, N. Prasad

1116 Costs and benefits of OXA-48 variants selected under sub-lethal concentrations of ceftazidime
C. Fröhlich* [Tromsø, Norway], J. Alves Gama, K. Harms, P. Johnsen, O. Samuelsen, H. Leiras

Emergence of blaNDM and mcr-1 positive pan-and extremely-drug resistant bacterial infections in patients with renal diseases
U. Ghoshal* [Lucknow, India], A. Pathak, S. Singh, C. Sahu, N. Prasad

Prevalence of carbapenemase-producing Gram-negative bacilli in a health area of southern Spain

Qualitative detection of OXA-23-like, OXA-24-like and OXA-58-like carbapenemases from Acinetobacter species by real-time PCR
M. Mentasti, K. Prime, K. Sands, S. Khan, M. Wootton* [Cardiff, United Kingdom]

Whole genome sequence analysis of Klebsiella pneumoniae isolates belonging to sequence type 231 harbouring rapidly disseminating blaOXA-232 located on ColKP3 plasmid in Kuwait
A. Al Fadhli* [Kuwait, Kuwait], W. Jamal, V. Rotimi

Prevalence and impact of meropenem-resistant among nonresistant OXA-48-producing Klebsiella pneumoniae
N. Bustos De Godoy, L. Lopez-Cerera* [Seville, Spain], M. Sánchez, E. Recacho, M. Conejo, A. Pascual Hernandez

Effect of biocides on the mobilisation of plasmid-encoded OXA-48 carbapenemases from Klebsiella pneumoniae growing in biofilms
P. Pérez-Palacios, A. Gual-De-Torrella* [Seville, Spain], M. Delgado-Valverde, J. Oteo, A. Pascual Hernandez, F. Fernández-Cuenca

Identification of genetic factors increasing carbapenem resistance in Klebsiella pneumoniae with blaOXA-48
M. Cremanns* [Bochum, Germany], S. Gattermann, N. Pfennigwerth

Diversity of ESBL- and carbapenemase-producing Enterobacteriaceae with emergence of mcr-1 and carbapenem transferable resistance in a cancer clinical setting in Egypt
M. Mersa* [Porto, Portugal], J. Palmeira, H. Ferreira

The application of CRISPR/Cas9-based genome editing in knockout out the blaNDM-1 gene to study the mechanisms of pandrug resistance in clinical isolates
X. Yu* [Hangzhou, China], Y. Xiao

IS26-mediated transfer of blaNDM-1 as the main route of resistance transmission during a polyclonal, multispecies outbreak in a German hospital
R. Weber* [Wernigerode, Germany], M. Pietsch, A. Frühlauf, Y. Pfeifer, M. Martin, D. Luft, S. Gatermann, N. Pfennigwerth, M. Kaase, G. Werner, S. Fuchs

Rapid detection of OXA-23-, OXA-40- and OXA-58-mediated carbapenem resistance in Acinetobacter baumannii
S. Mertins* [Cologne, Germany], P. Higgins, C. Thunissen, Q. Gillemann, P. Martens, H. Seifert, M. Kroenke, A. Klimka
4994 A retrospective study to evaluate the epidemiology, standard of care, outcomes and resource utilisation in patients with confirmed or suspected infection by a carbapenem-resistant Gram-negative organism in the UK: the CARBAR study part 2
S. Goldenberg* [London, United Kingdom], A. Dodgson, G. Barlow, B. Parcell, L. Jones, M. Albur, P. Wilson, D. Enoch, A. Marek, D. Manissero, C. Longshaw, K. Tone, S. Lopes

5021 The resistance ratchet tightens: widespread penicillin-binding protein-3 insensitivity in carbapenem-producing Escherichia coli
S. Mushtaq* [London, United Kingdom], M. Ellington, N. Woodford, D. Livermore

5075 Characterisation of resistance-increasing determinants of OXA-48-bearing clinical isolates of Klebsiella pneumoniae
L. Höfken* [Bochum, Germany], M. Cremanns, S. Gatermann, N. Pfennigwerth

5569 Characterisation of carbapenemase-producing Enterobacteriales isolates with phenotypic and genotypic methods in southern Hungary
M. Gajdics* [Szeged, Hungary], M. Ábrók, L. Andrea, L. Jámvári, A. Tóth, K. Burian, G. Terhes

5729 Investigation of antibiotic susceptibilities, clonal relationships and carbapenem resistance mechanisms of Serratia marcescens obtained between 2011 and 2019 in a university hospital
G. Hazralan* [Ankara, Turkey], S. Nigiz, A. Gundogdu, G. Altinkan-Gelmez, M. Hasdemir, F. Bayrakdar, D. Gür

6385 A mobilisable plasmid spreads the blaGES-6 carbapenemase gene among multidrug-resistant Enterobacter cloacae complex isolates
J. Rodríguez Lozano* [Santander, Spain], M. Garcillán, M. Lucas, L. Martinez-Martinez, J. Aguero, J. Calvo-Montes

6648 Mitigating the fitness costs of carbapenemase-encoding clinical plasmids in Escherichia coli: Piggy-backing on environmental adaptation
J. Klaas, J. Alves Gama* [Trondheim, Norway], J. Hegstad, O. Samuelsen, D. Johnsen

7080 Detection of the novel variant of NDM-type metallo-β-lactamase: significance of D130N amino acid substitution
P. Stárnová* [St Petersburg, Russian Federation], D. Sultan, D. Likoš, V. Ageevets, I. Lazareva, J. Sopova, S. Sidorenko

7167 Co-production of two types of carbapenemases in Enterobacteriales from Poland
E. Literacka* [Warsaw, Poland], R. Izbicki, A. Baraniak, P. Urbanowicz, M. Herda, K. Molinowska, D. Żabićka, W. Hryniewicz, M. Gniadkowski

7182 The impact of H-NS-like protein on InX3 plasmid dissemination and stability
L. Baomo* [Guangzhou, China], C. Zhuo, L. Shui, Y. Guo

7382 Carapbenem hetero-resistance in blood isolates of OXA-48-producing Klebsiella pneumoniae and Escherichia coli
A. Biçakçığil, B. Sancak* [Ankara, Turkey]

7438 Hospital outbreak of Klebsiella pneumoniae producing GES-1 or GES-5 β-lactamases in Poland
E. Literacka* [Warsaw, Poland], R. Izbicki, D. Żabićka, A. Baraniak, P. Urbanowicz, I. Zák, I. Sowa-Sierant, M. Herda, K. Molinowska, W. Hryniewicz, M. Gniadkowski

7551 Emergence of “high risk clone” Klebsiella pneumoniae ST307 producing KPC-3 and NDM-1 in Argentina
D. Cejas, M. Ferrara, F. Magaritioú, C. Alfonsu, A. Elena, G. Gutkind* [Buenos Aires, Argentina], M. Radice

7878 Evaluation of carbapenem resistance in Enterobacteriaceae isolated from intensive care unit using phenotypic and genotypic methods
N. Shaikh* [Mumbai, India], L. Drego, A. Shetty, C. Rodrigues

8158 Impact of porin deficiency and expression levels of environmental CRH-1 and CRP-1 class A β-lactamases on carbapenem and ceftazidime resistance

8401 Local prevalence of molecular resistance mechanisms in carbapenem-resistant Enterobacteriaceae at a tertiary healthcare centre in Lebanon
G. Zmerli* [Beirut, Lebanon], S. Saliba, A. Chami, C. Afji, E. Azar

8687 X-ray induced changes in substrate specificity of OXA-48
M. Dabos* [Le Kremlin-Bicêtre, France], M. Mondini, E. Deutsch, T. Naas

9346 Evolutionary insights of multidrug-resistant hypervirulent ST23 Klebsiella pneumoniae predominantly driven by ICEKp
C. Shankar* [Vellore, India], J. Jacob, K. Vasudevan, M. Venkatesan, S. Anandan, V. Balaji

Session accepted as Mini-oral ePoster Session
Carbapenemases learn geography: they are everywhere!

1524 Epidemiology of carbapenemase-producing Enterobacteriales in the Netherlands in 2018
C. Wielers* [Bilthoven, Netherlands], L. Schouls, D. Notermans, A. Hendrickx, E. Kuijper, A. Schaffelen, S. De Greeff

1786 Temporal and regional prevalence of carbapenemase-producing Enterobacteriales in Switzerland from 2013 to 2018
M. Gasser* [Bern, Switzerland], A. Ramette, R. Zbinden, J. Schrenzel, P. Nordmann, D. Perisa, A. Kronenberg

2198 National pathogen surveillance for carbapenem-resistant Enterobacteriaceae in Japan, 2017-2018
M. Matsui* [Tokyo, Japan], S. Suzuki, M. Sugai

2918 Prevalence of different resistance mechanisms in carbapenemase-producing organisms in Kenya: a phenotypic study
A. Amulele* [Kilifi, Kenya], J. Waichungo, A. Mwanza, E. Machanja, D. Wareham, J. Berkley, N. Gordon
3121 National survey of carbapenemase-producing Klebsiella pneumoniae and Escherichia coli in Belgium in 2019
T. Huang* [Yvoir, Belgium], P. Bogaerts, C. Berhin, M. Hoebeke, Y. Glupczynski, D. Denis

3748 High levels of carbapenem resistance in paediatric bloodstream infection across WHO regions influenced by variation in relative pathogen prevalence
A. Cook* [London, United Kingdom], Y. Yau, J. Bielicki, M. Sharland

9400 KpnBR: Brazilian genomic database for monitoring resistance and virulence of Klebsiella pneumoniae

M. Polemis* (Athens, Greece), K. Tryfinopoulou, A. Vatopoulos

Session accepted as Paper Poster Session
Carriage of resistant enterobacteria: a gut feeling!

1315 Resistance to extended-spectrum β-lactams, aminoglycosides and quinolones in multidrug-resistance Enterobacteriales isolated in patients receiving an allogeneic haematopoietic stem cell transplantation: the ENHERE-SCT Study.
M. Fernández-Martínez* [Santander, Spain], C. González Rico, M. Bermúdez-Rodríguez, I. García-García, L. Vázquez, J. Aguado García, C. Martín Calvo, L. Martinez-Martínez, J. Calvo-Montes, M. Fariñas

2469 Prevalence of carriage and characterisation of extended-spectrum beta-lactamase-producing Escherichia coli in healthy pregnant women living in Madagascar
M. Milenkov* [Lyon, France], E. Westeel, S. Rasoanandrasana, L. Rahajamanana, R. Rakotomalala, O. Clermont, L. Rasoanandrasana, A. Koutoucheva, S. Fenlon, D. Bertrand, D. Lye, B. Ang, E. Perencevich, O. Ng, B. Cooper, N. Nagarajan, S. Chen, T. Barkham

4062 Household transmission of carbapenemase-producing Enterobacteriales: a prospective case-ascertained cohort study
K. Marimuthu* [Singapore, Singapore], Y. Mo, M. Ling, A. Koutoucheva, S. Fenlon, D. Bertrand, D. Lye, B. Ang, E. Perencevich, O. Ng, B. Cooper, N. Nagarajan, S. Chen, T. Barkham

4276 Increased carriage of ESBL-producing Enterobacteriaceae among men who have sex with men
E. Van Dulm* [Amsterdam, Netherlands], W. Van Bilsen, A. Matser, I. Linde, Y. Van Duijn, Prins, M. Prins, A. Boyd, A. Van Dam

4510 Epidemiology of ESBL-producing Enterobacteriaceae among healthcare students, Portuguese Red Cross Health School of Lisbon, Portugal
C. Fournier* [Fribourg, Switzerland], M. Aires De Sousa, B. Fuster, P. Nordmann, L. Poirel

4657 Prevalence of and risk factors for extended-spectrum beta-lactamase genes carriage in a middle-aged and elderly population-based cohort
M. Mulder, P. Arp, D. Radjabzadeh, J. Kiefte-De Jong, A. Uitterlinden, C. Klaassen, R. Kraaij, W. Goessens, B. Stricker, A. Verbon* [Rotterdam, Netherlands]

6457 Faecal carriage of extended-spectrum beta-lactamase-producing members of order Enterobacteriales among patients in Bulgarian hospitals

6720 Longitudinal large-scale survey on blaCTX-M faecal carriage in children from Bolivian Guaraní indigenous communities
S. Boncompagni* [Siena, Italy], T. Di Maggio, A. Mantella, M. Micieli, A. Villagrán, M. Spinicci, M. Strahmeyer, M. Cecchetti, H. Gamboa Barahona, V. Poma, A. Bartoloni, G. Rossolini, L. Pallecchi

6919 Healthy carriage of colistin-, ESC- and carbapenem-resistant Enterobacteriales in workers in Lebanese pastries
A. Hiba* [Lyon, France], M. Osman, J. Madec, M. Hamze, M. Haenni

7875 Community faecal carriage of extended-spectrum beta-lactamase-producing Escherichia coli in Niger

6092 Household transmission of carbapenemase-producing Enterobacteriaceae: a prospective case-ascertained cohort study
K. Marimuthu* [Singapore, Singapore], Y. Mo, M. Ling, A. Koutoucheva, S. Fenlon, D. Bertrand, D. Lye, B. Ang, E. Perencevich, O. Ng, B. Cooper, N. Nagarajan, S. Chen, T. Barkham

4276 Increased carriage of ESBL-producing Enterobacteriaceae among men who have sex with men
E. Van Dulm* [Amsterdam, Netherlands], W. Van Bilsen, A. Matser, I. Linde, Y. Van Duijn, Prins, M. Prins, A. Boyd, A. Van Dam

4510 Epidemiology of ESBL-producing Enterobacteriaceae among healthcare students, Portuguese Red Cross Health School of Lisbon, Portugal
C. Fournier* [Fribourg, Switzerland], M. Aires De Sousa, B. Fuster, P. Nordmann, L. Poirel

Prevalence of and risk factors for extended-spectrum beta-lactamase genes carriage in a middle-aged and elderly population-based cohort
M. Mulder, P. Arp, D. Radjabzadeh, J. Kiefte-De Jong, A. Uitterlinden, C. Klaassen, R. Kraaij, W. Goessens, B. Stricker, A. Verbon* [Rotterdam, Netherlands]

Faecal carriage of extended-spectrum beta-lactamase-producing members of order Enterobacteriales among patients in Bulgarian hospitals

Longitudinal large-scale survey on blaCTX-M faecal carriage in children from Bolivian Guaraní indigenous communities
S. Boncompagni* [Siena, Italy], T. Di Maggio, A. Mantella, M. Micieli, A. Villagrán, M. Spinicci, M. Strahmeyer, M. Cecchetti, H. Gamboa Barahona, V. Poma, A. Bartoloni, G. Rossolini, L. Pallecchi

Healthy carriage of colistin-, ESC- and carbapenem-resistant Enterobacteriales in workers in Lebanese pastries
A. Hiba* [Lyon, France], M. Osman, J. Madec, M. Hamze, M. Haenni

Community faecal carriage of extended-spectrum beta-lactamase-producing Escherichia coli in Niger
Abstract Categories 2020

Session accepted as 2-Hour Oral Session
Clinical and molecular epidemiology of key antimicrobial-resistant enterobacteria: the devil lies in the details
721 Genomic analysis of carbapenemase-encoding plasmids from Klebsiella pneumoniae across Europe highlights three major patterns of dissemination S. David* [Cambridge, United Kingdom], V. Cohen, S. Reuter, T. Gian, G. Rossolini, E. Feil, H. Grundmann, D. Aannensen

1908 Burden and impact of carbapenem resistance caused by Enterobacteriales in a Bangladeshi hospital: an epidemiological, clinical and molecular study R. Farzana* [Cardiff, United Kingdom], L. Janes, A. Rahman, K. Sands, E. Portal, I. Boosten, M. Pervin, B. Hassan, A. Barratt ?, T. Walsh

2488 Community outbreak of OXA-48-producing Escherichia coli linked to a food premises: New Zealand, 2018-19 C. Thornley* [Lower Hutt, New Zealand], M. Kelly, M. Bloomfield, A. Nesdale, X. Ren

2942 Carbapenemase-producing and colistin-resistant Enterobacteriaceae in intensive care unit patients from Mediterranean countries, 2019 S. Borges Dos Santos, S. Diene, B. Amina, K. Zerouali, D. Ghath, R. El-Mahdy, S. El Tayeb, A. Hammami, I. Boutiba, R. Husni, Z. Daoud, L. Mereghetti, P. François, N. Van Der Mee-Marquet* [Tours, France]

Evidence of high prevalence, transmission rate and persistence of Escherichia coli ST131-Rx among residents of nursing homes in south Spain (JPI-ST131TS project) E. Salamanca* [Seville, Spain], L. Lopez-Cerero, M. Delgado-Valverde, J. Rodriguez-Baño, A. Pascual Hernandez

6240 A multi-year decline of multidrug-resistant Escherichia coli in French nursing homes and primary care: are we on the good track? S. Thibaut* [Nantes, France], T. Coeffe, D. Boutaille, G. Birgand, J. Caillon, P. Network

6673 Identifying the drivers of multidrug-resistant Klebsiella pneumoniae at a European level V. Kachalov* [Zurich, Switzerland], H. Nguyen, S. Balakrishna, L. Salazar Vizcaya, R. Sommerstein, S. Kuster, A. Houser, P. Abel Zur Wiesch, E. Klein, R. Kouyos

Session accepted as Mini-oral Flash Session
Colistin resistance and other resistance mechanisms in the horizon

1894 Identification of novel mobile colistin resistance gene mcr-10 C. Wang, Y. Feng, Z. Zong* [Chengdu, China]

3486 Widespread distribution of the acquired colistin resistance gene, mcr-9, amongst Enterobacteriales in England and Wales M. Ellington* [London, United Kingdom], T. Dallman, D. Meunier, K. Hopkins, N. Woodford

5117 Colistin resistance in human Salmonella spp. isolates collected from Italian Enter-Net surveillance during the period 2016-2018 D. Perlino, S. Owczarek, A. Dioni, I. Benedetti, L. Busani, C. Lucarelli, L. Villa* [Rome, Italy], A. Garcia-Fernandez

5240 Sequential time-kill experiments to characterize lyopolysaccharide-modifying genes involved in polymyxin resistance in Escherichia coli and Klebsiella pneumoniae carrying mcr-1 H. Ih* [Poitiers, France], N. Gregoire, W. Couet, S. Marchand, J. Buycck

An OXA-48 variant hydrolysing carbapenems, expanded-spectrum cephalosporins and aztreonam: welcome OXA-793 M. Dabas* [Le Kremlin-Bicêtre, France], R. Bonnin, L. Dortet, T. Naas

A novel plasmid-mediated RND family efflux pump confers tigecycline resistance in Klebsiella pneumoniae S. Sun* [Beijing, China], H. Gao, L. Yu, L. Jin, R. Wang, X. Wang, D. Wang, H. Wang

Within-patient evolution of a clinical isolate of Escherichia coli uncovers an IS26-linked amplification of blaTEM-1 leading to piperacillin-tazobactam resistance T. Edwards* [Liverpool, United Kingdom], J. Mason, P. Roberts, C. Parry, J. Van Aartsen, A. Howard, A. Roberts, E. Adams, A. Hubbard

Inter- and intraspecies spread of mcr-1 between twenty-nine distinct Enterobacteriaceae isolates from one patient H. Xu* [Hangzhou, China], B. Zheng, Y. Xiao
Abstract Categories 2020

9444 Investigation of colistin resistance mechanisms in Klebsiella pneumoniae strains
B. Borsa* [Linköping, Sweden], G. Karabiyik, I. Karalti, B. Guvenc-Tuna, I. Acuner

Session accepted as Paper Poster Session

Commercial AST methods: what’s new?

1079 ETEST Eravacycline for antimicrobial susceptibility testing of Enterobacteriaceae and Enterococcus spp.: performance results from a multi-centre study
L. Blanchard* [Marcy-l’Étoile, France], T. Armstrong, D. Gerald, Y. Ying, M. Kresken, J. Carpenter, V. Sauvonnnet, G. Zambardi

1138 Evaluation of the accuracy of the panel for antimicrobial susceptibility testing of Enterobacteriaceae and carbapenemase detection
H. Cho* [Seoul, South Korea], Y. Park, J. Kim, J. Choi, S. Ha, Y. Cha

1813 Does automated susceptibility testing overcall temocillin resistance?
M. Campbell* [Oxford, United Kingdom]

2300 Multi-centre evaluation of cephalxin MIC results for Enterobacteriaces using EUCAST breakpoints on MicroScan dried Gram-negative MIC panels
[West Sacramento, United States]

2304 Luminogenic phosphatase substrate for rapid susceptibility testing of Gram-positive strains
V. Chalansonnet* [La Balme-les-Grottes, France], F. Macé, S. Brenga

2366 Using T2Dx and rapid AST with blood culture presampling for combined ID and AST before blood culture positivity
C. Malmberg* [Uppsala, Sweden], L. Flintheldt, P. Yuen, J. Fernberg, H. Öhrn, C. Johansson, T. Tängdén, J. Kreuger

2724 Phenotypic testing of ceftriaxone susceptibility on the Pheno system in characterised Enterobacteriaces
A. Bhalodi* [Tucson, United States], N. Magnano, R. Humphries

3715 Comparative study of two susceptibility testing methods for carbapenem-resistant Klebsiella pneumoniae clinical isolates

3779 An evaluation of an automated broth microdilution platform versus the EUCAST disk diffusion methodology
P. D’Arcy-Grover* [Southampton, United Kingdom], I. Taylor

3822 A low-cost nanoliter droplet handling system for pathogen identification and antimicrobial susceptibility testing on microtitre plates
Q. Yi* [Beijing, China], W. Du, Y. Xu

4069 Rapid generation of a standard inoculum direct from positive blood cultures using electrical biosensor technology
E. Deak* [Menlo Park, United States], S. Putney, Y. Nga, W. Yip, K. Vo, T. Abbey, M. Herget

4673 Evaluation of a new commercial fosfomycin agar dilution-kit against reference agar dilution
L. Davies, L. Jones, F. Demetro, S. Pompomio, F. Brocco, M. Wootton* [Cardiff, United Kingdom]

4887 A multi-site study comparing a commercially-prepared dried MIC susceptibility system to the CLSI/ISO broth microdilution method for ceftazidime-aztreonam (formerly ceftazidime/VNRX-5133) using Gram-negative non-fastidious organisms

5636 Evaluation of Bacillus anthracis agar-based susceptibility testing by Etest for ciprofloxacin, levofloxacin, doxycycline and tetracycline
B. Cherney* [Atlanta, United States], P. Michel, J. Bugrysheva, A. Gargin, T. Kangphet-Tran, C. Lascols, H. Mclaughlin, D. Sue

5834 Evaluation of antimicrobial susceptibility testing assays for ceftazidime-avibactam and ceftolozane-tazobactam with Gram-negative bacteria directly from positive blood culture on the Pheno system
N. Oppermann, A. Ndobegang, A. Sikorski, A. Taku, D. Gamage, C. Chantell, R. Humphries* [Los Angeles, United States]

6316 Clinical evaluation of FASTinov kits for ultra-rapid antimicrobial susceptibility testing directly from positive blood cultures
A. Silva-Dias, B. Pérez-Visa, R. Gomes, I. Martins-Oliveira, A. Rodrigues, R. Canton Moreno, C. Pina-Vaz* [Porto, Portugal]

6516 Detection of colistin resistance in Pseudomonas and Acinetobacter by the ATB PSE EU strips
S. Petre, E. Pillon* [La Balme Les Grottes, France], M. Roland

6486 Comparative study of two susceptibility testing methods for carbapenem-resistant Klebsiella pneumoniae clinical isolates

6516 Evaluation of different commercial methods for fosfomycin susceptibility testing of Staphylococcus aureus
F. Campanile, A. Aprile* [Catania, Italy], C. Bonomo, C. Imbrasciano, A. Mirabile, D. Bangiorno, S. Stefani, M. Mezzatesta

6925 ETEST Imipenem-rellebactam for antimicrobial susceptibility testing of Enterobacteriaceae and Pseudomonas aeruginosa: performance results from a multi-centre study

Serotype is associated with high rate of colistin resistance among clinical isolates of Salmonella from China
Q. Luo* (Hangzhou, China), H. Fu, X. Yu, Y. Wang, Y. Xiao

First epidemiological report on colistin- and carbapenem-resistant Enterobacteriaceae isolates obtained from selected tertiary hospitals in south-eastern Nigeria
U. Ugah** (Abakaliki, Nigeria), T. Udeani

Emergence of mobile mcr-8 colistin resistance in Klebsiella pneumoniae from clinical infections of hospitalised patients in Bangladesh
R. Farzana* (Cardiff, United Kingdom), L. Jones, A. Barratt?, A. Rahman, K. Sands, E. Portal, Q. Yang, T. Walsh

Role of AcrAB-ToIC multidrug efflux pump in mcr-1-mediated colistin resistance
W. Liang* (Guangzhou, China), Z. Zhao, D. Lin, S. Feng, L. Liang, J. Li, W. Wen, C. Shen, G. Tian

The intestinal carriage of colistin-resistant Enterobacteriaceae in a tertiary care hospital setting and whole genome sequence data analysis of mcr-1 positive Escherichia coli isolates
J. Tkadlec* (Prague, Czech Republic), E. Smelikova, A. Bárková, M. Cabnnochova, G. Tereza, R. Karpiskova, O. Nycz, P. Drevinek, M. Krutova

Molecular detection of the mcr-1 mobile colistin resistance gene in healthy humans and a dog with skin infection from Portugal
J. Menezes* (Lisbon, Portugal), A. Belas, I. Cunha E Silva, M. Pamba

Coproduction of mcr-9 and KPC-2 by archived clinical Enterobacter spp. strains from Colombia
L. Rojas Cay* (Cleveland, United States), W. Shropshire, S. Marshall, S. Rudin, E. De La Cadena, A. Dinh, M. Villegas, B. Hanson, C. Arias, R. Bonam

Persistor response of Klebsiella pneumoniae to colistin exposure
C. Vatansever* (Istanbul, Turkey), N. Atac, B. Özer, B. Kılıçoğlu, M. Berkkan, U. Guler, D. Baskurt, E. Sever, O. Dogan, F. Can

Stable mutants and persisters variants are involved in heteroresistance to colistin in wild-type Klebsiella pneumoniae of clinical origin
I. Sánchez León* (Córdoba, Spain), C. Elias-Lopez, L. Martínez-Martinez

Comparison of colistin-resistant Klebsiella pneumoniae strains in five Greek hospitals
M. Maisi* (Heraklion, Greece), G. Tsioulas, E. Maisi, I. Choudalaki, P. Giakkoupi

mcr-8-mediated colistin resistance in a carbapenem-resistant Klebsiella pneumoniae isolate
R. Bonnin, S. Bernabeu, F. Jauregui, T. Naas, L. Dortet* (Paris, France)

Genetic characterisation of multidrug-resistant Klebsiella pneumoniae harbouring colistin resistance gene mcr-1 from North India
A. Pathak* (Lucknow, India), S. Singh, K. Prasad

Rapid detection of colistin-resistant Klebsiella pneumoniae using colistin drop test
V. Rocha* (Salvador, Brazil), D. Nascimento, M. Sales, A. Martins, J. Azevedo, A. Malheiro, L. Ataide, M. Reis, J. Reis

Colistin hetero-resistant Klebsiella pneumoniae and Escherichia coli blood isolates
Ü. Liste, E. Kirbaş* (Ankara, Turkey), A. Biçakçgil, B. Sancak

Hetero-resistance to colistin in Stenotrophomonas maltophilia isolates: challenges in colistin susceptibility testing
Ü. Liste, A. Biçakçgil, C. Özkyuymcu, B. Sancak* (Ankara, Turkey)

Acquired resistance to colistin in Enterobacteriaceae isolated at university hospital of Algiers
B. Mohamed Azzedine* (Algiers, Algeria), D. Fazio, L. Farah, M. Tazir, W. Amhis

First national survey on colistin resistance among Escherichia coli in Belgium
O. Denis* (Brussels, Belgium), P. Bogaerts, C. Berhin, M. Hoebeke, W. Bouchahrouf, Y. Glupczynski, T. Huang

Diversity of colistin resistance mechanisms in carbapenemase-producing Klebsiella pneumoniae isolated in Bulgaria from 2013 to 2018
K. Ivanova* (Sofia, Bulgaria), I. Ivanov, S. Sabtcheva, V. Dobrinov, M. Nedjalkov, E. Dobreva, R. Hristova, T. Kantardjiev

Molecular surveillance of mcr gene in gut microbiome of healthy individuals, acute diarrhoea and inflammatory bowel diseases patients from India
S. Banerjee* (New Delhi, India), T. Senapati, J. Verma, A. Mani, A. Kapil, B. Das

Clonality and genetic determinants of resistance in paired isolates of Klebsiella pneumoniae with divergent polymyxin B phenotypes
S. Sampaio, R. Carvalho, M. Mimica, C. Da Silva, A. Lima, K. Lima, D. Rocha, J. Mello-Sampaio* (São Paulo, Brazil)

Characterisation of KPC-50, a novel transferable KPC-3 variant conferring resistance to ceftazidime-avibactam in a colistin-resistant Klebsiella pneumoniae from Switzerland
L. Poirel* (Fribourg, Switzerland), X. Vuillemin, A. Masseron, M. Juhas, S. Mancini, R. Zbinden, S. Tiziani, U. Bechtel-Grosch, P. Nordmann

Genomic characterisation of meropenem/vaborbactam resistant KPC-producing Klebsiella pneumoniae strains isolated from bacteremic patients
P. Gaibani* (Bologna, Italy), M. Re, S. Ambretti

A silent mcr-9 and a novel class A beta-lactamase in Citrobacter telavivum sp. nov. colonising hospital patients
T. Gancalves Ribeira* (Porto, Portugal), R. Izdebski, P. Urbanowicz, Y. Carmeli, M. Gniadkowski, L. Peixe
Abstract Categories 2020

4051 Chemical genomics to reverse the colistin resistance of MDR Klebsiella pneumoniae
B. Jana* (Brighton, United States), K. Baker, A. Cain, W. Doerrler, L. Guardabassi

5028 Acquired resistance to fosfomycin through acquisition of an ISecp1-blaCTX-M-14 tandem in a Klebsiella pneumoniae clinical isolate
N. Kieffer, L. Poiré* (Fribourg, Switzerland), L. Mueller, P. Nordmann

5510 Mechanisms of resistance in Pseudomonas aeruginosa against ceftazidime-avibactam and ceftolozane-tazobactam from Qatar
M. Sid Ahmed* (Doha, Qatar), F. Ahmad Khan, H. Abdel Hadi, A. Sultan, M. Al-Maslamani, A. Al-Khal, B. Söderquist, E. Ibrahim, A. Omrani, J. Jass

7656 Multiple mutational possibilities allow ceftazidime-avibactam resistance in KPC-type carbapenemase

9106 Characterisation of mcr-5 action suggests a unified mechanism for polymyxin resistance
Y. Feng* (Hangzhou, China)

EUCAST rapid disk diffusion: the story so far

3616 Evaluation of EUCAST rapid antimicrobial susceptibility testing (RAST) on blood cultures in a clinical laboratory
P. Rydström* (Växjö, Sweden), E. Jonasson

4028 Evaluation of rapid AST in blood cultures using CHROMagar Mueller-Hinton orientation agar
B. Mnif* (Sfax, Tunisia), F. Zouari, S. Gouiaa, N. Sallem, A. Hammami

4543 Usefulness of RAST-EUCAST directly from blood culture bottles combined with rapidly interpreted antibiogram reading to detect ESBL/carbapenemase-producing Enterobacteriales
V. Cerrudo Lopez* (Madrid, Spain), J. Cortes Cuevas, S. Garcia-Fernández, R. Canton Moreno, M. Morosini, A. Sanchez Diaz

4978 The EUCAST Rapid AST directly from positive blood culture bottles: breakpoints for additional antimicrobial agents for Escherichia coli, Klebsiella pneumoniae and Pseudomonas aeruginosa
E. Jonasson, E. Matuschek, G. Kahlmeter* (Växjö, Sweden)

5113 Direct-from-blood-culture disk diffusion to determine antimicrobial susceptibility of Escherichia coli and Klebsiella pneumoniae

5127 Automated rapid antimicrobial susceptibility testing from positive blood cultures using Copan WASPlab
C. Verduin, S. Derksen, J. Stalpers* (Veldhoven, Netherlands), T. Liebregts, M. Nijs, A. Jansz

6278 Evaluation of the rapid antimicrobial susceptibility testing (RAST) from positively-flagged blood cultures
T. Ka* (Taipei, Taiwan), P. Chuang, C. Hsu, T. Lee, P. Hsieh

6845 EUCAST rapid AST directly from positive blood culture bottles: breakpoints for Acinetobacter baumannii
E. Jonasson, E. Matuschek* (Växjö, Sweden), G. Kahlmeter

6934 Evaluation of the EUCAST rapid antimicrobial susceptibility testing directly from positive blood cultures for Escherichia coli and Staphylococcus aureus in a routine laboratory
E. Jonasson* (Växjö, Sweden), P. Rydström
Abstract Categories 2020

Molecular detection of mutations involved in *Helicobacter pylori* antimicrobial resistance in Ecuador

Evaluation of *Stenotrophomonas maltophilia* non-susceptibility and associated risk factors: a multi-centre analysis
C. Bland, N. White, J. Lin, J. Wagner, K. Stover, B. Bookstaver, D. Chastain* (Albany, United States), H. Matson, M. Motes, B. Jones

Limited multidrug-resistant efflux pump overexpression among multidrug-resistant *Escherichia coli* of ST131
J. Camp* (Freiburg, Germany), S. Schuster, M. Yavra, T. Schweigger, J. Rossen, W. Kern

The rational of antibiotic failure in *Helicobacter pylori*
S. Ghofourian, E. Aboualigalehdari* (Ilam, Iran), B. Bodakhsh

Session accepted as Paper Poster Session

**In vitro activity of ceftolozane/tazobactam**

Emergence of non-susceptibility among Gram-negative respiratory pathogens from a phase III clinical trial for treatment of nosocomial pneumonia [ASPECT-NP]
M. Motyl* (Kenilworth, United States), M. Castanheira, M. Johnson, B. Yu, J. Huntington, P. Carmelitana, C. Bruno, C. De Anda, E. Rhee

In vitro activity of ceftolozane/tazobactam against clinical isolates of carbapenem-resistant *Pseudomonas aeruginosa* from Japan hospitals
T. Nakamura* (Kyoto, Japan), M. Fujiwara

Ceftolozane/tazobactam-resistant *Pseudomonas aeruginosa* isolates in a teaching hospital in central Italy
M. Gianluca* (Ancona, Italy), L. Breccini, A. Brenchiani, A. Antonelli, V. Di Pilato, S. Castelletti, S. Fioriti, T. Giani, G. Rossolini, A. Giacometti, O. Cirioni

In vitro activity of ceftolozane/tazobactam and comparators against *Pseudomonas aeruginosa* isolates collected in the United States: SMART 2018
K. Kazmierczak* (Schaumberg, IL, United States), J. Raddatz, K. Young, M. Motyl, D. Sahm

Characterisation of ceftolozane/tazobactam resistance among *Enterobacteriales* and *Pseudomonas aeruginosa* isolates recovered during the SUPERIOR study using whole genome sequencing

Confronting ceftolozane/tazobactam susceptibility in multidrug-resistant *Enterobacteriales* isolates and whole genome sequencing results [STEP study]

Activity of ceftolozane/tazobactam against prevalent Gram-negative pathogens across Asia: PACTS 2016-2018
M. Tulloch* (Sydney, Australia), D. Shortridge, M. Motyl, P. Moise, W. Chen

Important resistance issues in enterococci

K. Loens* (Antwerp, Belgium), S. Van Koeveringe, H. Goossens, V. Matheeussen

Prevalence and outcome of ampicillin-susceptible but penicillin-resistant *Enterococcus faecalis* bacteraemia: a multi-centre retrospective study
E. Rosselli Del Turco* (Bologna, Italy), M. Bartoletti, S. Carvalho Brugger, S. Ambretti, M. Garcia, M. Giannella, R. Pascale, L. Raumer, P. Viale, J. Pericàs Pulido

Risk factors and outcomes associated with the carriage of tigecycline-non-susceptible vancomycin-resistant *Enterococcus faecium*
J. Kessel* (Freiburg, Germany), J. Bender, G. Werner, M. Griskaitis, E. Herrmann, A. Leh, H. Serve, K. Zacharowski, S. Zeuzem, M. Vehreschild, T. Wichelhaus, V. Kemptf, M. Hogardt

Molecular epidemiology of vancomycin-resistant enterococci: changing paradigms at the crossroads of Europe
C. Correa-Martinez* (Münster, Germany), A. Jurke, J. Schmitz, S. Kempfmeier, A. Mollmann

First vancomycin-variable enterococci from France: molecular mechanisms of phenotypic susceptibility
Z. Mamou* (saint gregoire, France), A. Zouari, S. Potrel, A. Collet, G. Auger, V. Cattoir

Session accepted as 1-Hour Oral Session

Important resistance issues in enterococci

Molecular detection of mutations involved in *Helicobacter pylori* antimicrobial resistance in Ecuador

Evaluation of *Stenotrophomonas maltophilia* non-susceptibility and associated risk factors: a multi-centre analysis
C. Bland, N. White, J. Lin, J. Wagner, K. Stover, B. Bookstaver, D. Chastain* (Albany, United States), H. Matson, M. Motes, B. Jones

Limited multidrug-resistant efflux pump overexpression among multidrug-resistant *Escherichia coli* of ST131
J. Camp* (Freiburg, Germany), S. Schuster, M. Yavra, T. Schweigger, J. Rossen, W. Kern

The rational of antibiotic failure in *Helicobacter pylori*
S. Ghofourian, E. Aboualigalehdari* (Ilam, Iran), B. Bodakhsh

In vitro activity of ceftolozane/tazobactam against prevalent *Pseudomonas aeruginosa* isolates from Japan hospitals
T. Nakamura* (Kyoto, Japan), M. Fujiwara

Ceftolozane/tazobactam-resistant *Pseudomonas aeruginosa* isolates in a teaching hospital in central Italy
M. Gianluca* (Ancona, Italy), L. Breccini, A. Brenchiani, A. Antonelli, V. Di Pilato, S. Castelletti, S. Fioriti, T. Giani, G. Rossolini, A. Giacometti, O. Cirioni

In vitro activity of ceftolozane/tazobactam and comparators against *Pseudomonas aeruginosa* isolates collected in the United States: SMART 2018
K. Kazmierczak* (Schaumberg, IL, United States), J. Raddatz, K. Young, M. Motyl, D. Sahm

Characterisation of ceftolozane/tazobactam resistance among *Enterobacteriales* and *Pseudomonas aeruginosa* isolates recovered during the SUPERIOR study using whole genome sequencing

Confronting ceftolozane/tazobactam susceptibility in multidrug-resistant *Enterobacteriales* isolates and whole genome sequencing results [STEP study]

Activity of ceftolozane/tazobactam against prevalent Gram-negative pathogens across Asia: PACTS 2016-2018
M. Tulloch* (Sydney, Australia), D. Shortridge, M. Motyl, P. Moise, W. Chen
4302 In vitro activity of ceftolozane-tazobactam and comparators against beta-lactam-resistant pathogens isolates collected from patients with urinary tract, intra-abdominal and lower respiratory infections in Lebanon and Jordan (SMART Study Data 2016-2017) [Beirut, Lebanon], W. Hayajneh, A. Adame, N. Hakime, M. Malik Hamdan, J. Maalouf, R. Alsamarneh, M. Motyl, D. Sahim, I. Alekseeva, D. Karam Sarkis

8680 Activity of ceftolozane-tazobactam and combinatorial regimens against a contemporary collection of carbapenem-resistant Pseudomonas aeruginosa C. Black* (San Antonio, United States), J. Shurko, C. Chen, D. Burgess, G. Gowrys, G. Lee

5626 The effect of intestinal alkaline phosphatase and physical activity on the course of experimental colitis in obese mice D. Wójcik* (Kraków, Poland), M. Surmiak, M. Hubalewska-Mazgaj, Z. Śliwowski, S. Kwiecień, T. Brzozowski

6955 Molecular analysis of metronidazole-resistant Bacteroides strains from Kuwait Z. Baity* (Szeged, Hungary), W. Jamal, K. Burian, V. Rotimi, J. Soki

Session accepted as Paper Poster Session

KPC-producing enterobacteria

3282 Plasmid diversity among genetically related Klebsiella pneumoniae blakPC-2 and blakPC-3 isolates collected in the Dutch national surveillance A. Hendrickx* (Bilthoven, Netherlands), F. Landman, A. De Haan, D. Borst, S. Witteveen, M. Van Santen, H. Van Der Heide, L. Schouls

4671 Absence of the Type I-E CRISPR-Cas system in Klebsiella pneumoniae clonal complex 258 is associated with dissemination of blakKPC plasmid in this clonal complex Z. Ying* (Shanghai, China), T. Yu, X. Jiang

4889 Antimicrobial susceptibility in Clostridioides difficile varies according to European region and isolate source J. Freeman* (Leeds, United Kingdom), V. Viprey, V. Tkalec, D. Ewin, W. Spittal, E. Clark, J. Vernon, W. Fawley, A. Benson, G. Davis, M. Rupnik, M. Wilcox, K. Davies

Session accepted as Paper Poster Session
It’s a gas: anaerobes and AMR

2315 Descriptive epidemiological analysis of antimicrobial resistance in strict anaerobes in Scotland, 2013-2018 J. Wilson, A. Zalewska, M. Lockhart* (Glasgow, United Kingdom), E. Mcardle, W. Malcolm

2410 Evaluation of the antimicrobial activity of dinilbazole and six comparators against Chinese, Japanese and South Korean isolates of Clostridioides difficile D. Collins* (West Leederville, Australia), Y. Wu, K. Tateda, H. Kim, R. Vickers, T. Kierski

3386 The antimicrobial susceptibility profile and prevalence of known anaerobic resistance genes in less common anaerobic Gram-negative bacteria, isolated in the Netherlands K. Boiten* (Groningen, Netherlands), W. Baas, P. Buijs, J. Rossen, A. Veelø

3511 Descriptive epidemiology of antimicrobial resistance in strict anaerobes in Scotland, 2013-2018 J. Wilson, A. Zalewska, M. Lockhart* (Glasgow, United Kingdom), E. Mcardle, W. Malcolm

3928 Aetiology and antimicrobial susceptibility of anaerobic bacteria causing serious infections in a tertiary hospital of Madrid J. López-Pintar* (Madrid, Spain), A. Sánchez-Diaz, P. Ruiz-Garbajosa, R. Canton Moreno, M. Morosini Reilly, S. García-Fernández

4489 Antimicrobial susceptibility in Clostridioides difficile varies according to European region and isolate source J. Freeman* (Leeds, United Kingdom), V. Viprey, V. Tkalec, D. Ewin, W. Spittal, E. Clark, J. Vernon, W. Fawley, A. Benson, G. Davis, M. Rupnik, M. Wilcox, K. Davies

4671 Absence of the Type I-E CRISPR-Cas system in Klebsiella pneumoniae clonal complex 258 is associated with dissemination of blakKPC plasmid in this clonal complex Z. Ying* (Shanghai, China), T. Yu, X. Jiang

4889 Antimicrobial susceptibility in Clostridioides difficile varies according to European region and isolate source J. Freeman* (Leeds, United Kingdom), V. Viprey, V. Tkalec, D. Ewin, W. Spittal, E. Clark, J. Vernon, W. Fawley, A. Benson, G. Davis, M. Rupnik, M. Wilcox, K. Davies

6819 Epidemic of carbapenem-resistant Klebsiella pneumoniae in a tertiary referral hospital for an annual surveillance in China Y. Jiang* (Hangzhou, China), Q. Shi, D. Zhao, P. Zhang, Y. Wang, J. Quan, X. Han, R. Yan, H. Liu, X. Wu, X. Hua, Y. Yu
Abstract Categories 2020

8303 Genomic features of Argentinean KPC-2 producing Klebsiella pneumoniae ST25 and comparative genomics with carbapenem susceptible ST25 isolates
D. Cejas, V. Di Pilato, L. Henrici De Angelis, S. Di Gregorio, L. Pallecchi, F. Arena, G. Rossolini, G. Gutkind* [Buenos Aires, Argentina], M. Radice

8602 Vertical transmission of the gene blaKPC-3 in clinical isolates of carbapenemase resistant Klebsiella pneumoniae
C. Ferreira* [Porto, Portugal], J. Rocha, S. Bikkarolla, K. Frykholm, S. Pohjanen, M. Brito, C. Lameiras, O. Nunes, F. Westerlund, C. Manaia

9415 Prevalence of genes encoding 16S RNA methyltransferase in carbapenemase-producing Serratia spp. in south Brazil
L. Bari* [Ponta Grossa, Brazil], C. Sanches Ito, L. Arend, K. Nogueira, F. Tuan

Session accepted as Paper Poster Session

Metallo-beta-lactamases and OXAs on the spot

425 Persistence of high-risk clones of carbapenem-resistant Klebsiella pneumoniae in a tertiary hospital in Valencia, Spain
B. Foster Escriva* [Oliva, Spain], N. Torno, C. Salvador Garcia, M. Beldu, C. Gimeno Cardona

597 Occurrence of NDM-1-producing Morganella morganii and Proteus mirabilis in a single patient, Portugal: probable in vivo transfer by conjugation
M. Aires De Sousa, J. Ortiz De La Rosa, M. Goncalves, F. Mattner, A. Wendel* [Cologne, Germany]

1269 Characterisation of NDM-producing Klebsiella pneumoniae isolates from different Roman hospitals

3818 Complex polyclonal outbreak of blaVIM-1-harboursing and mcr-9-cohabouring Enterobacter cloacae complex linked to drains in a German hospital
M. Malecki, P. Higgins, K. Xanthopoulou, H. Seifert, F. Mattner, A. Wendel* [Cologne, Germany]

4054 Carbapenemase-producing Klebsiella pneumoniae in a Tunisian university hospital: emergence of hypervirulent strains
B. Mnif* [Sfax, Tunisia], N. Sallem, F. Zouari, A. Hammami

4188 Oxacillinase-48-like [OXA-48] carbapenemases along with New Delhi metallo-β-lactamase in a neonatal unit
S. Naha, S. Mukherjee, K. Sands, P. Chattopadhyay, S. Mukherjee, S. Basu* [Kolkata, India]

4434 Dissemination of carbapenem-non-susceptible Klebsiella pneumoniae from Oman
M. Coorens, H. Al Farsi* [Stockholm, Sweden], J. Sylvin, Z. Al-Muharrmi, S. Al-Azri, A. Al Jardani, C. Giske

4508 Detection and successful containment of a NDM-1-producing Proteus mirabilis clone spread in an Italian sub-acute care unit
A. Mercato* [Grotte, Italy], I. Bitar, V. Mattioni Marchetti, F. Marchesini, M. Mancinelli, S. Bracco, V. Ragnani, A. Anesi, E. Nuclea, R. Migliavacca

4602 Whole genome sequencing investigation into a single-site outbreak of NDM-mediated carbapenem resistance disseminated across multiple species predominantly via IncI/M plasmids

5311 Molecular epidemiology and genetic characteristics of New Delhi metallo-β-lactamase among Gram-negative bacteria in a tertiary care hospital of north India
S. Singh* {Lucknow, India}, A. Singh, A. Pathak, C. Sahu, K. Prasad

Extensively drug-resistant Klebsiella pneumoniae ST383 co-harbouring OXA-48 and NDM-5 outbreak at a tertiary care centre in Lebanon
O. Zmerli* [Beirut, Lebanon], A. Chamieh, S. Saliba, Z. Daoud, C. Afif, E. Azar

Phenotypic and molecular investigation of ST11 NDM-1-producing Klebsiella pneumoniae isolates persisting between 2015 and 2018 in a Bulgarian hospital
T. Kostyanov* [Witrjik, Belgium], R. Yatcheva-Dobrevska, B. Xavier, V. Dicheva, P. Stefanowa, C. Lammens, H. Goossens, S. Malhotra-Kumar

Integrated molecular surveillance of carbapenem-resistant Enterobacteriaceae in Germany

Investigation of increased prevalence of IMP carbapenemases by next-generation sequencing in Wales
M. Woottton* [Cardiff, United Kingdom], M. Mentasti, K. Prime, S. Khan, K. Sands, J. Watkins, S. Corden, T. Connor, L. Jones

Investigation of a hospital outbreak of multi-drug resistant Klebsiella pneumoniae ST307, including isolates producing OXA-244 carbapenemase
L. Jones* [Cardiff, United Kingdom], M. Mentasti, K. Sands, J. Watkins, M. Morgan, S. Lingard, K. Prime, S. Khan, M. Bull, E. Davies, S. Corden, B. Healy, T. Connor, M. Woottton

Regional outbreaks of Enterobacter cloacae complex NDm-1 in Poland, 2015-19
R. Izdebski* [Warsaw, Poland], P. Urbanowicz, M. Biedrzycka, D. Żabicka, E. Literacka, W. Hryniewicz, M. Gniadkowski

Dissemination of OXA-244-producing Escherichia coli in Germany
J. Hars* [Bachum, Germany], B. Neumann, R. Kramer, K. Kremer, S. Haller, N. Pfennigwerth, A. Reuss, Y. Pfeifer, G. Werner, T. Eckmanns, S. Gatterman

Emergence of Klebsiella quasipneumoniae carrying New Delhi metallo-β-lactamase (blaNDM-1) gene in a Brazilian hospital
B. Boettger* [Sao Paulo, Brazil], A. Pignatari
7341 Regional dissemination of Klebsiella pneumoniae ST147 NDM-1 in Poland
M. Biedrzycka, R. Izedbski* (Warsaw, Poland), A. Baraniak, M. Machuliska, P. Urbanowicz, D. Żabińska, E. Literacka, W. Hytniewicz, M. Gniadkowski

7351 OXA-48 producing Klebsiella pneumoniae in non-hospitalised elderly patients in Zagreb, Croatia
J. Vranes* (Zagreb, Croatia), S. Šuto, B. Bedenic, A. Milinar-Dzepeina, S. Likić, S. Kibel, J. Knezevic, M. Anusic, V. Ticic, A. Grisold

7454 Epidemic clonal lineages of Enterobacteriales producing VIM-type carbapenemasases in Poland, 2013-18
R. Izedbski* (Warsaw, Poland), D. Żabińska, E. Literacka, P. Urbanowicz, A. Baraniak, W. Hytniewicz, M. Gniadkowski

8992 Unexpected detection of clinical isolates of Proteus mirabilis producing OXA-48 but susceptible to carbapenems and piperacillin-tazobactam
M. Artacho* (Málaga, Spain), R. Pedraza Merino, M. Cousse, M. Muñoz De La Rosa, E. Perez-Nadales, C. Pitart, M. Hernández García, J. Vila Estape, R. Canton Moreno, M. Egea, L. Martínez-Martínez

9072 Emergence of biaVIM-2 and detection of biaVIM-24 in Pseudomonas sp. from clinical samples in Brazil

9209 The emergence of new STs of blaNDM-positive hypervirulent Klebsiella pneumoniae isolates in an oncology hospital, Russia
P. Starkova* [Saint Petersburg, Russian Federation], I. Lazareva, V. Ageyevts, J. Sopova, V. Gostev, I. Tsvetkova, M. Lebedeva, S. Sidorenko

9373 Multidrug-resistant Klebsiella pneumoniae ST231: the new endemic super bug of India?
C. Shankar* (Vellore, India), J. Jacob, K. Vasudevan, B. Abirami, S. Anandan, V. Balaji

9593 Genomic epidemiology of NDM-producing Enterobacteriaceae in Portuguese hospitals
V. Manageiro* (Lisbon, Portugal), E. Ferreira, M. Caniça

Session accepted as Paper Poster Session
MIC: are all methods equal?

150 Assessment of trimethoprim-sulfamethoxazole susceptibility testing methods for fastidious Haemophilus spp.
Y. Sierra Urueña* [Barcelona, Spain], A. González Díaz, F. Tubau, A. Carrera-Salinas, J. Moleres, P. Bajanca-Lavado, J. Garmendia, M. Domínguez Luzon, A. Ardanuy Istaíre, S. Martí

1108 Reduced in vitro killing of methicillin-resistant Staphylococcus aureus blood culture isolates by vancomycin as the bacterial inocula increases
A. Alsaede, J. Rubin, S. Sanche, H. Deneer, J. Blondeau* [Saskatoon, Canada]

3564 Benzylpenicillin gradient tests underestimate MICs for penicillin non-susceptible Strephtococcus pneumoniae
F. Nilsson, E. Matuschek* [Växjö, Sweden], G. Kahlmeier

3658 Area of technical uncertainty for ciprofloxacin in Enterobacteriales: evaluation of MIC values using the E-test method
V. Viaggi, E. Meroni, O. Spezia, S. Tanolo, B. Pini, F. Luzzaro* [Lecco, Italy]

4613 Evaluation of commercial media for susceptibility testing of Neisseria gonorrhoeae
L. Davies, M. Cole, C. Horner, F. Ismail, Z. Ivanov, H. Fijer, L. Jones, R. Howe, M. Wootten* [Cardiff, United Kingdom]

4746 Stability studies with tigecycline in bacterial growth medium and impact of stabilising agents: a pre-requisite for in vitro susceptibility testing
L. Amann* [Hamburg, Germany], E. Ruda Vicente, M. Rathke, A. Broeker, S. Wicha

5137 Comparison of methods to evaluate the activity of ceftolozane/tazobactam against clinical isolates of carbapenem-resistant Pseudomonas aeruginosa from Chile

5433 Performance of VITEK 2 AST-GN meropenem/ vaborbactam for antimicrobial susceptibility testing of Enterobacteriaceae and Pseudomonas aeruginosa: a multi-centre study
S. Franklin* [St. Louis, United States], H. Dwivedi, G. Procop, M. Tračzewski, O. Garner, P. Deol

6184 The Insertion Sequence (IS) disruption of mgrB gene is critical for colistin susceptibility testing efficiency of Sensititre in carbapenem-resistant Klebsiella pneumoniae
B. Ozer* [Istanbul, Turkey], C. Vatansever, B. Gundogdu, O. Dogan, F. Can

6413 Molecular and phenotypic investigation of resistance in Neisseria gonorrhoeae
F. Luzzaro* (Lecco, Italy)

7351 Area of technical uncertainty for ciprofloxacin in Enterobacteriales: evaluation of MIC values using the E-test method
V. Viaggi, E. Meroni, O. Spezia, S. Tanolo, B. Pini, F. Luzzaro* [Lecco, Italy]

7454 Epidemic clonal lineages of Enterobacteriales producing VIM-type carbapenemasases in Poland, 2013-18
R. Izedbski* (Warsaw, Poland), D. Żabińska, E. Literacka, P. Urbanowicz, A. Baraniak, W. Hytniewicz, M. Gniadkowski

8992 Unexpected detection of clinical isolates of Proteus mirabilis producing OXA-48 but susceptible to carbapenems and piperacillin-tazobactam
M. Artacho* (Málaga, Spain), R. Pedraza Merino, M. Cousse, M. Muñoz De La Rosa, E. Perez-Nadales, C. Pitart, M. Hernández García, J. Vila Estape, R. Canton Moreno, M. Egea, L. Martínez-Martínez

9072 Emergence of biaVIM-2 and detection of biaVIM-24 in Pseudomonas sp. from clinical samples in Brazil

9209 The emergence of new STs of blaNDM-positive hypervirulent Klebsiella pneumoniae isolates in an oncology hospital, Russia
P. Starkova* [Saint Petersburg, Russian Federation], I. Lazareva, V. Ageyevts, J. Sopova, V. Gostev, I. Tsvetkova, M. Lebedeva, S. Sidorenko

9373 Multidrug-resistant Klebsiella pneumoniae ST231: the new endemic super bug of India?
C. Shankar* (Vellore, India), J. Jacob, K. Vasudevan, B. Abirami, S. Anandan, V. Balaji

9593 Genomic epidemiology of NDM-producing Enterobacteriaceae in Portuguese hospitals
V. Manageiro* (Lisbon, Portugal), E. Ferreira, M. Caniça

Session accepted as Paper Poster Session
Molecular and phenotypic investigation of resistance in staphylococci

369 Molecular characterisation of Staphylococcus aureus clinical strains from endotracheal tubes of patients with intensive care unit-acquired pneumonia
R. Cabrera* [Barcelona, Spain], L. Fernandez Barat, A. Motos, R. López, N. Vázquez Burgos, M. Panigada, F. Alvarez-Lerma, Y. Lopez, M. Acuña, D. Ramírez, F. García, J. Munita* [Santiago, Chile]

4746 Stability studies with tigecycline in bacterial growth medium and impact of stabilising agents: a pre-requisite for in vitro susceptibility testing
L. Amann* [Hamburg, Germany], E. Ruda Vicente, M. Rathke, A. Broeker, S. Wicha

5137 Comparison of methods to evaluate the activity of ceftolozane/tazobactam against clinical isolates of carbapenem-resistant Pseudomonas aeruginosa from Chile
1194 Mutant prevention concentration values of linezolid, moxifloxacin and vancomycin against Staphylococcus pseudintermedius strains recovered from humans
L. Blondeau* [Saskatoon, Canada], J. Rubin, R. Kanthan, S. Sanche, H. Denee, J. Blondeau

1298 Effect of short-term antimicrobial therapy on the tolerance and antibiotic resistance of multidrug-resistant Staphylococcus capitis
X. Yu* [Hangzhou, China]

1479 Risk factors associated with daptomycin non-susceptible Staphylococcus aureus bloodstream infections
S. Gudipati, A. Vahia* [Detroit, United States], M. Perri, R. Tibbetts, M. Zervos, G. Suleyman

1933 Nasal methicillin-resistant Staphylococcus aureus colonisation among adults and children in Russia: predominance ST22-subclone “Gaza Strip”

1942 Involvement of walK gene mutations in antibiotic resistance increase in daptomycin-unsusceptible methicillin-resistant Staphylococcus aureus
A. Hugo Campano, N. Gómez Casanova, J. Munoz-Bellido* [Salamanca, Spain]

2274 Molecular characterisation of methicillin-resistant Staphylococcus aureus isolates from the United Arab Emirates: emergence of novel strains and variants

3388 Minimum Inhibitory Concentration distributions and putative new resistance mechanisms for methicillin and trimethoprim in Staphylococcus saprophyticus

3626 Genomic analysis of Pantone-Valentine leukocidin-positive methicillin-resistant Staphylococcus aureus in hospitalised patients in Germany by whole genome sequencing: 2015-2018
S. Klein* [Heidelberg, Germany], J. Hannesen, P. Zanger, K. Heeg, S. Boutin, D. Nurjadi

3980 Direct detection of PBP2a using the high-resolution Orbitrap mass spectrometer and rapid discrimination of antibiotic resistance in Staphylococcus aureus using the Acron system
J. Neil* [Cambridge, United States], A. Verma, M. Viirtola, W. Mcgee, S. Kronewitter, J. Stephenson

4245 Investigation of linezolid resistance mechanisms of Staphylococcus epidermidis isolates collected in Gauteng, South Africa
K. Addison, K. Strydom, E. Hoosien, Y. Bolukaoto, M. Kock, M. Ehlers* [Pretoria, South Africa]

4271 Bloodstream infections caused by Staphylococcus aureus non-susceptible to daptomycin: clonal and clinical aspects
D. Fernandes, R. Władyka, A. Ferreira, S. Nouer* [Rio de Janeiro, Brazil], K. Dos Santos

4533 Rapid nuc and mecA gene testing by polymerase chain reaction is useful to choose appropriate antibiotics in Staphylococcus aureus bacteraemia
M. Ikemachi* [Kobe, Japan], Y. Go, H. Takekawa, K. Miyagawa

4550 The temporal dynamics of Staphylococcus aureus carriage among healthcare workers in a tertiary referral hospital with a history of endemic methicillin-resistant Staphylococcus aureus, investigated by whole genome sequencing
A. Kearney* [Dublin, Ireland], P. Kinnevey, M. Earls, T. Poovelikunnel, G. Brennan, A. Shore, H. Humphreys, D. Coleman

Linezolid resistance mechanisms in Staphylococcus capitis and Staphylococcus haemolyticus isolates collected in Gauteng, South Africa
K. Addison, K. Strydam, E. Hoosien, Y. Bolukaoto, M. Kock, M. Ehlers* [Pretoria, South Africa]

Methicillin-resistant Staphylococcus aureus bacteraemia: clinical-epidemiological characteristics and evolution of oxacillin resistance in 17 years
L. Vinuela, G. Santillana, R. Martinez, P. Bardon, C. Garcia, E. Clavijo, M. Garcia López* [Málaga, Spain]

Worldwide dissemination of linezolid-resistant Staphylococcus epidermidis clones
N. Faria, N. Bogas, C. Torres, A. Robinson, E. Petinati, J. Empel, N. Ishiwada, B. Kahl, F. Campanile, H. De Lencastre, F. Laurent, M. Miragaia* [Leiria, Portugal]

Penicillin-binding protein 2a temperature-sensitive folding defect: a new path to tackle methicillin resistance in Staphylococcus aureus
M. Roach* [Geneva, Switzerland], E. Lelong, R. Sierra, O. Panasenko, A. Renzon, W. Kelley

Evaluation of a culture surveillance application for the detection of methicillin-resistant Staphylococcus aureus in the clinical setting
M. Bois, E. Mcelvania, M. Gosnell, C. Orny, V. Jean-Marc, J. Lemstra, M. Van Der Lei* [Drachten, Netherlands], R. Marcelpoil

A study of virulence factors and antimicrobial resistance in Staphylococcus epidermidis isolates from ocular infections
N. Hussain Ahmed* [Delhi, India], A. Basu, G. Satpathy, B. Tezpur, N. Sharma, R. Chawla

Stepwise in vitro daptomycin resistance selection of Staphylococcus aureus: accumulation mutations and heteromutations
V. Gostev* [Saint Petersburg, Russian Federation], O. Kalinogorskaya, J. Sapova, I. Tsvetkova, M. Velizhanina, S. Sidorenko
Prevalence and molecular characteristics of Staphylococcus aureus carrying Panton-Valentine leukocidin genes isolated from patients accessing at emergency department in 2016-2018 period

A. Lai* [Milan, Italy], A. Bergna, S. Rimoldi, A. Ridelfo, M. Gismondo, C. Bolotta, M. Galli, G. Zehender

qPCR to detect mecA in faecal samples: a tool for assessing resistance burden amongst pets and their owners in the microbiological ‘fast age’?

S. Frosini* [Hatfield, United Kingdom], G. Gallow, J. Menezes, A. Belas, C. Saraiva Marques, C. Aborim, M. Pombo, A. Loeffler

Penicillin-binding protein 2 (PBP2), PBP2a and PBP4 clone-specific polymorphisms are not associated to cefotaroline- (CPT) susceptibility in Chilean clinical isolates of methicillin-resistant Staphylococcus aureus [MRSA]

M. Spencer, R. Martinez, L. Rivas, M. Rojas, R. Ríos, A. Dinh, L. Díaz, J. Reyes, B. Hanson, P. García, C. Arias, J. Munita* [Santiago, Chile]

Decline of the Brazilian endemic clone and dominance of internationally disseminated lineages among MRSA from bacteraemic patients in Porto Alegre, Brazil

Study of penicillin-susceptible Staphylococcus aureus in patients with bacteraemia. a multi-centre study in Spanish hospitals

Performance of the PBP2a (Alere-Abbott) immunochromatographic test on early primary cultures from positive MRSA/MR-CoNS blood cultures

C. Munier* [Lyon, France], C. Dupieux, C. Kolenda, M. Bes, O. Dauwalder, F. Vandenesch, A. Triston, F. Laurent

Evaluation of an immunochromatographic assay for rapid identification of PBP2a-positive Staphylococcus aureus

R. Sainz Rodriguez* [Málaga, Spain], M. Valverde Traya, M. Gasco Sanjuán

Linezolid resistance in coagulase-negative Staphylococcus spp. in six private hospitals in Sao Paulo, Brazil

An emerging methicillin resistance mechanism due to loss-of-function of the GdpP protein in mec gene-negative staphylococci undetected by reference methods

Genomic analysis reveals persistence and microevolution of methicillin-resistant Staphylococcus aureus in recurrent carriers

Increase of daptomycin-resistant Staphylococcus aureus with a possible link to antiseptic wound treatment in three medical centres in Cologne, Germany

A. Wendel* [Cologne, Germany], R. Otchwemah, F. Mattner, H. Oberländer, T. Tellez-Castillo, R. Skov, G. Werner, F. Bayer, B. Strommenger

The dissemination and molecular characterisation of clonal complex 361 methicillin-resistant Staphylococcus aureus in Kuwait hospitals, 2016-2018

E. Udo, E. Sarkhoo* [Jabriya, Kuwait], S. Boswini, E. Müller, S. Monecke, R. Ehrich

Accessory gene regulator (agr) functionality differences among closely related methicillin-resistant mecC-Staphylococcus aureus

Nasopharyngeal carriage of methicillin-resistant Staphylococcus aureus in newly HIV-diagnosed, antiretroviral therapy naïve adults, Dar es Salaam, Tanzania

J. Manyahi* [Bergen, Norway], S. Moyo, S. Aboud, N. Langeland, B. Blomberg

Lineage CC398 among methicillin-susceptible and methicillin-resistant Staphylococcus aureus isolates of blood cultures. A multi-centre study in Spanish hospitals

Zooming into the CoNS group on a species level exposes high heterogenicity in prevalence and antibiotic resistance: an in-depth data analysis in the MALDI-TOF era

M. Berends* [Groningen, Netherlands], C. Luz, Y. Roelofs, J. Arends, G. Andriesse, C. Clasen, A. Friedrich

Changing profile of invasive disease-causing Staphylococcus aureus in Australia

S. Baines* [Melbourne, Australia], S. Giuliani, A. Gançalves Da Silva, N. Holmes, G. Coombs, S. Pang, T. Stinear, B. Howden

Session accepted as 2-Hour Oral Session

Molecular epidemiology and detection of resistant staphylococci

Epidemiology of the Staphylococcus aureus CA-MRSA USA300 in Belgium

M. Argüin* [Brussels, Belgium], D. Marting, N. Yin, A. Deplano, C. Nonhoff, A. Meghraoui, C. Michel, M. Hallin
Development and preliminary evaluation of Multidrug Resistance Direct Flow Chip kit, a molecular method for a rapid detection of multiple antibiotic resistance markers
J. Carrero* (Granada, Spain), A. Galiana, D. Gomez, A. Olmo, M. Ruiz, N. Gonzalo-Jiménez

Molecular and cultural tests in a multi-centre point prevalence surveillance study on carbapenem-resistant Enterobacteriaceae in long-term care facilities’ residents in northern Italy area
G. Lo Cascio* (Verona, Italy), A. Azzini, A. Bazaj, G. Be, L. Lambertenghi, N. Salerno, I. Coledan, F. Mazzaferrì, L. Maccacaro, E. Concia, E. Tacconelli, G. Cornaglia

Evaluation of the EasyScreen ESBL/CPO kit for the detection of β-lactam resistance genes
C. Gonzalez* [Le Kremlin-Bicêtre, France], S. Dueslati, D. Girlich, L. Dortet, T. Naas

Molecular methods for carbapenemase detection

343 Expediting antibiotic therapy management of critically ill patients with pneumonia by the detection of the main carbapenemase and ESBL-encoding genes directly from bronchoalveolar lavage
M. Boattini* [Turin, Italy], G. Bianco, M. Iannaccone, C. Costa, R. Cavollo

593 Evaluation of a new commercial assay for detection and characterisation of carbapenemase genes
G. Eltringham* [Newcastle upon Tyne, United Kingdom], M. Suwara, M. Bakheit, S. Stack, E. Gillies, J. Perry

1054 Establishment and clinical application of a multiple touchdown PCR for detection of carbapenemase genes
X. Li* [Nanjing, China], N. Sun, L. Zhang, B. Yu, W. Wang, X. Yao, J. Yu

1800 Application of a new molecular biology method for carbapenem-resistant Enterobacteriaceae detection in rectal swabs
G. Parisi* [Rome, Italy], A. Denara, S. D’Inzeo, R. D’Arrigo, D. Gallone, B. Mariani, R. Oliverio

2126 Evaluation of a novel high-definition PCR multiplex assay to identify nine genetic targets associated with multidrug-resistant organisms
D. Gerstbrein, B. Mesich, N. Ledeboer, M. Faran, B. Buchan* [Milwaukee, United States]

4657 Performance of the Xpert Carba-R assay versus the ChromID CARBA SMART for the detection of carbapenemase-producing Gram-negative bacteria from rectal swabs

5630 Surveillance of circulating carbapenemase genes with automated molecular system (BD Max) at a healthcare centre in Buenos Aires, Argentina
M. Zárate* [Buenos Aires, Argentina], G. Weltman, G. Serruto, P. Mainetti, B. Wisner, J. Zaracho

6146 Novodiag Carba-R+ assay for the detection of carbapenemase-producing bacteria
S. Bernabeu* [Le Kremlin-Bicêtre, France], D. Girlich, W. Bouchahraf, S. Dueslati, I. Langlois, N. Arangia, C. Begasse, T. Huang, P. Bogaerts, Y. Glupczynski, T. Naas

6472 Development of LAMP-based multiplex real-time assay for rapid detection of genes of NDM, VIM, KPC and OXA-48 carbapenemase groups
A. Nosova* [Moscow, Russian Federation], Y. Savochkina, A. Ibragimova, G. Shipulin

7215 Evaluation of the Revogene Carba C assay for detection and differentiation of carbapenemase-producing bacteria
D. Girlich, M. Laguide, L. Dortet, T. Naas* [Le Kremlin Bicêtre, France]

7386 Utility of Xpert Carba-R in identifying carbapenem resistance in blood culture isolates in critically ill patients
V. Krishna* [Chennai, India], R. Vimal Kumar, S. Uma

7945 Rapid, direct antimicrobial susceptibility testing of positive blood cultures within 4 hours using ATP bioluminescence detection and machine learning method
S. Kawabe* [Kokubunji-shi, Tokyo, Japan], Y. Uchiha, H. Noda, A. Matsui, H. Niimi, I. Kitajima

5695 Implementing rapid susceptibility testing directly from positive blood cultures in the routine laboratory workflow for sepsis
P. Mantzana, E. Kandiliotou, M. Kyriakopoulou, F. Nitskina, M. Arhonti, A. Tychala* [Thessaloniki, Greece], G. Meletis, G. Vasilaki, G. Kagkalou, E. Protonotariou, L. Skoura

5630 Molecular and cultural tests in a multi-centre point prevalence surveillance study on carbapenem-resistant Enterobacteriaceae in long-term care facilities’ residents in northern Italy area
G. Lo Cascio* (Verona, Italy), A. Azzini, A. Bazaj, G. Be, L. Lambertenghi, N. Salerno, I. Coledan, F. Mazzaferrì, L. Maccacaro, E. Concia, E. Tacconelli, G. Cornaglia

3257 Rapid phenotypic susceptibility testing of Neisseria gonorrhoeae using Graver-Wade medium, broth microdilution, and the flow cytometry-assisted susceptibility test (FAST)
C. Gonzalez* [Le Kremlin-Bicêtre, France], S. Dueslati, D. Girlich, L. Dortet, T. Naas

6690 Impaired membrane integrity as a marker for colistin susceptibility: a flow cytometry method for rapid AST in Pseudomonas aeruginosa and Acinetobacter spp.
G. Ekelund, E. Sturegård, T. Schön, S. Samajo* [Karlskrona, Sweden]

6194 The flow cytometry-assisted susceptibility test [FAST] accurately predicts colistin MICs for Gram-negative bacilli directly from positive blood culture in less than four hours
T. Paton* [Perth, Australia], K. Mulroney, M. Kapczyk, C. Inglis

6194 The development of rapid multidrug resistance surveillance methods in acute care facilities
K. Mulroney, M. Kapczyk, C. Inglis

6194 Evaluation of the EasyScreen ESBL/CPO kit for the detection of β-lactam resistance genes
C. Gonzalez* [Le Kremlin-Bicêtre, France], S. Dueslati, D. Girlich, L. Dortet, T. Naas

6194 Development and preliminary evaluation of Multidrug Resistance Direct Flow Chip kit, a molecular method for a rapid detection of multiple antibiotic resistance markers
J. Carrero* (Granada, Spain), A. Galiana, D. Gomez, A. Olmo, M. Ruiz, N. Gonzalo-Jiménez

6194 Molecular and cultural tests in a multi-centre point prevalence surveillance study on carbapenem-resistant Enterobacteriaceae in long-term care facilities’ residents in northern Italy area
G. Lo Cascio* (Verona, Italy), A. Azzini, A. Bazaj, G. Be, L. Lambertenghi, N. Salerno, I. Coledan, F. Mazzaferrì, L. Maccacaro, E. Concia, E. Tacconelli, G. Cornaglia

6194 Evaluation of the EasyScreen ESBL/CPO kit for the detection of β-lactam resistance genes
C. Gonzalez* [Le Kremlin-Bicêtre, France], S. Dueslati, D. Girlich, L. Dortet, T. Naas

6194 Development and preliminary evaluation of Multidrug Resistance Direct Flow Chip kit, a molecular method for a rapid detection of multiple antibiotic resistance markers
J. Carrero* (Granada, Spain), A. Galiana, D. Gomez, A. Olmo, M. Ruiz, N. Gonzalo-Jiménez

6194 Molecular and cultural tests in a multi-centre point prevalence surveillance study on carbapenem-resistant Enterobacteriaceae in long-term care facilities’ residents in northern Italy area
G. Lo Cascio* (Verona, Italy), A. Azzini, A. Bazaj, G. Be, L. Lambertenghi, N. Salerno, I. Coledan, F. Mazzaferrì, L. Maccacaro, E. Concia, E. Tacconelli, G. Cornaglia

6194 Evaluation of the EasyScreen ESBL/CPO kit for the detection of β-lactam resistance genes
C. Gonzalez* [Le Kremlin-Bicêtre, France], S. Dueslati, D. Girlich, L. Dortet, T. Naas

6194 Development and preliminary evaluation of Multidrug Resistance Direct Flow Chip kit, a molecular method for a rapid detection of multiple antibiotic resistance markers
J. Carrero* (Granada, Spain), A. Galiana, D. Gomez, A. Olmo, M. Ruiz, N. Gonzalo-Jiménez

6194 Molecular and cultural tests in a multi-centre point prevalence surveillance study on carbapenem-resistant Enterobacteriaceae in long-term care facilities’ residents in northern Italy area
G. Lo Cascio* (Verona, Italy), A. Azzini, A. Bazaj, G. Be, L. Lambertenghi, N. Salerno, I. Coledan, F. Mazzaferrì, L. Maccacaro, E. Concia, E. Tacconelli, G. Cornaglia

6194 Evaluation of the EasyScreen ESBL/CPO kit for the detection of β-lactam resistance genes
C. Gonzalez* [Le Kremlin-Bicêtre, France], S. Dueslati, D. Girlich, L. Dortet, T. Naas
Abstract Categories 2020

Evaluation of FAST-Prep Liquid Colony for early antimicrobial sensitivity testing of positive blood culture by disk diffusion method
A. Khine* [Richmond Hill, Canada], N. Fernandez, L. Pandey, A. Telepbour, S. Novak, T. Alavie

Session accepted as Paper Poster Session
Phenotypic AST: still important!

Adjunction of daptomycin for the treatment of bacterial meningitis: in vitro study
T. Maldiney, D. Bonnat, N. Anzala, S. Albac, D. Labrousse, E. Varon, C. Neuwirth, D. Croisier, P. Chavanet*
[Dijon, France]

Can Rapid Antimicrobial Susceptibility Testing (RAST) improve the time to the optimal therapy for bloodstream infections?
F. Oleara* [Hamburg, Germany], B. Berinson, M. Christner, H. Rohde

Evaluation of EUCAST disk diffusion criteria to screening mecA gene in species of Staphylococcus epidermidis-like group
V. Pietta Perez* [João Pessoa, Brazil], M. Da Silva, A. Rossato, P. Alves D’Azevedo

Effective antimicrobial combination testing: linking rapid microcalorimetry screening to in vivo efficacy
K. Kragh* [Copenhagen, Denmark], D. Gijon, A. Maruri, A. Antonelli, M. Copp, M. Kolpen, S. Crane, C. Tellapragada, B. Hasan, C. De Vogel, W. Van Wamel, A. Verbon, C. Giske, G. Rossolini, R. Canton Moreno, N. Frimodt-Moller

In vitro evaluation of ceftolozane-tazobactam-aztreonam and ceftolozane-tazobactam-fosfomycin combinations by time-kill assays according to SPM-1-producing Pseudomonas aeruginosa clinical strains
G. Santos, G. Cuba* [São Paulo, Brazil], C. Silva Nodari, A. Streling, R. Caoy Da Silva, A. Gales, A. Pignatari, D. Nicolau, C. Kiffer

The predictive value of disc diffusion assay results for resistance in Gram-negative bacteraemia: a UK district general hospital experience
T. Swaine* [London, United Kingdom], C. Dominic, R. Buchanan

EUCAST improved screening algorithm for beta-lactam resistance in Haemophilus influenzae
E. Matuschek* [Växjö, Sweden], J. Ahman, J. Thegerström, F. Resman, S. Bengtsson, G. Kahlmeter

EUCAST temocillin breakpoints and antimicrobial susceptibility testing guidelines
C. Giske* [Stockholm, Sweden], E. Matuschek, R. Canton Moreno, J. Turnidge, G. Kahlmeter

Variations in categorical agreement between fosfomycin agar dilution and disk diffusion using standard and high inoculum protocols for Klebsiella pneumoniae testing

A rapid adenosine triphosphate bioluminescence-based assay for predicting antibiotic combinations against dividing and non-dividing live carbapenem-resistant Enterobacteriaceae
Y. Cai* [Singapore, Singapore], N. Begam, N. Fauzi, H. Wong, T. Lim, J. Tea, T. Tan, J. Sim, A. Kwa

Evaluation of ceftolozane-tazobactam disk diffusion testing of Pseudomonas aeruginosa in a multi-centre UK study
J. Diggle, I. Monahan, A. Alvarez Buylla, E. Manu, M. Allen, T. Planche, M. Wootton* [Cardiff, United Kingdom]

A study comparing the performance of an eravacycline oxoid antimicrobial susceptibility testing disc against an FDA-cleared predicate device
K. Church* [Basingstoke, United Kingdom], D. Carpenter, M. Olesky

SynAST, a reliable in vitro synergy test as support for New Delhi metallo-beta-lactamase Klebsiella pneumoniae infection therapy
A. Leonardi* [Pisa, Italy], C. Girodara, E. Tagliaprente, M. Falcone, G. Tisea, S. Barnini, F. Menichetti

Ceftazidime-avibactam/aztreonam synergism assay against carbapenem-resistant Enterobacteriaceae and Pseudomonas aeruginosa carrying metallo-beta-lactamases
J. Barbosa, K. Moraes* [São Paulo, Brazil], E. Sanchez Espinazo, L. Perdigao Neto, S. Santos, A. Marchi, R. Ruedas Martins, T. Guimaraes, F. Rossi, S. Figueiredo Costa

In vivo and in vitro synergistic activity of colistin combining with meropenem and sulbactam against multidrug-resistant and pandrug-resistant Acinetobacter baumannii clinical isolates
C. Kulah* [Zonguldak, Turkey], E. Subasi, A. Atalar

AST for fastidious bacteria: a reliable automation to standardise the EUCAST disk diffusion test
M. Paolucci* [Brescia, Italy], C. Lacchini, N. Schepis, L. Navarrina

Impact of lung transplantation on the phylogenetic diversity of Pseudomonas aeruginosa isolates from end-stage cystic fibrosis patients
R. Datar* [La Balme Les Grottes, France], A. Coello Pelegrin, S. Urengi, A. Perry, J. Samuel, A. Van Belkum, H. Goossens, V. Chalansonnet

Predicting Pseudomonas aeruginosa susceptibility phenotypes from whole genome sequence resistance analysis
S. Cortes-Lara* [Palma, Spain], C. Lopez Causpe, E. Del Barrio-Tofiño, A. Oliver

Whole genome sequencing to detect antimicrobial resistance-associated determinants in Staphylococcus epidermidis
K. Cole* [Brighton, United Kingdom], B. Young, D. Wilson, B. Atkins, J. Paul, M. Llewellyn
Abstract Categories 2020

1644 Prediction of antibiotic resistance in Helicobacter pylori by whole genome sequencing and open-source bioinformatics tools
A. Miqueleiz, A. Blanco Suárez, C. Alba Rubia, P. Urruzune, K. Thorell, T. Labarca Caveró* [Madrid, Spain]

1658 TOF MS-typing: employment of bioinformatics by MALDI-TOF MS

4828 Understanding discordance between observed and WGS-predicted resistance: a study of amoxicillin-clavulanate in Escherichia coli
T. Davies* [Oxford, United Kingdom], A. Sheppard, J. Swann, N. Stoesser, M. Ellington, N. Woodford, T. Peto, D. Crook, M. Anjum, A. Walker

4940 Bioinformatic fake news: the important but under-appreciated caveats of identifying resistance genes from whole genome sequencing data
T. Davies* [Oxford, United Kingdom], A. Sheppard, J. Swann, N. Stoesser, M. Ellington, N. Woodford, T. Peto, D. Crook, M. Anjum, A. Walker

5117 Optimisation of the MALDixin test for the rapid identification of colistin resistance in Klebsiella pneumoniae using MALDI-TOF MS
W. Xu* [Singapore, Singapore], S. Prakki, N. Thevasagayam, L. Wang, K. Marimuthu, I. Venkotchalam, J. Teo, O. Ng

5896 Quantitative detection of bacterial resistance by meropenem hydrolysis using MALDI-TOF MS
C. Wilhelm* [Porto Alegre, Brazil], M. Carneiro, P. Wink, A. Barth

5960 Evaluation of a liquid chromatography and tandem mass spectrometry-based Carba detection method using the Acron system for clinical isolates expressing multiple carbapenemases

6130 Metagenomic analyses of antibiotic resistance genes in gut microbiome of healthy people in Korea: high carriage rate of blaCTX-M, blaCMY-2 and plasmid-mediated quinolone resistance genes
J. Kim* [Guri, South Korea], M. Sea, K. Park, H. Park, H. Hwang, B. Kim, R. Rho, H. Pai

6679 Evaluation and differentiation of carbapenemase-encoding plasmids by short-read sequencing data: validation by ONT long-read hybrid assembly of a large Singaporean carbapenem-resistant Enterobacteriaceae collection
W. Xu* [Singapore, Singapore], S. Prakki, N. Thevasagayam, L. Wang, K. Marimuthu, I. Venkotchalam, J. Teo, O. Ng

6917 Big data analysis of all bacterial genomes establishes a triple whammy of carbapenemases, ICEs and mediated quinolone resistance genes
T. Tomaz Santos Batelha* [Porto, Portugal], J. Cordeiro

7035 Rapid MALDI-TOF MS-based method for vancomycin-resistant Enterococcus faecium detection
A. Candela* [Madrid, Spain], L. Quiraga, M. Arroyo, A. Ruiz, E. Cercenado, G. Méndez, M. Marín, P. Muñoz, L. Mancera Pascual, B. Rodríguez-Sanchez

7646 Accurate differentiation of carbapenemases by MALDI-TOF MS-typing: employment of bioinformatics
E. Goto, J. Arca Suárez, B. Rodrí, G. Méndez, M. Arroyo, L. Mancera Pascual, G. Bou Arevalo, M. Oviño García* [A Coruña, Spain]

8627 Rapid non-molecular methods for detection of beta-lactam and polymyxin resistance
M. Sorensen, E. Nilsson, F. Gardner, S. Ramadan, D. Goodlett, R. Ernst* [Baltimore, United States]

9635 Characterisation of extended-spectrum beta-lactamases by mass spectrometric analysis
S. Lee* [Seoul, South Korea], W. Yang, H. Suh, H. Jang, Y. Park, S. Hwang, J. Baek

Session accepted as Paper Poster Session
Proteomics beyond bacterial identification

256 Evaluation of a novel method for detection of carbapenem hydrolysis with an automated software (Clover BioSoft) by MALDI-TOF MS
E. Goto, G. Méndez, L. Mancera Pascual, G. Bou Arevalo, M. Oviño García* [A Coruña, Spain]

1658 Accurate differentiation of carbapenemases by MALDI-TOF MS-typing: employment of bioinformatics
E. Goto, J. Arca Suárez, B. Rodrí, G. Méndez, M. Arroyo, L. Mancera Pascual, G. Bou Arevalo, M. Oviño García* [A Coruña, Spain]

3385 MBT STAR-Carba assay: going beyond the routine protocol
M. Zlach* [Toruń, Poland], M. Peer, K. Sparbier, M. Kastrzewa, B. Buszewski

4757 Extended antibiotic panel to analyse the susceptibility of Enterobacteriaceae by the MALDI-TOF MS-based MBT FAST Assay
K. Sparbier, D. Drews, M. Peer, I. Nix, E. Idelevich, K. Becker, M. Kastrzewa* [Bremen, Germany]

5896 Quantitative detection of bacterial resistance by meropenem hydrolysis using MALDI-TOF MS
C. Wilhelm* [Porto Alegre, Brazil], M. Carneiro, P. Wink, A. Barth

6476 Optimization of the MALDixin test for the rapid identification of colistin resistance in Klebsiella pneumoniae using MALDI-TOF MS
L. Dortet* [Paris, France], S. Bernabeu, P. Bogaerts, R. Bonnin, T. Naas, A. Filloux, G. Larrouy-Maumus

8718 Antimicrobial susceptibility testing by MALDI-TOF MS of lipids determines true MICs in six hours
M. Sorensen, E. Nilsson, F. Gardner, S. Ramadan, D. Goodlett, R. Ernst* [Baltimore, United States]

3385 MBT STAR-Carba assay: going beyond the routine protocol
M. Zlach* [Toruń, Poland], M. Peer, K. Sparbier, M. Kastrzewa, B. Buszewski

1658 Accurate differentiation of carbapenemases by MALDI-TOF MS-typing: employment of bioinformatics
E. Goto, J. Arca Suárez, B. Rodrí, G. Méndez, M. Arroyo, L. Mancera Pascual, G. Bou Arevalo, M. Oviño García* [A Coruña, Spain]
Detection of carbapenemases in *Pseudomonas* and *Acinetobacter* by the Mast Carba PâcE kit
O. Fournier, K. Jeannot* [Besançon, France], L. Gabriel, P. Tripolley, J. Rousselot, A. Potran, P. Plé siat

Rapid detection of piperacillin/tazobactam resistance and extended spectrum β-lactamases in clinical isolates of *Escherichia coli*
A. Rodríguez Villodres* [Seville, Spain], A. Gutiérrez-Linares, J. Pachon-Díaz, J. Lepe, Y. Smani

Direct detection of extended-spectrum β-lactamases in bacteria isolated in blood culture bottles using a lateral flow assay
G. Cuesta Chasco* [Barcelona, Spain], J. Bosch, Y. Zboromyrska, C. Pitart, A. Vergara, F. Morales, E. Rubio García, B. Fidalgo, M. Fernández, C. Casals-Pascual, J. Vila Estape

Evaluation of the rapid ResaPolymyxin Acinetobacter/*Pseudomonas* NP test for rapid screening of colistin resistance in non-lactose fermenters
H. Jung* [Pretoria, South Africa], J. Pitout, B. Mitton, K. Strydom, C. Kingsburgh, N. Mbelle, M. Ehlers, M. Kock

Polymerase chain reaction (PCR) uses as a screening tool to detect polymyxin B susceptibility in *Enterobacterales*

Investigation of carbapenemases by RESIST-4 O.K.N.V Immunochromatographic lateral flow assay in *Enterobacteriaceae* isolates
M. Yasar* [Izmir, Turkey], F. Cilli, Y. Tekintas, F. Polat, M. Holubar, S. Deresinski, N. Banaei

Evaluation of the RESIST-4 O.K.N.V K-SeT test for the detection of carbapenemase production in *Enterobacteriaceae*
A. Both, L. Jávnári, A. Hanczvikkel, A. Tóth* [Budapest, Hungary]

Improved NG-test Carba5 assay for the detection of previously undetected IMP-variants

Comparison of four ESBL detection tests directly from blood cultures and urine samples
F. Camétena* [Paris, France], H. Kafando, A. Ly, P. Thiebot, M. Rouveau, T. Sophie, M. Lafaurie, B. Ber cot

Evaluation of the new BL-RED electrochemical test for the detection of 3GC-resistant *Enterobacteriaceae* directly from positive blood cultures
C. Durand, A. Boudet* [Nîmes, France], J. Lavigne, A. Pantel

High-throughput bacterial phenotyping to characterise antimicrobial resistance mechanisms
B. Warne* [Cambridge, United Kingdom], J. Bartholdson Scott, S. Forrest, M. Maes, S. Sridhar, M. Török, G. Dougan

Clinical impact of rapid susceptibility testing in Gram-negative bloodstream infections
V. Antón Vázquez* [London, United Kingdom], C. Suarez, S. Adjepong, T. Planche

Improving Outcomes and Antibiotic Stewardship for patients with bloodstream Infections (IOAS): a quasi-experimental multi-centre analysis of time to optimal therapy
A. Bhaladi* [Tucson, United States], S. Mavane, M. Morgan, M. Ben-Aderet, M. Madhusudhan, J. Kolev, R. Daré, E. Rosenbaum, K. Wolfe, B. Ford, D. Ince, P. Kinn, K. Percival, R. Humphries

Implementation of EUCAST rapid antimicrobial susceptibility testing combined with routine infectious disease bedside consultation
T. Valentín* [Graz, Austria], T. Loizenbaur, E. König, J. Prattes, S. Wunsch, C. Zurl, R. Krause, I. Zollner-Schwetz

Impact of rapid antimicrobial susceptibility testing on antimicrobial stewardship and clinical outcomes of patients with Gram-negative rod bloodstream infection

Very good results for the use of the RAST methodology and for identification of agents of sepsis directly from the blood cultures by MALDI-TOF to optimise antibiotic therapy
J. Maman Pariona, F. Oliveira, P. Scatoni, T. Zaccariotto, N. Lincopan, C. Levy* [Campinas, Brazil]
2670 Potentiation of quinolones activity against *Escherichia coli* by suppression of SOS response and oxidative detoxification systems

3101 Identified beta-lactamase genes in *Aeromonas* species: an experience from Qatar
A. Hussain* (Doha, Qatar), S. Skariah, M. Sid Ahmed, M. Badawi, H. Ahmedullah, M. Al-Maslamani, A. Al-Khal, H. Al Souh, A. Sultan, E. Ibrahim, H. Ziglam

3418 Enhancing fosfomycin activity via glycerol-3-phosphate transporter activation
M. Ortiz Padilla* (Seville, Spain), I. Portilla Calderón, B. De Gregorio Laria, J. Rodríguez-Baró, A. Pascual Hernandez, J. Rodríguez Martínez, F. Docobo Perez

3790 Unveiling the role of nisin on resistance development by diabetic foot staphylococci: mutant selection window and horizontal gene transfer
M. Costa, E. Cunha, L. Tavares, M. Oliveira* (Lisbon, Portugal)

4124 Characterising a novel mechanism of inducible carbapenem resistance in toxigenic *Corynebacterium diphtheriae*
B. Forde* (Brisbane, Australia), A. Henderson, G. Playford, D. Paterson, S. Beatson

4264 Prevalence of macrolide resistance mutations in *Mycoplasma pneumoniae* from patients with respiratory tract infections in Europe
I. Edelstein* (Smolensk, Russian Federation), A. Romanov, A. Kuzmenkov, N. Alyabyeva, T. Pleskachevskaia, E. Groshenkova, R. Kozlov

4380 Spontaneous and clinically relevant tet(A)-dependent tigecycline resistance development
J. Jagdmann* (Uppsala, Sweden), D. Andersson, H. Nicoloff

4699 Carbapenem-resistant *Pseudomonas aeruginosa* in cystic fibrosis children
E. Samoylova, E. Ibrahim, H. Ziglam

5546 A novel variant of CTX-M β-lactamase in a clinical strain of *Serratia marcescens*
P. Celejewski-Marciniak, R. Wolinowska, M. Wroblewska* (Warsaw, Poland)

5835 Two antibiotics are better than one: using functional genomics to elucidate mechanisms of action in combination therapy
G. Sullivan* (North Ryde, Australia), R. Maharjan, N. Delgado, A. Cain

5948 Induction of erythromycin resistance in *Bordetella* sp. confirmed by whole genome sequencing
W. Fong* (Westmead, Australia), V. Timms, E. Sim, T. Nguyen, V. Sintchenko

6164 The rates of antimicrobial resistance in leprosy are higher among cases diagnosed in France than in those diagnosed in African countries [WHO sentinel surveillance network]

6229 Antimicrobial susceptibility of medically important *Nocardia* species in Korea
K. Hur* (Seoul, South Korea), K. Park, M. Kim, H. Sung

6312 Do bacterial growth conditions affect antibiotic resistance evolution?
J. Littler* (Coventry, United Kingdom), F. Harrison

7866 Piperacillin-tazobactam resistance developed during febrile neutropenia
C. Gomes* (São Paulo, Brazil), E. Sanchez Espinaza, M. Farrel Cortes, A. Marchi, T. Guimaraes, F. Rossi, L. Perdigao Neto, V. Rocha, S. Figueiredo Costa

9132 Aminoglycoside resistance mechanisms in invasive *Klebsiella pneumoniae* and *Escherichia coli*: a threat of rmtC-mediated resistance
I. Uzun* (Istanbul, Turkey), T. Celik, B. Aksu, N. Ulger Toprak, M. Hasdemir

Session accepted as Paper Poster Session

**Resistance issues in streptococci**

1280 Multiple mutations in dihydrofolate reductase gene in cotrimoxazole-resistant *Streptococcus pneumoniae* isolated from HIV adults in a community setting, Tanzania
J. Manyahi* (Bergen, Norway), S. Mayo, S. Aboud, N. Langeland, B. Blomberg

1237 Whole genome analysis of non-PCV13 emergent serotypes 8, 12F, 9N and 22F causing invasive pneumococcal disease in Spain
A. González Díaz* (Barcelona, Spain), J. Cámara, M. Ercibengoa Arana, E. Cercenado, N. Larrosa, M. Quesada, D. Fontals, M. Cubero, J. Marimon Ortiz De Zorate, J. Yuste, C. Ardany Tisaire

2277 Colonisation dynamics of *Achromobacter xylosoxidans* in the airways of cystic fibrosis patients: a longitudinal study
S. Kampmeier* [Münster, Germany], A. Mellmann, B. Kuhl

2299 Enhanced fosfomycin activity via glycerol-3-phosphate transporter activation
M. Ortiz Padilla* (Seville, Spain), I. Portilla Calderón, B. De Gregorio Laria, J. Rodríguez-Baró, A. Pascual Hernandez, J. Rodríguez Martínez, F. Docobo Perez

3044 Unveiling the role of nisin on resistance development by diabetic foot staphylococci: mutant selection window and horizontal gene transfer
M. Costa, E. Cunha, L. Tavares, M. Oliveira* (Lisbon, Portugal)

4264 Prevalence of macrolide resistance mutations in *Mycoplasma pneumoniae* from patients with respiratory tract infections in Europe
I. Edelstein* (Smolensk, Russian Federation), A. Romanov, A. Kuzmenkov, N. Alyabyeva, T. Pleskachevskaia, E. Groshenkova, R. Kozlov

5546 A novel variant of CTX-M β-lactamase in a clinical strain of *Serratia marcescens*
P. Celejewski-Marciniak, R. Wolinowska, M. Wroblewska* (Warsaw, Poland)

5835 Two antibiotics are better than one: using functional genomics to elucidate mechanisms of action in combination therapy
G. Sullivan* (North Ryde, Australia), R. Maharjan, N. Delgado, A. Cain

5948 Induction of erythromycin resistance in *Bordetella* sp. confirmed by whole genome sequencing
W. Fong* (Westmead, Australia), V. Timms, E. Sim, T. Nguyen, V. Sintchenko
Emergence of the uncommon multiple drug-resistant non-PCV13 serotype 13/ST2754-clone among paediatric nasopharyngeal pneumococci isolated in Russia: 2010-2018
E. Brzhazovskaya* [Moscow, Russian Federation], N. Alyabyeva, T. Savinova, O. Panomarekova, A. Mirzaeva, T. Kalichenko, V. Mikhailova, D. Shagin, N. Mayanskiy

In the absence of pressure, physical interaction within nasopharyngeal pneumococcal biofilms leads to acquisition of cephalosporin resistance but not to capsule switch events
X. Wu* [Hangzhou, China], L. Santiago, Y. Tzeng, D. Stephens, J. Vidal

Resistance patterns and serotype distribution of Streptococcus pneumoniae isolates responsible for respiratory tract infections in Poland, 2006-2018
A. Gołębiowska* [Warsaw, Poland], I. Waśko, P. Rankiewicz, M. Kiedrowska, I. Wróbel, A. Bojarska, D. Stephens, J. Vidal, X. Wu* [Hangzhou, China], L. Santiago, Y. Tzeng, D. Stephens, J. Vidal

Identification of a multidrug-resistance cluster in clinical isolates of Streptococcus pyogenes that confers resistance to macrolides, lincosamides, tetracyclines, chloramphenicol and co-trimoxazole
D. Berbel Palau, G. López De Egea, J. Câmara* [Barcelona, Spain], A. González Díaz, M. Cubera, F. Tubau, M. Dominguez Lucon, C. Ardanyu Tisoire

Clonal spread of multidrug-resistant penicillin-nonsusceptible Streptococcus agalactiae
J. Chang* [Goyang-si, South Korea], H. Sung, M. Kim

A multi-centre evaluation of the US prevalence and regional variation in macrolide-resistant Streptococcus pneumoniae from blood or respiratory cultures among adult patients
V. Gupta* [Naperville, United States], K. Yu, J. Schranz, H. Jakinen-Guzon, S. Gelone

Collateral responses to fluorquinolone resistance in Streptococcus pneumoniae
A. Liakopoulos* [Leiden, Netherlands], M. Buffoni, D. Rozen

Emergence of penicillin non-susceptible Group B streptococci within the hypervirulent CC17 clone colonising pregnant women in Portugal: a genomic analysis
R. Mamede, J. Melo-Cristino, M. Ramirez* [Lisbon, Portugal], E. Ferreira Martins

Genetic diversity of invasive, non-invasive and colonising Group B Streptococcus isolates in Southern Brazil
O. May-Fuerschutter, E. Alves, A. Vilela, F. Barazetti, J. Palmeiro, M. Scheffler* [Florianopolis, Brazil], M. Bazzo

Antimicrobial susceptibility of Streptococcus dysgalactiae subspecies equisimilis isolates recovered from invasive infections in Portugal
A. Castro, J. Melo-Cristino, M. Ramirez, M. Pinho* [Lisbon, Portugal]

Non-lethal concentrations of ceftazidime and ceftazidime-avibactam select for multiple-resistant genotypes
C. Fröhlich* [Tromsø, Norway], J. Alves Gama, P. Johnsen, H. Leiros, O. Samuelsen

Dual therapy with aztreonam & ceftazidime/avibactam against multi-drug resistant Stenotrophomonas maltophilia on tricuspide valve endocarditis
J. Alexander* [Orlando, United States], A. Carr, S. Minor, D. Navas

Baseline resistance to ceftazidime-avibactam and aztreonam-avibactam in carbapenemase-producing Enterobacteriales from Argentina mediated by the co-expression of PER ESBL: role of imipenem-relebactam and aztreonam-relebactam as therapeutic alternatives
F. Pasteran* [Buenos Aires, Argentina], J. De Mendieta, M. Rappaport, S. Ramirez, D. Faccone, C. Lucera, P. Ceriana, A. Corso

Genomic and transcriptomic approach to unravel the resistance mechanisms to ceftazidime-avibactam in Pseudomonas aeruginosa and Enterobacter cloacae
A. Bösch* [St. Gallen, Switzerland], S. Schmitt, M. Held, J. Findlay, A. Egli, H. Seth-Smith, V. Hinic, V. Gisler, H. Fankhauser, M. Oberle, P. Kohler, S. Seiffert, N. Oliver, B. Babouee Flury

A novel KPC-3 variant associated with CAZ/AVI resistance in an Klebsiella pneumoniae ST512 causing bacteremia
A. Knezevic* [Trieste, Italy], M. Cappi, A. Antonelli, V. Di Pilato, T. Giani, S. Di Bella, C. Maurel, M. Zatta, S. Fossati, M. Bartolini, E. Piccoli, R. Luzzati, G. Rossolini, M. Busetti

Mechanism of ceftazidime-avibactam resistance in carbapenem-resistant Escherichia coli isolated in the Arabian Peninsula
A. Sonnevend* [Pécs, Hungary], A. Ghazawi, V. Di Pilato, A. Antonelli, G. Rossolini, T. Pal

Mechanism of ceftazidime-avibactam resistance in carbapenem-resistant Klebsiella pneumoniae infections
S. Van Asten* [Leiden, Netherlands], M. Boattini, G. Blanco, M. Kraakman, C. Costa, R. Cavallio, A. Bernards

Mutations variability of KPC-3 carbapenemase related to ceftazidime-avibactam resistance found in Klebsiella pneumoniae strains isolated in Verona, Italy
S. Cavallini, I. Unali, I. Di Nolfo, A. Bertoncelli, A. Mazzariol* [Verona, Italy]
Impact of porin deletions on the in vitro antimicrobial activity of cefepime/taniborbactam (formerly cefepime/VNRX-5133) in Klebsiella pneumoniae
T. Uehara* [Malvern, United States], S. Vernacchia, B. Miller, C. Chatwin, G. Moeck, C. Burns, D. Pevear, D. Daigle

Evaluation of in vitro susceptibility and molecular resistance mechanisms to ceftazidime-avibactam in clinical isolates of Pseudomonas aeruginosa from five Latin American countries
E. De La Cadena* [Bogota, Colombia], T. Appel, M. Mojica, D. Daigle, B. Miller, C. Chatwin, G. Moeck, C. Burns, D. Pevear, T. Uehara* [Malvern, United States], S. Vernacchio, J. Marschall, R. Sommerstein* [Bern, Switzerland]

Non-vancomycin antibiotic resistance genes in vancomycin-resistant E. faecium: variation linked to MLST and mis-match between aminoglycoside resistance geno- and phenotypes
Z. Adamecz* [Copenhagen, Denmark], K. Nielsen, N. Kirkby, N. Frimodt-Moller

Detection of low-level vanB-type vancomycin-resistant Enterococcus faecium with agar screen methods
S. Van Koeveringe, K. Loens, I. Mermans, H. Jansens, H. Goossens, V. Matheeussen* [Edegem, Belgium]

Molecular epidemiology of vancomycin-resistant enterococcus in parts of China
H. Sun* [Beijing, China], L. Chang, Y. Xu

Daptomycin plus fosfomycin or ceftaroline is active in vitro against high-level aminoglycoside-resistant and vancomycin-resistant or vancomycin-susceptible Enterococcus spp. strains

Resistance to key drugs in enterococci
Abstract Categories 2020
ABSTRACT BOOK – 30th ECCMID 2020

Linezolid-resistant strains of Enterococcus faecium in the Czech Republic from 2009 to 2018
L. Malisova* [Prague, Czech Republic], V. Jakubu, E. Lira, I. Boszczowski, C. Dantas De Maio Carrilho, Côrtes* [Sao Paulo, Brazil], T. Orsi, R. Ruedas Martins, E. Sanchez Espinoza, L. Perdigao Neto, M. Farrel J. García-Betancur, C. Pallares, M. Villegas

Linezolid-resistant strains of Enterococcus faecium [VREFm] among patients admitted to emergency departments in Copenhagen [Denmark] compared with VREFm prevalence of the background population
I. Rubin* [Frederiksberg, Denmark], M. Pinholt, H. Calum, C. Pohl Kavalris, M. From-Hansen, M. Stangerup, H. Westh, J. Knudsen

Gene expression analysis of transport channels in Enterococcus faecium
Z. Alhareth* [Leicester, United Kingdom], K. Laird, L. Smith, J. Dixon, L. Owen

Genome-based surveillance of clinical vancomycin-resistant Enterococcus faecium reveals increased prevalence of vanB-type isolates of ST117/CT71 in German hospitals, 2010-2016
B. Neumann* [Wernigerode, Germany], M. Kresken, G. Werner

Improved detection of van-B bearing E. faecium isolates in a German hospital laboratory by a modified routine workflow for antimicrobial susceptibility testing
C. Scherer* [Bielefeld, Germany]

Clonal attack: number of vancomycin-susceptible, -variable and -resistant E. faecium clones in individual rectal swabs
K. Nielsen* [Copenhagen, Denmark], S. Radmer, K. Knudsen List, N. Frimodt-Moller

Duration of colonisation with vancomycin-resistant Enterococcus faecium in a large ST796 vanB hospital outbreak: a cohort study
V. Piezzi, Y. Schmiedel, T. Kaspar, M. Baechli, P. Bittel, J. Marschall, R. Sommerstein* [Bern, Switzerland]
5505 High-throughput culture-based vancomycin-resistant enterococci screening using artificial intelligence
A. Nowag, H. Wisplinghoff* [Cologne, Germany], X. Quante, S. Giglia, S. Wirth, B. Pohl, N. Jazmati

5612 Increasing importance of Enterococcus faecium as an aetiological agent of healthcare-associated bloodstream infections
H. Marchel, M. Wrablewska* [Warsaw, Poland]

6070 Comparative genomics of global linezolid-resistant Enterococcus faecalis strains unveils a chromosomal hotspot for optrA acquisition
A. Freitas* [Porto, Portugal], A. Tedim, C. Novais, V. Fernandez Lanza, L. Vieira Peixe

6235 Phenotypic susceptibility testing for vancomycin-resistant enterococci in less than 4 hours using the flow cytometry-assisted susceptibility test
K. Mulroney, T. Paton* [Perth, Australia], M. Kopczyk, A. Chakera, C. Carson, T. Inglis

6473 Major changes detected in penicillin-binding proteins of vancomycin-resistant Enterococcus faecalis by sequencing and homology modeling
N. Caglayan, B. Sancak, E. Aybakan, Z. Kanlidere, O. Öflaz, T. Kocagoz* [Istanbul, Turkey]

6579 Possible horizontal transfer of enterococcal IS1216V-mediated composite transposon between enterococci and methicillin-resistant Staphylococcus aureus
W. Hung* [Kaohsiung City, Taiwan], C. Chang

7269 Large diffusion of optrA- and poxtA-producing lincosamide-resistant Enterococcus spp. among healthy children from rural communities of the Bolivian Chaco

7827 Genetic context of the poxtA gene that confers resistance to linezolid in enterococci
L. Dejoies* [Rennes, France], S. Schultz, A. Zouari, S. Potrel, A. Collet, G. Auger, M. Sassi, V. Cattoir

9246 Detection of linezolid-resistant enterococci carrying optrA and/or poxtA in raw-frozen dog foods commercialised in the EU: trend or threat?
L. Finisterra, C. Novais, B. Duarte, L. Vieira Peixe, A. Freitas* [Porto, Portugal]

9311 Genomic characterisation of clinical Enterococcus faecium from Tunisia: remarkable identity with ampicillin-resistant strains obtained from animals/meat in the same area
A. Freitas* [Porto, Portugal], H. Elghoibet, C. Novais, B. Duarte, M. Abbassi, L. Vieira Peixe

Whole genome sequencing of Pseudomonas aeruginosa isolates from across the United Kingdom: population structure and molecular predictors of resistance
T. Planche* [London, United Kingdom], A. Witney, A. Alvarez Buylla, M. Allen, E. Manu, I. Monahan, M. Wootton

Whole genome sequence of a pan-resistant Klebsiella pneumoniae sequence type 11 harbouring an IncR-F33:A-B- plasmid carrying multiple resistance determinants identified in Japan in 2016
S. Nishida* [Tokyo, Japan], Y. Ono

Whole genome sequence-based PCR for the rapid identification of Pseudomonas aeruginosa ST175 high-risk clone isolates directly from clinical samples
C. Gobot* [Palma, Spain], P. Lara-Esbrí, X. Mulet, A. Oliver

Whole genome sequence analysis of antimicrobial resistance genes in Global Priority Superbugs
N. Perera* [Teddington, United Kingdom], C. Fedorchuk, J. Sutcliffe, J. Sohn, R. Mclaughlin, J. Lopera

Pathogenic potential and antimicrobial resistance genomic analysis of human gut commensal Escherichia coli
B. Pakbin, P. Lisotto, E. Raangs, A. Friedrich, J. Rossen, S. Garcia Cobos* [Madrid, Spain]

Insights in the resistome of multidrug-resistant Pseudomonas aeruginosa strains isolated in Romania from nosocomial infections and wastewater
I. Gheorghe* [Bucharest, Romania], I. Czobor, L. Papa, I. Avram, A. Haitham, S. Mohsin, S. Paraschiv, M. Surleac, V. Cristea, M. Papa, L. Marustescu, D. Otelea, V. Lazar, M. Chifiriuc

Resistome analysis of new bacterial species isolated at the Institut Hospitalo-Universitaire Méditerranée S. Khabthani, M. Hamel, S. Diene, V. Merhej, J. Rolain* [Marseille, France]

An outbreak of hypervirulent and multidrug-resistant clone [ST2096] Klebsiella pneumoniae silently transmitting in a Saudi Arabia western region hospital: a clinical and molecular surveillance study

Genomic surveillance at the regional scale: antimicrobial-resistant Klebsiella pneumoniae ST11 isolates in the Valencian community, Spain
N. Garcia-Gonzalez* [Paterna, Spain], F. Gonzalez-Candelas

Hybrid genome based approach for investigation of molecular basis of international high risk clone ST357 Pseudomonas aeruginosa circulating in India
A. Pragasam* [Vellore, India], A. Jacob, K. Vasudevan, N. Perera* [Teddington, United Kingdom], C. Fedorchuk, N. Natarajan, V. Narasiman, M. Yaseen, A. Alsaedi, A. Althaqafi

De novo hybrid genome assembly and genome analysis of polymyxin- and carbapenem-resistant clinical isolate Klebsiella pneumoniae
M. Zubasheeva* [Moscow, Russian Federation], D. Shcherbinin, G. Speshilov, V. Zhukhovitsky
Rapid detection of ceftazidime/avibactam-resistant Enterobacteriaceae by VITEK MALDI-TOF mass spectrometry using direct-on-target microdroplet growth assay
S. Huang* [Shanghai, China], B. Hu, W. Guo, J. Pan, B. Wang, Z. Chunmei, Y. Ma, Y. Shan, Y. Zhang

Evaluation of CARBA PAcE, a novel rapid test for detection of carbapenemase-producing Enterobacteriales
J. Sattler* [Cologne, Germany], A. Brunke, A. Hamprech

Rapid detection of colistin resistance using a newly developed protocol for MALDI-TOF MS
N. Perrot* [La Balme les Grottes, France], D. Dechaume, F. Javerliat, K. Pinkston, V. Girard, G. Zambardi, J. Charrier

Comparative evaluation of MAST Carba PAcE, RESIST-4 O.K.N.V. and NG-Test Carba 5 kits in the detection of carbapenemase production in clinical isolates
J. Lee* [London, United Kingdom], Z. Sadouki, I. Balakrishnan, E. Wey

Rapid detection of bacteria resistant to the last resort antibiotics using MALDI Biotyper Sirius: the MALDixin test

Blue-Carba complete
A. Lima, D. Rocha, K. Lima, S. Sampaio, J. Mello-Sampaio* [São Paulo, Brazil]

Evaluation of different methods for the detection and differentiation of mechanisms of resistance in carbapenemase-producing Enterobacteriales at a large district hospital, UK
S. Parikh, H. Kondi* [Watford, United Kingdom]

Detection and identification of intact carbapenemases using liquid chromatography and tandem mass spectrometry from microbial lysates in a rapid carba method using the Action system
W. Mcgee* [Wattertown, United States], A. Verma, M. Viirtola, S. Kronewitter, J. Neil, J. Haakana, J. Stephenson

Directly detecting imipenemase [IMP] carbapenemase with high-resolution Orbitrap mass spectrometry

Epidemiology of carbapenemase-producing Klebsiella pneumoniae in Northern Portugal: predominance of KPC-2 and OXA-48

**Antimicrobial activity of plazomicin and old aminoglycosides against clinical isolates of *Enterobacteriaceae* collected worldwide in 2018**

H. Sader* [North Liberty, United States], J. Streit, L. Duncan, J. Gogtay, C. Carvalhaes, M. Castanheira

**In vitro activity of tebipenem against *Enterobacteriaceae* and *Klebsiella pneumoniae* collected from UTIs in Europe and the United States in 2019**

I. Critchley* [Cambridge, United States], N. Cotroneo, M. Pucci, A. Jain, R. Mendes

**Antimicrobial activity of plazomicin and old aminoglycosides against clinical isolates of *Enterobacteriaceae* collected worldwide in 2018**

H. Sader* [North Liberty, United States], J. Streit, L. Duncan, J. Gogtay, C. Carvalhaes, M. Castanheira

**In vitro activity of imipenem-relebactam plus aztreonam against metallo-β-lactamase producing *Pseudomonas aeruginosa***

N. O’Donnell* [Albany, United States], V. Putra, G. Belfiore, B. Maring, K. Young, T. Lodise

**Antimicrobial activity of ceftazidime in combination with taniborbotam (formerly VNRX-5133) against clinical isolates of *Enterobacteriaceae* from Europe collected from 2018-2019 surveillance**

M. Hackel* [Schaumburg, United States], D. Sahm, M. Wise

**Antimicrobial activity of ceftazidime in combination with taniborbotam (formerly VNRX-5133) against a European 2018-2019 surveillance collection of *Pseudomonas aeruginosa***

M. Hackel* [Schaumburg, United States], D. Sahm, M. Wise

**Change of antimicrobial susceptibility testing guidelines from CLSI to BRCAST: impact of breakpoint change on the susceptibility of clinical isolates in a tertiary care hospital in Brazil**

Á. Celestino De Souza, P.Borth* [Porto Alegre, Brazil], L. Lutz, M. Brasil Da Silva, V. Aquino, E. Wurdig Roesch, D. Castro Pereira
In vitro activity of ceftazidime-avibactam against ceftazidime-resistant Enterobacterales and Pseudomonas aeruginosa from hospitalised patients in Germany: 2016-17
M. Kresken [Rheinbach, Germany], M. Korte-Berwanger, N. Pfenninger, S. Gatemann

Antimicrobial activity of aztreonam-avibactam and comparator agents when tested against a large collection of contemporary Stenotrophomonas maltophilia isolates collected from medical centres worldwide
H. Sader [North Liberty, United States], T. Doyle, R. Mendes, V. Kantra, M. Castanheira

Antimicrobial activity of aztreonam-avibactam and comparator agents against Enterobacterales and Pseudomonas aeruginosa from Turkey collected through the ATLAS global surveillance programme 2013-2018
M. Person, M. Hackel [Schaumburg, United States], G. Stone, D. Sohm

In vitro activity of aztreonam-avibactam and comparator agents against Enterobacterales from Europe collected during the ATLAS global surveillance programme 2015-2018
K. Kazmierczak [Schaumburg, United States], F. Arhin, D. Sohm

In vitro activities of ceftazidime-avibactam and comparator agents against Enterobacterales from Europe stratified by region, ATLAS global surveillance programme 2018
M. Estabrook, K. Kazmierczak [Schaumburg, United States], G. Stone, D. Sohm

In vitro activity of aztreonam-avibactam and comparator agents against Enterobacterales and Pseudomonas aeruginosa collected from paediatric patients as part of the ATLAS global surveillance program: 2013-2018
K. Kazmierczak [Schaumburg, United States], M. Hackel, G. Stone, D. Sohm
In vitro activities of ceftazidime-avibactam and comparator agents against Enterobacteriales from Europe stratified by infection type from the ATLAS global surveillance programme 2016-2018
M. Estabrook, K. Kazmierczak*[Schaumburg, United States], G. Stone, D. Sahm

In vitro activities of ceftazidime-avibactam and comparators against Pseudomonas aeruginosa from Europe stratified by infection type: ATLAS global surveillance programme 2016-2018
M. Wise, K. Kazmierczak*[Schaumburg, United States], G. Stone, D. Sahm

In vitro activities of ceftazidime-avibactam and comparator agents against Gram-negative isolates from China as part of the ATLAS global surveillance programme 2018
M. Hockel*[Schaumburg, United States], G. Stone, D. Sahm

Activity of meropenem-vaborbactam and single-agent comparators against Enterobacteriales isolates, including KPC-producing isolates, from European patients hospitalised with pneumonia [2014-2018]
D. Shortridge*[North Liberty, United States], L. Deshpande, L. Duncan, J. Streit, M. Castanheira

In vitro activity of ceftazidime-avibactam against Enterobacteriales and Pseudomonas aeruginosa from central Europe and Israel: ATLAS global surveillance programme 2018
K. Kristof*[Budapest, Hungary], V. Adamkova, A. Adler, E. Gospodarek-Komkowska, A. Rafila, S. Bilova, B. Mozzejko-Pastewka, F. Kiss

Multi-centre evaluation of meropenem/vaborbactam MIC results for Enterobacteriales and Pseudomonas aeruginosa using EUCAST breakpoints on MicroScan dried Gram-negative MIC panels

In vitro activities of aztreonam-avibactam and comparator agents against carbapenemase-producing Enterobacteriales collected during the ATLAS global surveillance programme 2015-2018
K. Kazmierczak*[Schaumburg, United States], F. Arhin, D. Sahm

In vitro activity of imipenem/relebactam against Pseudomonas aeruginosa isolates collected from patients in Europe: SMART 2018
N. Kothari, S. Hawser*[Monthey, Switzerland], S. Lab, K. Kazmierczak, K. Young, P. Moise, M. Motyl, F. Siddiqui, D. Sahm

Activity of imipenem/relebactam against non-Morganellaceae Enterobacteriales and Pseudomonas aeruginosa Isolates from 6 countries in western Europe: SMART 2016-2018
N. Kothari, S. Hawser*[Monthey, Switzerland], S. Lab, K. Kazmierczak, M. Gonzalez-Del Vecchio, K. Young, M. Motyl, F. Siddiqui, D. Sahm

In vitro activity of imipenem/relebactam against Klebsiella pneumoniae and Pseudomonas aeruginosa isolates from patients with respiratory tract infections in the Asia/Pacific region: SMART 2015-2018
S. Lab, K. Kazmierczak*[Schaumburg, United States], W. Chen, Y. Khoo, K. Balwani, K. Young, M. Motyl, D. Sahm

In vitro activity of imipenem/relebactam against Gram-negative organisms collected from patients in Colombia: SMART 2015-2018
S. Lab, K. Kazmierczak*[Schaumburg, United States], J. Pavia, K. Young, M. Motyl, D. Sahm

Antimicrobial activity of aztreonam-avibactam and comparator agents tested against contemporary (2019) clinical Enterobacteriales isolates
H. Sader*[North Liberty, United States], C. Carvalhaes, S. Arends, R. Mendes, M. Castanheira

In vitro activity of imipenem/relebactam against Klebsiella pneumoniae and Pseudomonas aeruginosa isolates from Patients in intensive care unit and non-intensive care unit wards in the Philippines: SMART 2016-2018
S. Lab, K. Kazmierczak*[Schaumburg, United States], W. Chen, G. Abella, M. Villanueva, K. Young, M. Motyl, D. Sahm

Retrospective analysis of the in vitro activity of imipenem/relebactam against KPC-encoding Enterobacteriales
K. Young*[Kenilworth, United States], D. Hilbert, M. Motyl, W. Chen, K. Kazmierczak

Adapting technology to provide nationwide testing for highly-resistant infections in the United States: aztreonam-avibactam susceptibility testing of metallo-β-lactamase-producing Enterobacteriales
S. Malik*[Atlanta, United States], A. Bhatnagar, M. Karlsson, D. Lonsway, J. Lutgring, J. Huang, S. Gumbis, A. Brown
Increasing frequency of OXA-48-producing Enterobacteriales worldwide and activity of ceftazidime-avibactam, meropenem-vaborbactam and comparators against these isolates

M. Costanheira* [North Liberty, United States], T. Doyle, P. Rhamberg, H. Sader, R. Mendes

In vitro susceptibility of carbapenem-resistant Enterobacteriaceae from the Arabian Peninsula to ceftazidime-avibactam, aztreonam-avibactam and other rescue antibiotics

T. Pal* [Al Ain, United Arab Emirates], A. Sonnevend, A. Ghazawi, D. Darwin, G. Bharathan, R. Hashmey, T. Ashraf

Activity of imipenem-relebactam and meropenem-vaborbactam against ceftazidime-avibactam-resistant Klebsiella pneumoniae isolates producing KPC carbapenemases

I. Galani, E. Angelidis, V. Papoutsaki, I. Koraikos* [Athens, Greece], L. Galani, H. Giamarellou, M. Souli, A. Antoniadou

German multi-centre study on standardised in vitro testing of ceftazidime-avibactam against extensively drug-resistant clinical Pseudomonas aeruginosa isolates from 2017-2019

R. Stauf* [Nuremberg, Germany], J. Abel, E. Molitor, G. Hischebeth, A. Halfmann, S. Becker, J. Steinmann

Comparative in vitro activity of ceftolozane/tazobactam, ceftazidime/avibactam, meropenem/vaborbactam, and imipenem/relebactam against susceptible and resistant Pseudomonas aeruginosa

J. Pogue* [Ann Arbor, United States], K. Kaye, V. Marshall, A. Smith, C. Young, P. Lephart, J. Mills, O. Albin, T. Patel

Activity of imipenem-relebactam against Enterobacteriales and Pseudomonas aeruginosa isolates collected in Latin America and Brazil from 2017-2018: results from the Study for Monitoring Antimicrobial Resistance Trends (SMART)

E. Beiroa* [Sao Paolo, Brazil], F. Tuon, S. Rodrigues, T. Klein De Andrade, F. Serra, M. Della Negra De Paula, T. Bueno Polis, A. Gales

Comparative in vitro activity of ceftolozane/tazobactam, ceftazidime/avibactam, meropenem/vaborbactam, and imipenem/relebactam against susceptible and resistant Pseudomonas aeruginosa

J. Pogue* [Ann Arbor, United States], K. Kaye, V. Marshall, A. Smith, C. Young, P. Lephart, J. Mills, O. Albin, T. Patel

Activity of imipenem-relebactam against a genetically diverse collection of carbapenemase-producing and non-producing carbapenem-resistant Enterobacteriaceae

C. Chen* [San Antonio, United States], W. So, S. Dallas, N. Wiederhold, R. Benavides, G. Gawrys, K. Reveles, J. Shurko, G. Lee

Faecal carriage of extended-spectrum beta-lactamase producing Enterobacteriaceae at hospital admission in Portugal: a prospective survey

M. Aires De Sousa* [Lisbon, Portugal], E. Lopes, M. Godinha Gonçalves, A. Pereira, A. Costa, H. De Lencastre, L. Pai

Acquired resistome of Escherichia coli

M. Petitjean* [Bagneux, France], O. Clermont, B. Condamine, E. Demamur, E. Ruppé

Georeferencing patients infected by Gram-negative bacteria producing extended-spectrum beta-lactamase, Pereira city, Colombia, 2012-2017

J. Hoyos Pulgarin* [Medellin, Colombia], D. Arias, A. Alzate, G. Moreno, J. Olaya, I. Cortés, C. Vargas

CTX-M type extended-spectrum beta-lactamase in Serratia marcescens in Japan

H. Baba* [Sendai, Japan], H. Kamamori, Y. Suzuki, S. Endo, H. Yano, M. Kaku

Comparison of Escherichia coli multilocus sequence typing from the UK, Saudi Arabia and Kazakhstan indicates that UK sepsis rates are directly related to carriage of pathogenic E. coli strains in the community

A. Almusallam, J. Mathias, M. Toleman* [Cardiff, United Kingdom], D. Babenko

CTX-M-15 and CTX-M-14 genes in UK Escherichia coli are found as often on the chromosome as they are on plasmids

A. Almusallam, D. Babenko, J. Mathias, D. Wareham, M. Toleman* [Cardiff, United Kingdom]

Diversity of beta-lactamase genes carried by multidrug-resistant Enterobacteriaceae clinical isolates in Georgia

Detection of virulence genes and capsule types in Klebsiella pneumoniae isolated from blood cultures in patients with haematological malignancies

S. Khrulnova* [Moscow, Russian Federation], A. Korobova, A. Fedorova Mironova, I. Frolova, G. Klyasova

Genomic analysis of the subclades C2/H30Rx and C1-M27 of Escherichia coli ST131 high-risk clone across Hungary

T. Kinga* [Budapest, Hungary], A. Tath, L. Jánvári, E. Ungvári, I. Damjanova, D. Szabo
Abstract Categories 2020

5084 Prevalence and molecular epidemiology of high-risk clones among third-generation cephalosporin-resistant and carbapenem-resistant Klebsiella pneumoniae in Germany

K. Xanthopoulou* [Cologne, Germany], J. Wille, A. Walker, Y. Steizer, V. Persy, C. Imrzalioglu, K. Luassen, H. Seifert, P. Higgins

5798 Clonal expansion of extended-spectrum β-lactamase-producing Escherichia coli ST131 in bloodstream infections of Ecuadorian patients from 2009 to 2018

J. Zurita* [Quito, Ecuador], G. Sevillano, A. Paz Y Mino, N. Haro

5800 Clonal diversity of uropathogenic Escherichia coli strains from Zimbabwe

F. Takawira, J. Pitout, T. Mashe, A. Tarupiwa, M. Ehlers, S. Zinyowera, M. Kock* [Pretoria, South Africa]

6371 Molecular characterisation of Escherichia coli isolated from children admitted with bloodstream infection in Dar es Salaam, Tanzania

S. Myo, J. Manyahi* [Bergen, Norway], A. Hubbard, B. Blomberg, A. Roberts, N. Langeland

7819 ESBL- and/or carbapenemase-producing Klebsiella pneumoniae with multidrug-resistant phenotypes as a main cause of non-Escherichia coli Enterobacteriales healthcare-associated bacteraemia of urinary origin episodes in Spain

8531 Emergence of plasmid-mediated AmpC genes in Enterobacter cloacae complex strains from a sepsis outbreak in a neonatal intensive care unit

E. Hernandez Alonsa* [Paris, France], V. Faraout-Derouin, M. Evevin, M. Villet, M. Bilan, P. Matteau, D. De Luca, F. Doucet-Populaire, N. Bourgeois-Nicolaos

8534 Detection of OXA-244 producing Escherichia coli of ST131 from surface water of Pavia urban area, northern Italy

F. Marchesini* [Bargarella, Italy], M. Spalla, A. Mercato, M. Mancinelli, V. Mattiani Marchetti, G. Pilla, R. Sconfitti, R. Migliavacca, E. Nucleo

8574 Detection of blaKPC-2 in a conjugative IncP-6 plasmid in Escherichia coli isolated from wastewater in Romania

L. Papa, A. Negu?, I. Czabor* [Bucharest, Romania], I. Gheorghe, S. Mohsin, M. Mitache, M. Papa, L. Marutescu, M. Chifiriuc

8993 Carbapenem resistance mechanisms uncovered by nanopore sequencing in wastewater canalisations from Ghana

J. Delgado Blas* [Madrid, Spain], E. Marin Rodriguez, C. Valenzuela, C. Serna Bernaldo, N. Montera, C. Saba, B. Gonzalez-Zorn

Session accepted as Paper Poster Session

Water and surfaces as reservoir for resistance

532 Are residual waters vehicles of transmission of resistance mechanisms? DARWIN JPI AMR-2016 study

E. Torres Sangiao* [Santiago de Compostela, Spain], A. Diequez, E. Rabuñal-Rey, S. Balboa, M. Quintela-Bujan, R. De La Cruz Moreno, M. Paul, S. Sørensen, J. Kreft, D. Graham, A. Dechesne, B. Smets, J. Romalde, C. García-Riestra

5469 Pathogenic, antimicrobial-resistant Escherichia coli in low-income settings household soils: origins and genetic diversity

M. Montealegre* [Dübendorf, Switzerland], A. Talavera Rodriguez, S. Roy, M. Hossain, V. Fernandez Lanza, M. Islam, T. Julian

9034 Association of carbapenemase-producers in hospital effluents with carbapenemase-producer’s infection incidence and sewages heavy metals concentrations: results from the Canalis project

L. Romero-Orad* [Seville, Spain], J. Borrego-Jiménez, F. Galan-Sanchez, R. Tejera-García, M. Rojo Martín, M. Rodríguez-Mateos, A. Pérez-Pérez, V. Merino Bohórquez, L. Lopez-Cerero

9330 Clinical class 1 integrin patterns and relative antibiotic resistance gene carriage in urban compartments

M. Quintela-Bujan* [Newcastle Upon Tyne, United Kingdom], M. Abouelnaga, J. Romalde, M. Gomez Lopez, B. Allen, D. Frigan, D. Graham
9452  KPC-producing and colistin-resistant Klebsiella pneumoniae ST258 persistence during wastewater treatment plant processes  
I. Czabar* [Bucharest, Romania], I. Gheorghe, L. Papa, M. Surleac, S. Paraschiv, D. Otelea, L. Marutescu, M. Papa, S. Mohsin, M. Chifriuc

Session accepted as Mini-oral ePoster Session  
We are not alone: One Health in AMR

690  Dissemination of a blaNDM-1-carrying IncA/C2 plasmid in a broiler flock: a possible real-life scenario
S. Hadziabic* [Berlin, Germany], J. Fischer, B. Malorny, I. Szabo

1541  One Health surveillance of extended-spectrum beta-lactamase-producing Enterobacteriales in urban and rural Malawi  
D. Cocker* [London, United Kingdom], A. Singer, T. Marse, C. Jewell, A. Roberts, N. Feasey

3202  Bacteriophage-controlling dominant sequence types of carbapenem-resistant Escherichia coli in Bangladesh  
J. Mathias* [Cardiff, Wales, United Kingdom], D. Babenko, A. Almusallam, R. Farzana, M. Toleman

3623  Seawater: a risk for transmission of antimicrobial resistance?

4227  Colistin-resistant Enterobacteriaceae in Belgian broiler and pig farms  
S. De Koster* [Antwerp, Belgium], M. Ringenier, C. Lammens, M. Kluytmans - Van Den Bergh, J. Kluytmans, J. Dewulf, H. Goossens

4318  Quantification and characterisation of antibiotic resistance in greywater discharged to the environment  
S. Porob, H. Craddock* [Beer Sheva, Israel], O. Sagi, M. Gdalevich, N. Davidovitch, Z. Ronen, S. Hadziabic* [Galway, Ireland], S. Peacock

4319  Tracing of ESBL-producing and ciprofloxacin-resistant Escherichia coli in Belgian broiler and pig farms: a longitudinal study  
S. De Koster* [Antwerp, Belgium], M. Ringenier, C. Lammens, D. De Coninck, M. Kluytmans - Van Den Bergh, J. Kluytmans, J. Dewulf, H. Goossens

5271  A One Health approach identifies the environment surrounding food animals as a potential reservoir of blaCTX-M genes in the community in Vietnam  
M. Nguyen Ngoc* [Antwerp, Belgium], H. Thi Thu Hoang, B. Xavier, C. Lammens, T. Hoang, H. Le Thanh, N. Thi Pham, A. Dang Duc, H. Goossens, S. Malhotra-Kumar

8162  Persistence of antimicrobial resistance genes in treated sewage water intended for reuse  
M. Dropa* [São Paulo, Brazil], J. da Silva, T. Knöbl, M. Vieira Cunha, R. Araujo, C. Brandão, M. Razzolini, M. Sato

Session accepted as Mini-oral Flash Session  
XDR Gram-negatives on the run

1291  Acinetobacter baumannii complex, the beast of the weakest  
D. Peravic [Johannesburg, South Africa], W. Strasheim, M. Lowe, R. Mukakateng, M. Smith, A. Singh-Moodley

4551  Ongoing dissemination of OXA-244 carbapenemase-producing Escherichia coli in Switzerland  
P. Nordmann* [Fribourg, Switzerland], A. Masseron, I. Sánchez-Diener, L. Zamarrona, A. Oliver

5299  Molecular diversity of carbapenem-resistant Enterobacteriaceae [CRE] in Singapore  
J. Teo* [Singapore, Singapore], C. Tang, S. Ong, S. Lee, S. Tan, Y. Cai, T. Lim, T. Tan, J. Sim, R. Ong, A. Kwa

7832  Unexpected genetic diversity among KPC-producing Klebsiella pneumoniae in France  
R. Bonnin* [Le Kremlin-Bicêtre, France], A. Jousset, A. Chiarelli, E. Cécile, P. Glaser, T. Van Der Schalk* [Antwerp, Belgium], A. Walker

7839  Ongoing dissemination of OXA-244 carbapenemase-producing Enterobacteriaceae over 5 years reveals transmission clusters of clones and plasmids and extensive diversity of bacterial species encoding carbapenemases  
C. Lammens, S. Kumar-Singh, H. Goossens, S. Malhotra-Kumar

8137  Complex sharing of KPC-producing Klebsiella pneumoniae carbapenemase [KPC] plasmids in patients harbouring multiple KPC-positive organisms  
A. Mathers* [Charlottesville, United States], H. Parikh, D. Eyre, K. Barry, N. Stoesser, A. Sheppard, D. Crook, A. Walker

8137  Evolutionary dynamics of carbapenem resistance genes among different international clones of Acinetobacter baumannii: resistance and dissemination implications  
S. Vijayakumar* [Tamil Nadu, India], J. Jacob, K. Vasudevan, V. Balaji

8137  Colistin heteroresistance in carbapenemase-producing Acinetobacter baumannii  
D. Machado* [Lisbon, Portugal], S. Gothe, M. Martins, T. Pacheco, J. Batista, C. Toscano, M. Viveiros
Abstract Programme

4. Diagnostic bacteriology & general microbiology

- Diagnostic bacteriology – culture based and general microbiology
- Lab management, automation and QC
- MALTI-TOF and other proteomic methods
- Molecular diagnostics (incl POCT and syndromic testing)
- Molecular and genomic typing and surveillance
- Whole genome sequencing (diagnostic)
- Microbiome studies (incl One Health aspects)
- Clinical metagenomics
- Bioinformatics tools & pipelines
- Other

Abstract Categories 2020

7586 Efficient inactivation of clinically relevant antimicrobial drug concentrations by two resin-containing media in simulated paediatric blood cultures

7686 Fever of unknown origin: a prospective observational study from a tertiary university hospital
S. Vlachos, D. Bassoulis* {Athens, Greece}, M. Samarkos, G. Patavoukas, C. Sirafakis, F. Ntziora, A. Apostolidi, N. Sypasos, G. Daikos, M. Psychogiou

8577 Chorioamnionitis: time for changes in management?
B. Crespo Estrada* {Santa Cruz De Tenerife, Spain}, I. Gutiérrez González, C. Alegría, N. Hernando, B. Reyes

9445 Culture-dependent analysis of the bacterial profile of breast milk samples from women with diagnosis of subacute lactational mastitis
M. Lung, A. García Sehán* {Barcelona, Spain}, Y. Roca, M. López, E. López Gimeno, M. Viñedo

Session accepted as Paper Poster Session

Current challenges in laboratory automation

1995 Evaluation of a fully automated prototype version of the BD Kiestra ID/AST system
J. Snyder, G. Thomson, K. Jamros, S. Heckman, S. Abdelghani, K. Thomson* {Louisville, United States}

2463 Performance evaluation of the BD Kiestra ID/AST prototype for automatic colony picking, Bruker MALDI Biotyper target plate spotting and Phoenix AST panel preparation and loading
G. Sarton-Lohéac, A. Coste, G. Prod’Ham, C. Bertelli, A. Croxatto* {Lausanne, Switzerland}

2581 Evaluation of Colibrí for antimicrobial susceptibility testing
J. Bayette* {Montpellier, France}, A. Roché, T. Bayol, R. Fournier, G. Teissier

2594 Evaluation of Colibrí for the identification of Gram-negative bacilli
A. Roché, G. Teissier, R. Fournier, P. Mion, J. Bayette* {Montpellier, France}

2600 PhenoMATRIX TAG and Colibrí for a faster workflow of the management of urine specimens
A. Roché, G. Teissier, R. Fournier, T. Bayol, P. Mion, J. Bayette* {Montpellier, France}

3097 Laboratory productivity index and efficiency gains at 3 benchmark BD Kiestra TLA sites
K. Renić, K. Lehmann* {Ontario, Canada}

3106 Artificial intelligence and automation of microbiology: the urinalysis 3.0

Session accepted as Paper Poster Session

Diagnosing bloodstream infection

481 Reducing paediatric blood culture contamination rates: a benefit to arterial catheter-drawn cultures
M. Meir* {Haifa, Israel}, O. Naserideal, H. Dabaja-Younis, Y. Geffen, I. Kassius

2092 Blood culture contamination is commonly associated with divergent blood culture sets
E. Ben-Chetrit* {Jerusalem, Israel}, P. Levin

2280 Laboratory stewardship initiative on repeat blood culture collection practices led to reduction of collection rates but electronic best practice alerts are needed to sustain reduction rates
J. Gastaldo, P. Ozbolt, K. Kruipinski-Shaw, K. Kerr, S. Hohman, S. Antonara* {Sparks, United States}

2590 Impact of a training activity on collecting blood samples regarding a correct bloodstream infections diagnosis: The risks of overseeing the foundations

3672 Impact of BD urine culture application on clinical microbiology laboratory activity
F. D’Alò, A. Cesarini, R. Paggi* {Perugia, Italy}, D. Pietrella, A. Repetta, E. Cenci, A. Mencacci

3991 Flexible implementation of microbiology laboratory automation using BD’s solution of standalone instruments
S. Raghunandan, S. Reinhalt, B. Pframmer, A. Cardenas* {Sparks, United States}

4039 Evaluation of the implementation of diagnostic automation into the bacteriology laboratory as part of pathology modernisation
G. Mohammad* {London, United Kingdom}, J. Turner

4063 Evaluating emerging technologies in microbiology: what if your gold-standard isn’t gold?
L. Brenton* {Fitzroy, Australia}, M. Waters, T. Stanford

5442 Improvement of blood cultures processing with full automation in microbiology

7311 Measuring the impact on turnaround time by implementation of a new fully-automated random, continuous-access molecular platform in a large microbiology department
L. Martinez Garcia* {Madrid, Spain}, M. Rodriguez, C. Rodríguez, B. Romero, R. Canton Moreno, J. Galán

7853 Impact of total laboratory automation systems on efficiency, cost and clinical outcomes: a systematic review
M. Wimmer, D. Makkhija, K. Guo* {Sparks, United States}, D. Gary
Abstract Categories 2020

5989 Rapid identification of positive blood culture, short-incubation subcultures by MALDI-TOF MS comparing pre-conditioned and non-conditioned culture media adapted to laboratory automation
C. Reimers, E. Grabsch, K. Lui, A. Batye, K. Chua* (Heidelberg, Australia), M. Leroi

6053 Simplification of direct MALDI-TOF MS identification from positive blood culture broth
J. Bratto, E. Grabsch, K. Chua* (Heidelberg, Australia), M. Leroi

6191 Direct MALDI-TOF MS identification from positive blood cultures: rapid sepsityper
M. Cordovana* (Bologna, Italy), S. Ambretti

6468 Bacterial contamination of umbilical cord blood collected at Ankara University cord blood bank
P. Yurdakul-Mesutoglu* (Ankara, Turkey), E. Gencerc-Oncul, H. Yalim Akin, M. Bekesac

6499 Polymicrobial species identification from positive blood cultures with high-resolution Orbitrap mass spectrometry
H. Peitoniemi, M. Damsbo, I. Ritala, M. Viirtola* (Vantaa, Finland), A. Rantakari

6536 Evaluation of a sub-culturing solution directly from manual blood cultures in low-resource settings

6580 Identification of microorganisms in polymicrobial blood culture bottles using short-term culture MALDI-TOF MS
A. Wong* (Stockholm, Sweden), M. Ullberg, V. Ozenci

6614 Reference evaluation of two manual blood culture bottles for low-resource settings
S. Ombelet* (Antwerp, Belgium), A. Natale, J. Ronat, T. Naas, O. Vandenberg, J. Jacobs

6645 The impact of delayed analysis of positive blood cultures on the performance of short-term culture followed by MALDI-TOF MS
A. Johnsson, A. Wong* (Stockholm, Sweden), V. Ozenci

6701 The clinical impact of extended blood culture incubation time
R. Willemze, A. Kwakernaak, T. Koster, V. Hira* (Gouda, Netherlands)

6702 Reference-setting evaluation of MicroScan panels for identification of bloodstream pathogens in low-resource settings
S. Ombelet* (Antwerp, Belgium), A. Natale, J. Ronat, T. Naas, J. Jacobs

7649 Evaluation of the BACT/ALERT VIRTUO in terms of time to detection, performance, workflow efficiency and impact on patient management, compared to the BACTEC FX automated blood culture system
A. Halperin* (Madrid, Spain), J. Cortes Cuevas, M. Cuesta, S. Talens, R. Birch, A. Sanchez Diaz, R. Canton Moreno

8539 How does blood volume cultured in Europe comply with guidelines? Results of a 125-centre ESGBIES/CTCB survey
B. Lamy* (Nice, France), A. Morisot, E. Sanchez, L. Bailly, R. Ruimy, C. Pradier, S. Albarède, J. Galinier

8769 The impact of rapid identification of blood culture pathogens by MALDI-TOF MS and their direct antibiotic susceptibilities on antimicrobial stewardship at a large district general hospital, United Kingdom
N. Malik* (Watford, United Kingdom), H. Kandil

9276 Diagnostic stewardship in real life

572 Time to positivity of blood cultures and its role in the diagnosis of bacteraemia
A. Aguirre Quinonera* (Vitoria, Spain), M. Marroyo-Salazar, E. Saez De Adana Arroz, A. Canut

5464 Impact of artificial intelligence on time to result in culture-based MRSA screening
A. Nowag, N. Jozmati, S. Giglia, S. Wirth, B. Pohl, X. Quante, H. Wisplinghoff* (Cologne, Germany)

6090 Benchmarking blood culture turnaround times in an automated laboratory, at a tertiary teaching hospital
M. Sullivan, E. Grabsch, K. Chua* (Heidelberg, Australia), M. Leroi

7801 A prolonged incubation time is not needed for cultures obtained from acute periprosthetic joint infections
D. Talsma* (Groningen, Netherlands), J. Ploegmakers, P. Jutte, G. Kampinga, M. Wouthuyzen-Bakker

7756 What clinicians and researchers should know about machine learning for infection management: review of methods, targeted outcomes and reporting of future technologies
C. Luz* (Groningen, Netherlands), M. Vollmer, J. Decruyenaer, M. Nijsten, C. Glasner, B. Sinha

7801 Impact of unique blood culture sampling in the emergency departments of Strasbourg University Hospital, France
P. Boyer* (Strasbourg, France), A. Chabaud, P. Bilbault, D. Menahem, E. Fonti, V. De Peyrecave, T. Lavigne, B. Jaulhac

7926 Dipstick urinalysis: an alternative screening test for urine cultures to rule out negatives?
F. Daganci, M. Karaoglan, B. Erdir, S. Aslan, O. Ozel, A. Ilki* (Istanbul, Turkey)

8976 Time to positivity of blood cultures and its role in the diagnosis of bacteraemia
A. Aguirre Quinonera* (Vitoria, Spain), M. Marroyo-Salazar, E. Saez De Adana Arroz, A. Canut

9276 Impact of artificial intelligence on time to result in culture-based MRSA screening
A. Nowag, N. Jozmati, S. Giglia, S. Wirth, B. Pohl, X. Quante, H. Wisplinghoff* (Cologne, Germany)

9329 Accuracy of sepsityper methodology for identifying microorganisms directly from positive blood culture bottles using MALDI-TOF MS
R. Gorton* (London, United Kingdom), R. White, C. Baker, R. Smith

9342 Sepsis diagnosis: have we solved the riddle yet?
A. Rohit* (Chennai, India), A. Danangi, M. Prasad, A. Jenifer, S. Dorairajan, C. Boahen, V. Kumar

Session accepted as Mini-oral ePoster Session

ABSTRACT BOOK – 30th ECCMID 2020
Abstract Categories 2020

Session accepted as Paper Poster Session

Gastrointestinal infections and molecular diagnosis

866 Application of a multiplex polymerase chain reaction test for diagnosing bacterial enteritis in children in a real-life clinical setting
E. Lee* [Seoul, South Korea], H. Lee, S. Han

947 Should a molecular bacterial syndromic approach totally replace culture for the diagnosis of gastrointestinal tract infections?
A. Boudet* [Nimes, France], R. Stephan, A. Pantel, M. Carles, C. Enault, S. Charachon, J. Lavigne, H. Marchand

1519 Evaluation of the Oiastat-Dx Gastro-intestinal Panel at the University Hospital of Liege (Belgium)
J. Schmitt, C. Diop* [Liege, Belgium], L. Schoneveld, C. Meex, P. Melin, M. Hayette

1583 Evaluation of the filmarray GI panel in the microbiological diagnosis and management of the patient with infectious gastroenteritis
J. Parra Martínez, R. Carranza González* [Albacete, Spain], M. Castano Aroco, V. Salves Ferriz, F. Ferrer Amate, C. Sáinz De Baranda Camino

1801 Impact of ribotype on Clostridioides difficile diagnostics
K. Rizzardi* [Solna, Sweden], T. Åkerlund, T. Norén, A. Matussek

2685 Evaluation of the Novodiag Bacterial GE+ kit for the diagnosis of intestinal bacterial infections
C. Roy, D. Robert, D. Baraud, A. Buissounniere, L. Benejat, A. Ducournau, F. Megraud, E. Bessède, P. Lehours* [Bordeaux, France]

2736 Diagnostic utility of stool polymerase chain reaction in enteric fever: experience from a high-incidence London hospital
D. Hsu* [London, United Kingdom], S. Tiberi, R. Buchanan, C. Rosmarin

3084 Development of a biosensor for the detection of Campylobacter jejuni
S. Shams* [Qom, Iran], B. Bakhshi, T. Tahidi Moghodam

4406 Improved diagnostic of acute gastrointestinal disease by a multiplex real-time PCR semi-automated method for the detection of enteropathogens

6094 Evaluation of a Point-of-Care molecular system for rapid detection of toxigenic Clostridioides difficile in paediatric patients: impact on diagnostic yield and time to result

7755 Prospective evaluation of three rapid multiplex PCR assays for the detection of gastrointestinal pathogens from stool samples

7793 Evaluation of Novodiag C. difficile and GenePOC CDiff test for quick and accurate detection of Clostridioides difficile infection
A. Petersson* [Lund, Sweden], L. Rebihic, S. Karlsson Sobirk

7991 Performances of BD MAX Cdiff assay for detection of toxigenic Clostridioides difficile in 1321 clinical stool specimens using FecalSwab
A. Ranc* [Lyon, France], D. Dauwalder, S. Celia, A. Tristant, B. Coralie, K. Santos, F. Sonia, P. Duraffourg, F. Vandenekens, F. Laurent

8443 Laboratory evaluation of a cartridge-based multiplex PCR assay for the detection of gastrointestinal pathogens
C. Holmes, P. Bird* [Leicester, United Kingdom]

Session accepted as 2-Hour Oral Session

Genomic epidemiology: from local to global

48 The phylogenetic landscape and nosocomial spread of the multidrug-resistant opportunist Stenotrophomonas maltophilia

4406 Improved diagnostic of acute gastrointestinal disease by a multiplex real-time PCR semi-automated method for the detection of enteropathogens

5096 Improved diagnostic of acute gastrointestinal disease by a multiplex real-time PCR semi-automated method for the detection of enteropathogens

5096 Improved diagnostic of acute gastrointestinal disease by a multiplex real-time PCR semi-automated method for the detection of enteropathogens

6585 The distribution, transmission and adaptation of Klebsiella species in multiple clinical and non-clinical settings

7168 Bordetella pertussis in the Netherlands, 2015-2019: a sharp increase in prn-deficient isolates
R. Mariman* [Leiderdorp, Netherlands], C. Schot, J. Groot, F. Reubsaet, R. Noomen, T. Bosch

7168 Bordetella pertussis in the Netherlands, 2015-2019: a sharp increase in prn-deficient isolates
R. Mariman* [Leiderdorp, Netherlands], C. Schot, J. Groot, F. Reubsaet, R. Noomen, T. Bosch

7168 Genomic analysis of Group B streptococci colonising pregnant women in Portugal reveals the emergence of novel genetic lineages resulting from capsular switching
E. Ferreira Martins, R. Pedrosa, J. Melo-Cristino, M. Ramirez* [Lisbon, Portugal]
Session accepted as 1-Hour Oral Session

Implementing metagenomics in clinical practice

7623  The role of mobile genetic elements and virulence factors in the typing of vancomycin-resistant *Enterococcus faecium* outbreak isolates of a successful MLST ST117 cluster type 24

7865  Understanding the *Corynebacterium diphtheriae* population through whole genome sequencing

N. Groves* [London, United Kingdom], M. Chand, D. Litt, S. Rose, C. Gower, A. Enefer, G. Amirthalingam, N. Fry

8122  Phylogenetic and taxonomic approaches to elucidate the *Citrobacter* genus

T. Goncalves Ribeiro* [Porta, Portugal], C. Rodrigues, L. Peixe

8981  A genomic snapshot of antimicrobial resistance in *Campylobacter fetus*

B. Duim* [Utrecht, Netherlands], A. Zomer, T. Looft, A. Timmerman, J. Wagenaar, L. Van Der Graaf-Van Bloois

Session accepted as Paper Poster Session

Improvements in diagnosis

1184  Does *C. Diff Quik Chek* display the same sensitivity than *C Diff Quik Chek Complete* for GDH detection?

C. Gateau* [Paris, France], R. Syed-Zaidi, A. Youssouf, V. Lalande, J. Couturier, F. Barbut

1459  Two novel fastidious anaerobes from the genus *Bacteroides* isolated from chicken gastrointestinal tracts

S. Králova* [Brno, Czech Republic], L. Davidova Gerzova, M. Medvecky, I. Rychlik, M. Cigánek, A. Cizek

1798  Serodiagnosis of Lyme borreliosis: is IgM in serum more harmful than helpful?

H. Hillerdal, A. Henningsson* [Jönköping, Sweden]

1952  A comparative prospective study for the qualitative detection of *Helicobacter pylori* specific antigens in stool samples at Sheffield Teaching Hospitals Foundation Trust, England

S. Coleman* [Sheffield, United Kingdom], S. Davies, H. Carr

Discordant *Clostridioides difficile* diagnostic assay and treatment practice: a retrospective observational study

L. Lenggenhager* [Geneva, Switzerland], M. Zanella, A. Ponce, L. Kaiser, J. Schrenzel

Staphylococcus lugdunensis: coloniser or pathogen: outlining the clinical importance: a study of 295 clinical samples from hospital patients received for culture at the department of Medical Microbiology, SI Lillehammer, Norway, from November 2016 to November 2019

S. Hartzen* [Lillehammer, Norway], C. Dahlseide, A. Hartzen

Campylobacter concisus prevalence in microscopic colitis: a cultivation study

M. Agaard* [Aalborg, Denmark], K. Kirk, H. Nielsen, I. Targgaard, J. Hansen, H. Nielsen

The importance of CXCL13 cytokine as a biomarker in the molecular diagnosis of Lyme neuroborreliosis versus multiple sclerosis

T. Carreira* [Lisboa, Portugal], F. Geraldo Dias, A. Armada, M. Vieira

Early syphilis infection: a clinical case

M. Bozhilova, D. Velcheva* [Sofia, Bulgaria]

Diagnosing disseminated histoplasmosis in an AIDS patient: the role of bone marrow evaluation

N. Mussá* [Lisbon, Portugal], D. Carvalho, S. Ismail, A. Jääskeläinen* [Helsinki, Finland], S. Salmenlinna, J. Antikainen, A. Pätäri-Sampo

Stool multiplex PCR for *Shiga* toxin-producing *Escherichia coli* sufficiently equals with culture for clinical diagnosis and follow-up

A. Jääskeläinen* [Helsinki, Finland], S. Salmenlinna, J. Antikainen, A. Pätäri-Sampo

Faster and more sensitive diagnostics of *Shigella* by *Shigella* specific PCR and improved culture

C. Lindsten* [Halmstad, Sweden], H. Wirdelius, D. Palmér, F. Mårtensson, A. Ljung, P. Nilsson
7605  Group B Streptococcus vaginal colonisation from antenatal screening to 2 months after delivery: results from a prospective cohort study in France

8660  Antibiotic resistance in anaerobic infections in a hospital in Tenerife
B. Crespo Estrada* [Santa Cruz De Tenerife, Spain], I. Gutierrez Gonzalez

9614  Prevalence and susceptibility profile of Corynebacterium glucuronolyticum in semen cultures
A. Rodríguez Achaerandio* [Vitoria, Spain], E. Insagurbe Saez Camara, A. Palomares Casado, S. Guerra Merino, A. Fernández De Romarategui Gómez, R. Salazar Calleja, A. Conut

1678  Decreasing reporting time of blood cultures by workflow optimisation with the WASPLab system

5002  How to accelerate bacteria identification from positive blood culture in a routine microbiology laboratory with the aid of MALDI-TOF MS: a simple and rapid in-house protocol
P. Barth* [Porto Alegre, Brazil], Á. Celestino De Souza, L. Lutz, E. Wurdig Roesch, V. Aquino, D. Castro Pereira

5204  Time-to-result quantification for different blood culturing workflows in an external microbiology laboratory setting
J. Fonville* [Veldhoven, Netherlands], M. Van Den Broek, A. Jansz, T. Liebregts

6854  Identification of microorganisms direct from signal positive blood culture using Acrion system
J. Sako* [Vantaa, Finland], S. Gurung, O. Niiranen, N. Chant, M. Wilks

7161  Light scatter AST for positive blood cultures, how impactful on antimicrobial therapy management of septic patient?
A. Curtoni* [Torino, Italy], D. Ghiauda, L. Imperatore, C. Veglia, G. Bianco, S. Corcione, S. Scabini, C. Costa, L. Scaglione, F. De Rosa, R. Cavalla

7261  Prospective evaluation of BinaxNOW for rapid identification of Streptococcus pneumoniae from positive blood culture bottles
K. Žnidar* [Ljubljana, Slovenia], D. Tratnik, M. Pirs, M. Mueller-Premru

7357  Speeding up identification and antimicrobial susceptibility testing of bacteria from positive blood cultures by the use of Alifax HBBL system
Y. Wang* [Beijing, China], Y. Dai, D. Li, H. Sun, Y. Zhao, Y. Xu

9244  Easy technique for ultra-fast identification of positive blood cultures with MALDI-TOF MS
F. Bressant, M. Messy, H. Rodriguez-Villalobos, A. Verraken* [Brussels, Belgium]

9520  Rapid identification of bacteria directly from positive blood cultures by a modified method using a Serum Separator Tube (SST) and MALDI-TOF MS
G. Carretero, G. Rivas, C. Loras, M. Orellana Miguel* [Madrid, Spain]

Session accepted as Mini-oral ePoster Session
Innovative approaches for faster ID/AST from positive blood cultures

179  A rapid direct from specimen MALDI-TOF MS diagnostic for bacterial and fungal pathogens
D. Goodlett* [Baltimore, United States], M. Sorensen, F. Gardner, L. Leung, C. Chandler, E. Nilsson, R. Ernst

929  Pilot evaluation of machine learning for the classification of Streptococcus pneumoniae PCV-13 serotypes from non-PCV13 serotypes based on MALDI-TOF MS analysis
J. Zintgraff* [Caba, Argentina], M. Rocca, D. Napoli, M. Moscoloni, G. Ayala, C. Lara

1891  Typing of emm1 Group A streptococci using MALDI-TOF MS
M. Sakuma, K. Shima* [Kyoto, Japan], S. Funatsu, K. Ogata, M. Morozumi, S. Iwata

1980  Rapid identification of uropathogens by combining Alfred 60 system with matrix-assisted laser desorption ionisation-time of flight mass spectrometry technology
K. Athamna* [Hadera, Israel], A. Zbriger, M. Shapira, Y. Tal, S. Freimann

2459  Comparison of two commercial platforms for identification of bacteria and Candida isolates at species-level by MALDI-TOF MS in Shenzhen, China
W. Lau* [Shenzhen, China], J. Chan, S. Lo, L. Yan, Y. Ting, L. Caijuan, L. Huijuan, K. Yuen

2746  A Peptoniphilus species nova closest to P. harei from human clinical materials but which was misidentified by Bruker Biotyper as P. indolificus
K. Bernard, D. Wiebe, A. Velboa* [Groningen, Netherlands], A. Ebbing

3117  Identification of clinical isolates of Tannerella forsythia by MALDI-TOF mass spectrometry
T. Teržan* [Ljubljana, Slovenia], M. Pirs, M. Furlan, P. Hrvat, V. Cvitkovič-Špik, T. Čerar Kišek, K. Seme

3477  Differentiation of the members of the Staphylococcus aureus complex by MALDI-TOF using the VITEK MS platform
B. Celliere* [La Balme les Grottes, France], V. Collin, C. Meunier, D. Giraud, V. Monnin, V. Girard, F. Javerliat

4880  Achromobacter identification using nr4A gene phylogeny and MALDI-TOF MS
M. Rumigny* [La Balme les Grottes, France], F. Allard, V. Collin, C. Meunier, D. Giraud, V. Monnin, V. Girard, F. Javerliat

**Abstract Categories 2020**

**6682** Pan-pathogen microbiological diagnosis by accredited routine clinical metagenomics: one-year experience

P. Woerther* [Créteil, France], R. Lepeule, D. Vanessa, G. Gricourt, C. Lamoureux, V. Fihman, S. Faurati, F. Botterel, C. Angebault, J. Pawlotsky, C. Rodriguez

**6850** Rescue diagnosis of a cerebral nocardiosis by accredited clinical metagenomics: a case report

V. Courbin, D. Riller, G. Gricourt, D. Vanessa, R. Lepeule, J. Pawlotsky, C. Rodriguez, P. Woerther* [Créteil, France]

**7238** Comparative analysis of kitleme identification methods in viral metagenomic data

**7886** Clinical metagenomics next-generation sequencing for diagnosis of suspected clinical infections, a prospective multi-centre cohort study

J. Ai* [Shanghai, China], H. Zhang, Y. Zhang, J. Ma, W. Zhang

**8055** Next-generation sequencing for kinetics of the respiratory microbiota of intensive care unit intubated patients

S. Meyer* [Limoges, France], T. Daix, B. Francois, D. Chaine, A. Gay, M. Ploy, P. Vignon, D. Barnaud

**8070** The rapid clinical diagnosis of lower respiratory infection by an unbiased real-time metagenomics methods in validated intensive care unit patients

H. Zhang* [Shanghai, China], J. Ai, O. Zhang, W. Zhang

**8863** Rapid, non-invasive detection of Legionella and resolution of species diversity in clinical infections using the Karius test, a microbial cell-free DNA sequencing test for pathogen detection

A. Ahmed* [Redwood City, United States], S. Dalai, D. Hong, L. Blair, M. Lindner, D. Hollemon, S. Bercovici, T. Blauwkamp, M. Kertesz, A. Macintyre

**9069** Direct sequencing from clinical samples in the diagnostic microbiology laboratory without capital expenditure or specialised bioinformatic training is possible using nanopore technology

A. Alcolea Medina* [London, United Kingdom], C. Niehaghartaigh, J. Lambourne, R. Sorajna-Wani, M. Wilks

**9251** Long-read sequencing for the diagnosis and characterisation of pathogens in severe pneumonia: the role of simulation and standards in clinical metagenomics pipeline development

M. Chand* [London, United Kingdom], N. Groves, G. Amos, V. Chalker

**9458** Application of a user-friendly, end-to-end metagenomics platform for rapid pathogen identification in children with osteoarticular infections

R. Stinnett, N. Ramchandar, H. Xie, S. Flygare, T. Schwarz, K. Broadbent, A. Davis, L. Farnaes, R. Schlaberg* [Salt Lake City, United States]

**9503** Application of a comprehensive, user-friendly metagenomic sequencing platform for rapid pathogen identification in a paediatric population with meningitis and encephalitis

R. Stinnett, N. Ramchandar, K. Broadbent, T. Schwarz, S. Flygare, H. Xie, J. Foley, A. Davis, L. Farnaes, R. Schlaberg* [Salt Lake City, United States]

**Session accepted as 2-Hour Oral Session**

**Microbiome and human disease: from top to bottom**

**595** Longitudinal analysis of lung microbiota in intensive care unit patients undergoing mechanical ventilation

**1744** Characterisation of the microbial community in patients with pharyngeal gonorrhoea infection

C. Foschi* [Bologna, Italy], C. Ceccarani, T. Camboni, C. Consolandi, M. Salvo, V. Gaspari, A. D’Antuono, M. Belletti, M. Re, M. Severgnini, A. Marangoni

**3552** The role of the eye microbiome in health and disease states of the lacrimal system

Y. Yagel* [Beer Sheva, Israel], Y. Matro, T. Kornhauser, S. Kardulak, S. Green, J. Morán-Gilad, E. Tsumi

**3553** Intestinal microbiome in critical care patients: association with patient status and outcome

**4102** Diversity of the gut microbiome before haematopoietic cell transplantation is an independent predictor of respiratory failure and sepsis requiring intensive care in the post-transplant period

F. Adhi* [Cleveland Heights, United States], E. Littmann, E. Pamer, J. Peled

**6133** Diagnosis of invasive pneumococcal disease in children by using a classification method based on nasopharyngeal microbiota signatures

**6309** Role of the gut microbiota in the anastomotic leakage after colorectal surgery

P. Herráez-Pérez* [Madrid, Spain], M. Ponce-Alonso, J. Barquin, A. Camino-Lizarraide, E. Conde, B. Romero, J. Garcia-Pérez, R. Del Campo

**6359** Evolution of cutaneous bacterial microbiota of pressure ulcers in patients with spinal cord injury

C. Dungyach-Remy* [Nimes, France], A. Géli, S. Bastide, A. Yahiaoui-Martinez, J. Lavigne, A. Sotto

**6590** Individuals at risk of developing rheumatoid arthritis possess a unique microbiome

C. Rooney* [Leeds, United Kingdom], S. Mitra, K. Mankia, I. Moura, P. Emery, M. Wilcox
**Abstract Categories 2020**

---

**Session accepted as Paper Poster Session**

**Microbiome impact in health and disease**

---

**32** Metatranscriptomic analysis reveals active bacterial communities in diabetic foot infections

F. Sadeghpour Heravi* [Sydney, Australia], M. Zakrzewski, K. Vickery, H. Hu

**4479** Determining the lung microbiome of chronic obstructive pulmonary disease patients from hospitals in Pretoria, South Africa using IS-Pro method and 16S rDNA sequencing

I. Goolam Mahomed* [Pretoria, South Africa], R. Peters, G. Pretorius, A. Goolam Mahomed, V. Ueckermann, A. Stoltz, M. Kock, M. Ehlers

**228** Gut microbiome interferes with host tryptophan metabolism pathway and regulates basal anxiety-like behaviour

J. Shaﬁq* [Karachi, Pakistan], B. Khan, G. Abbas, A. Ahmed

**4629** Surface ocular microbiome in dry eye syndrome: a preliminary study

C. Foschi, P. Versura, C. Consolandi, M. Sevrignini, M. Re, A. Marangoni* [Bologna, Italy]

**810** A new perspective: microbiota, the role of Streptococcus galactilyticus in childhood colorectal cancer

A. Büyükcam* [Ankara, Turkey], C. Akyüz, N. Gursoy, D. Orhan, B. Otu, B. Sancak, A. Kara

**5440** Differences in the lower respiratory tract microbiota in patients with severe pneumonia of viral or bacterial origin

J. Marimon Ortiz De Zarate* [Donostia-San Sebastian, Spain], A. Perez-Gavilán, M. Ercibengoa, N. Azcue, M. Alonso, L. Vidaur

**1471** Relationship between intestinal microbiota and infantile colic

C. Haddad, T. Itani* [Beirut, Lebanon], A. Moukarzel, D. Karam Sarkis

**5575** A multi-omics approach to understanding the aetiology of Q fever fatigue syndrome

R. Ruijmakers* [Nijmegen, Netherlands], M. Roerink, A. Jansen, S. Keijmel, R. Gacesa, Y. Li, L. Joosten, J. Van Der Meer, M. Netea, C. Bleeker-Rovers, C. Xu

**2371** Assessment of quantitative composition of Bacteroides fragilis in children with coeliac disease at the time of diagnosis and after a six-month period of diet

A. Krawczyk* [Krakow, Poland], D. Salamon, K. Kowalska-Duplaga, Z. Grzenda-Adamek, A. Kozioł-Kozakowska, K. Fyderek, T. Gosiewski

**6236** Characterisation of vaginal microbiota in pregnant women with preterm prelabor rupture of the foetal membranes

A. Vergara* [Barcelona, Spain], T. Cobo, E. Rubio Garcia, J. Bosch, J. Vila Estape, C. Casals-Pascual

**2221** Microbiome analysis of samples from patients with idiopathic pulmonary fibrosis in the A Coruña University Hospital, Spain: a pilot study

K. Conde* [A Coruña, Spain], J. Vallejo, L. Alvarez-Fraga, S. Rumbo-Feal, B. Rodiño-Janeiro, G. Bou Arevalo, C. Montero Martínez, I. Vidal Garcia, M. Poza Dominguez

**6544** Differences in nasopharyngeal microbiota composition according to the severity of human rhinovirus infection in the first 1000 days of life

**6790** Long-term effect of dietary preferences and nutritional regimes on intestinal microbiota diversity and composition

M. Hora, A. Gundagdu* [Kayseri, Turkey]

**3498** The female reproductive tract microbiome and its relationship with infertility and hydrosalphinx

Y. Yagel* [Beer Sheva, Israel], A. Weintraub, E. Pardo, S. Green, Y. Motro, J. Moran-Gilad

**6794** Chemotherapies for acute lymphoblastic leukaemia may have a long-term impact on bacterial gut microbiota

M. Payen* [Paris, France], A. Cointe, A. Pascault, G. Mahemed, M. Fadh, S. Delannoy, P. Fach, A. Baruchel, A. Monjault, S. Bonacorsi, A. Birgy

**4187** Vaginal microbiota in Japanese women undergoing infertility treatment

A. Matsumoto* [Saitama, Japan], Y. Yamagishi, S. Takahashi, Y. Kuroki, A. Minemura, K. Oka, M. Takahashi, H. Mikamo

**6839** Akkermansia muciniphila in multiple sclerosis

**4451** Microbiota as a marker of mucoid Pseudomonas aeruginosa and Haemophilus influenzae in non-cystic fibrosis bronchiectasis

R. López, L. Fernandez Barat* [Madrid, Spain], N. Vazquez, V. Alcaraz, L. Bueno, R. Cabrera, G. Sciascia, P. Oscañoa, R. Amara, A. Torres

**7021** Interplay between genetic disorders and gut microbial community: Rubinstein-Taybi syndrome as a model

G. Bassanini, E. Di Fede, E. Colombo, C. Ceccarini, E. Ottaviano, V. Masso, C. Gervasini, E. Borghi* [Milan, Italy]
7370 Gut microbiota of full-term and late preterm newborns in Moscow
P. Totiana, E. Isaeva, V. Muravev, A. Gardeev* (Moscow, Russian Federation), A. Melkumyan, L. Lyubasovskaya, M. Mesyan, L. Timofeeva, V. Zubkov, E. Sukhikh

7582 Faecal microbiota in Romanian ankylosing spondylitis patients
M. Oprea* (Bucharest, Romania), D. Cristea, D. Predateanu, V. Bojinca, M. Trandafir, S. Dinu, S. Ciontea, C. Usein

7893 Studying the association of the human vaginal microbiome with HPV infection using enriched metagenomic sequencing
A. Latszuzbioa* (Dudelange, Luxembourg), A. Wienecke-Baldacchino, M. Herald, I. Karabegovic, J. Topp, M. Fischer, F. Mühlischlegel, J. Massong

8400 Dynamic study of microbial interactions in the skin microbiota of patients with epidermal necrolysis (DynaMiCut)

8758 Dystbiosis in a triplet with an autism spectrum disorder: a case study
S. Hazan* (Ventura, United States), J. Daniels, A. Popoutsis

8760 Correlation between vaginal microbiota diversity and human papilloma virus induced cervical carcinogenesis in population of Santander, Colombia
L. Torrado Garcia* (Bucaramanga, Colombia), B. Rincon-Martínez, A. Vergara, J. Martínez

8830 Preliminary analysis of a pilot study using a new oral encapsulated formulation of faecal microbiota
V. Rico Caballero* (Barcelona, Spain), A. Aire, E. Rubio Garcia, C. Casals-Pascual, A. Vergara, J. Martínez Martínez, A. Soriano

999 Modulation of the microbiota by oral intake of a synbiotic mixture in healthy volunteers: a single-centre one-armed pilot study
I. Rubin* (Frederiksborg, Denmark), S. Mollerup, M. Pinholt, M. Pedersen, T. Kollemose, H. Westh, A. Petersen

1730 Effects of penicillin V on the intestinal microbiota in patients with pharyngo-tonsilitis
P. Edquist* (Stockholm, Sweden), K. Rystedt, C. Giske, K. Hedin, S. Mölstad, M. Ringman, G. Skaag Ståhlgren, P. Sundvall, C. Edlund

3435 Using metagenomics to study the impact of hospital stay on the human gut resistome
M. Yokoyama* (Brighton, United Kingdom), L. Peto, A. Walker, M. Llewelyn

3809 Long-term exposure to ceftriaxone sodium induces alteration of gut microbiota accompanied by anxiety-like and depression-like behaviours in mice
Z. Zhao* (Chengdu, China), L. Zhou, C. Tao

4298 Effects of spectrum of antibiotics on microbiome compositions and resistome levels
K. Nielsen* (Copenhagen, Denmark), M. Olsen, A. Palleja, S. Ebdurp, N. Sørensen, O. Lukjancenko, R. Marvig, K. Møller, N. Frimodt-Moller, F. B. Hertz

4942 Bacterial consortium: the evolution of the Faecal Microbiota Transplantation (FMT)
G. Quaranta* (Rome, Italy), G. Fancelli, R. Graffea, G. Ianiri, G. Cammarota, M. Sanguinetti, L. Masucci

4998 Donor selection in the Belgian Ghent Stool Bank: a relief to help
H. Hamerlinck* (Ghent, Belgium), J. Vandevoije, E. Naessens, S. Vandenbossche, L. Coevert, J. Boelens, B. Verhasselt

5420 Early microbiome changes associated with the novel, targeted-spectrum antibiotic ACX-362E compared to oral vancomycin

5805 Disease prevention not decolonisation: a cohort study for faecal microbiota transplantation for patients colonised with multidrug-resistant organisms

5833 Impact of different antimicrobial exposures on the gut microbiome and resistome characterised by metagenomic sequencing
L. Peto* (Oxford, United Kingdom), N. Fawcett, T. Peto, D. Crook, M. Llewelyn, A. Walker

6174 Change of gut microbiome and resistome of the patients with Clostridioides difficile infection and those with chronic obstructive pulmonary diseases compared with healthy population
J. Kim* (Guri, South Korea), M. Sea, M. Bae, B. Kim, M. Rho, H. Pai

6210 Gut microbiota of healthy volunteers with or without stool carriage of Klebsiella pneumoniae in an area with invasive Klebsiella pneumoniae syndrome
Y. Huang* (New Taipei, Taiwan), C. Liao

6230 Characterisation of the human gut microbiome in a high antibiotic use and resistance setting in Vietnam
Gut microbiome characterisation in irritable bowel syndrome patients following faecal microbiota transplant: a case report study
M. Surleac, S. Paraschiv* (Bucharest, Romania), C. Apostolescu, D. Otelea

Recruiting donors for faecal microbiota transfer: a one year experience
A. Airo* (Barcelona, Spain), V. Rico Caballero, E. Rubia Garcia, C. Cosals-Pascual, A. Soriano

Ceftriaxone and cefotaxime have similar impact in emergence of resistance in gut microbiota from hospitalised patients
P. Benoit* (Paris, France), O. Jiang, A. Mizrahi, J. Zahar, A. Le Monnier

Bacteroides as a next-generation of probiotics in neonatology
L. Lyubasovskaya, P. Tatiana, V. Muravieva, E. Isaeva, D. Serdyukova, A. Gordeev, N. Shabanova* (Moscow, Russian Federation), G. Sukhikh

Is periodic screening of donor faeces with temporary quarantine storage effective in preventing transmission of multidrug-resistant organism during faecal microbiota transplantation?

What constitutes a healthy faecal microbiome?
S. Mitra, A. Buckley, I. Moura, D. Ewin, W. Spittal, E. Clark, K. Bentley, J. Freeman* [Leeds, United Kingdom], M. Wilcox

Impact of selective digestive and oropharyngeal decontamination on the gut microbiome and resistome in intensive care patients
B. Xavier* [Antwerp, Belgium], S. Patz, N. Plantinga, B. Wittekamp, C. Lammens, D. Huson, M. Bonten, K. Singkhamanan, A. Chukamnerd, K. Silpapojakul

Continuous infusion versus intermittent antipseudomonal β-lactam antibiotics for acute pulmonary exacerbations of cystic fibrosis: effect on the respiratory microbiome
K. Langan* [Kensington, Australia], J. Choa, G. Rogers, D. Keating, R. Stirling, J. Wilson, A. Cheng, C. Chang, T. Kotsimbos, A. Peleg

Longitudinal microbiome analysis defines expected and aberrant antibiotic effects on the human respiratory microbiome
E. Clarke, E. Lautenbach, E. Reesey, M. Wernovsky, P. Tolameo, B. Kelly* [Philadelphia, United States]
5025 Epidemiological typing of Neisseria gonorrhoeae with whole genome sequencing: a vital supplement in transmission surveillance
K. Hajj Bhattarai* [Stockholm, Sweden], E. Ericsson, F. Dyrkell, D. Arnellois, G. Bratt, M. Ullberg, N. Bjärkström, H. Fang

5082 Evaluation of meningococcal B vaccine antigen variants in Neisseria meningitidis: Italy 2012-2018
P’Vacca* [Rome, Italy], L. Ambrosio, C. Fazio, A. Neri, A. Palmieri, A. Coranante, P’Stefanelli

5303 European Centre for Disease Prevention and Control system for cluster detection and interactive exploration of WGS data
E. Alm* [Stockholm, Sweden]

6000 Metagenomic sequencing to identify environmental reservoirs of carbapenem-resistant Acinetobacter baumannii associated with clinical outbreaks
B. Forde* [Brisbane, Australia], L. Roberts, P’Harris, A. Jennison, K. Hajkowicz, T. Hurst, M. Doidge, S. Beatson, D. Paterson

6250 Molecular epidemiology of leptospirosis in Tahiti, French Polynesia, during the 13-year-time spanning from 2007 to 2019
H. Angermeier* [Paris, France], L. Grillová, S. Lastere, M. Levy, M. Picardeau

6834 Phylogenetic and resistome analysis of human and animal Acinetobacter baumannii ST25 isolates
A. Lupo* [Lyon, France], B. Valiot, E. Saros, M. Bour, E. Hirchaud, M. Haenni, P’Plésiat, J. Madec, A. Potron

7177 Genomic surveillance of Bordetella pertussis in Austria
A. Cabol Rosel* [Vienna, Austria], D. Schmid, O. Soetens, S. Denayer, D. Pierard* [Brussels, Belgium]

7799 Prevalence, antimicrobial susceptibility and molecular typing of Legionella pneumophila in hot water systems in Morocco
A. Assaïdi* [Beni Mellal, Morocco], M. Elouadi, H. Latrache, H. Zohir, C. Ginevra, S. Jarraud, M. Mliji

7838 Multi locus sequence typing of Treponema pallidum subspecies pallidum in Barcelona
C. Fernández Naval* [Barcelona, Spain], M. Aranda, M. Espasa, A. Anton, M. Fernández-Huerta, J. González-López, J. Serra Pladevall, T. Pumarola-Suñé, M. Vall, J. Espejarla

7858 Macrolide-resistant Mycoplasma pneumoniae detection
S. Leung* [Hong Kong, Hong Kong]

9062 National survey of Neisseria gonorrhoeae isolates by whole genome sequencing in France in 2018

Session accepted as Paper Poster Session

Molecular and genomic typing of Gram-negatives

1598 Routine use of whole genome sequencing for Salmonella Enteritidis surveillance in the Netherlands in 2019
M. Van Den Beld* [Bilthoven, Netherlands], R. Pijnacker, A. Verbruggen, K. Van Der Zwaluw, S. Kuiling, E. Franz

3377 Distribution of capsular types among multi-resistant Klebsiella pneumoana isolates in the south of Spain by using a whole genome sequence-based solution

3781 Escherichia coli ST457: an emerging pathogen with wildlife and food-producing animals’ reservoirs
K. Nesperova* [Brno, Czech Republic], E. Wyrsch, I. Jamborova, A. Valček, I. Literak, S. Djordjevic, M. Dalejska

3952 Developing a pragmatic framework for genomics-informed surveillance of endemic Salmonella Typhimurium in Australia
P Andersson, W. Pritchers, D. Hennessy, M. Valcanis, J. Gregory, Z. Cutcher, M. Easton, B. Howden* [Parkville, Australia], D. Williamson

131
6414 Continuous genomic surveillance of the third generation cephalosporin-resistant *Enterobacteriaceae* circulating in intensive care units of a 1600 bed university hospital, France F. Gravey* [Caen, France], M. Fines-Guyon, C. Isnard, F. Ethuin, D. Samba, D. Du Cheyron, C. Daubin, A. Mouet, C. Lesteven, O. Jain-Lambert, M. Auzou, F. Guérin, S. Le Hello

7314 Molecular characterisation of 15 strains of OXA-181-producing *Klebsiella pneumoniae* in Spain N. Romani Radés* [Badalona, Spain], A. Moreno-Mingorance, M. Ouesada, N. Larrosa, M. Gimenez, J. González-López

7423 Unexpected genomic variability among *Enterobacteriaces* causing bloodstream infections in European neonates and infants less than 90 days L. Folgori* [Milan, Italy], A. Piazza, F. Comandatore, A. Witney, Y. Hsia, N. Russell, K. Loing, I. Monahan, M. Perini, G. Zuccotti, T. Planche, P. Heath, M. Sharland

8701 Molecular epidemiology of carbapenem-resistant *Klebsiella pneumoniae* isolates in France 2018 M. Budia* [Le Kremlin-Bicêtre, France], R. Bannin, L. Dortet, T. Noas

517 Prevalence and serotype distribution of *Streptococcus agalactiae* colonisation among pregnant women in Taiwan C. Yu-Fen* [Changhua, Taiwan], F. Yu-Ping, C. Lee

723 Typing of MRSA isolates from bloodstream infections in the Dutch-German border region and Berlin N. Couto* [Groningen, Netherlands], E. Raangs, J. Rossen, J. Hellkamp, J. Elias, R. Köck, A. Friedrich

1336 Emergence of a mupirocin-resistant, methicillin-susceptible *Staphylococcus aureus* clone associated with skin and soft tissue infections in Greece N. Giormezis* [Patras, Greece], A. Doudouloakakis, K. Tsilipoudiakidou, M. Mitsipoulou, G. Kalogeras, V. Stamoulis, F. Klonitsiou, E. Petinaki, E. Lebessi, I. Spiliopoulou

1363 Genetic structure and treatment for *Listeria monocytogenes* infections W. Yu* [Hangzhou, China], Y. Huang, L. Guo, J. Zhang, Y. Zhan, L. Zhang, Y. Qiu

Molecular epidemiological survey of *Staphylococcus lugdunensis* isolates with different copies of the repeat region in the gene encoding the von Willebrand factor-binding protein J. Lu* [Taoyuan, Taiwan], L. Lin

Prospective surveillance of invasive group A *Streptococcus* disease in the Netherlands L. Rumke* [Utrecht, Netherlands], S. Vestjens, A. Van Der Ende, B. De Gier, N. Van Sorge, B. Vlaminckx

The unexpected stability of Group B *Streptococcus* clones/serotypes colonising the genitourinary tract of healthy young women M. Ksiezarek, A. Guimarães, V. Martins, J. Rocha, S. Ugarcina Perovic, F. Grosso* [Porto, Portugal], L. Vieira Peixe

Prevalence and molecular characterisation of methicillin-susceptible *Staphylococcus aureus* carrying Panton-Valentine leucocidin gene isolated from patients with invasive infections and nasal carriers D. Tapia, C. Sanhueza, C. Campusano, I. Gallardo, L. Porte* [Santiago, Chile], C. Varela, M. Ulloa

Paediatric invasive pneumococcal disease in Portugal: dominance of serotype 3 and increase in serotype 8 four years after PCV13 inclusion in the national immunization plan C. Silva-Costa, J. Gomes-Silva, L. Prados, M. Ramirez* [Lisbon, Portugal], J. Melo-Cristino

Clinical and bacterial characteristics of paediatric invasive infections caused by *Streptococcus pyogenes* C. Gouveia, L. Varandas, M. Ramirez* [Lisbon, Portugal], J. Melo-Cristino, A. Fábres
6485
The PCV13 serotypes still account for a large fraction of invasive pneumococcal disease in adults three-years after PCV13 introduction in the paediatric vaccination schedule [Portugal: 2015-2018]
C. Silva-Costa, J. Gomes-Silva, I. Teodoro, M. Ramirez* (Lisbon, Portugal), J. Melo-Cristino

6986
Genomic analysis of invasive Streptococcus pyogenes isolated in 2013 and 2018 from Hungary
K. Kristof, P. Forkas, M. Iván, E. Ungvári, T. Erdős, A. Toth* (Budapest, Hungary)

7196
Characterisation of Group B streptococci (GBS) colonising pregnant women in Belgium, 2018: antimicrobial susceptibility profile and distributions of capsular-types, pili-types and sequence-types
C. Mee* (Liège, Belgium), S. Douillez, A. Kinet, R. Sacheli, P. Melin

8772
Genomic epidemiology of paediatric invasive Group A Streptococcus infections in British Columbia, Canada
I. Sekirav* (Vancouver, Canada), W. Demczuk, I. Martin, S. David, M. Naus, J. Sigley, L. Hoang

9094
Streptococcus agalactiae in adults in England and Wales 2014-2015, large scale recombination and capsular shifting
U. Khan* (Cardiff, United Kingdom), E. Jauneikaite, R. Andrews, V. Chalker, B. Spiller

9231
Sharing of MLVA clusters of Listeria monocytogenes among bovine and human invasive clinical isolates
I. Dirigo* (Fontane di Villorba, Italy), E. Mozollini, C. Bacchin, A. Barberis, L. Barco, M. Cocchi, L. D’este, M. Favretti, T. Gallo, A. Gattuso, A. Lettini, E. Schiavon, A. Tavella, F. Agnoletti

Session accepted as Paper Poster Session
Molecular diagnosis of genital infections

287
Screening of Chlamydia trachomatis and Neisseria gonorrhoeae in female sex workers: pooled versus single site testing
N. Verougstraete, V. Verbeke, A. De Cannière, E. Padalka, L. Coorevits* (Ghent, Belgium)

293
Sexually-transmitted infections detection using real-time PCR Allplex in the east coast of Spain
B. Foster Escriva* (Oliva, Spain), M. Belda, M. Ocete, C. Gimeno Cardona

1075
Evaluation of simultaneous detection of pathogens associated with sexual transmitted infection and vaginal disorders on a real-time qPCR microfluidics platform in an asymptomatic female college student’s cohort
M. Montesinos Hernández* (Bs-Hertogenbosch, Netherlands), S. Lutgens-Dumont, M. Herrmans

1319
MYCOPLASMA IST3, a new in vitro medical device to aid the diagnosis of urogenital mycoplasma infection: performance results from an international multi-centre trial
Y. Bala* (Marcy l’Etoile, France), I. Boostram, J. Minic Vasic, A. Barratt ?, E. Chanard, J. Gluvakov, B. Spiller, L. Devigne

1677
ESwab collection device allows both detection of human papilloma virus with molecular assays and culture with WASP automation
R.Gatej, M. Giuca, S. Constanda* (Bucharest, Romania), R. Musat, M. Dinescu

1728
Evaluation of the Aptima BV assay for detection of bacterial vaginosis by comparison with the BD MAX vaginal panel assay
S. Vaagd, B. Ridwan, D. Willemse-Erix* (’s-Hertogenbosch, Netherlands), S. Lutgens-Dumont, M. Herrmans

4351
Evaluation of a multiplex PCR in genital ulceration diagnosis

4805
Molecular detection of Mycoplasma ammoniforme and Ureaplasma species from patient samples previously investigated for Mycoplasma pneumoniae infection in England and Wales between 2016 – 2017
S. Rehman, S. Maddocks, B. Afshar, J. Day, V. Chalker, M. Beeton* (Cardiff, United Kingdom)

4827
Rapid molecular Chlamydia trachomatis/Neisseria gonorrhoeae testing is now a reality
B. Van Der Pol* (Birmingham, United States), L. Crane, S. Taylor, J. Lebed, A. Ermel, L. Mena, C. Mcneil, A. Sukhija-Cohen

4839
Comparison of analytical performances of the new QiaGen NeuMoDx CT/NG assay with the Abbott RealTime CT/NG assay for detecting Chlamydia trachomatis and Neisseria gonorrhoeae
S. Svraka-Latjovic* (Hilversum, Netherlands), T. Dzebisasjvili, R. Doorn, C. Timmerman, L. Bakker, R. Nijhuis, J. Dorigo-Zetsma

4911
Clinical validation of the BD CT/GC/TV2 for BD MAX system in vaginal, endocervical and female urine specimens
B. Van Der Pol* (Birmingham, United States), E. Torres-Chavolla, S. Kodsí, C. Cooper, T. Davis, K. Fife, S. Taylor, M. Augenbraun, L. Bachmann, C. Gaydos

4946
Clinical validation of the BD CTGCTV2 for BD MAX system assay in male urine specimens
B. Van Der Pol* (Birmingham, United States), E. Torres-Chavolla, S. Kodsí, C. Cooper, T. Davis, K. Fife, S. Taylor, M. Augenbraun, L. Bachmann, C. Gaydos

5059
Method comparison: Abbott Alinity m STI (CT, NG, MG, TV) vs Hologic Aptima CT/NG & Aptima MG
R. Gatej, M. Giuca, S. Constanda* [Bucharest, Romania], R. Musat, M. Dinescu

5528
Epidemiology of sexually-transmitted infections in women with suspected pelvic inflammatory disease admitted to gynaecology emergency unit of an Italian hospital
S. Fiorentini* (Brescia, Italy), A. Pirazzi, A. Matteelli, V. Marchese, R. Stellini, M. Traversi, F. Caccili, S. Rubessa, M. Gulletta
Abstract Categories 2020

6640 Assessment of the performance of the Vaginosis kit Aptima BV on Panther system from vaginal samples during a 3-month period at Nantes university hospital L. Ruffier D’Epenoux, A. Guillouzouic, P’Bemer, S. Corvec* [Nantes, France]

6822 Molecular cpn60-targeted PCR sequencing to assess the diagnostic characteristics of the Nugent Score diagnosis of bacterial vaginosis in reproductive age Kenyan women T. Fear* [Toronto, Canada], E. Shwartsman, J. Russell, M. Richmond, C. Perciani, S. Vancuren, J. Hill, P.Sandstrom, K. Macdonald

7110 Performance of two commercial multiplex PCR assays on the detection the aetiologies of sexually-transmitted infections in men who have sex with men T. Lee* [Taipei, Taiwan], K. Lin, S. Chang, C. Hung, P.Hsueh

7394 Performance evaluation of a novel Trichomonas vaginalis and Mycoplasma genitalium assay in urine and swab specimens C. Lounds, L. Gong* [Ann Arbor, United States], E. Craig, C. Couture, M. Mastronardi, B. Wu, S. Brahmasandra

7502 Use ESwab in sexually-transmitted disease diagnosis by STD Direct Flow Chip Kit T. Soler Maniega* [Madrid, Spain], N. Zurita Cruz, A. Fraile Torres, S. Gómez De Frutos, A. García, L. Cardero

7700 Evaluation of a multiplex real-time PCR assay for detection of the aetiologic agents of vaginitis P. Salmerón* [Barcelona, Spain], P. García, M. Fernández-Huerta, C. Fernández Naval, T. Pumarola-Suñé, Y. Hoyos-Mallecatt, J. Serra Piadevall

8491 A study to investigate the utility of confirmatory testing of oropharyngeal samples positive for Neisseria gonorrhoeae by Cobas 4800 CT/NG test S. Jones* [Cardiff, United Kingdom], R. Drayton, C. Knapper, M. Perry

8592 Performance and comparison of the rapid VivalyticSTI multiplex assay for the detection of sexually-transmitted infections (STI) in specimens from male patients attending an STI dermatologist practice G. Lang* [Vienna, Austria]

Session accepted as Paper Poster Session

Molecular diagnosis: additional aspects

2022 The impact of transport media, shipping time and DNA extraction kits on the absolute abundance of key vaginal bacterial species T. Haahr, J. Jensen* [Copenhagen, Denmark]

3297 A highly sensitive, non-amplification detection method of nucleic acids in bacilli and viruses E. Ito* [Tokyo, Japan], N. Kawada, Y. Kyosei, M. Okamatsu, Y. Sakoda, T. Yoshimura, R. Takeuchi, T. Ohta, K. Nakaishi, S. Watabe

3965 Evaluation of multiplex PCR for rapid detection of bacteria and antibiotic resistance in spontaneous bacterial peritonitis: a pilot study J. Tan* [London, United Kingdom], N. Burke, N. Roth, D. Owen, J. Ryan, M. Morgan, R. Westbrook, E. Wey

4016 Highly sensitive and specific detection and serotyping of five prevalent Salmonella serovars by multiple cross displacement amplification X. Zhang* [Sutherland, Australia], M. Payne, Q. Wang, V. Sintchenko, R. Lan

4255 Evaluation of the Allplex H. pylori and ClariR Assay PCR kit on gastric biopsies Q. Jehanne, L. Benejet, F. Megraud, E. Bessède, P. Lehours* [Bordeaux, France]

4458 qPCR inhibitors/enhancers: the interference in the reaction by drugs used for patient treatment or ingested by the patients E. Machetti-Mareca, R. Morales Hernández, C. Escolar* [Zaragoza, Spain], M. Gil-Rodríguez

6601 Viral versus bacterial infection diagnosis: Affimer proteins as alternative molecular recognition reagents M. Ajayi* [Leeds, United Kingdom], D. Tomlinson, M. Mcpherson

6640 Automation of laboratory developed tests using CSF, transport medium, and whole-blood specimens on the NeuMoDx molecular system C. Lounds, B. Zgheib, P. Mateas, C. Couture* [Ann Arbor, United States], M. Mastronardi, B. Wu, S. Brahmasandra

6752 Molecular testing of the bone marrow in post-mortem samples for the detection of fatal disseminated infections M. Navarro* [Barcelona, Spain], J. Hurtado, P. Castilla, N. Rakislova, A. Martinez-Palhares, I. Casas, M. Freire, L. Ferreira, M. Lacerda, W. Monteiro, L. Marimon, J. Vila Estape, O. Bassat, C. Menéndez, J. Ordí, M. Martinez

6947 Development of an in-house cell-SELEX methodology for Acinetobacter baumannii aptamers selection M. Farrel Côrtes* [Sao Paulo, Brazil], T. Marli Bes, B. Déo, E. Cerdeira Sabino, S. Figueiredo Costa, C. Santos
Abstract Categories 2020

Session accepted as 1-Hour Oral Session

Molecular testing and multiplex panel approaches for diagnosis

3983 Assessing impact of Multiplex PCR Point-of-Care testing in patients with respiratory tract infection: a French national study

4090 Discriminating bacterial and viral infection using a rapid host gene expression test

7249 The effects of introduction of a syndromic PCR sputum testing in intensive care unit pneumonia patients in a tertiary trauma centre
D. Kluczna* [Hull, United Kingdom], P. Burns, D. Wearmouth, P. Lillie

Session accepted as Mini-oral Flash Session

Molecular tools for bacterial diagnosis: how, when and why to use them?

5469 Syndromic tests for meningitis: patient screening before testing allows a high efficient medical value
O. Dauwalder* [Lyon, France], C. Jean-Sebastien, L. Chelghoum, B. Viseux, C. Gustave, D. Dupont, P. Girard, H. Saikia, F. Mzou, T. Solomon, M. Griffiths* [Sydney, Australia], W. Huston, N. Lima

5944 Do DNA based NAAT tests lead to over diagnosis of Chlamydia trachomatis infections?
J. Todd* [Sydney, Australia], W. Huston, N. Lima

6135 Molecular pathogen identification and resistance gene detection from positive blood cultures
A. Brachner, L. Marki, H. Enroth* [Skåne, Sweden], B. Ronacher

6926 Towards an enhanced diagnosis of relapsing fevers by the use of dried blood spots
E. Talagrand-Reboul* [Strasbourg, France], P. Boyer, A. Grillon, C. Bartel, L. Baldinger, M. Engel, L. Zilliox, B. Jaulhac, N. Boulanger

6941 Diagnostic evaluation of the new FluoroType MRSAfast assay for the detection of MRSA from clinical swab specimens
S. Dargel, B. Herberth, M. Eckart* [Nehren, Germany], V. Allerheiligen, T. Bradegeger

7018 Clinical evaluation of ChromaCode’s HDPCR tick-borne pathogen panel
L. Petersen* [Lebanon, United States], J. Jefferts, G. Tsangalis

7094 Rapid distinction of capsules Acinetobacter baumannii using a density gradient method

7098 Rapid diagnostics of bloodstream infections using sybodies and nanobodies as capturing agents
L. Huber, M. Sorgenfrei* [Zurich, Switzerland], R. Melissa, H. Keserue, P. Keller, M. Seeger

7267 Loop-primer endonuclease cleavage loop-mediated isothermal amplification technology for singleplex or multiplex target detection and single-nucleotide polymorphism identification
O. Higgins* [Galway, Ireland], T. Smith

7385 Fighting antimicrobial resistance with breath analysis
E. Adams* [Liverpool, United Kingdom], E. Brodrick, J. Covington, N. Feasey, J. Skinner, M. Radice, D. Sanders
Abstract Categories 2020

Direct detection of Escherichia coli in clinical samples by an ultrasensitive fluorescent copper nanoparticles-aptasensor
Y. Xiao* [Chengdu, China], P. Zhang, L. Wang, Z. Wang, J. Geng

Evaluation of EUCAST rapid antimicrobial susceptibility testing (RAST) directly from blood culture bottles
S. Waled, Y. Soo, S. Ng, Y. Peh, K. Chew* [Singapore, Singapore]

Evaluation of diagnostic method with sonication and culturing of orthopaedic implant-associated infection at Karolinska University Hospital, Sweden
B. Saeedi, D. Kartou Boukdr* [Stockholm, Sweden]

Neural networks for prediction of minimum inhibitory concentration
E. Carlsson, F. Dyrkell* [Gothenburg, Sweden], T. Lundh

Performance of the urine flow cytometer Sysmex UF-5000 in rapid diagnosis of urinary tract infections
K. Haugum* [Trondheim, Norway], M. Haugan, J. Skage, M. Tetik, A. Jakovljev, H. Schjelderup Nilsen

Light scattering technology in the diagnosis of infections in children on dialysis
L. Boronina* [Ekaterinburg, Russian Federation], E. Samatova

Comparison of the Accelerate Pheno rapid diagnostic system with standard of care for diagnosing Gram-negative bloodstream infections: bacterial identification, antimicrobial sensitivity and turnaround time

A clinical predictive model of multidrug resistance in neutropenic cancer patients with bloodstream infection due to Pseudomonas aeruginosa [IRONIC study]

Predicting phenotypic polymyxin resistance in Klebsiella pneumoniae through machine learning analysis of genomic data
N. Macosic* [Melbourne, Australia], Q. Bear Don’T Walk IV, I. Pe’Er, N. Tatonetti, A. Peleg, A. Uhlemann

Visual antibiogram of Staphylococcus aureus using machine learning demonstrates multidrug resistance as associations between individual antimicrobials
C. Cazer* [Ithaca, United States], L. Westblade, M. Simon, R. Magleby, M. Castanheira, S. Jenkins, Y. Grahn

Optimisation of blood components sterility testing: impact of small volumes in analytical sensitivity
D. Voy, F. Gotta, L. CARRABBA, R. MAZZEA, A. Rocchetti* [Alessandria, Italy]

Turnaround time for pathogen identification and antimicrobial susceptibility testing of bronchoalveolar lavage specimens in U.S. acute care hospitals
S. Macvane* [Tucson, United States], N. Oppermann, R. Humphries

Evaluation of the RIDA QUICK Helicobacter and RIDASCREEN Helicobacter kits on stool samples for Helicobacter pylori diagnosis
A. Buissonniere, L. Benejat, E. Bessède, F. Megraud, P. Lehours* [Bordeaux, France]

CXCL13, a new marker in the diagnosis of Lyme neuroborreliosis?
A. Barbry* [Lyon, France], C. André, A. Carricajo, A. Doleans Jardheim, F. Christine, P. Girarda, A. Boibieux, F. Laurent, G. Lina, F. Vandenesch, C. Roure-Sobas

Value of pneumococcal urinary antigen testing in a recent series of Streptococcus pneumoniae bacteraemia
A. García Caballero* [Madrid, Spain], M. Serrano Tomás, D. Marcos Mencía, J. Fortun Abete, M. Maya, R. Cantón Moreno, A. Sanchez Diaz

Sensitivity of the pneumococcal urinary antigen ImmuView in proven or probable pneumococcal pneumonia
G. López De Egea* [L’Hospitalet de Llobregat, Spain], A. González Díaz, M. Domínguez Luzon, C. Ardanuy Tisaire

Comparison of bacterial recovery of stored sonication fluid cultures using liquid broth and solid media obtained from orthopaedic implant-associated infections
M. Kurihara, I. Nayara Marcelino Santos, B. Castro, A. Pignatari, M. Salles* [Sao Paulo, Brazil]

Typing of Salmonella enterica by Fourier-transform infrared spectroscopy
M. Cordovana* [Bologna, Italy], N. Mauder, S. Pangolini, L. Soliani, S. Ambretti, M. Kostrzewa

Predicting co-amoxiclav resistance in Escherichia coli bloodstream infections using machine learning methods and bacterial genome-wide association studies
K. Vlha* [Oxford, United Kingdom], T. Davies, N. Stoesser, S. Earle, D. Wilson, E. Eyre, S. Lipworth, D. Clifton, S. Kouchaki, D. Crook, T. Peto, A. Walker

Validation of FASTmar kit, a flow cytometric assay for detection of main mechanisms of beta-lactams resistance directly from positive blood cultures
I. Martins-Oliveira, R. Gomes, B. Pérez-Viso, A. Silva-Dias, L. Vieira Peixe, A. Rodrigues, I. Martins-Oliveira, R. Gomes, B. Pérez-Viso, A. Silva-Dias

Education for diagnostic stewardship needs fresh approaches in the digital era: lessons from an attempt to reduce inappropriate urine cultures
A. Ang* [Singapore, Singapore]
Usefulness of flow cytometry as a screening technique in the detection of bacterial vaginosis and vaginitis
J. Peñate* (Cádiz, Spain), I. Guerrero Lozano, S. Rodríguez-Pallarés, F. Galan-Sanchez, M. Rodriguez-Iglesias

Evaluation of the CAMPYLOBACTER QUIK CHECK to detect Campylobacter in stool samples
J. Franco* (Bordeaux, France), L. Benejat, A. Ducournau, F. Megraud, P. Lehours, E. Bessède

Usefulness of flow cytometry as a screening technique in the detection of bacterial vaginosis and vaginitis
J. Peñate* (Cádiz, Spain), I. Guerrero Lozano, S. Rodríguez-Pallarés, F. Galan-Sanchez, M. Rodriguez-Iglesias

Evaluation of the CAMPYLOBACTER QUIK CHECK to detect Campylobacter in stool samples
J. Franco* (Bordeaux, France), L. Benejat, A. Ducournau, F. Megraud, P. Lehours, E. Bessède

Session accepted as Mini-oral Flash Session
No time to lose: rapid diagnostics

Rapid carbapenemase detection using the CARBAS lateral flow device
H. Ciesielczuk* [London, United Kingdom]

Proof of concept of a low-cost tropicalised device to detect bacterial growth in equipment-free blood cultures: results from the Turbidimeter pilot study
L. Hardy* [Antwerp, Belgium], E. Corsmit, J. Jans, K. Kaur, R. Boets, J. Jacobs

Optimal detection of multidrug-resistant Gram-negatives from stools
C. Fournier, M. Sadek, L. Poirel, P. Nordmann* [Fribourg, Switzerland]

Improving culture of Neisseria gonorrhoeae, by immediate plating and incubation at a venereology clinic
L. Brendefur Corwin* [Oslo, Norway], P. Campbell, K. Jakobsen, M. Ledaal, B. Moayeri, G. Syversen, F. Müller, T. Leegaard, J. Vildershøj Bjørnholt, A. Olsen

New approach for determination of antimicrobial susceptibility to amoxicillin by an acoustic sensor-based on a slot mode
O. Guliy* [Saratov, Russian Federation], B. Zaitsev, O. Karavaeva, I. Borodina

Can UF-5000 body fluid mode be an alternative for cerebrospinal fluid cell count?
E. Baran* [Istanbul, Turkey], A. Ilki

Rapid identification of methicillin-resistant Staphylococcus aureus (MRSA) in clinical microbiology labs by infrared spectral fingerprinting following growth on agar supplemented with cefoxitin
T. Tsutsumi* [Montreal, Canada], C. Frenette, N. Doherty, J. Seden, A. Ismail

Faster turn-around-time for blood cultures after relocation of blood culture units at Karolinska University laboratory
K. Ininbergs* [Stockholm, Sweden], S. Sheikhholeslami, M. Kedfors Holm, K. Hedman, S. Dhillion, M. Ullberg, A. Kelly, V. Özençi

The INHALE trial: designing a prescribing algorithm to aid antibiotic choices for the FilmArray Pneumonia Panel Plus
Z. Dhesi, V. Enne* [London, United Kingdom, J. Gant, D. Livermore

Performance of a PCR-based syndromic panel compared to routine culture and microscopy in patients suspected of pneumonia
V. Andrews* [Lund, Sweden], M. Pinholt, U. Schneider, L. Sées, K. Schønning, G. Lisby

Multinational performance evaluation of the BIOFIRE FILMARRAY Pneumonia plus (PNPlus) panel
C. Ginacchio* [Durham, United States], C. Garcia, B. Mauerhofen, C. Rindlisbacher

Microbiological validation of the BIOFIRE FILMARRAY Pneumonia Panel plus: a single-centre experience
V. Hinic, B. Nickel, V. Böttig, N. Khanna, D. Tamm, A. Blaich, D. Goldenberger, A. Egli* [Basel, Switzerland]

Impact of respiratory panel PCR assay on antibiotic use in patients with community-acquired pneumonia admitted to intensive care unit

Evaluation of the RIDA GENE CAP Bac real-time PCR assay for diagnosis of community-acquired pneumonia from human bronchoalveolar lavage (BAL)
A. Hieregeist* [Regensburg, Germany], S. Foerster, A. Simons, U. Reischl

BIOFIRE FILMARRAY pneumonia panel in the evaluation of severe lower respiratory tract infections
E. Kyriazopoulou* [Athens, Greece], A. Karageorgas, L. Liaskou-Antoniou, P. Kaoufyrgyris, A. Safarika, G. Adamis, A. Antoniadou, E. Giamarellos-Bourboulis

Laboratory evaluation of the BIOFIRE FILMARRAY pneumonia panel plus compared to standard-of-care testing at a private laboratory in Cape Town, South Africa
P. Naicker, L. Suleman* [Cape Town, South Africa], F. Khan, A. Haripersad, J. Hellig, E. Naicker, Q. Labuschagne, H. Naicker, F. Van Der Merwe, M. Hlazo, T. Poole, S. Cass, J. Wojno, A. Brink

Evaluation of the FILMARRAY pneumonia plus panel for rapid diagnosis of hospital-acquired pneumonia
L. Cremet* [Nantes, France], M. Bouras, B. Gaborit, E. Persyn, V. Riche, B. Rozec, K. Lakhoh, A. Roquilly, S. Gibaud

Multi-centre study for the evaluation of BioFire FilmArray Pneumonia Plus for the rapid microbiological diagnosis of low respiratory tract infections
E. Riccobono* [Florence, Italy], T. Spanu, F. Allegrucci, C. Tiberio, S. Ambretti, P. Bottino, V. Ghisetti, G. Lo Cascio, G. Rassolini
Evaluation of a highly specific sample-to-result real-time PCR assay for detection and typing of *Bordetella pertussis*, *Bordetella parapertussis* and *Bordetella holmesii* in nasopharyngeal aspirates, nasopharyngeal swabs and sputum samples

G. Linardos, G. Ricciotti, L. Piccioni, C. Concato* (Rome, Italy)

Evaluation of the potential clinical impact of BioFire FilmArray Pneumonia Plus for the treatment of VAP in intensive care unit patients, Careggi University Hospital, Florence

B. Viaggi, E. Riccobono* [Florence, Italy], M. Bendinelli, V. Zucchelli, T. Giani, G. Rossolino

Patient management and indication for influenza A/B and respiratory syncytial virus Point-of-Care testing in the emergency room and possible gains by syndromic respiratory testing

U. Schneider* [Copenhagen, Denmark], M. Holm, D. Bang, R. Petersen, S. Martensen, R. Trebbien, G. Lisby

Ungyero multiplex PCR on broncho-alveolar lavage for rapid microbiologic and antibiotic susceptibility documentations in immunocompromised patients under antibiotic therapy admitted to the intensive care unit

J. Tankovic* [Paris, France], J. Baudel, R. Dahoumane, S. Gallah, L. Benzerara, N. Veziris, E. Maury, B. Guidet

Evaluation of a quantitative multiplex PCR panel for the diagnosis of pneumonia: how do we optimise utilisation?

S. Whittier* [Edison, United States], M. Lopez, Y. Chen

Microbiological Point-of-Care analysis of endotracheal aspirate from intubated patients admitted to the intensive care unit

D. Ørsnes Christensen* [Copenhagen, Denmark], D. Kur, J. Brandt, M. Hindborg, C. Sørensen, M. Kolpen, C. Jensen, F. B. Hertz, J. Bangsborg, M. Bestle

Evaluation of Biofire FilmArray Pneumonia for the detection of pathogen bacteria in respiratory infections

M. Bermúdez Ruiz, M. Valverde Troya, F. Ana María, C. Mediavilla, B. Palop* [Málaga, Spain], I. De Toro Peinado

Procalcitonin diagnostic performance for differentiating bacterial from viral infection in adults and children with lower respiratory tract infection

Microbiological performances and clinical impact of the FilmArray Pneumonia Panel Plus on critically ill with severe pneumonia

A. Verraken* [Brussels, Belgium], J. Favresse, H. Rodriguez-Villalobos, P. Laterre

Impact assessment of the results of BIOFIRE FILMARRAY pneumonia panel plus for the detection of pathogenic bacteria and individualised therapeutic targeting

C. Gómez-Camarosa, V. García-Casas, M. Yuste Ósorio, N. Chueca Parcana* [Granada, Spain]

The potential impact of molecular rapid identification of pneumonia by The BIOFIRE FILMARRAY pneumonia panel on antimicrobial stewardship and patient management at a large district general hospital, United Kingdom

H. Kandi* [Watford, United Kingdom], R. Hilson, V. Page

Strategies for studying the human microbiome

1631 Insights into vaginal metabolic profiles throughout pregnancy

C. Faschi, L. Laghi, L. Zhu, G. Patuelli, L. Zagonari, M. Pedna, V. Sambri, A. Marangoni* [Bologna, Italy]

[In]stability of female urinary microbiota: who’s resident and who’s passing by

M. Ksiezarek* [Porto, Portugal], S. Ugarcina Perovic, J. Racha, F. Grossa, L. Vieira Peixe

Stool versus rectal swab for microbiome composition analysis in critical care patients

MiSeq protocol for 16S rDNA community profiling revisited with exact ribosomal sequence variants

J. Matern* [Münster, Germany], D. Hagenfeld, K. Prior, B. Ehmke, D. Harmsen

The microbiome of nasal samples from an all-age, healthy, UK cohort reveals the epidemiology of potentially protective bacterial genera

D. Cleary* [Southampton, United Kingdom], M. Asai, K. Moore, S. Clarke

Nasal microbiota: is it the war between staphylococci and corynebacteria?

J. Rigail, A. Baray* [Lyon, France], M. Gavid, Y. Lelonge, F. Laurent, P. Berthelot, J. Rasigade, E. Clarke, E. Lautenbach, E. Reesey, M. Wernovsky, P. Verhoeven

Application of direct MALDI-TOF MS analysis in routine study of gut microbiota of newborns

P. Tatiana* [Moscow, Russian Federation], A. Gordeev, V. Muravieva, E. Isaeva, L. Lyubasovskaya, A. Melkumyan, A. Skorobogatiy, S. Trubinov, G. Sukkhkh

Detection of respiratory *Mycoplasma pulmonis* during prolonged mechanical ventilation

E. Clarke, E. Lautenbach, E. Reesev, M. Wernovsky, P. Toameo, B. Kelly* [Philadelphia, United States]

**ABSTRACT BOOK –** **30th ECCMID 2020** 139
2888 Interest of rapid detection of emerging extensively drug-resistant bacteria by PCR associated with temporary dedicated team for high-risk patients M. Otta, C. Darles, J. Plantamura, P. Rossi, M. Walker, E. Sennavoine, B. Ducret, Y. Auoy, F. Janvier* [Toulon, France]

Endemicity of carbapenemase-producing Enterobacteriaceae in Hong Kong S. Wong* [Hong Kong, Hong Kong], V. Cheng

Characterisation of carbapenemase-producing Serratia marcescens clinical isolates recovered in a hospital in Madrid [Spain] using whole genome sequencing M. Hernández García, B. Pérez-Viso* [Madrid, Spain], M. Morosini Reilly, P. Ruiz-Garbajosa, R. Del Campo, R. Canton Moreno

Which anatomic sites should be screened for carbapenem-resistant Acinetobacter baumannii? A. Nutman* [Tel-Aviv, Israel], J. Lellouche, D. Schwartz, A. Lerner, P. Elmalih, R. Rav, A. Vaturi, D. Ben-David, Y. Carmeli

Management and cost-analysis of a Klebsiella pneumoniae carbapenemase-producing cluster in the cardiac intensive care unit in Vicenza hospital, Italy S. Mondina* [Vicenza, Italy], V. Manfrin, M. Russu, R. Cazzaro, D. Bradasco, A. Diiguiovanni, L. Zaghis, I. Zecchinato, M. Zanoten, E. Bovolenta, S. Zanovello, S. Barra

Determining the value of sequential screening to detect carbapenemase-producing Enterobacteriales J. Henderson* [London, United Kingdom], H. Ciesielczuk, M. Wilks, S. Nelson

Colonisation by drug-resistant bacteria in nursing home residents in Crete, Greece K. Moschou, P. Ioannou* [Heraklion, Greece], E. Maraitaki, D. Stafylaki, G. Vougiouklakis, S. Maraki, G. Samonis, D. Kofteridis

Diverse populations of carbapenem-resistant Klebsiella pneumoniae isolated in rectal colonisation cultures from intensive care units of a single tertiary centre in Greece E. Protonotariou* [Thessaloniki, Greece], C. Kotzamanidis, T. Papadopoulos, D. Pilalas, A. Tychala, D. Papadopoulos, F. Netsiga, G. Meletis, A. Zragas, M. Symeon, L. Skoura

Longitudinal genomic analysis of IMP-1 metallo-β-lactamase-producing Enterobacteriaceae at a tertiary care hospital in north-east Japan H. Kanamori* [Sendai, Japan], Y. Makino, H. Baba, K. Oshima, T. Aoyagi, K. Tokuda, S. Endo, H. Yano, M. Kaku

The use of carbapenemase real-time PCR directly from rectal swab for control carbapenem-resistant Enterobacteriaceae cross-transmission in a kidney transplant ward M. Freire* [Sao Paulo, Brazil], A. Curty, D. Garcia, F. Spadao, W. C. G. Valentin, F. Jota De Paula, F. Rossi, E. David Neto, W. Nahas, L. Pierrotti

Carbapenem-resistant Enterobacteriaceae: a 7-year surveillance at Keimyung University Dongsan Hospital and changes after moving to a new location N. Ryoo* [Daegu, South Korea], H. Kang, D. Kim, W. Lee, J. Ha, D. Jeon, S. Suh

Epidemiological and genomics insights into the first outbreak of an extensive drug-resistant NDM-1-producing Klebsiella pneumoniae in Portugal A. Novais* [Porto, Portugal], R. Ferraz, M. Viana, P. Martins Da Costa, L. Vieira Peixe

Diagnostic yield of pharyngeal, axillary, inguinal and rectal swab samples for multidrug-resistant Gram-negative detection in intensive care patients S. Román Soto* [Madrid, Spain], M. Alguacil Guillén, A. Quintás-Viqueira, A. Robustillo, G. Ruiz-Crascoso

Colonisation and infection with carbapenemase-producing Enterobacteriaceae [CPE] in high-risk patients in a private hospital setting in İstanbul, Turkey M. Özdamar* [Kocaeli, Turkey], E. Hakko, I. Karaman, M. Topaloglu, S. Turkoglu

Whole genome sequencing in an outbreak of Serratia marcescens in a neonatal intensive care unit of a tertiary care centre in Italy B. Saccani* [Brescia, Italy], L. Signorini, F. Castelli, E. Von Hauwermeiren, R. Marzollo, M. Motta, M. Ricca, S. Fiorentini, A. Caruso, R. Pezzotta, C. Bandi, P. Marone

Prediction Model for carbapenemase-producing Enterobacteriaceae colonisation upon admission to hospital in an endemic geographic area C. Papafotiou* [Athens, Greece], S. Bampali, S. Roussos, V. Sypsa, T. Moutsouli, M. Samarkos, M. Psychogiou, K. Spyridopoulou, A. Karapanou, G. Daikos

An outbreak of carbapenem-resistant Serratia marcescens carrying blaKPC in an intensive care unit between 2010 and 2013: which is the role of environment? F. Farrel Córtes* [Sao Paulo, Brazil], G. Melo, A. Soares, R. Ruedas Martínez, T. Guimaraes, S. Figueiredo Costa

7164 Genomic features involved in intra-hospital transmission of *Pseudomonas aeruginosa*
J. Liese, M. Desch, S. Peter, R. Eggeling, N. Pfeifer, M. Willmann* (Tübingen, Germany)

7426 Molecular epidemiology and spatiotemporal analysis of carbapenem-resistant *Enterobacteriaceae* among network hospitals in southern Thailand
S. Chusri* [Songkhla, Thailand], T. Hartvikul, K. Kaenwirat, A. Chukamnerd, K. Silpapajakul

7532 Rectal isolates display high-negative predictive value for bloodstream infections with [ESBL+] Gram-negative bacteria in neonates with suspected sepsis in a low-resource setting neonatal care unit
A. Lenglet* [Amsterdam, Netherlands], J. Schuurmans, K. Charles, E. Borlundvaag, C. Badjo, K. Clezy, M. Lekkerkerker, C. Ariti, M. Mcrae, H. Wertheim, J. Hopman

7600 Screening for carbapenemase-producing *Enterobacteriaceae*
A. Sarian* [Preston, United Kingdom], N. Mughal, L. Moore

7625 Incidence of hospital-acquired bloodstream infections caused by Klebsiella pneumoniae and impact of different preventive strategies: need to going back to basics?
F. Tassinari, M. Astengo, A. Battaglini, F. Butera, G. Nobrascio, I. Schenone* [Genoa, Italy], D. De Florentiis, A. Battistini, L. Sticchi, G. Icardi, A. Orsi

7779 Notification of hospital-acquired infections events: the French experience
I. Poujol* [Saint-Maurice Cedex, France], S. Sophan, L. Audreg, S. Yann, M. Colomb-Cotinat, A. Berger-Carbonne

8094 Intra- and inter-facilities spread of multidrug-resistant *Enterobacteriaceae* across a large nursing homes network
C. Legeay, B. Fuchs, T. Haubeud, C. Poulain, F. Raymond, S. Corec, G. Birgand* [London, United Kingdom]

8204 Screening of colonisation for carbapenemase-producing *Enterobacteriales*: impact in the empiric antibiotic choice of carbapenemase-producing *Klebsiella pneumoniae* infection in a Portuguese hospital
A. Cipriano* [Loulé, Portugal], M. Pereira, A. Read, F. Carneiro, M. Monteiro, M. Soares, V. Alves

8344 The role of a monthly active surveillance programme for multidrug-resistant Gram-negative bacteria in a neonatal intensive care unit: impact evaluation of preventive measures
L. Saporito, G. Graziano* [Palermo, Italy], F. Mescolo, V. Inisita, G. Rinaudo, A. Aleo, C. Bonura, M. Vitaliti, C. Maida, M. Giuffè

8526 Screening of risk groups detects only a minority of patients with carbapenemase-producing Gram-negative bacilli
A. Wagemakers* [Amsterdam, Netherlands], L. Cadena, R. Van Mansfeld

9086 Random forest and multilevel multivariable analyses to assess risks for colonisation with multidrug-resistant Gram-negatives in 27 long-term care facilities in high endemic settings
A. Azzini, G. Lo Cuscio* [Verona, Italy], G. Be, I. Coledan, L. Lambergen, G. Natale, A. Bazzar, M. Minardola, A. Gorno, F. Russo, G. Napoleano, F. Mazzorferi, G. Coraggio, E. Conca, E. Taccanelli

9508 Parenteral colistin therapy induces rapid selection of colistin-resistant bacteria in human gut: first report from India
S. Banerjee* [New Delhi, India], J. Verma, T. Senapati, A. Mani, M. Soneja, A. Biswas, N. Wig, B. Das, A. Kapil

9594 First description of GES-20-producing *Pseudomonas aeruginosa* in Brazil
A. Lima, D. Rocha, K. Lima, S. Sampaio, J. Mello-Sampaio* [São Paulo, Brazil]

Session accepted as Mini-oral ePoster Session

WGS: real life experience

Prophages, plasmid integration and lack of CRISPR-Cas elements underlie genome adaptation in European human-associated *Staphylococcus aureus* ST398

Novel organism verification and analysis (NOVA) study: identification of potentially novel bacterial species from a diverse spectrum of clinical isolates
D. Goldenberger* [Basel, Switzerland], A. Egli, V. Hinic, A. Blaich, T. Roloff, H. Seth-Smith

Increased carriage of *Streptococcus pneumoniae* serotype 19A three years after a PCV13 to PCV10 vaccine switch in Belgian children
L. Van Heirstraeten, I. Wouters, S. Desmet, C. Lammens, J. Verhaegen, H. Goossens, P. Van Damme, P. Beulens, H. Theten* [Antwerp, Belgium], S. Malhotra-Kumar

Molecular biomarker to monitor NDM-producing *Klebsiella pneumoniae* outbreak in two Belgian hospitals: a whole genome sequencing-based infection control application
A. Heinrichs* [Brussels, Belgium], M. Argudín, L. Nienhaus, C. Nonhoff, L. Filippin, F. Bogaerts, T. Huang, Y. Glupczynski, D. Denis

Investigating the feasibility and clinical impact of a prospective genomics workflow for hospital infection control
**Development of a high-throughput single nucleotide polymorphism (SNP) typing assay for Klebsiella pneumoniae**

E. Shaidualina* [Smolensk, Russian Federation], E. Sheck, A. Mikotina, A. Mardanova, M. Edelstein

**Typing of carbapenemase-producing Klebsiella pneumoniae: IR Biotyper meets NGS**

M. Cordavano* [Bologna, Italy], H. Seth-Smith, A. Deni, V. Hinic, A. Egli, S. Ambretti

**It takes two to tango: antimicrobial resistance and virulence contribute to the success of particular Acinetobacter baumannii clones**

F. Grossa* [Porto, Portugal], L. Silva, C. Rodrigues, M. Ksiezek, H. Ramos, L. Vieira Peixe

---

**Multi-centre whole genome sequencing bioinformatic outbreak analysis proficiency test conducted in The Netherlands**

J. Coolen* [Nijmegen, Netherlands], C. Jamin, P. Savelkoul, H. Wertheim, J. Rossen, S. Matamoras, L. Van Alphen

**Whole genome sequences analyses by a new easy-to-use software solution confirm a neonatal ward outbreak of MRSA CC22 being related to strains in the neighbouring region**

M. Slott Jensen, M. Chen, M. Skov, M. Kemp* [Odense, Denmark]

**Biochemical description of seven putative novel species of the genus Yersinia identified by core-genome multilocus sequence typing (cgMLST)**

H. Angermieier* [Paris, France], A. Le Guern, S. Bremont, C. Savin, J. Pizarro-Cerdá

**What's new in bacterial typing?**

**A k-mer-based approach for MLST and cgMLST analysis of nanopore sequenced Staphylococcus aureus**

O. Aspelin* [Gothenburg, Sweden], F. Dyrkell, D. Arnellos

**Using machine learning for improving MLST analysis of nanopore sequenced bacteria**

O. Aspelin* [Gothenburg, Sweden], E. Carlsson

**Subtyping Escherichia coli in spontaneous bacterial peritonitis with use of IR biotyper and whole genome sequencing**

J. Tan* [London, United Kingdom], C. Leboereia, P. Solanki, R. Westbrook, E. Wey

**K-mer based prediction of Clostridioides difficile ribotypes and relatedness**

M. Moore* [Oxford, United Kingdom], D. Eyre

**Systematic review: transmission inference using single nucleotide polymorphism (SNP) differences between isolates of ESBL and CR-Enterobacteriaceae. Can a SNP cutoff be defined?**

A. Jamali* [Toronto, Canada], A. Carbeil, L. Farooqi, Z. Zhong, E. Uleryk, A. Mcgeer

**Standardisation and validation of the PCR technique for detection of ST16-KL51 serotype among Klebsiella pneumoniae isolates**

J. Paulino, D. Andrey, W. Martins, N. Lincopan, A. Gales* [São Paulo, Brazil]
Whole genome sequencing in outbreak analysis

301 Whole genome analysis of vancomycin-resistant Enterococcus faecium causing nosocomial outbreaks suggests the occurrence of few endemic clonal lineages in Bavaria, Germany
D. Eisenberger* [Erlangen, Germany], C. Tuschk, S. Nickel, V. Lehner-Reindl, C. Höller, B. Liebl, G. Valenza

2082 Drain water as a potential source of in-hospital room-to-room transmission of carbapenemase-producing Klebsiella pneumoniae
L. Heireman* [Ghent, Belgium], H. Hamerlinck, J. Boeles, S. Vandendriessche, L. Coorevits, I. Leroux-Roels, M. Chlebowicz, J. Rossen, B. Verhasselt

2116 Whole genome sequencing investigation of iGAS outbreak in elderly care
J. Coelho, N. Groves, D. Ready* [London, United Kingdom], C. Brown, O. Olufon, R. Manuel, K. Paranthaman, I. Braithwaite, M. Cummins, C. Allam* (Lyon, France), C. Ginevra, C. Campese, C. Ebberson, D. Lawrence, T. Lamagni, E. Wynne-Evans

3981 Legionnaires’ disease and sleep apnea devices: retrospective analysis of a 9-year-investigation and contribution of whole genome sequencing
C. Allam* [Lyon, France], C. Ginevra, C. Campese, A. Prugne, D. Morel, L. Beraud, G. Descours, S. Jarraud

4973 Retropective WGS of Acinetobacter baumannii over 6.5-year-period reveals former unknown structure of clusters and uncovers resistance profile
A. Grafit* [Freiburg, Germany], J. Rauch, W. Ebner, H. Grundmann, S. Reuter

5665 Whole genome sequencing clarifies potential outbreak with extended-spectrum beta-lactamase-producing Escherichia coli
S. Mernelius* [Jönköping, Sweden], L. Berglind

7848 An unusual cluster of community-acquired skin infections by a multidrug-resistant MRSA harbouring genes that encode for exfoliative toxins
D. Notermans* [Bilthoven, Netherlands], E. Denie, W. Silvis, B. Postma, S. Bantjes, A. Schoffelen, M. Dimmendaal, H. Ruijs, F. Coenen-Bennett, M. Petrignani, K. Vandrik, L. Schouls, E. Kuiper

8157 Use of whole genome sequencing for rapid detection of a national nosocomial outbreak of Listeria monocytogenes associated with contaminated prepacked sandwiches in England, 2019
G. Godbole* [London, United Kingdom], G. Sabitowska, T. Dallman, L. Byrne, A. Simbo, J. Mclauchlin, S. Lai, N. Phin

9126 A home humidifier responsible for Legionnaires’ disease: input of WGS for genomic investigation in a ST1 case

Session accepted as Paper Poster Session

Whole genome sequencing: from molecular characterization to typing

677 Pan-genome analysis supports the differentiation of Bacteroides fragilis in division I and the potentially carbapenem-resistant cf+ division II into two species
T. Vognbjerg Sydénham* [Vejle, Denmark], U. Justesen

1976 In silico identification of host-associated genomic determinants in Escherichia coli using bacterial genome-wide association study

New polysaccharide capsule identification in urogenital Haemophilus parainfluenzae related to capsular locus present in Haemophilus spp.
A. Ganzález Díaz* [Barcelona, Spain], Y. Sierra Uruéña, F. Tubau, J. Ayats, M. Cubero, A. Ardanuy Tisaire, S. Marti

2203 Stx2K-producing Escherichia coli in China
X. Xiang* [Beijing, China], X. Bai, X. Yang

2284 Temporal acquisition of IS1548 in Streptococcus agalactiae clonal complexes
S. Khazaal* [Tours, France], R. Al Safadi, D. Osman, A. Hiran, P. Gilat

2568 Genomic characterisation of multidrug-resistant Klebsiella michiganensis strains
P. Shibu, F. McCuigh, M. Kujawski, L. Hall, A. McCartney, L. Hayes* [Nottingham, United Kingdom]

2609 Implementing pathogen genomics effectively: a seamless service

2626 NDM-1 emerging on distinct plasmid backbones from the IncL/M family
M. Lopez* [A Coruna, Spain], N. Ellaby, N. Woodford, M. Tomas, M. Ellington

3568 Genetic diversity of blaKPC gene containing IncF plasmids from epidemiologically related and unrelated Enterobacteriaceae
J. Stohr* [Breda, Netherlands], M. Klyuytman - Van Den Bergh, V. Weterings, J. Rossen, J. Klyuytman

3817 Recurrence of multidrug-resistant Klebsiella pneumoniae ST48 at Charité, Universitätsmedizin Berlin
F. Maechler, A. Weber* [Berlin, Germany], P. Gastmeier, A. Kola
4522 High-throughput genome sequencing highlights Pseudomonas aeruginosa adaptative evolution in the urinary tract
A. Cottalorda, S. Dahyot* (Rouen, France), M. Leoz, F. Gravey, F. Aujoulat, K. Alexandre, S. Le Hello, E. Jumas-Bilak, M. Pestel-Coran

5264 Whole genome sequencing of heterochronous isolates of Burkholderia cenocepacia and B. contaminans from two patients with cystic fibrosis using Nanopore and Illumina platforms
A. Bernier* (Winnipeg, Canada), S. Tyson, T. Burdz, D. Wiebe, K. Bernard

5479 Genetic characterisation of virulence factors of non-O1 non-O139 Vibrio cholerae strains from clinical and environmental origin isolated in Chile between 1992 and 2018

6522 Whole genome sequencing reveals differences between previously indistinguishable isolates of tobramycin resistant Staphylococcus aureus
S. Mernelius* (Jönköping, Sweden), A. Jogenfors, L. Berglind, A. Matussek

6623 Relatedness of European Clostridioides difficile strains from humans, food and animals by whole genome sequencing, ribotyping and toxinotyping; results from COMBACTE-CDI

7669 First insight into the genome sequence of Clostridioides difficile strains isolated from Romanian patients
I. Czobor* (Bucharest, Romania), V. Cristea, I. Gheorghe, C. Chifiriuc, Y. Feng, X. Wang, L. Papa, M. Popa, L. Marutescu, V. Lazar, M. Popa, Z. Zong

7698 Optimisation of bacterial whole genome sequencing workflow for implementation in routine clinical and epidemiological applications
C. Heismoortel* (Leuven, Belgium), L. Laenen, E. Souche, L. Dehaspe, N. Dedoncker, W. Bossuyt, S. Desmet, E. Andre

7970 Virulence profile and comparative genomics analysis of the emerging Klebsiella pneumoniae genotypes ST45, ST101 and ST629
E. Esposito* (Naples, Italy), M. Cervoni, C. Roe, L. Peixe, S. Pournaras, S. Brisse, J. Sahl, F. Imperi, R. Zarrilli
19th ESCMID Summer School
Carcavelos, Portugal
3 – 10 July 2021

A one-week course dedicated to postgraduate and continuing medical education. The programme covers a broad range of topics in clinical microbiology and infectious diseases and will interest young MDs at the end of their specialty training as well as biologists, pharmacists, PhD students and postdoctoral fellows working in the infection field.

Please register at www.escmid.org/education.
Registration opens in January 2021.
Places are limited, apply until 1 June 2021!

Organised by the ESCMID Education Subcommittee
Abstract Programme

5. New Antibacterial Agents, PK/PD & Stewardship

• Mechanisms of action, new compounds, preclinical data & pharmacology of antibacterial agents

• Pharmacokinetics/pharmacodynamics of antibacterial drugs & therapeutic drug monitoring

• New or repurposed antibacterial agents: clinical trials

• Pharmacoepidemiology (incl economics and cost-effectiveness), improved prescribing and antibiotic stewardship (incl decision-support / prediction tools, behavioural aspects)

• Other
Session accepted as Paper Poster Session

Adverse effects of antibiotics: data from clinical trials

2197 Impact of combining vancomycin with piperacillin/tazobactam or with meropenem on vancomycin-induced nephrotoxicity
R. Tokhi, N. Kabli, M. Hantool, A. Thabit* [Jeddah, Saudi Arabia]

2538 A retrospective matched cohort study evaluating the rate of acute kidney injury in patients with severe Gram-negative infections treated with colistin or new β-lactam + β-lactamase inhibitor antibiotics
C. Doremus* [New Jersey, United States], S. Marcella, B. Cai, R. Echols

2889 Antimicrobial therapy with aminoglycoside or meropenem in the intensive care unit for hospital-associated infections and risk factors for acute kidney injury
R. Pitta, J. Gasparetto, T. De Moraes, J. Telles* [Sao Paulo, Brazil], F. Tuan

4180 Nephrotoxicity during teicoplanin therapy in combination with piperacillin/tazobactam or other anti-pseudomonal β-lactams
C. Tai* [Taipei City, Taiwan], C. Shao, C. Wang, F. Lin, C. Palacios

4310 Effect of a serum lactate monitoring recommendation policy on patients treated with linezolid
J. Baek* [Incheon, South Korea], J. Im, J. Lee, H. Kwon

5518 Daptomycin and pulmonary eosinophilia: An unrecognised opportunity
K. West* [Portland, United States], A. Sheeti, G. Forrest

5678 Occurrence and predictors of nephrotoxicity in adult patients treated with intravenous colistin: a cohort study
L. Graça, J. Torres, A. Silva-Pinto, F. Almeida, N. Rocha Pereira* [Porto, Portugal], P. Andrade, R. Duro, C. Alves

5874 Impact of safety alerts and warnings on fluoroquinolone and alternative antibiotic use in Colombian outpatient care
M. Silva-Medina Weil* [Cali, Colombia], P. Ricardo, M. Palacios

6435 Phase II clinical data showed that lower recurrence of Clostridioides difficile infection with ridinilazole is associated with minimal impact on the gut microbiota and bile acid composition
E. Duperchy* [Abingdon, United Kingdom], X. Dian, K. Yanagi, A. Kane, N. Alden, M. Lei, D. Snydman, R. Vickers, D. Rabin, K. Lee, C. Thorpe

8138 Real-world experience with prolonged courses of tedizolid at a large academic medical centre
W. Alegria* [Stanford, CA, United States], D. Ho, M. Holubar, L. Meng, E. Mui, S. Deresinski

8337 Vancomycin plus piperacillin-tazobactam and the risk for acute kidney injury: what is the effect size?
S. Avedissian* [Nebraska, United States], J. Liu, G. Pais, M. Scheetz, N. Rhodes

Session accepted as Paper Poster Session

Antibiotic hospital consumption measurements around the world

1381 Antibiotic use in French hospitals 2012-2018: improvements to be confirmed!

2907 The Global Point Prevalence Survey of Antimicrobial Consumption and Resistance (Global-PPS): roll-out of a successful antimicrobial stewardship programme in Nigeria using the global-PPS tool
O. Oduyebo, A. Roberts, O. Ola-Bello, A. Versporten* [Antwerp, Belgium], I. Pauwels, C. Osuagwu, I. Fojolu, P. Oshun, H. Goossens, P. Akintan, E. Temiye

3384 A novel methodical approach to quantifying the value of an antibiotic: enablement-, insurance- and productivity-value
J. Kowalik* [London, United Kingdom], A. Blake, R. Russell, D. Mircea, D. Leonard, N. Meadows

5360 The Global Point Prevalence Survey of Antimicrobial Consumption and Resistance (Global-PPS): the results of antimicrobial prescribing in 33 hospitals in Guinea
M. Sow* [Conakry, Guinea], A. Versporten, I. Pauwels, D. Djiro, H. Goossens

5680 Antimicrobial stewardship in Cambodia: the importance of antimicrobial point prevalence survey and lessons learned from the field
G. Khim* [Phnom-Pen, Cambodia], F. Dailly, P. Pen, R. Kong, S. Sok, S. Yim, S. Oung, J. Hesse, J. Letchford, J. Ferguson

6638 Trends in antimicrobial use in Brazilian hospitals: 2017 and 2018 point prevalence surveys
Trends of antibiotic consumption in German hospitals from 2015-2018
B. Schweickert* [Berlin, Germany], M. Feig, M. Schneider, K. Groeschner, M. Behnke, L. Pena Díaz, P. Gastmeier, M. Abu Sin, D. Richter, H. Blank, H. Wehrmeyer, A. Hoffmann, T. Eckmanns

Comparing the financial burden of hospitalised patients within the same Diagnosis Related Groups (DRGs) with and without an infection: a multi-centre evaluation in the USA
L. Puzniak, K. Yu* [New Jersey, United States], V. Gupta

Using point prevalence methodology to evaluate antimicrobial prescribing in the UK’s largest renal dialysis centre
A. Chavda* [London, United Kingdom], A. Ghazy, L. Whitney, M. Gilchrist, A. Holmes

Nation-wide audit with feedback of antibiotic stewardship in Norwegian hospitals: a low cost initiative with many opportunities
P. Akselsen* [Bergen, Norway], M. Neteland, J. Høgli, B. Skodvin, S. Harthug

The Global Point Prevalence Survey of Antimicrobial Consumption and Resistance (Global-PPS): results of antimicrobial prescribing at Ghana’s National Referral Centre
M. Mirfenderesky* [London, United Kingdom], J. Mahungu, A. Aggar, A. Versporten, I. Pauwels, H. Goossens, D. Ankrah

The Global Point Prevalence Survey of Antimicrobial Consumption and Resistance (Global-PPS): an opportunity to lead global stewardship actions in Belgian hospitals?
X. Holemans* [Charleroi, Belgium], C. Van Wetter, A. Versporten, O. Tassin, I. Pauwels, H. Goossens, M. Ventura

Improving country-level antimicrobial prescribing with the implementation of a uniform and standardised surveillance method: the Global-PPS Chilean experience, year 2015 and 2017
C. Carvajal* [Santiago, Chile], A. Versporten, A. Rojas, M. Cifuentes, F. Silva, H. Goossens, J. Labarca

Consumption of antibiotics effective against multi-resistant Gram-positive pathogens: data of German hospitals from 2015-2018
B. Schweickert* [Berlin, Germany], M. Feig, M. Schneider, K. Groeschner, W. Niklas, M. Behnke, L. Pena Díaz, P. Gastmeier, D. Richter, H. Blank, H. Wehrmeyer, T. Eckmanns, M. Abu Sin

14-year evolution of antimicrobial consumption in a Belgian tertiary hospital based on the BeH-SAC surveillance
F. Bugle* [Ghent, Belgium], S. Callens, A. Somers, S. Commeyne, D. Vogelaers

A global point prevalence study of antimicrobial use in the neonatal intensive care unit: the NO-More-Antibiotics and Resistance study (NO-MAS-R)
P. Prusakov* [Columbus, United States], D. Goff, P. Wozniak, A. Medoro, P. Sanchez

A nation-wide parent survey of antibiotic use in Australian children

Antibiotic consumption in very low birth weight neonates on neonatal intensive care units in Germany: a longitudinal study 3 years of national surveillance
F. Salm, T. Kramer* [Berlin, Germany], F. Schwab, M. Behnke, P. Gastmeier, C. Geffers, B. Pieing

Impact of antibiotic stewardship programme on the most utilised antibiotics’ utilisation and financial expenditure in 57,357 Children Cancer Hospital Egypt inpatient setting
E. Khaled Mohamed Abu Alaanain, A. Elteiny, M. Nagy, A. Koshef, A. Badie* [Cairo, Egypt], A. Sameh, L. Shalaby

Prescribing in paediatric inpatients in England, 2016: factors associated with prescribing “watch” and “reserve” antibiotics
A. Demirjian* [London, United Kingdom], R. Freeman, B. Muller-Pebady, D. Ashish-Uredope, S. Hopkins

Community antibiotic prescribing for children in France from 2015 to 2017: a prospective national study

Heterogeneity of antimicrobial prescribing in large paediatric tertiary centres: implications for future interventions and benchmarking of antimicrobial stewardship activities
M. Gilchrist* [London, United Kingdom], A. Chavda, F. Chappell, C. Dalton, A. Demirjian, R. Freeman, A. Kashef, A. Badie* [Cairo, Egypt], A. Sameh, L. Shalaby, E. Khaled Mohamed Abualanain, A. Elzeiny, M. Nagy

Infectious disease specialist intervention in the neonatal intensive care unit: a safe approach to reduce antibiotic exposure in neonates
J. Armann* [Dresden, Germany], B. Seipolt, M. Rüdiger, R. Berner

Introducing end-of-life considerations into a computerised decision support system for antibiotic treatment: effects on the system’s recommendations and comparison to physicians’ behaviour
Y. Dishon-Benattar* [Haifa, Israel], I. Pfeffer, M. Magensen, L. Ward, L. Leibovici, E. Dagan, M. Paul
Abstract Categories 2020

2170 How an inflammatory marker Point-of-Care test can reduce inappropriate antibiotic use in urinary tract infections: perceptions of physicians and nurses in Dutch nursing homes
S. Kui* (Amsterdam, Netherlands), C. Schneeberger, M. De Jong, F. Van Leeh, J. Harting

3035 Impact of an antimicrobial stewardship programme on antibiotic resistance profile of urinary Enterobacteriaceae isolated from nursing home residents: a retrospective cohort study

3602 Antibiotic use at the end-of-life in patients with advanced cancer: a systematic literature review
A. Marra, M. Puig-Asensio* (Iowa City, United States), E. Perencevich

5774 Antibiotic consumption in 417 nursing homes: results from a pilot survey

6057 Development of an antimicrobial stewardship programme for post-acute and long-term care centre by the use of teledicine
S. Gómez-Zorrilla* (Barcelona, Spain), M. Marin, P. García, D. Echeverría-Esnal, N. Prim, M. Gracia-Arnillas, E. Padilla, O. Vázquez, J. Horcajada, S. Grau

7099 Spectrum overly broad and duration too long: an assessment of appropriateness of antimicrobial prescriptions in older patients admitted to an Australian tertiary teaching hospital
L. Gebremichael, R. Visvanathan, M. Warner* (Adelaide, Australia)

8884 A new approach of antibiotic stewardship in geriatric facilities
R. Collarina* (Le Kremlin-Bicêtre, France), C. De Villelong, X. Lescure, V. Fossey-Diaz, L. Deconinck, L. Vaillant

Session accepted as Paper Poster Session

Assessment of community and outpatient antibiotic prescribing worldwide

996 Antibacterial prescribing in the outpatient setting: results from a longitudinal surveillance programme and a sentinel network of physicians: Switzerland, 2018
C. Pluess-Suward* (Bern, Switzerland), D. Perisa, O. Friedli, M. Mäusezahl-Feuz, A. Kronenberg

1129 National ambulatory care programme of oral antibiotics and prevalence of inappropriate prescribing in the United States, 2009 to 2016
E. Young* (San Antonio, United States), A. Yap, R. Panchal, K. Reveles

1225 Overuse of antibiotics in primary care: a secondary analysis of standardised patient studies across four low- and middle-income countries
G. Sulis* (Montreal, Canada), B. Daniels, A. Kwan, J. Das, M. Pai

2258 Community-acquired and hospital-acquired Clostridioides difficile infections in the context of a trans-sectoral antibiotic stewardship intervention in Berlin, Brandenburg and Thuringia
S. Schneider, C. Schröder, F. Salm, I. Petruschke, A. Mooser, S. Hagel, M. Pletz, P. Gastmeier* (Berlin, Germany)

2698 Impact of a national antimicrobial stewardship programme to switch from trimethoprim to nitrofurantoin for treatment of urinary tract infections on the incidence of Escherichia coli bloodstream infection in England, 2015–2019
A. Au-Yeung* (London, United Kingdom), A. Soei, A. Charlet, O. Nsonwu, R. Hope, B. Muller-Pebady, S. Hopkins, R. Freeman

2716 Antibiotic prescription practices in primary care in low- and middle-income countries: a systematic review and meta-analysis
G. Sulis* (Montreal, Canada), P. Adam, V. Nafade, G. Gore, B. Daniels, A. Daftary, J. Das, S. Gandra, M. Pai

A computerised decision support system (CDSS) for antibiotic prescribing in primary care: Antibiotic: implementation, adoption and sustainable use in the era of extended antimicrobial resistance
T. Delory* (Paris, France), P. Jeannougin, S. Lariven, J. Aubert, N. Peiffer-Smadja, P. Boëlle, E. Bouvet, X. Lescure, J. Le Bel

3186 Optimising the treatment of upper respiratory tract infections and tackling antibiotic resistance: effect of online education on physician knowledge and confidence
J. Duffey* (Matlock, United Kingdom), V. Lund, D. Hoban, B. Rubin, S. Voorn

Ten-year trends in Estonian ambulatory antibiotics use and comparison of ESAC quality indicators with Nordic countries
J. Lass, O. Laius, E. Linask, E. Sepp, I. Lutsar* (Tartu, Estonia)

3389 Community antimicrobial stewardship programme in pregnant women with urinary tract infections in primary care service
J. Asimbaya, P. Zambrano Sánchez* (Quito, Ecuador)

4043 Antibiotics prescribing in the outpatient setting: results from a longitudinal surveillance programme and a sentinel network of physicians: Switzerland, 2018
C. Pluess-Suward* (Bern, Switzerland), D. Perisa, O. Friedli, M. Mäusezahl-Feuz, A. Kronenberg

4398 Variations in antibiotic prescribing among village doctors in rural Shandong province, China
O. Dyar* (Stockholm, Sweden), Y. Ding, Y. Jia, S. Qiang, C. Stälsby Lundborg

4402 Acceptability of selective reporting of antibiotic susceptibility testing results in primary care
M. Simon* (Chaligny, France), G. Le Dref, S. Fougnout, P. De Monchy, J. Kivits, C. Pulcini, N. Thilly
Abstract Categories 2020

4705 Acceptability of a public commitment charter associated with patient information leaflets on antibiotics by general practitioners
A. Essilini* [Nancy, France], G. Le Dref, J. Kivits, A. Welter, C. Pulcini, N. Thilly

4825 Antibiotic use prior to seeking medical care in patients with persistent fever in four low- and middle-income countries
B. Ingelbeeen* [Antwerp, Belgium], K. Koiraia, K. Verdonck, B. Barbé, D. Mukendi Mulumba, T. Phe, S. El Safi, E. Bottieau, M. Van Der Sande, M. Boelaert, F. Chappuis, J. Jacobs

5125 Association between susceptibility to quinolones in Escherichia coli and tetracycline use in the community: analysis with community-specific ARIMA models
M. Viñet, O. Le Bastard, M. Low, B. Gottesman, J. López-Lazano, E. Montassier, E. Batard* [Nantes, France]

5799 Evaluation of large urban-rural outpatient antibiotic stewardship programme
L. Mag* [Sacroanto, United States], T. Chechi, H. Bettencourt, M. Wang

5946 Perceptions of general practitioners on antimicrobial stewardship: a nation-wide survey in Australia
S. Saha* [Melbourne, Australia], D. Kong, K. Thursky, D. Maaza

6263 Geodes Antibiotiques: restituting French antimicrobial consumption in the ambulatory sector using two indicators and an interactive website
P. Cavalié* [Saint Maurice, France], M. Boussac, S. Moufet, E. Lucas, A. Berger-Carbonne, L. Watier, B. Coignard

6962 Monitoring outpatient antibiotic utilisation using sales and reimbursement data: a population-based comparison in France, 2012-2017

7556 Bridging the gap between human and animal antimicrobial resistance and consumption surveillance data, antibiotic policy and stewardship: the EPI-Net and ARCH projects
M. Pezzani* [Verona, Italy], F. Arieti, E. Carrara, R. Cuada, M. Campri, S. Goepel, F. Mazzaferrì, E. Mazzolini, M. Mendelson, N. Mûters, N. Babu Rajendran, R. Schrijver, M. Sibani, A. Voss, E. Tacconelli

8186 Impact of a French regional centre infection hotline on antibiotic prescriptions in general medical practice
M. Bachelet, P. Thibon, A. Lessourd, S. Dargèrè, F. Caron, R. Verdon, E. Fiaux* [Rouen, France]

8325 An automated data extraction from primary-care-paediatricians’ computers: a French paediatric ambulatory research in infectious diseases
S. Béchet, A. Werner, F. Vie Le Sage, G. Thiebault, N. Gelbert, F. Cahn-Sellem, F. Kochert, C. Levy, R. Cohen* [Créteil, France]

9250 Population-level antimicrobial consumption is associated with cultural factors in 37 high-income countries: a global ecological analysis
C. Kenyon* [Berchem, Belgium]

9291 Antibiotic stewardship: assessment of education and awareness tools for improving citizen involvement
F. Grimaud* [Créteil, France], X. Lescure, J. Le Bel, Y. Yazdanpanah

9504 Epidemiology of previous antibiotic treatment in a community setting infectious diseases consultation office
J. Choucair* [Beirut, Lebanon]

Session accepted as Paper Poster Session

Bacteriophage therapy goes viral

865 Bacteriophage therapy against multidrug-resistant Acinetobacter baumannii infections
R. Rothore* [Tbilisi, Georgia], N. Karumidze

1268 Quality control of therapeutic bacteriophages: the Belgian experience
A. Leray, L. Cuignet, C. Vanhee, E. Deconinck, P. Ceyssens* [Brussels, Belgium]

1329 Efficacy of bacteriophage-antibiotic combinations on two different phenotypes of methicillin-resistant Staphylococcus aureus
R. Kebriaei, K. Lev, T. Morrissette, P. Maassen, J. Abdul-Mutakabbir, S. Morales, M. Rybak* [Detroit, United States]

1532 Personalised production and administration of bacteriophages: lesson learned from a unique European academic collaboration to treat a patient with pandrug-resistant Pseudomonas aeruginosa spinal infection
T. Ferry* [Lyon, France], J. Pirnay, C. Gustave, C. Kolenda, M. Merabishvili, L. Gilles, A. Marchet, C. Barrey, T. Perpoint, F. Laurent, G. Resch

Diversity and therapeutic potential of Klebsiella pneumoniae bacteriophages and their depolymerases: genomics and enzymatic activity
R. Ragupathy* [Manchester, United Kingdom], J. Redfern, M. Enright

Intravenous administration of personalised cocktail of bacteriophages as salvage therapy in combination with ceftazidime/avibactam in patients with relapsing Pseudomonas aeruginosa bacteremia associated with intravascular implants: lesson to be learned from two cases
**Abstract Categories 2020**

**4070 In vitro activity of four lytic bacteriophages specific for OXA-72-producing Acinetobacter baumannii**
W. Martins* (São Paulo, Brazil), J. Ciro, E. Medeiros, M. Toleman, A. Gales

**4556 Phage-MR003 prevents infection caused by clinical isolated meccillin-resistant Staphylococcus aureus in mouse wound model**
T. Suda* [Katka, Japan], T. Hanawa, Y. Tanji, K. Miyagawa, H. Ohnishi, T. Matsuda

**5553 Effectiveness of bacteriophage-antibiotic combinations for daptomycin-resistant Enterococcus faecium harbouring LiaS and LiaR substitutions**
T. Morrisette* [Detroit, United States], K. Lev, R. Kebriaei, J. Abdul-Mutakabbir, P. Maassen, S. Morales, C. Arias, M. Rybak

**6054 Characterisation of phage obtained from meccillin-resistant Staphylococcus aureus**
D. Ulusan* [Izmir, Turkey], F. Sahin, M. Kiyar

**7992 Bacteriophage therapy in the treatment of burn wounds**
M. Alexander, I. Grigoryan* [Moscow, Russian Federation], A. Melikumyan, O. Safronova, Y. Turnikov

**9964 Late spot evaluation reveals enhanced phage lytic activity**
D. Rezevska* [Riga, Latvia], K. Racenis, J. Kraica

**9007 Anti-biofilm activity of bacteriophage φWL-3 conjuncted with ciprofloxacin, fosfomycin, gentamicin, meropenem or ceftriaxone against a ciprofloxacin-ceftiraxone-resistant Escherichia coli clinical isolate**
L. Wang* [Hefei, China], T. Tkhiashvili, B. Bernal Andrés, A. Trampuz, M. Gonzalez Moreno

**9015 Biofilm killing activity of bacteriophage φWL-3 against antibiotic-resistant Escherichia coli clinical isolate**
L. Wang* [Hefei, China], T. Tkhiashvili, B. Bernal Andrés, A. Trampuz, M. Gonzalez Moreno

**9063 In vitro evaluation of single or combined bacteriophages targeting different Staphylococcus aureus clinical isolates**
J. Orcastegui Delso* [Berlin, Germany], F. Kunisch, A. Trampuz, M. Gonzalez Moreno

**9153 Bacteriophage therapy in orthopaedic and cardiovascular surgery: first clinical experience with difficult-to-treat infections**
P. Marovic* (Berlin, Germany), T. Tkhiashvili, D. Margaryan, S. Karbysheva, A. Trampuz

Session accepted as **Paper Poster Session**

**Clinical experience with recently approved antibiotics**

**1152 Efficacy of ceftazidime-avibactam for multidrug-resistant Gram-negative bacteria infections: a retrospective evaluation in a Belgian teaching hospital**
V. Gancette, N. Layias, F. Frippiat* [Liège, Belgium]

**1214 Exposure-efficacy analyses support optimal dosing regimens of ceftolozane/tazobactam in patients with hospital-acquired pneumonia /ventilator-associated pneumonia in ASPECT-NP**

**2946 Optimal PK/PD target and high efficacy rates of ceftolozane-tazobactam in patients with infections caused by extensively drug-resistant Pseudomonas aeruginosa**
E. Navarete-Rouco, S. Luque, L. Sorli, A. Arancon, N. Campillo, M. Montero, N. Prim, A. Bentitez-Cano, E. Samso, J. Horcajada* [Barcelona, Spain], S. Grau

**SUSANA project: real-world data coming from the use of new antimicrobial drugs**

**Ceftolozane-tazobactam for treatment of severe ESBL-producing Enterobacteriaceae infections: a multi-centre nationwide clinical experience [Ceftabuse II Study]**

**Delafloxacin (DLX) in the treatment of community-acquired bacterial pneumonia [CABP]: patients with PORT Risk Class III-V**
R. Alvarez-Salo, M. Popescu, L. Lawrence, S. Cammarata, D. Zinzi* [Pomezia, Italy]

**Resistance to ceftolozane-tazobactam and ceftazidime-avibactam in extensively drug-resistant [XDR] and multidrug-resistant [MDR] Pseudomonas aeruginosa: comparing antimicrobial activity, associated risk factors and clinical outcomes**
M. Meschiari* [Modena, Italy], K. Shaniok, V. Bianco, M. Sarti, G. Orlando, A. Bedini, C. Mussini
Abstract Categories 2020

Clinical experience with ceftazidime-avibactam (CAZ-AVI) in the treatment of infections caused by XDR Klebsiella pneumoniae producing OXA-48 carbapenemase
A. Bykav, M. Savorova, I. Sychev, E. Burrmistrova, A. Ismagilov, D. Protosenko, S. Yakovlev* [Moscow, Russian Federation]

5234 Experience after analysing a ceftazidime/avibactam national registry of infections caused by KPC-producing Klebsiella pneumoniae

Comparative effectiveness of ceftolozane/tazobactam versus aminoglycosides or polymyxins in multidrug-resistant Pseudomonas aeruginosa infections
A. Coffrey, E. Piehl* [Providence, United States], V. Lopes, L. Puzniak, K. Laplante

Real-world multi-centre experience with eravacycline at academic hospital systems
S. Alosaimy, K. Molina, K. Claegs, J. Andrade, J. Truong, M. King, B. Pullinger, G. Huang, T. Morrisette* [Detroit, United States], A. Lagrjf, M. Rybak

Real-life experience with ceftazidime-avibactam in South Spain

Radiologic features of Pneumocystis pneumonia differ between patients with and without HIV Infection
H. Wu* [Kaohsiung, Taiwan], K. Wu, S. Lee, D. Chang, S. Dai, S. Kua, C. Chou, Y. Weng, Y. Tseng, J. Chen, C. Sy, H. Tsai, Y. Chen

Successful use of the novel antifungal oroflom in the treatment of disseminated coccidiodymycosis
E. Harvey, L. Fitton, J. Rex* [Wellesley, United States], G. Thompson

Outcomes of candidaemia caused by biofilm-forming isolates in haematological patients
G. Klyasova* [Moscow, Russian Federation], A. Malchikova, K. Tandilova, S. Kravchenko, P. Elena, V. Savchenko

Clinical evaluation of an investigational use only Aspergillus galactomannan lateral flow assay at a tertiary cancer care centre
K. Jani, T. Mcmillen, E. Babady* [New York, United States]

Performances evaluation of the first sample-to-result system for detection and quantification of Pneumocystis jirovecii in respiratory tract samples
S. Patanè* [Torino, Italy], G. Bovolenta, A. Camporese, R. Tedeschi, P. Stano, S. Costa, C. Bittoto, G. Stefanuto

Effectiveness and safety of isavuconazole treatment for invasive fungal infections in solid organ transplant recipients

Antimicrobial stewardship teams in candidaemia management: advise or take care of the patient?
A. Alemán Alemán, N. Gómez-Manero, M. Fernández Regueras, M. Mantecón, L. Buzón Martín, M. Morán-Rodriguez, C. Navarro San Francisco* [Burgos, Spain]

Evaluation of the antifungal stewardship programme at St George’s Hospital, London 2018-19
A. Rusdiah* [London, United Kingdom], T. Yau, C. Logan, T. Bicanic

Population pharmacokinetic/pharmacodynamic assessment of a clinical imipenem/cilastatin and relebacbam in patients with hospital-acquired bacterial pneumonia and ventilator-associated bacterial pneumonia
M. Patel* [Kenilworth, United States], P. Patel, N. Daryani, W. Copalu, P. Kulkarni, D. Hilbert, K. Young, M. Rizk

Pharmacokinetic/Pharmacodynamic benefit of prolonged ceftazidime/avibactam infusion
S. Baklouti, C. Massip, C. Mane, H. Guet-Revillet, M. Murris, D. Concordet, P. Gandia* [Toulouse, France]

Evaluating the predictive performance of ID-ODS software in critically ill patients for piperacillin: a comparison using IV bolus and continuous infusion data
A. Alsultan* [Riyadh, Saudi Arabia], S. Wallis, J. Lipman, J. Roberts

Development of a simultaneous population pharmacokinetic model for aztreonam-avibactam
R. Xie* [Singapore, Singapore], P. Chan, M. Mcfadyen, S. Rober

Ceftolozane/tazobactam probability of target attainment in patients with hospital-acquired pneumonia/ventilator-associated pneumonia
Z. Zhang, Y. Patel, H. Feng* [Kenilworth, United States], M. Johnson, J. Fiedler-Kelly, C. Bruno, E. Rhee, C. De Anda, W. Gao

Utilising the full potential of model-based dosing tables: an interprofessional collaboration to develop and integrate meropenem dosing tables into clinical routine
Abstract Categories 2020

1812 Once-daily dose ceftriaxone plus ampicillin: an alternative for Enterococcus faecalis infective endocarditis OPAT treatment

2657 Use of therapeutic drug monitoring to optimise cephazolin dosing in the treatment of methicillin-susceptible Staphylococcus aureus bacteraemia V. Venugopalan, S. Hernandez, K. Desean, C. Peloquin, K. Cherabuddi, A. Casapao* (Jacksonville, United States)

3028 Capillary micro-sampling versus conventional sampling to conduct a clinical pharmacokinetic study for meropenem in critically ill patients Y. Guerra Valero* (Queensland, Australia), J. Roberts, J. Lipman, C. Fourie, T. Storr, S. Wallis, S. Parker

3531 New evidence-based recommendations for cefazolin prophylaxis in patients undergoing cardiac surgery with cardiopulmonary bypass S. Zelenitsky* (Winnipeg, Canada), D. Calic, R. Ariano, R. Arora, H. Gracott

4024 Pharmacokinetic/pharmacodynamic simulation of cost-effective dosage regimens of ceftazidime/avibactam in patients with renal impairment L. Dhegiat, L. Bourguignon, M. Leray, T. Ferry, S. Goutelle* (Lyon, France)

4150 Impact of hypoalbuminemia and augmented renal clearance on fluoroquinolone plasma concentrations: a real-life retrospective study D. Marriott* (Sydney, Australia), A. Duckworth, G. Jones, C. Lau, D. Cottoneo

4362 Population pharmacokinetics of ceftriaxone administered as continuous or intermittent infusion in critically ill patients E. Leegwater* (The Hague, Netherlands), B. Kraajenbrink, D. Moes, I. Purmer, E. Wilms

4908 Plasma population pharmacokinetic modelling of ceffepime and enmetazobactam in patients with complicated urinary tract infections M. Machacke, F. Bernhard, M. Mameli, A. Kelley, P. Knechtle* (St. Louis, France)

5078 Large variability of unbound active fraction of ceftriaxone in contrast to ciprofloxacin in plasma of critically ill patients T. Ewoldt, A. Abdulla* (Rotterdam, Netherlands), D. Gommers, A. Muller, H. Endeman, B. Koch

5228 Variability in ceftazidime exposure and probability of target attainment of different dosing regimens of ceftazidime in critically ill patients with a proven or assumed Pseudomonas aeruginosa infection A. Werumeus Buning* (Amsterdam, Netherlands), C. Hadiamont, N. Lechner, P. Eibers, N. Juffermans, R. Mathot, R. Van Hest

8785 A Monte Carlo simulation modelling meropenem bolus to prolonged infusion dosing and expected suppression of resistance in Pseudomonas aeruginosa S. Moore* (Louisville (KY), United States), M. Kays, C. Cheatham

Session accepted as Paper Poster Session
Clinical trials: PK and dosing

Can gentamicin concentrations be used to estimate glomerular filtration rate in intensive care unit patients? A. Smekal* (Stockholm, Sweden), M. Swartling, M. Furebring, E. Nielsen, A. Larsson, M. Liptcsey

Retrospective evaluation of appropriate dosing of cefmetazole for invasive urinary tract infection due to ESBL-producing Escherichia coli K. Hayakawa, Y. Matsumura, Y. Hamada, S. Saito, M. Nagashima, K. Uemura, N. Ohmagari, Y. Dai* (Pittsburgh, United States)

Clinical and economic outcome evaluation of cefepime 4 grams/day extended infusion in pneumonia and sepsis E. Dionne, A. Khole, M. Campion* (Worcester, United States)

A phase I study in healthy volunteers to assess the absolute bioavailability of the bilayer tablet of sulopenem etzadroxil with probencid M. Dunne* (Old Saybrook, United States), M. Dai, R. Zhou, S. Aronin, J. Wald
Abstract Categories 2020

4426 Human mass balance study of enmetazobactam using 14C analysed by AMS
P. Matta* [Saint-Louis, France], S. English, P. Barth

5246 Factors associated with inadequate intravenous colistin dosages: results from a multi-centre, cross-sectional study
M. Mirabella* [Genoa, Italy], D. Giacobbe, A. Vena, C. Saffioti, M. Rinaldi, A. Losito, F. Raffaelli, M. Mikulska, M. Giannella, P. Viale, M. Tumbarello, M. Bassetti

5581 The trouble with gentamicin: a realistic evaluation exploring two distinct protocols for prescribing gentamicin in hospital settings
N. Dyar* [Barrack Road, United Kingdom], K. Mattick, R. Bethune

Session accepted as Mini-oral ePoster Session

119 Dynamic in vitro pharmacodynamics evaluation of piperacillin/tazobactam-tobramycin combination therapy against Escherichia coli and Klebsiella pneumoniae clinical isolates
C. Sumi* [Brisbane, Australia], A. Heffernan, S. Naicker, K. Cottrell, P. Harris, F. Sime, J. Roberts

1187 Effect of antiretroviral therapy on resistant Escherichia coli
R. Hammond* [St Andrews, United Kingdom], A. Coates, S. Gillespie

1224 Exebacase resensitises methicillin-resistant Staphylococcus aureus to oxacillin in a rabbit model of infective endocarditis
J. Oh, D. Lehoux, C. Cassino, W. Abdelhady, Y. Xiong, A. Bayer, R. Schuch* [Yonkers, United States]

1885 Optimising the combination of ceftazidime/avibactam and gentamicin against KPC-producing Klebsiella pneumoniae (KPC-Kp) with aminoglycoside-modifying enzymes
Y. Huang, K. Sokolowski, A. Rana, N. Kadiyala, Z. Bulman* [Chicago, United States], K. Krupp, E. Ozer, A. Hauser

4916 In vivo bactericidal activity of minocycline and rifampicin combination in a lung infection model in neutropenic mice

7002 Evaluation of the interactions of polymyxin B in combination with aztreonam, minocycline, meropenem and rifampicin against NDM- and OXA-48-like producing Escherichia coli
A. Olsson* [Uppsala, Sweden], M. Hong, H. Al Farsi, C. Giske, P. Lagerbäck, T. Tängdén

7570 Dose-dependent in vitro interactions of colistin with meropenem against carbapenem-resistant Gram-negative bacteria

Session accepted as Paper Poster Session

Drug combinations: 1+1 does not equal 2

2270 Colistin, turns active an otherwise ineffective rifampicin-linezolid combination in Gram-negatives
E. Armengol Rivero* [Barcelona, Spain], I. Perez-Guillen, M. Jorba, R. Herraez Moral, J. Sierra

2644 Pharmacodynamic analysis of meropenem in combination with a novel B-lactamase inhibitor ANT2681 against New Dehli metallo B-lactamase-producing Escherichia coli
A. Johnson* [Liverpool, United Kingdom], L. Mcintee, N. Farrington, A. Kirby, R. Kolamunnage-Dona, M. Everett, M. Zalacain, C. Sable, L. Ailboud, N. Harper, S. Das, W. Hope

Evaluation of omadacycline alone and in combination with rifampin against biofilm-producing Staphylococcus aureus and Staphylococcus epidermidis
T. Morissette* [Detroit, United States], K. Lev, R. Kebriaei, J. Abdul-Mutakabbib, M. Rybak

Predicting antistaphylococcal effects of daptomycin and gentamicin in an in vitro dynamic model using MICs determined at pharmacokinetically-derived concentration ratios
M. Golikova, E. Strukova, Y. Portnoy, S. Zinner* [Cambridge, United States], A. Firsov

MPC-based prediction of anti-mutant effects of linezolid/daptomycin combinations against Staphylococcus aureus: a study in an in vitro dynamic model
K. Alieva* [Moscow, Russian Federation], M. Golikova, E. Strukova, Y. Portnoy, S. Zinner, A. Firsov

Combined effect of fosfomycin and amikacin against fosfomycin-heteroresistant Escherichia coli isolates
I. Portilla Calderón* [Seville, Spain], M. Ortiz Padilla, B. De Gregorio-Iaria, V. Merino Bohórquez, J. Blazquez, J. Rodríguez-Baño, J. Rodríguez Martínez, A. Pascual Hernandez, F. Docabo Perez

Imipenem/sulbactam, a repurposed drug combination for the treatment of MDR Acinetobacter baumannii infections
M. Meiqi Tan, L. Phee, J. Standing, D. Wareham* [London, United Kingdom]

Activity of enmetazobactam in combination with cepafine in a murine urinary tract infection model challenged with an ESBL-producing isolate of Escherichia coli
C. Vingsbo Lundberg, A. Belley, P. Knechtle* [St. Louis, France]

Antibacterial activity of aztreonam-epigallocatechin gallate combinations versus multidrug-resistant strains of Acinetobacter baumannii
J. Betts, K. Lucassen, J. Salgueiro-Bades, M. Hornsey, H. Seifert, R. La Ragione, P. Higgins* [Cologne, Germany]
Cannabidiol synergic antimicrobial activity combined with polymixin B (PB) against PB susceptible and resistant Gram-Negative bacilli
N. De Lima Martins Abichabki* [Ribeirao Preta, Brazil], L. Zacharias, T. Ogasawara, F. Campioni, A. Seribelli, J. Falcão, A. Zuardi, J. Hallak, J. Crippa, A. Darini, L. Andrade

Efficacy of ceftolozane-tazobactam in combination with colistin against extensively drug-resistant Pseudomonas aeruginosa including high risk clones, in an in vitro pharmacodynamic model

Antimicrobial combination activity of vancomycin and antimalarial quinacrine against methicillin-resistant Staphylococcus aureus isolated from infected diabetic foot ulcers
A. Oliveira Da Silva* [Vila Real, Portugal], D. Correia, V. Silva, J. Carvalhal, A. Castro, G. Igrejas, R. Rego, P. Poeta

In vitro activity of imipenem/relebactam among Gram-negative clinical isolates in two Spanish tertiary hospitals
M. Perhuelas Martínez, C. García Salguero, M. Ihiaga, F. Candel* [Madrid, Spain], J. Del Pozo, E. Culebras

Combinations activity of azithromycin and colistin against colistin-resistant Klebsiella pneumoniae in a murine model of urinary tract infection
R. Odreda, D. Corbett, A. Coates, D. Molnar, Y. Hu, P. Warn, P. Thommes*[Cheshire, United Kingdom]

Glutoxin, a new candidate against methicillin-resistant Staphylococcus aureus showing synergistic effect with classical antimicrobial drugs in Caenorhabditis elegans infection model
P. Estebon*[Zaragoza, Spain], S. Redrado, L. Comas, C. Seral, J. Pardo Jimeno, M. Arias, E. Gálvez

Evidence from in vitro pharmacokinetic/pharmacodynamic studies on polymyxin-based combination therapies to treat infections due to carbapenem-resistant Gram-negative bacteria
M. Chiamenti* [Mantova, Italy], D. Bragantini, L. Scudeller, L. Paddock, F. Franceschi, S. Ellis, M. Sanguinetti, G. Menchinelli, A. Savoldi, E. Righi, E. Tacconelli

Pharmacodynamic properties of amoxicillin-clavulanic acid in a neutropenic mouse thigh infection model
A. Muller*[The Hague, Netherlands], W. Kloezen, B. De Winter, A. Van Der Meijden, H. Van Der Spek, M. Ten Kate, S. Van Den Berg, J. Meletiadis

Tackling resistance to carbapenem and colistin in clinical isolates of Acinetobacter baumannii
R. Ravichandran, D. Machado* [Lisbon, Portugal], M. Viveiros, C. Kroeger, M. Martins

Impact of an antimicrobial stewardship team on the de-escalation of carbapenem use in a tertiary hospital
M. Maeda*[Tokyo, Japan], Y. Nagatomo, Y. Naita, E. Akima, K. Nakane, K. Ugojin, M. Yoshikawa, T. Takuma, I. Tokimatsu, Y. Niki

Essential human resources for antimicrobial stewardship teams in Japan: estimates from a nationwide survey

Design and implementation of a Real-Time Carbapenem List (RTCL) using Electronic Patient Record (EPR) to enable Post Prescription Review and Feedback (PPRF) as a carbapenem stewardship strategy for resource-constrained antimicrobial stewardship team
C. Hickey*[Dublin, Ireland], M. Kelly, G. Courtney, K. Flannery, B. Boyle

Mandatory computerised decision support system is necessary for sustained control of carbapenems and piperacillin-tazobactam usage in a multi-faceted hospital antimicrobial stewardship programme: interrupted time series with segmented regression analysis
B. Chua*[Singapore, Singapore], S. Heng, L. Ang, S. Tan, H. Tay, M. Yap, J. Ouek, C. Teng, B. Young, R. Lin, B. Ang, T. Lee, D. Ly, T. Ng

Multidisciplinary treatment model led by infectious physician reduce the unreasonable use of antibiotics and improve the efficacy in the treatment of patients with diabetic foot infection
L. Xianguan*[Beijing, China], X. Qi, S. Tian, S. Jiang, R. He

Outcomes of the antibiotic stewardship programme in a teaching hospital of southern Italy: an interrupted time-series analysis
M. Macera*[Naples, Italy], F. Calò, L. Onorato, N. Coppola

Impact of antibiotic stewardship programme in an intensive care unit in Brazil
W. Freitas*[Rio de Janeiro, Brazil], M. Silvana Alves, S. Souer

Epidemiology and management of pneumonia based on data entry in a computerised decision support system for antimicrobial prescriptions: a retrospective study
G. Catho*[Geneva, Switzerland], A. Ranzani, J. Strinemann, V. Prendki, B. Huttner

Adherence to antibiotic guidelines at a Danish university hospital, a quantitative and qualitative prospective study
P. Rasmussen*[Aalborg, Denmark], S. Sørensen, L. Mygind
3160 Implementing antibiotic stewardship in humanitarian contexts: MSF’s experience
A. Filali* [Paris, France], R. Kanapathipillai, L. Noonan, B. Molla, J. Michel, N. Hurtado, M. Nada, C. Mills

3423 Setting up antimicrobial stewardship programme in tertiary area hospitals in India
K. Walia* [New Delhi, India], V. Ramasubramanian, V. Ohri

3499 Improving the adequacy of empirical antimicrobial therapy at regional level in bacteriaemia due to Escherichia coli of urinary source: an intervention of the VINCat programme (infection control and antimicrobial stewardship Catalan programme)

3661 Review of the hospital empiric antibiotic guideline in treating community-onset bloodstream infection in a Singapore tertiary hospital
G. Foo* [Singapore, Singapore], J. Samani, C. Teng, T. Tan, K. Chew

4018 Patient level predictors of vancomycin never events

4025 The antimicrobial stewardship in surgery (ASCHI) project: long-term follow-up
A. Chiesa* [Brescia, Italy], A. Zoncada, N. Brianse, E. Van Hauwermeiren, A. Ferrarese, S. Lorenzetti, C. Fornabaio, P. Lanza, A. Patrani, C. Tinelli, N. Pasquali, M. Rovatti, M. Martinotti, A. Pan

4085 Increase of parenteral antibiotic use in Japan could be explained by the society aging
R. Koizumi* [Tokyo, Japan], Y. Kusama, Y. Gu, M. Ishihane, Y. Muraki, D. Yamasaki, M. Tanabe, N. Ohmagari

4371 Persuading the prescriber: the impact of prospective audit with feedback on hospital antibiograms
M. Chatzopouloou* [Larissa, Greece], A. Kyriakaki, L. Reynolds

4914 Transforming care through data transparency: impact on cellulitis therapy standardisation
S. Minor* [Maitland, United States], N. Sankar, J. Burns, K. Calise, V. Herrera

5056 Infectious disease consultation reduces time to appropriate antimicrobial treatment in Gram-negative bacteriaemia: data from an area of high prevalence of antibiotic resistance
V. Da Prat* [Milan, Italy], L. Galli, M. Maro, P. Cichero, B. Castiglioni, C. Ottolini, C. Tassan Din, A. Poli, C. Ossi, A. Andolina, A. Ambrosio, A. Lazzarin, A. Castagna, P. Scarpellini, M. Ripa

5246 Prospective observational study of antimicrobial stewardship programmes in Brazil: preliminary results
R. Menezes, M. Gonçalves, M. Costa, E. Krummenauer, C. Reuter, J. Renner, M. Carneiro* [Santa Cruz do Sul, Brazil]

5779 Antibiotic use indicators: which and how? Pilot study of 3 indicators in French hospitals

6116 The appropriateness of prescribing antimicrobials in an infectious emergency outpatient department
M. Logar* [Ljubljana, Slovenia], I. Korpar, M. Uršič

6442 Personal experience and availability of surveillance data, diagnostics and therapeutics are the main drivers for treating carbapenem-resistant Gram-negative bacteria infections
A. Savoldi* [Verona, Italy], E. Carrara, L. Piddock, F. Franceschi, S. Ellis, E. Tacconelli

6712 Quality of documentation on antibiotic treatment in medical records: evaluation of the long-term impact of an antimicrobial stewardship intervention
C. Vercheval* [Lieu, Belgium], P. Damas, F. Frippiat

7022 Impact of the inpatient infectious disease consultations at a tertiary care university hospital
J. Choucair* [Beirut, Lebanon], D. Jaafar, M. Chedid, E. Haddad, G. Saliba, R. Waked

7176 Implementing an antibiotic stewardship programme without increasing the surgical site infection rate in a highly antibiotic-resistant setting
W. Harb, F. Mansour, J. Mourad, M. Trelles, A. Williams* [Luxembourg, Luxembourg]

7554 Persuasive antimicrobial stewardship intervention in the context of a KPC outbreak: a controlled interrupted time-series analysis
N. Roche Pereira* [Porto, Portugal], P. Figueiredo, S. Correa, S. Shahriari, J. Neves, J. Teixeira, J. Paiva, C. Alves, A. Azevedo

7559 Monitoring of interactions with clarithromycin: evaluation of routinely performed drug interaction checks
A. Weber* [Munich, Germany], J. Jung, R. Draenert

7639 SAVE: Stewardship Antibiotica Verona: a new model of stewardship to reduce antimicrobial overuse in a setting with high levels of antimicrobial resistance rates

7640 Antimicrobial stewardship in oral and maxillofacial surgery: melting the iceberg
I. Jaost* [Düsseldorf, Germany], M. Kempe, L. Schorn, C. Mackenzie

7697 Implementation of a homegrown electronic antimicrobial prescribing authorisation process at King Abdulaziz Medical City (KAMC) in Saudi Arabia
N. Shamas* [Riyadh, Saudi Arabia], M. Al Ahmadi, A. Alsaedi, D. Naeem, D. Alijefri, M. Aseeri, M. Alshamrani

7701 Digital antimicrobial dashboard facilitates antimicrobial stewardship in a large London teaching hospital
L. Whitney, M. Gilchrist* [London, United Kingdom], A. Chavda, A. Kinderterer, S. Mookerjee, A. Holmes
Abstract Categories 2020

8203 The role of co-morbidities in the prescription of carbapenemes
A. Makina* (Athens, Greece), G. Poulakou, E. Liakapoulou, A. Makina, A. Papadopoulos, L. Sybardi

8358 The case for infectious disease-centered antimicrobial stewardship: a 10-year experience at Saint George Hospital
S. Saliba* (Beirut, Lebanon), D. Zmerli, A. Chamieh, C. Afff, E. Azar

8426 Antimicrobial stewardship practices in Brazil: where are we?
R. Menezes, M. Gonçalves, M. Costa, E. Krummennauer, J. Renner, C. Reuter, M. Carneiro* (Santa Cruz do Sul, Brazil)

9412 A critical appraisal of the new antibiotic prescription chart using HAPPI (Hospital Antibiotic Prudent Prescribing Indicators) in a large UK district hospital
A. Liu* (Cheltenham, United Kingdom)

9575 Clinical and financial impact of an empiric antibiotic prescribing policy: single department experience
L. Melo, M. Barosa, R. Marques* (Amadora, Portugal), J. Delgado Alves

9596 eHealth-based antimicrobial stewardship programme focused on individual prescriptions assessment: sustainability at 4 years
C. Palos* (Loures, Portugal), L. França, P. Rodrigues, R. Tavares, A. Silva

Session accepted as 2-Hour Oral Session
Hospital antimicrobial stewardship interventions: models, tools, experience, impact!

8426 Antimicrobial stewardship practices in Brazil: where are we?
R. Menezes, M. Gonçalves, M. Costa, E. Krummennauer, J. Renner, C. Reuter, M. Carneiro* (Santa Cruz do Sul, Brazil)

9596 eHealth-based antimicrobial stewardship programme focused on individual prescriptions assessment: sustainability at 4 years
C. Palos* (Loures, Portugal), L. França, P. Rodrigues, R. Tavares, A. Silva

Session accepted as Mini-oral ePoster Session
From new TDM technology to optimised dosing

318 Renal function and albumin are drivers for exposure of fluoroquinoloxin in critically ill patients
N. Jager* (Amsterdam, Netherlands), R. Van Hest, R. Brüggemann, J. Lipman, J. Roberts

1153 Continuous infusion and outpatient parenteral antimicrobial therapy with ceftazidime-avibactam: evaluation of efficacy based on therapeutic drug monitoring
V. Gancette, N. Layios, F. Frippiat* (Liège, Belgium)

1334 Administration of ceftazidime to patients undergoing haemodialysis: are trough levels consistently above the EUCAST breakpoints for Enterobacteriales and Pseudomonas?

1419 Dose optimisation of cefotaxime in critically ill patients: a population pharmacokinetic study
E. Roelofs* (Zuid Holland, Netherlands), B. De Winter, A. Abdulla, H. Endeman, A. Dijkstra, A. Muller, B. Koch

1904 The positive impact of infectious diseases consultation on antimicrobial appropriateness in hospitalised patients with antimicrobial stewardship oversight: a propensity-score matched study
J. Bark* (Baltimore, United States), K. Claesys, E. Heil, M. Banoub, S. Leekha, J. Sarkin, M. Kleinberg

2695 Impact of a restrictive antibiotic policy on the emergence of extended-spectrum β-lactamase producing Enterobacteriaceae in the intensive care unit: a quasi-experimental observational study
C. Le Terrier* (Geneva, Switzerland), M. Vinetti, R. Richard, B. Jarrige, S. Breurec, M. Carles, G. Thiéry

4034 Alternative, cost-effective dosage regimens of cefotolozane/tazobactam in patients with renal impairment: a simulation analysis
L. Dheyriat, L. Bourguignon, M. Leray, T. Ferry, S. Goutelle* (Lyon, France)

4087 Therapeutic drug monitoring of levofloxacin using a mobile microvolume-UV/VIS spectrophotometer and derivative spectroscopy
J. Alffenaar* (Sydney, Australia), E. Jongedijk, C. Van Winkel, M. Sarika, S. Heyssel, S. Mpamaha, D. Touw

4855 Pharmakokinetic variability and target attainment of meropenem in critically ill patients undergoing extracorporeal membrane oxygenation: a matched-cohort analysis
M. Gijsen* (Leuven, Belgium), E. Dreesen, Y. Debaveye, J. Wauters, I. Spriet

7597 Continuous infusion of cefoxitin is associated with higher probability of target attainment in patients infected with ESBL-producing Enterobacteriaceae
P. Benoit* (Paris, France), A. Mizrahi, A. Le Monnier, N. El Helali

7734 Development of a dried blood spot assay to quantify levofloxacin drug concentrations for personalised dose adjustment in multidrug-resistant tuberculosis in endemic settings
S. Mohamed* (Charlottesville, United States), S. Stroup, M. Sarika, E. Jongedijk, D. Touw, P. Mbellele, S. Mpamaha, J. Alffenaar, S. Heyssel

1625 Effects of prospective review and feedback and mandatory computerised decision support system for carbapenemes and piperacillin-tazobactam on other broad-spectrum antibiotic use: interrupted time series with segmented regression analysis
B. Chua* (Singapore, Singapore), S. Heng, L. Ang, S. Tan, H. Tay, M. Yap, J. Ouek, C. Teng, B. Young, R. Lin, B. Ang, T. Lee, D. Lye, T. Ng

1904 The positive impact of infectious diseases consultation on antimicrobial appropriateness in hospitalised patients with antimicrobial stewardship oversight: a propensity-score matched study
J. Bark* (Baltimore, United States), K. Claesys, E. Heil, M. Banoub, S. Leekha, J. Sarkin, M. Kleinberg

2695 Impact of a restrictive antibiotic policy on the emergence of extended-spectrum β-lactamase producing Enterobacteriaceae in the intensive care unit: a quasi-experimental observational study
C. Le Terrier* (Geneva, Switzerland), M. Vinetti, R. Richard, B. Jarrige, S. Breurec, M. Carles, G. Thiéry

3978 Effects of fluorquinololone-sparing empirical therapy guideline implementation in a collaborative hospital network
An antibiotic stewardship intervention in the emergency department leads to improved antibiotic prescription especially during normal working hours and among younger faculty
M. Demichel, S. Horster, J. Jung, A. Weber, A. Lechner, R. Drerror* [Munich, Germany]

Use of antimicrobial stewardship smartphone applications by physicians and appropriate prescribing in hospitals: a systematic review
R. El Helou* [Amsterdam, Netherlands], D. Fouldaine, G. Catho, A. Peyravi Latif, N. Verkaik, A. Verban

An interoperable informatics application for the workflow improvement of an antimicrobial stewardship programme in a tertiary hospital

Effectiveness and cost-effectiveness of antimicrobial stewardship programmes in French acute care hospitals
A. Perozziello* [Paris, France], X. Lescure, S. Deuffic-Burban, L.nardas-Sloma, L. Binh Luong Nguyen, Y. Yazdanpanah, J. Lucet

Comparative effectiveness of stewardship interventions in reducing Clostridioides difficile infection incidence
K. Brown* [London, United Kingdom], K. Schwartz, B. Langford, C. Diang, G. Garber, N. Daneman

RESTORE-IMI 2: randomised, double-blind, phase III trial comparing efficacy and safety of imipenem/ cilastatin (IMI)/relebactam (REL) versus piperacillin/tazobactam (PIP/TAZ) in adult patients with hospital-acquired or ventilator-associated bacterial pneumonia [HABP/VABP]

Meropenem-Vaborbactam [VABOREM] in treatment of patients with hospital- and ventilator-acquired pneumonia [HABP/VABP] and bacteremia due to carbapenem-resistant Enterobacteriaceae
M. Bassetti, F. Menichetti, G. Daikos, S. Cammarata, K. Fusaro, D. Zinzi* [Pozzeme, Italy,]

Ceftobiprole compared with vancomycin plus aztreonam in the treatment of acute bacterial skin and skin-structure infections: results of a phase III, randomised, double-blind trial [TARGET]

Empowering nurses to assess patient-reported antibiotic allergies: a pilot implementation study of a validated antibiotic allergy assessment tool

Posomycin for the treatment of neonatal sepsis
P. Williams* [Clovelly, Australia], J. Berkley, D. Christina, S. Murunga, A. Walker, B. Nyaoke, R. Omollo, S. Ellis, E. Correa, M. Sharland

Pharmacokinetics and pharmacodynamics of dalbavancin in the clinical setting
G. Straffolini* [Turin, Italy], S. Biffi, A. De Nicolò, A. Barco, S. Bonaro, G. Di Perri, M. Antouucci, A. Briozzo, V. Avataneo, G. Carito, A. D’Alavo

Risk factors (derived from host, pathogen and disease) did not affect the efficacy of delafloxacin monotherapy in acute bacterial skin and skin structure infections trials
B. Pizà Vallespir, S. Biliatti, A. Nizzardo, A. nuti, S. Cammarata, D. Zinzi* [Pozzeme, Italy]

Evaluating prophylactic post cardiac transplantation amphotericin B treatment by simulation
C. Mane* [Toulouse, France], V. Duhalde, I. Labadens, O. Cointault, D. Condercat, P. Gandia

Influence of inflammation on pharmacokinetics and protein binding of tedizolid in healthy volunteers
B. Wulkersdorfer* [Vienna, Austria], C. Schörgenhofer, P. Matzneller, V. Al Jalali, M. Bauer, E. Lackner, F. Kees, C. Dorn, B. Jilma, M. Zeitlinger

Pharmacokinetic/pharmacodynamic analysis of tedizolid phosphate compared to linezolid for the treatment of infections caused by Gram-positive bacteria
A. Aguirre Quinonera* [Vitoria, Spain], A. Rodríguez, M. Solinis, A. Canut

A mechanism-based pharmacokinetic/pharmacodynamic model based on pharmacokinetic and static time-kill data alone can predict the in vitro bacterial regrowth of 3 fluoroquinolone-resistant Escherichia coli strains after dynamic exposure
R. Michelet* [Berlin, Germany], J. Seeger, C. Kloft

Rifampicin reduces tedizolid concentrations in healthy volunteers
S. Lee* [Singapore, Singapore], D. Hee

Current evidence on dose reduction of antibiotics in patients with impaired renal function: a systematic review
S. De Vroom* [Amsterdam, Netherlands], F. Van Daalen, S. Zieck, R. Mathôt, R. Van Hest, S. Geerlings
Abstract Categories 2020

5292 Systematic review on estimated rates of nephrotoxicity and neurotoxicity in patients treated with polymyxins
F. Wagenlehner* [Giessen, Germany], E. Lucenteforte, F. Pea, J. Pogue, A. Soriano, L. Tavoschi, V. Steele, A. Henriksen, C. Longshaw, D. Manissera, R. Pecini

5349 Frequency and impact of differences across Chronic Kidney Disease Epidemiology Collaboration (CKD-EPI) and Cockcroft-Gault (C/G) estimations of glomerular filtration rate on antimicrobial dosing
D. Francis, B. Potsaki* [Gibsonia, United States]

5377 Model-informed exposure response analyses for ceftazidime and levofloxacin against Klebsiella pneumoniae and Pseudomonas aeruginosa in murine thigh infection models

8224 Population pharmacokinetics and pharmacodynamics of colistin A and B in the murine thigh infection model with Pseudomonas aeruginosa: an integrated experimental and modelling approach

8369 The predictive performance of a model averaging approach is superior over using distinct population pharmacokinetic models in model-informed precision dosing of vancomycin
D. Uster* [Hamburg, Germany], S. Stocker, J. Garland, R. Day, S. Wicha

5129 Optimising pharmacokinetics/pharmacodynamics of β-lactam/β-lactamase inhibitor combinations against high inocula of extended-spectrum β-lactamase-producing bacteria
V. Tam* [Houston, United States], H. Abodayaki, W. Wang, K. Ledesma, P. Merlau, K. Chan, R. Altman, A. Sofjan, T. Tran, M. Nikolaou

5421 Vancomycin for patients with MRSA bloodstream infections (BSIs) is nephrotoxic even within the recommended area under the curve (AUC) therapeutic exposure range
T. Lodise* [Watervliet, United States], M. Scheetz, J. Carrero, T. Holland

8194 Sulbactam-durlobactam (ETX2514) activity against carbapenemase-producing Acinetobacter baumannii in the presence or absence of imipenem or meropenem using an in vitro hollow-fibre infection model
Y. Jiao, A. Tanudra, J. Bulitta, J. O'Donnell* [Waltham, United States]

8958 Which dosage of amoxicillin in infective endocarditis? Development of a simple predictive medicine tool for adaptation

4865 Comparative protein binding in vitro and in vivo: quantitative insights into binding dynamics by pharmacometrics
S. Wicha* [Hamburg, Germany], B. Wulkersdorfer, E. Kurdina, P. Matzneller, V. Al Jalali, M. Vossen, S. Riesenhuber, E. Lackner, C. Dorn, F. Kees, M. Zeitlinger

5373 Ceftriaxone penetration into epithelial lining fluid: are dosing regimens sufficient for severe community-acquired pneumonia?

1190 Systematic evaluation of development pathways of centrally-approved antibiotics in Europe including an innovative graphical illustration method
A. Jorda* [Vienna, Austria], M. Zeitlinger

1610 An international quality control pilot programme for the measurement of antimicrobial drugs
E. Wallenburg* [Nijmegen, Netherlands], R. Brüggemann, A. Harteveld, L. Wissela, E. Franssen, R. Aarnoutse

1843 Is it realistic to offer an antibiotic susceptibility bonus to developers?
C. Morel* [Geneva, Switzerland], O. Lindahl, S. Harbarth, M. De Kraker, S. Edwards, A. Hollis

2497 Comparison of 28-day mortality rates of recently completed prospective, randomised treatment studies of adult patients with carbapenem-resistant Gram-negative bacterial infections
T. Lodise* [Watervliet, United States], M. Bassetti, R. Ferrer, T. Naas, Y. Niki, D. Paterson, M. Zeitlinger, G. Tillotson, R. Echols

2544 Evaluation of difficult-to-treat resistant Gram-negative bacilli from European respiratory isolates: SIDERO-WT-2014–2018
M. Soriano* [Seattle, United States], S. Nguyen, M. Hackel, D. Sahm, R. Echols, M. Takemura, Y. Yamano

2550 In vitro antibacterial activity of ceftiderocol against a multinational collection of difficult-to-treat resistant Gram-negative bacteria from respiratory and bloodstream infections: SIDERO-WT-2014–2018
S. Nguyen* [Carrollton, United States], M. Soriano, M. Hackel, D. Sahm, R. Echols, M. Takemura, Y. Yamano

2555 In vitro antibacterial activity of ceftiderocol against a multinational collection of Gram-negative bacteria from urinary isolates: SIDERO-WT-2014–2018
R. Pecini* [Harrison, United States], S. Nguyen, M. Hackel, D. Sahm, R. Echols, M. Takemura, Y. Yamano

2560 In vitro antibacterial activity of ceftiderocol against Stenotrophomonas maltophilia clinical isolates in Europe and North America: multinational surveillance SIDERO-WT-2018 study
N. Ishibashi* [Tokyo, Japan], M. Hackel, H. Maki, T. Satou, R. Echols, D. Sahm, Y. Yamano

2567 In vitro activity of ceftiderocol against carbapenem non-susceptible Enterobacteriaceae from multiple countries in Europe and North America: multinational surveillance SIDERO-WT-2018 study
N. Kohira* [Osaka, Japan], M. Hackel, H. Maki, T. Satou, R. Echols, D. Sahm, Y. Yamano

846 Outcomes in ventilated patients with hospital-acquired ventilator-associated bacterial pneumonia (HABP/VABP) treated with imipenem/cilastatin (IMI)/relebactam (REL) versus piperacillin/tazobactam (PIP/TAZ): subgroup analysis of the RESTORE-IMI 2 randomised, controlled trial

2700 In vitro and in vivo antimicrobial activity of ceftiderocol and comparators against Stenotrophomonas maltophilia
R. Nakamura, M. Ota, T. Yoshihama, T. Satou, Y. Yamano* [Osaka, Japan]

Study of the in vitro activity of ceftiderocol in comparison to other antimicrobial agents against a collection of Acinetobacter baumannii clinical isolates from different geographical locations
L. Muñoz, C. Ballesté* [Barcelona, Spain], L. Roca, J. Viña Estape

2577 In vitro activity of ceftiderocol against carbapenem non-susceptible clinical isolates of Enterobacteriaceae from multiple countries in Europe and North America: multinational surveillance SIDERO-WT-2018 study
N. Ishibashi* [Tokyo, Japan], M. Hackel, H. Maki, T. Satou, R. Echols, D. Sahm, Y. Yamano

2578 In vitro and in vivo antimicrobial activity of ceftiderocol and comparators against Stenotrophomonas maltophilia
R. Nakamura, M. Ota, T. Yoshihama, T. Satou, Y. Yamano* [Osaka, Japan]
4557 Antibacterial activity of the novel compound [Mn(bpen-cholamide)(CO)3]Br versus methicillin-resistant Staphylococcus aureus
J. Betts, P. Roth, A. Liakopoulos* [Leiden, Netherlands], U. Schatzschneider, R. La Ragione

5210 Antibiotic-metal complexes: where microbiology meets bio-physics
M. Ferreira, L. Bessa, F. Campanile, D. Bongiorno, S. Stefani, P. Gameiro* [Porto, Portugal]

7037 Efficiency of phototherapy as a non-conventional antimicrobial strategy against selected Gram-negative bacteria in planktonic and biofilm models
H. Kamal* [Cairo, Egypt], N. Farag, S. Tammam, M. El-Azizi

9799 In vitro comparative activity of cefepime/taniborbactam against metallo-beta-lactamase-producing Pseudomonas aeruginosa and Klebsiella pneumoniae isolates
P. Paranos, P. Georgiou* [Athens, Greece], S. Antonopoulos, A. Micheliaki, E. Vagiai, S. Vourli, S. Pournaras, J. Meletiadis

Session accepted as 1-Hour Oral Session

New drugs and generics: initiatives to make them available or reliable

275 Assessment of the quality of data supporting the efficacy of new antibiotics for multidrug-resistant bacteria
D. Yahav, N. Tau, D. Shepselovich* [Petah-Tikva, Israel]

6899 A real-world review on OIDD designation: what lessons can we learn?
A. Kukreja* [Gurugram, India], N. Antunes, W. Hui, D. Holman

7173 Therapeutic equivalence between brand name antibiotics versus generics: a systematic review and meta-analysis
A. Cotia* [São Paulo, Brazil], I. Boszczowski, J. Matuoka, M. Barbosa, H. Oliveira

7660 Pilot study of reimbursement model to ensure access to new critical antibiotics in Sweden
J. Hellman* [Solna, Sweden], C. Edlund, T. Jamtehov, F. Robertsson, A. Ternhag

9361 Sub-standard and falsified antibiotics: a systematic review
G. Zabala* [London, United Kingdom], K. Bellingham, V. Vidihamly, P. Boukh, K. Boutsamay, P. Newton, C. Coillet

Session accepted as 2-Hour Oral Session

New drugs and new targets for highly resistant bacteria

2631 Validation and exploration of HldE: a promising target for antibiotic potentiation in Gram-negative bacteria
S. Silve, Y. Cherrak, J. Hansen, T. Vermat, M. Mourez, E. Bacqué, F. Jeannot, S. Coyne* [Marcy l’Étoile, France]

2679 ART24, a novel live biotherapeutic product, in development for the prevention of Clostridioides difficile infection spares gut commensal species in vitro and allows for expansion of beneficial bacteria
M. O’Donnell, B. Healy, C. Hill, P. Ross, M. Rea, R. Farquhar, L. Chesnel* [Concord, United States]

3245 Efficacy of cefiderocol against carbapenem-resistant Acinetobacter baumannii in ventilator-associated pneumonia mouse model
K. Ota* [Nagasaki, Japan], N. Kaku, N. Uno, K. Sakamoto, Y. Morinaga, H. Hasegawa, T. Miyazaki, K. Izumikawa, M. Hukae, K. Yanagihara

3926 Oral immunotherapy with secretory IgA improves survival in the hamster model of Clostridioides difficile infection
W. Weiss* [Fort Worth, United States], M. Simon, S. Kriessing, E. Chiari, M. Pulse, S. Brown, C. Von Eichel-Streiber, H. Gerding, M. Mandago

5956 In vitro activity of cefepime-taniborbactam (VNRX-5133) against genetically-diverse, largely multidrug-resistant, Pseudomonas aeruginosa clinical isolates
R. Shields* [Pittsburgh, United States], C. Jones, E. Kline, A. Rubia, Y. Doi

7192 Plazomicin activity against carbapenemase-producing Enterobacteriales carrying aminoglycoside-modifying enzymes from European and United States hospitals
M. Castanheira* [North Liberty, United States], T. Doyle, R. Mendes, J. Gogtay, H. Sader

984 Genomic and proteomic analysis of 42 bacteriophages located in the genomes of 17 clinical strains of Klebsiella pneumoniae resistant to carbapenems

C. Sánchez Tembleque, M. Montes De Oca, E. Morte
Ramea, P. Luque Gómez, M. De Cueto-López, L. Suárdi,
F. Guerrero-Sanchez, Z. Palacios Baena, S. Jiménez-
Jorge, J. Rodriguez-Baño, P. Retamar Gentil

Antimicrobial stewardship opportunities at discharge: current prescribing at Boston Medical Centre
N. Rebold* [Boston, United States], K. Brade

Adequacy of antibiotic treatment in patients with negative blood cultures: identifying a novel target for antimicrobial stewardship [NOBACT study]
R. Fernández Guerrero* [Seville, Spain], J. Girón Ortega,
E. Morte Ramea, P. Luque Gómez, C. Sánchez Tembleque,
M. Montes De Oca, F. Guerrero-Sanchez, M. De Cueto-
López, L. Suárdi, Z. Palacios Baena, S. Jiménez-Jorge,
J. Rodriguez-Baño, P. Retamar Gentil

Why don’t hospital prescribers stop antibiotics when it would be safe to do so? Results of a discrete choice experiment
L. Roope, J. Buchanan, E. Morrell, K. Pouwels, K. Sivyer,
F. Mowbray, L. Abel, E. L.A. Cross, L. Yardley, T. Peto,
A. Walker, M. Llewelyn* [Brighton, United Kingdom],
S. Wordsworth

Hospital physicians’ perspective on antibiotic prescribing and antimicrobial resistance: a qualitative study
I. Christensen* [Sarpsborg, Norway], J. Haug,
J. Vildershøj Bjørnholt, D. Berild, B. Skodvin,
L. Jelsness-Jergensen
Abstract Categories 2020

166

9160 Assessment of de-escalation of empirical antimicrobial therapy in medical wards with high rates of multidrug-resistant bacteria: a multi-centre prospective cohort study

9494 Knowing local cumulative antibiogram: does it matter?
S. Carvalho, J. Caldas, R. Duro, C. Alves, N. Rocha Pereira* [Porto, Portugal]

9642 Systematic blood culture testing identifies a large proportion of patients in whom antibiotics could be safely discontinued: hospital-associated infections in a tertiary care hospital in Ethiopia

Session accepted as Mini-oral Flash Session

Optimised prescribing through diagnostics

1822 TZ magnetic resonance technology in the diagnosis of sepsis and clinical impact in patient management
R. Paggi* [Perugia, Italy], G. De Socio, A. Belati, F. Allegrucci, A. Repetto, E. Cenci, A. Mencacci

2189 Is it safe to use rapid molecular tests for the detection of microorganisms in blood to optimise antimicrobial therapy in septic patients?
C. Rodrigues* [Sao Paulo, Brazil], T. Varejao Strabelli, R. Focaccia Siciliano, R. Zeigler, L. Højjar, A. Matos Porto

2925 Decrease in antibiotic days of therapy after notification of Clostridioides difficile carriage status: an interventional study
M. Gibboa* [Ramat-Gan, Israel], E. Meltzer, L. Maizels, S. Raibman-Spector, A. Segev, G. Rahav, G. Smollan, A. Leibowitz, G. Regev-Yochay

3461 Impact of restricting procalcitonin measurements on antibiotic use, clinical outcomes and costs in a Swiss tertiary care hospital: an interrupted time-series analysis
M. Abbas* [Geneva, Switzerland], N. Vennaz, E. Von Dach, N. Vuilleumier, S. Harbarth, B. Huttner

3778 High clinical impact on antimicrobial stewardship using multiplex PCR syndromic panels for severe community-acquired infections: a real-life experience
A. Alvarez-Uria* [Madrid, Spain], M. Valerio Minero, M. Kestler Hernandez, C. Sanchez-Sanchez, S. De La Villa Martinez, M. Veintimilla Yanez, M. Machado, P. Muñoz, E. Bouzo

4712 Impact of diagnostic and antimicrobial stewardship on time-to-appropriate therapy and clinical outcomes in infections caused by carbapenem-resistant Gram-negative organisms

4967 Communication of rapid identification results from positive blood cultures decreases time to effective therapy
R. Haj, L. Taggart, J. Forbes, E. Leung, J. Wu, R. Fattouh, L. Matukas* [Toronto, Canada]

7484 Evaluation of a new tool in diagnostic process of sepsis: reporting results to a smartphone
N. Zurita Cruz* [Madrid, Spain], A. Fraile Torres, T. Saler Manieiga, L. Fontan, S. Gómez De Frutos, A. Yarci Carrión, E. Navarro Lara, M. De Las Cuevas, L. Cardeño

Session accepted as Paper Poster Session

PK/PD studies and applications

24 High-dose ceftaroline fosamil recommendations for paediatric patients with Staphylococcus aureus complicated skin and soft-tissue infections using an extrapolation approach
P. Chan* [Sandwich, United Kingdom], M. Mcfadyen, A. Quaye, H. Leister-Tebbe, V. Hendrick, J. Hammond, S. Rober

Interim pharmacokinetic analysis of a multi-centre randomised open label phase IIb study in neonates to validate the meta-analysis population pharmacokinetic model used to simulate an optimised dosing regimen in neonates and infants aged < 90 days: the NeoVanc trial

Globally intravenous dosing of antibiotics in infants and children clusters around a small number of strategies but is not completely uniform

Probability of target attainment analyses inform ceftolozane/tazobactam dosing regimens in hospital-acquired pneumonia/ventilator-associated pneumonia patients with end-stage renal disease on intermittent haemodialysis
H. Feng* [Kenilworth, United States], Y. Patel, Z. Zhang, J. Fiedler-Kelly, C. Brunó, E. Rhee, C. De Anda, W. Gao

Cost-benefit analysis comparing trough, two-Level AUC, and Bayesian AUC dosing for vancomycin
B. Lee* [Los Angeles, United States], G. Fong, M. Bolaris, M. Neely, E. Minejima, A. Kang, G. Lee, C. Gong

Population pharmacokinetic modelling and simulations to support ceftazidime-avibactam dosing regimen for paediatric patients with nosocomial pneumonia
M. Mcfadyen* [Kent, United Kingdom], M. Vourvahis, M. Lovern, R. Franzese, T. Riccobene, T. Carrothers, M. Tawadrous

Development of intravascular microdialysis as a tool for therapeutic drug monitoring and intensive PK studies in children
V. Al Jalali* [Vienna, Austria], B. Wulkersdorfer, P. Matzneller, E. Lackner, S. Poschner, W. Jaeger, M. Zeitlinger
1587 The pharmacodynamics of omadacycline against *Escherichia coli* and *Acinetobacter baumannii* studied in an *in vitro* pharmacokinetic model of infection
A. Noel, M. Attwood, K. Bowker, A. Macgowan*
[Bristol, United Kingdom]

1693 *Imipenem/relebactam pharmacokinetic/pharmacodynamic analyses from an in vivo neutropenic murine thigh infection model*
M. Patel* [Kenilworth, United States], N. Daryani, H. Feng, D. Hilbert, M. Melchers, E. Movridou, K. Young, M. Rizk

1716 *Ceftobiprole and daptomycin concentrations in valve tissue in a patient with aortic native valve endocarditis*

1834 *Vancomycin pharmacokinetics in patients undergoing extracorporeal membrane oxygenation after 48 hours of treatment*
L. Herrera-Hidalgo, M. Munoz-Burgos, J. Laimerao, M. Mejias-Trueba, A. Garcia-Avello, J. Martinez, L. Lopez-Cortes* [Sevilla, Spain], M. Gil-Navarro

2086 *Pharmacokinetic model for intravenous vancomycin in pregnant rats and pups*
M. Pham* [Omaha, United States], S. Avedissian, G. Pais, M. Joshi, B. Griffin, J. Chang, K. Hlukhenka, W. Prozialeck, M. Scheetz

2050 *Prolonged versus intermittent infusion of beta-lactam antibiotics: a systematic review and meta-regression of bacterial killing in preclinical infection models*
S. Dhaese* [Ghent, Belgium], A. Heffernan, D. Liu, M. Abdul Aziz, V. Stove, V. Tam, J. Lipman, J. Roberts, J. De Waele

2368 *Comparison of intermittent versus continuous infusion vancomycin therapy for severe patients in intensive care unit*
C. Yamada, J. Telles* [Sao Paulo, Brazil], D. Santos, J. Cieslinski, V. Stadler Tasca Ribeiro, J. Gasparetto, F. Tuon

2727 *Exploring minocycline pharmacodynamics against *Acinetobacter baumannii* and *Staphylococcus aureus* in a lung model in neutropenic mice: clinical implications on optimal dosing regimens*

2782 *Amikacin probability of target attainment in critically ill oncological patients: results from a prospective observational cohort*
O. Borges, K. Migotto, J. Souza Framil, M. Campos, P. Carusa, J. Telles* [Sao Paulo, Brazil], I. Leonardo Franca Jr

2927 *Effect of augmented renal clearance on the extended-interval dosing of aminoglycosides in critically ill paediatric patients*
N. Rhodes* [Downers Grove, United States], S. Avedissian, A. Hadid, J. Bradley, J. Le

3146 *Extracorporeal membrane oxygenation does not impact the pharmacokinetics of liposomal amphotericin B*
C. Mane* [Toulouse, France], S. Ruiz, C. Monchaud, D. Concordet, G. Bernard, P. Gandia

3342 *Amikacin initial dosing in emergency surgery: pharmacokinetics and determinants of optimal dose S. Goutelle* [Lyon, France], G. Fritsch, M. Leray, C. Piron, C. Salvez, A. Frigeri

3588 *Pharmacodynamics of amikacin and fosfomycin combination therapy in neonatal sepsis modelled in a hollow fibre infection model*
C. Darlow* [Stockport, United Kingdom], F. Dacobo Perez, N. Farrington, A. Johnson, L. Mcentee, A. Jimenez-Valverde, J. Unsworth, R. Da Costa, S. Ellis, F. Franceschi, M. Sharland, L. Piddock, S. Das, W. Hope

4428 Does cefepime require dose adjustments in critically ill patients on extracorporeal membrane oxygenation? A pharmacokinetic study

4499 Treatment of urinary tract infections in haemodialysis patients: the controversy about antimicrobial urine concentration
W. El Nekidy* [Abu Dhabi, United Arab Emirates], A. Eshbair, M. Mooty, N. Attallah, A. Cherfan, F. Hijazi, I. Ghazi

4520 Investigating dynamic protein binding of clindamycin in vivo by means of intravasal microdialysis in healthy volunteers
B. Wulkers dorfer* [Vienna, Austria], S. Wicha, E. Kur dina, P. Matzneller, V. Al Jalali, M. Vossen, S. Riesenhuber, E. Lackner, C. Dorn, F. Kees, M. Zeitlinger

4658 *PK/PD of intravenous and oral fosfomycin in neonates with presumed serious bacterial Infection Z. Kane* [London, United Kingdom], S. Gastine, P. Williams, J. Berkley, S. Ellis, E. Correia, C. Darlow, W. Hope, M. Sharland, J. Standing

5008 Exploring minocycline pharmacodynamics against *Acinetobacter baumannii* and *Staphylococcus aureus* in a lung model in neutropenic mice: clinical implications on optimal dosing regimens
Simulated exposures of oritavancin in in vitro PK/PD models select for MRSA with reduced susceptibility to oritavancin but minimal cross-resistance or seesaw effect with other antimicrobials
B. Werth* [Seattle, United States], N. Ashford, J. Barreras Beltran, K. Penewit, E. Holmes, A. Waalke, S. Salipante

Population pharmacokinetics of cefazolin in paediatric patients undergoing cardiac surgery
S. Parker* [Brisbane, Australia], G. Moloney, B. Bierbach, J. Ungerer, J. Suna, A. Alphonso, J. Roberts

Beyond the minimal inhibitory concentration: novel pharmacokinetic/pharmacodynamic metrics quantify the exposure-effect relationship of levofloxacin- against fluoroquinolone-resistant Escherichia coli based on in vitro infection models
J. Seeger* [Berlin, Germany], R. Michelet, S. Guenther, C. Kloft

Obesity affects interstitial space fluid of subcutaneous adipose tissue concentrations of meropenem after single application: a controlled clinical trial

Cefepime 2g plus enmetazobactam 0.5g administered IV q8h achieves high probability of target attainment in patients with complicated urinary tract infections
J. Vollmer, M. Machacek, A. Kelley, P. Knechtle* [St. Louis, France]

Influence of extracorporeal membrane oxygenation on the pharmacokinetics of ceftolozane/tazobactam

Impact of pharmacist-driven antimicrobial stewardship interventions on multicomponent patient outcomes
E. Beasley, C. Georgescu, G. Suleyman, K. Cole* [Sylvania, United States]

Survey of attitudes, beliefs, and knowledge of community pharmacists in the United States on antimicrobial stewardship
D. Bowers* [Yakima, United States], C. Bran Morales, C. Daly, D. Jacobs

Organisation of an ID consultation: are medical reports more important than patients?
J. Tschapp* [Lausanne, Switzerland], B. Guery

Aims and challenges of founding a national network of young clinical microbiologists: a French experience

Outcomes of a pharmacist-led antimicrobial stewardship programme within a family medicine resident clinic
L. Dumkow* [Belmont, United States], L. Westerhof, T. Hanrahan, S. McPharlin, N. Egwuatu

Mapping the implementation of a clinical pharmacist-driven antimicrobial stewardship programme at a tertiary care centre in India
V. Nampaathi* [Kochi, India], S. Sudhir, M. Varsha, Z. Mohamed, V. Menon, E. Charani, S. Singh
Two in three final-year veterinary students demand improved education in rational antimicrobial use

Half of prescribed antibiotics are not needed: a pharmacist-led antimicrobial stewardship intervention and clinical outcomes in a referral hospital in Ethiopia

Real-world experience of dalbavancin use for the treatment of Gram-positive infections
N. Spernovasilis* (Heraklion, Greece), A. Mathioudaki, P. Ioannou, A. Gikas, G. Samonis, D. Kofteridis

De-escalation of carbapenems to ciprofloxacin in the treatment of bacteraemia caused by extended spectrum beta-lactamase-producing Enterobacteriaceae
J. Lim, W. Tong, J. Sheah, H. Shafi* (Singapore, Singapore), C. Teng

Efficacy of temocillin versus carbapenems for the treatment of extended spectrum beta-lactamase-producing Enterobacteriaceae urinary tract infections: a case control study
S. Gravier* (Colmar, France), T. Delory, D. Le Puart, G. Gaube, S. Siméon, B. Davido, S. Lejeune, E. Piet, R. Lepeule, P. Lesprit, M. Lafaurie

Treatment of bacteraemia caused by Enterobacter spp.: should the potential for AmpC induction dictate therapy?
G. Drozdinsky* (Petah-Tikva, Israel), A. Neuberger, M. Paul, D. Yahav

Efficacy of temocillin against multidrug-resistant Enterobacteriales: a retrospective cohort study
F. Leysour De Rohella, M. Etienne, S. Dabyat, I. Tret, M. Pestel-Caron, C. Caron, K. Alexandre* (Rouen, France)

Real-life dalbavancin use in acute bacterial skin and skin-structure infections and bone and joint infections: clinical experience at Florence university hospital (Italy)
N. Di Lauria* (Florence, Italy), F. Bartalesi, D. Bartolozzi, M. Cecchi, P. Corsi, A. Ipponi, F. Lagi, E. Mantengoli, A. Bartoloni

Retrospective analysis of intravenous fosfomycin use at Florence University Hospital, Italy: clinical and microbiological analysis
N. Di Lauria* (Florence, Italy), E. Mantengoli, N. Aiezza, A. Antonelli, S. Bresci, T. Giani, F. Lagi, K. Kaye, P. Patel, G. Rossolini, A. Bartoloni

A multi-centre study of dalbavancin use in Italy [DALBITA Study]: which could be the appropriate place for this easy-to-manage antibiotic to treat Gram-positive infections?
C. Aldieri* (Milan, Italy), F. Bai, F. Raumer, E. Di Meco, A. Cattelan, M. Moiali, P. Morelli, M. Rizzi, F. Castelli, M. Guglielmo, B. Menzaghi, G. Rizzardini, A. Saracino, A. Coscio, M. Puoti, A. D’Arminio Monforte, G. Marchetti

The 2020 Dutch working party on antibiotic policy guideline for empirical antibacterial therapy of sepsis in adults

Trimethoprim-sulfamethoxazole as de-escalation agent in bloodstream infections due to Enterobacter spp, Serratia marcescens and Citrobacter freundii

Optimising antimicrobial stewardship: an evaluation of temocillin in the treatment of Gram-negative bacteraemia
L. Cottom* (Glasgow, United Kingdom), L. Bagrade, R. Dhillon, J. Gillies, B. Jones
6. Fungal infection & disease

- Fungal disease epidemiology
- Diagnostic mycology (incl molecular)
- Antifungal drugs & treatment (incl clinical trials)
- Antifungal resistance & susceptibility testing (incl surveillance)
- Other
Session accepted as Paper Poster Session

**Antifungal stewardship, therapeutic drug monitoring and pharmacokinetics**

931 A multi-site evaluation of antifungal prescribing and the use of fungal diagnostics in critical care
C. Logan* [London, United Kingdom], C. Hemsley, A. Fife, J. Edgeworth, D. Wynnoil, P. Hopkins, F. Bicanic

986 Development of an antifungal stewardship programme at a London teaching hospital
L. Whitney, R. Wilson* [London, United Kingdom], F. Davies, M. Coleman, J. Woo, R. Polanicawarand, M. Gilchrist

1702 Evaluation of voriconazole therapeutic drug monitoring practice: experience of a tertiary referral centre
Y. Kwang, A. Nettuch, T. Lai, S. Chen, H. Kim* [Sydney, Australia], I. Sandaradura, J. Alffenaar

1765 Clinical feasibility of simultaneous microdialysis of voriconazole and its N-oxide metabolite at target site demonstrated by in vitro investigations
J. Schulz* [Berlin, Germany], R. Michelet, F. Kluwe, C. Klaft

1929 Antifungal cost in the patients with febrile neutropaenia episodes due to haematological malignancies
H. Gedik* [Istanbul, Turkey]

2533 The cost-effectiveness of isavuconazole compared to voriconazole, the standard of care in the treatment of patients with invasive fungal infection prior to differential pathogen diagnosis in Spain
J. Azanza, S. Grau Cerrato, L. Vázquez, P. Rebollo, C. Peral, L. Alejandra, V. Lopez Gomez* [Alcobendas, Spain]

3709 Posaconazole versus voriconazole as antifungal prophylaxis for invasive fungal diseases in patients with haematological malignancies

4311 Isavuconazole for the treatment of invasive fungal infection in solid organ transplant recipients: experience from a referral centre

5009 Pharmacokinetic variability and target attainment of fluconazole in critically ill patients
R. Van Daele* [Leuven, Belgium], J. Wauters, R. Brüggemann, R. Denoaz, M. Hayette, Y. Debaveye, I. Sriet

5180 A new Lichtheimia corymbifera mouse model close to human pathophysiology to test antifungal drugs
K. Brunet* [Poitiers, France], J. Martellosio, F. Arrivé, T. Brunet, I. Lamarche, S. Marchand, B. Rammaert

5566 Serum concentrations of intravenously administered posaconazole in critically ill patients
W. Heinzi* [Weiden, Germany], D. Wichmann, H. Klinker, S. Kluge

Session accepted as Paper Poster Session

**Aspergillus infections: not always the same!**

5831 Safety and efficacy of triazole use for prophylaxis and treatment of invasive fungal diseases in patients receiving gilteritinib, a novel tyrosine kinase inhibitor for the treatment of acute leukemia
M. Aleissa* [Boston United States], M. Luskin, B. Alshehri, H. Leblebijn, A. Mcdonnell, F. Marty

6803 Frequency and severity of potential drug-drug interactions before, during and after an antifungal stewardship pilot project
S. Lachenmayr* [Munich, Germany], A. Gretler, D. Strabach, H. Mannell, K. Berger, H. Ostermann

6969 Experience of 319 post-surgical abscesses: focus on empiric antifungal therapy
E. Taddei* [Roma, Italy], F. Giovanneness, E. Birocchi, R. Murri, L. Carelini, F. Taccari, R. Cauda, M. Fontoni

7211 Plasma exposures following posaconazole injection and delayed-release tablet
Y. Wang, S. Tsai, Y. Fu, P. Chen, S. Lin, Y. Chen, Y. Chen, S. Lin* [Taipei, Taiwan]

9280 Chitosan-coated magnetite nanoparticles as a biocompatible nystatin carrier: physicochemical characterisation and in vitro fungicidal determination
S. Yazdanpanah* [Shiraz, Iran], K. Zomorodian, H. Veisi, H. Veisi

9375 Invasive pulmonary aspergillosis after heart transplantation
K. Monosova* [Saint Petersburg, Russian Federation], M. Simonenko, Y. Sazonova, K. Zagarodnikova, L. Vasiljeva, R. Vadim, M. Bortsova, P. Fedotov

980 The Danish nationwide surveillance of azole-resistance in Aspergillus fumigatus: data from the first nine months
M. Risum* [Copenhagen, Denmark], R. Krøger Hare, J. Gertsen, L. Kristensen, F. Rosenvinge, S. Sulim, E. Marmolin, B. Røder, J. Bangsborg, E. Dzajic, M. Pedersen, K. Astvad, S. Andersen, M. Arendrup

3256 Relevance of EORTC-MSG criteria in invasive fungal infections in lung transplant recipients

3382 Invasive aspergillosis by cryptic Aspergillus species in a 700-bed third level hospital

4002 Aspergillosis complicating severe respiratory syncytial virus in intensive care unit patients: a retrospective cohort study
H. Nam* [Chicago, United States], M. Isom
Abstract Categories 2020

4246 Epidemiology of respiratory colonisations and infections caused by Aspergillus and non-Aspergillus moulds in lung transplant patients

4385 Emergence of cryptic Aspergillus species infection and importance of antifungal susceptibility testing
J. Tang* (Hong Kong, Hong Kong), C. Tsang, H. Ye, F. Xing, S. Lo, C. Xiao, A. Wu, A. Ngn, K. Law, Y. To, D. Sze, T. Hui, T. Zhu, C. Yao, B. Tse, S. Lau, P. Woo

4866 Invasive aspergillosis and influenza virus infection: an accidental relationship?

4939 Clinical, microbiological and molecular studies of invasive pulmonary aspergillosis caused by Aspergillus lentulus in China
S. Yu* (Beijing, China), M. Zhou, Y. Xu

5220 Prevalence of azole resistance in clinical Aspergillus fumigatus isolates in Greece

5557 Antifungal susceptibility of Aspergillus section Flavi clinical isolates in France
E. Bjenerontin* (Créteil, France), J. Costa, A. Benmostefa, B. Mousavi, N. Lin, C. Guillot, N. Ait-Ammar, J. Guillot, L. Delhaes, F. Botterel, E. Dannaoui

6944 Invasive CNS aspergillosis in non-neutropenic patients: a review of nine cases from North India
N. Gupta* (Manipal, India), A. Mittal, P. Kodan, N. Mundadan, R. Kumar, T. Kumar, G. Singh, D. Xess, P. Ramteke, M. Soneja

8473 Limitations of the diagnostic criteria for invasive aspergillosis in solid organ transplantation: a national cohort (DIASPERTOS study)

Keep the attention high on Putative Invasive Pulmonary Aspergillosis (PIPA) in medical wards and intensive care units: a four-year retrospective analysis
T. Lupia, S. Raviolo, A. Trentalange, A. Curtoni, R. Cavallo, F. De Rosa, S. Corcione* (Turin, Italy)

The emerging non-conventional invasive aspergillosis: 5-year experience

9599 The burden of chronic pulmonary aspergillosis on the respiratory service at a district general hospital
F. Maghrabi* (Manchester, United Kingdom), R. Cade, C. Kosmidis, R. Sundar, D. Denning

Session accepted as Paper Poster Session

Candida and Cryptococcus: treatment options and novel agents

988 Clinical experience of oral ibrexafungerp for treatment of four patients with invasive candidiasis from the FURI study
J. Prattes* (Graz, Austria), C. Zurl, N. Azie, D. Angulo Gonzalez, R. Krause

Candida spp. in the respiratory tract secretions of critically ill patients and the impact of antifungal treatment
N. Spernovasilis* (Heraklion, Greece), A. Voudaski, C. Alexeopoulos, A. Papazachariou, E. Paraschou, A. Achyropoulou, S. Maraki, D. Ieradiakonou, G. Samonis, D. Kofeidis

Treatment status and prognosis of 203 cryptococcosis in non-human immunodeficiency virus-infected and nontransplant patients
S. Yi* (Shanghai, China), B. Hu

Empiric treatment with fluconazole, as compared to echinocandins or amphotericin B, was associated with lower mortality among intensive care unit patients with sepsis due to candidaemia
M. Papadimitriou Olgiviers* (Lausanne, Switzerland), A. Spiliopoulos, F. Kolontsiou, A. Lambropoulou, V. Karamouzos, A. Georgakopoulou, I. Spiliopoulos, F. Filgo, M. Marangos, M. Christofidou

Synthesis of nano-capcsulated caprylic acid: evaluation of antifungal activity and its effect on EFG1 gene expression in Candida albicans
M. Roudbar* (Tehran, Iran), S. Roudbar Mohammadi, R. Zarimeidi, S. Mardani
Severe cryptococcal meningoencephalitis with large vessel vasculopathy and multi-territory cerebral infarcts
C. Sun* [Adelaide, Australia], M. Kernich, N. Chia, R. Nelson

Progressive disseminated histoplasmosis in a population with HIV/AIDS in the Colombian coffee triangle
J. Hogas Pulgarin* [Medellin, Colombia], A. Alzate, G. Moreno, J. Sierra, A. Jaramillo Torres

Chronic mucocutaneous candidiasis in children in Saint Petersburg, Russia
O. Kozlava, E. Frolova, T. Bogomolova, E. Suspsitin, T. Gabrusskaya, E. Dosavskay, N. Klimka*
[Saint Petersburg, Russian Federation]

Personalised prediction with machine learning approach to predict candidaemia in medical wards
A. Ripoli, E. Sazio, S. Sbrana, G. Bertolino, C. Pallotto, S. Meini, B. Viaggi, G. Cardinali, C. Tascini* [Naples, Italy]

In vitro activity of novel biofilm-disrupting agents against Candida auris and other Candida species
J. Vazquez* [Augusta, United States], S. Wokade, E. Manavathu, M. Bogacz, M. Myntti, S. Thompson

S. Emerj, M. Vannini, V. Mondain, N. Retur, R. Collomp, L. Hassine, F. Lieutier-Colas* [Strasbourg, France]

Analysis of outcomes by geographic region of enrolment in STRIVE, the phase II of rezafungin for the treatment of candidaemia and invasive candidiasis
J. Fortun Abete* [Madrid, Spain], A. Skoutelis, R. Viani, T. Sandison

Early empirical anidulafungin therapy reduces the prevalence of invasive candidiasis in critically ill sepsis patients: a retrospective study
M. Hason* [Dhaka, Bangladesh], S. Neelotpol, R. Rabbani

Clinical outcome of early central venous catheter removal in children with candidaemia: a retrospective multi-centre study
N. Poey* [Paris, France], M. Caseris, A. Faye, S. Bonacorsi, M. Lorrat, J. Toubiana, P. Mariani

In vitro activity of novel propionohydrazide derivatives BG-354 and KTU-341 against multidrug-resistant Candida auris
P. Kavaliauskas* [New York, United States], B. Grybaite, K. Anusevicius, V. Mickevicius, R. Planienien
R. Grigaleviciute, T. Walsh, R. Petraitiene, V. Petraitis
K. Anusevicius, V. Mickevicius, R. Planienien
P. Kavaliauskas* [New York, United States], B. Grybaite

Screening the antifungal activities of monoterpenes and their isomers against Candida species
K. Zomorodian* [Shiraz, Iran], A. Ir. S. Yazdanpanah
Comparison between visual reading, smartphone image and digital scanner interpretation of lateral flow device result for detecting Aspergillus-specific IgG
B. Wilopo* [Manchester, United Kingdom], E. Hunter, P. Goodwin, E. Phillips, G. Platt, M. Richardson, D. Denning

Evaluation of two lateral-flow assays with galactomannan in BAL fluids for the detection of invasive pulmonary aspergillosis: a retrospective two-centre study

Interest of immunoblotting with Aspergillus fumigatus western blot IgE assay for the differential diagnosis of IgE sensitisation and allergic broncho pulmonary aspergillosis
R. Piarroux* [Lyon, France], S. Ranque, J. Vitte

Aspergillosis IgE sensitisation and allergic broncho pulmonary western blot IgE assay for the differential diagnosis of invasive pulmonary aspergillosis: a retrospective two-centre study

Evaluation of a new lateral-flow test for detection of galactomannan in blood for the diagnosis of pulmonary invasive aspergillosis in patients with hematological neoplasms

Baseline activity test use for identification of fungal sensitisation in severe asthma patients
Y. Kazzola, E. Frolova, A. Uchevatkina, L. Filippova, O. Aak, G. Soloveva, V. Kuznetsov, N. Vasilyeva, N. Klimko* [Saint Petersburg, Russian Federation]

Diagnostic value of the IMMY Aspergillus LFA on bronchoalveolar lavage fluid of intensive care patients
A. Dunbar, T. Mercier* [Leuven, Belgium], V. Veldhuizen, B. Rijnders

Bismethylgliotoxin is detected in serum from oncohaematological neutropaenic paediatric patients: presentation of two cases of probable IPA with negative galactomannan and positive bmGT

Comparison of diagnostic performance of two Aspergillus antigen ELISAs

Clinical evaluation of the ID-fungi plates for direct identification of dermatophytes on nail, hair and skin samples by MALDI-TOF MS
R. Sacheli* [Liege, Belgium], S. Winandy, A. Adjetey, R. Darouf, O. Legras, C. Meex, L. Marechol, J. Arrese, M. Hayette

Direct identification of Candida species from positive blood culture by MALDI-TOF MS using a commercial pre-treatment kit
Y. Yamagishi* [Aichi, Japan], T. Mouri, H. Suematsu, A. Masuya, K. Ashizawa, Y. Shimpo, H. Mikamo

Species delimitation of clinically challenging fungi by Orbitrap ultra high-resolution mass spectrometry: a case study in Mucor, Rhizopus and Lichtheimia
I. Moser, A. Jamaliam* [Landsmeer, Netherlands], B. Stielow, J. Knuuttila, A. Giraldo Lopez, S. De Hoog, J. Freeke

Comparative evaluation of the Bruker Biotyper and Vitek MS MALDI-TOF MS systems for identification of non-albicans Candida and uncommon yeast isolates
L. Teke* [Istanbul, Turkey], B. Bayraktar, A. Boris

Rapid diagnostic test: identification of Candida spp. directly from the blood culture bottle using short-term subculture incubation and MALDI-TOF MS in a routine microbiology laboratory
A. Celestino De Souza P.Barth* [Porto Alegre, Brazil], P. De Souza Sampaio, L. Lutz, V. Aquino, E. Wurdig Roesch, D. Castro Pereira

Optimisation of culture protocol for the recovery of fungal pathogens from expectorated sputum of cystic fibrosis patients
W. Memon* [Baltimore, United States], R. Abellera, S. Zhang, R. Marayan

Evaluation of the performance of Vitek MS and Bruker MS on the identification of Candida haemulonii species complex
X. Hou* [Beijing, China]

Candida auris species and lineage identification from plate and blood cultures applying Orbitrap ultra high-resolution mass spectrometry
A. Jamaliam* [Landsmeer, Netherlands], J. Freeke, B. Stielow, I. Moser, A. Giraldo Lopez, H. Friedricht, J. Meis, S. De Hoog

Ultra high-resolution mass spectrometry database improves identification of clinical yeasts from blood cultures by the Action system
A. Jamaliam* [Landsmeer, Netherlands], J. Freeke, I. Moser, H. Friedricht, J. Knuuttila, A. Rantakari, J. Salo, K. Haapasalo-Tuomainen, B. Stielow, S. De Hoog

High-resolution mass spectrometry database (Acron) improves identification of clinical yeasts
J. Freeke* [Vantaa, Finland], A. Jamaliam, I. Moser, A. Giraldo Lopez, J. Knuuttila, O. Niiranen, B. Stielow, S. De Hoog

8616  Comparison of six simple methods for ribosomal DNA extraction directly from nail sample suspected to onychomycosis for PCR-based assay
M. Motamedi* [ Shiraz, Iran], M. Mahmoudi, S. Yazdanpanah

8654  Comparison of the performances of three commercial real-time PCR kits with an in-house real-time PCR assay for the diagnosis of invasive aspergillosis
C. Dulac, A. Bourguignon, L. Mollier-Pierret, D. Dupont, M. Wallon, M. Rabodonirina, F. Persat, J. Menotti* [ Lyon, France]

Session accepted as 2-Hour Oral Session
Different diagnostic tools for different fungal infections

1036  Accuracy and clinical impact of fungal cell-free DNA PCR panel on plasma for diagnosis of invasive fungal infection
F. Senchyna* [ Palo Alto, United States], C. Hogan, D. Ho, A. Subramanian, I. Budvytiene, S. Gombar, H. Costa, M. Budvytis, N. Banaei

1103  Improved molecular diagnosis of dermatomycosis
L. Berlinger* [ Lucerne 6, Switzerland], R. Lombriser, A. Gisler, S. Steiner, S. Pranghofer, M. Altwegg

2416  Clinical evaluation of a novel rapid test for Aspergillus galactomannan
H. Wang* [ Beijing, China], J. Peng, Y. Zhang, K. Sun, J. Wen, Y. Su, Z. Zhou

2929  Serum [1-3]-ß-D-glucan has suboptimal performance for the diagnosis of Pneumocystis jirovecii pneumonia and correlates poorly with respiratory burden measured by quantitative PCR in patients with cancer
A. Szvalbo* [ Houston, United States], A. Malek, Y. Jiang, D. Kontoyiannis

3014  Quantitative PCR detection of circulating DNA for the diagnosis of mucormycosis: prospective evaluation in the ModiMucor study

3573  Serum lateral flow tests for invasive aspergillosis: a prospective cohort study
T. Mercier* [ Leuven, Belgium], E. Guldentops, K. Lagrou, J. Moertens

3574  Evaluation of the performance of the Dynamiker Fungus [1-3]-ß-D-glucan assay for the diagnosis of invasive aspergillosis in high-risk patients with haematological malignancies
M. Siopi* [ Athens, Greece], M. Krmelj, S. Karakatsanis, C. Roumpakis, E. Eldeik, K. Karantasis, H. Sambatakou, P. Tsirigotis, M. Pagoni, N. Sypsas, S. Pouraras, J. Meletiadis

5965  The diagnostic accuracy of cryptococcal antigen detection in serum and cerebrospinal fluid in HIV patients with suspected cryptococcal meningitis: systematic review and meta-analysis

7133  Diagnostic performance of two novel semi-quantitative cryptococcal antigen assays
C. Skipper* [ Minneapolis, United States], K. Tadeo, E. Martyn, D. Meya, B. Kafufu, J. Rhein, D. Boulware

7142  Usefulness of serum as a non-invasive sample for the detection of Histoplasma capsulatum: comparative analysis of different diagnostic techniques
L. Bernal Martinez, P. De La Cruz, S. Gago, L. Alcazar-Fuoli, M. Buitrago* [ Madrid, Spain]

Session accepted as Paper Poster Session
Fungi and antifungal drugs: a complex relationship

45  In vitro activity of manogepix (APX001A) and comparators against 1294 fungal isolates collected worldwide during the SENTRY surveillance programme (2018)
M. Huband* [ North Liberty, United States], M. Pfaffer, R. Flamm, P. Bien, M. Castanheira

708  Detection of echinocandin resistance in Candida glabrata in the microbiology laboratory using commercial methods: interpret with caution!
P. Escribano* [ Madrid, Spain], L. Alguacil, J. Diaz-Garcia, C. Sanchez Carrillo, P. Munoz, J. Guineo Ortega

1358  Antifungal susceptibility profiles of orofom [formerly F901318], and currently available systemic antifungals against mould and yeast phases of Talaromyces marneffei
J. Zhang, H. Liu, L. Xi, Y. Chang, K. Kwan-Chung, S. Seyedmousavi* [ Bethesda, United States ]

1926  Spectrophotometric MICs reading of azoles and amphotericin B shows high agreement with visual reading MIC interpretation using EUCAST 9.3.1 methodology

2096  Occurrence, susceptibility profiles, evaluation of synergistic activity of isavuconazole or voriconazole plus anidulafungin and genetic characterisation of Candida auris detected in a surveillance programme
M. Castanheira* [ North Liberty, United States], L. Deshpande, P. Rhomberg, E. Utt, S. Messer, M. Pfaffer

2106  Application of whole genome sequencing analysis to detect the azole-resistance mechanisms in Aspergillus fumigatus in a global surveillance programme
M. Castanheira* [ North Liberty, United States], A. Davis, L. Deshpande, P. Rhomberg, M. Pfaffer
2614 \textit{In vitro} synergy of isavuconazole in combination with colistin against \textit{Candida auris}

P. Schwarz* (Marburg, Germany), A. Bidau, E. Dannaoui

3218 \textit{In vitro} activity of ibrexafungerp in pH 7.0 and pH 4.5 testing environments against 187 fluconazole-susceptible and -resistant \textit{Candida} species from vulvovaginal candidiasis patients

J. Sobel* (Detroit, United States), S. Barat, K. Borroto-Escocha, N. Azie, D. Angulo Gonzalez

3659 Antifungal susceptibility description in \textit{Candida parapsilosis} bloodstream infection: is there a change in the last years?

A. Ferre Beltran* (Palma de Mallorca, Spain), A. Olmos Torres, H. Vilchez Rueda, F. Fanjul Losa, E. Alcaceba, A. Oliver, J. Murillas Angotti, M. Riera

4266 Impact of proposed revised EUCAST breakpoints on susceptibility classification of contemporary Danish mould isolates

K. Jørgensen* (Copenhagen, Denmark), R. Datcu, R. Krøger Hare, M. Arendrup

4369 Antifungal susceptibility testing practices in mycology laboratories in France, 2018

A. Bellanger, F. Persat, F. Foulet, C. Bonnal, F. Botterel, E. Dannaoui* (Paris, France)

5558 Antifungal susceptibility patterns among clinical isolates of \textit{Aspergillus fumigatus} from paediatric cystic fibrosis patients in Greece: a laboratory-based study with focus on azole resistance

M. Siopi* (Athens, Greece), A. Stathi, H. Krikou, L. Zachariadou, S. Pournaras, J. Meletiadis

6173 Novel qPCR demonstrates azole-resistant TR34/L98H and TR46/Y121F/T289A \textit{Aspergillus fumigatus}, in air spore-samplings around Danish agricultural fields

R. Krøger Hare* (Copenhagen, Denmark), T. Heick, L. Jørgensen, M. Arendrup

6505 Comparison of antifungal activity against clinical isolates of \textit{Candida albicans} and \textit{Candida glabrata} of originator and generics of voriconazole and anidulafungin

A. Nussbaumer-Pröll* (Vienna, Austria), S. Eberl, B. Seiftsch, C. Dorn, F. Kees, T. Gasperetti, J. Marx, R. Welte, R. Bellmann, M. Zeitlinger

6610 Spectrophotometric detection of azole-resistant \textit{Aspergillus fumigatus} clinical isolates with EUCAST broth microdilution method. Is it time for automating EUCAST antifungal susceptibility testing of \textit{Aspergillus} spp.?

I. Efstatithiou, H. Van Der Lee, M. Arendrup, P. Verweij, J. Meletiadis* (Athens, Greece)

6658 Role of TAC1 orthologs in \textit{Candida auris} azole resistance

J. Li* (Lausanne, Switzerland), A. Coste, D. Bachmann, D. Sanglard, F. Lamoth

7376 Impact of calmodulin inhibition by flufenazine on susceptibility, biofilm formation and pathogenicity of caspofungin-resistant \textit{Candida glabrata}

A. Ceballos, D. Amada, E. Robert, C. Parra Giraldo, P. Lepape* (Nantes, France)

7647 Whole genome sequencing (WGS) and antifungal susceptibility testing of \textit{Candida glabrata} (\textit{C. glabrata}) reveals new associations of antifungal resistance (AFR) with gene variants

I. Stefanini, E. Stoakes, H. Wu, L. Mcrae, A. Hussain* (Birmingham, United Kingdom), J. Moat1, C. Dowson, M. David, C. Constantinidou

7902 Exploring posaconazole pharmacodynamics against \textit{Candida krusei} isolates: determination of EUCAST PK/PD susceptibility breakpoints

M. Beredaki* (Athens, Greece), M. Arendrup, S. Pournaras, J. Meletiadis

7975 Early (within 72h) phenotypic detection of fluconazole-resistant \textit{Candida glabrata} isolates

P. Georgiou* (Athens, Greece), M. Arendrup, S. Pournaras, J. Meletiadis

---

Session accepted as \textit{Mini-oral ePoster Session}

**Improving diagnostics in the fungal field**

216 Evaluation of newly formatted \textit{Aspergillus} lateral flow assay for IgG antibody detection in chronic pulmonary aspergillosis

Anna Yang* (Tianjin, China), Y. Wang, B. Lu

2745 The accuracy of \(\beta\)-D-glucan and \textit{Aspergillus} DNA detection by PCR in serum and bronchoalveolar lavage fluid for the diagnosis of pulmonary aspergillosis in critically ill patients with suspected ventilator associated pneumonia

L. Loughlin* (Belfast, United Kingdom), T. Hellyer, P. White, D. Mcauley, R. Posso, M. Richardson, D. Denning, J. Simpson, R. Mckmullan

3083 Usefulness of anaerobic blood culture vials for the microbiological diagnosis of candidaemia

E. Farfour* (Suresnes, France), C. Le Brun, A. Mizrahi, T. Guillard

3479 Differentiation at species level of the members of the PSC complex (\textit{Pseudallescheria boydii} / \textit{Scedosporium apiospermum}) involved in cystic fibrosis by MALDI-TOF MS

V. Monnin* (La Balme Les Grottes, France), L. Picoulet, D. Giraud, S. Arend, B. Celliere, P. Courault, B. Pincus, G. Durand, V. Girard

3805 \(18F\)-fluorodeoxyglucose positron emission tomography: computed tomography is a better tool for chronic disseminated candidiasis follow-up than conventional imaging

4367 Orbitrap ultra high-resolution mass spectrometry proteomics data mirrors clinically relevant functional associations of black dematiaceous hyphomycetes (black yeast-like fungi)

S. de Hoog* (Utrecht, Netherlands), A. Giraldo Lopez, I. Moser, J. Knuyt, J. Freeke, A. Jamalai, B. Stielow
Conserved host transcriptomic responses to acute infection are observed in the presence of multiple fungal pathogens
J. Steinbrink* [Durham, United States], A. Zaas, M. Johnson, E. Tsalik, B. Alexander, C. Woods, M. McClain

Multi-centre validation of a EUCAST method for the antifungal susceptibility testing of microconidia-forming dermatophytes
M. Arendrup* [Copenhagen, Denmark], K. Jørgensen, J. Guinea Ortega, K. Lagrou, E. Chryssanthou, M. Hayette, F. Barchiesi, C. Lass-Fliör, P. Hamal, E. Dannyaoui, A. Chowdhary, J. Meletiadis

Olorofim for a case of severe disseminated Lomentospora prolificans infection
S. Tia* [Parkville, Australia], K. Thursky, G. Ng, J. Rex, D. Carney, M. Slavin

Risk factors for mortality in patients with pulmonary mucormycosis
H. Son* [Seoul, South Korea], J. Song, S. Choi, J. Jung, A. Kim, Y. Chang, S. Lee, S. Choi, Y. Kim, J. Woo

Matched-paired analysis of patients treated for invasive mucormycosis with isavuconazole versus standard treatment

The guideline compatibility of mucormycosis management: a retrospective review of the case reports from European quality (EQUAL) score perspective
H. Koc, G. Metan* [Ankara, Turkey]

A case of Lomentospora prolificans (LoPro) treated with the novel antifungal olorofim
S. Chen, N. Joshi Rai, S. Cunneen, J. Rex, C. Heath, E. Harvey* [Manchester, United Kingdom]

The trend of changes in paraanasal computed tomography of patients with haematologic malignancies and febrile neutropaenia
S. Shafeeq* [Stockholm, Sweden], S. Pannanusorn, K. Pakshir, S. Rezaie, Z. Zare Shahrabadi, K. Zomorodian* [Shiraz, Iran], Pediococcus acidilactici

Successful salvage therapy for mucormycosis with isavuconazole: a murine model
A. Chowdhary, J. Meletiadis

A comparative phenotypic study of aggregate versus non-aggregate Candida isolates
K. Chan* [Hong Kong, Hong Kong], C. Tsang, J. Chan, A. Ngan, W. Chan, S. Lau, P. Woo

The role of complement and diabetes in invasive candidiasis
V. Harpf, R. Würzner* [Innsbruck, Austria]

Evaluation of potential implication of the wastewater microbiome in fungal pathogens spreading using next-generation sequencing technology
H. Yousfi* [Yerres, France], I. Rodriguez, E. Robert, I. Ourliac Garnier, M. Albassier, P. Bonnet, A. Ceballos, H. Koc, G. Metan* [Ankara, Turkey], C. Parra Giraldo, C. Alvarez, H. Son* [Seoul, South Korea], J. Song, S. Choi, J. Jung, A. Kim, Y. Chang, S. Lee, S. Choi, Y. Kim, J. Woo

Morphogenesis and pathogenesis regulation of Candida parapsilosis isolates from nosocomial bloodstream infections
S. Shafeeq* [Stockholm, Sweden], S. Pannanusorn, J. Morschhäuser, U. Römling
Abstract Categories 2020

Session accepted as 2-Hour Oral Session

Optimising antifungal treatment in different clinical settings

331 Systemic antifungal therapy (AFT) with isavuconazonium sulfate (ISAVUSULF) or other AFT in adults with invasive mucormycosis (IM) or invasive aspergillosis (IA) caused by a non-\emph{fumigatus} species (IA-nf): A multi-centre, non-interventional registry study

G. Thompson, J. Garcia-Diaz, M. Miceli, M. Nguyen, L. Ostrosky-Zeichner, J. Young, C. Fisher, N. Clark, R. Greenberg, A. Spec, L. Kovanda, R. Croas-Dabrera, D. Kontoyiannis* [Houston, United States]

1191 An open-label, phase I, multi-centre study to evaluate the pharmacokinetic, safety and tolerability profile of oral isavuconazol sulfate in paediatric patients

1580 Optimising the use of triazole therapeutic drug monitoring using quality improvement methodology

R. Wilson* [London, United Kingdom], F. Davies, R. Palanicwandar, K. Mcdaouagh, M. Coleman, J. Woo, C. Parkinson, L. Whitney, M. Gilchrist

2611 Evaluation of targeted antifungal prophylaxis after liver transplantation: are echinocandins the optimal choice?

M. Rinaldi* [Bologna, Italy], M. Bartoletti, A. Ferrarese, E. Franceschini, C. Campoli, S. Coladonato, S. Ambretti, A. Siniscalchi, M. Morelli, M. Cescon, P. Burra, C. Mussini, R. Lewis, P. Viale, M. Giannella

Session accepted as 1-Hour Oral Session

Pharmacokinetic considerations in fungal infections

2953 Posaconazole dosing and association with therapeutic drug levels in allogeneic cell transplant recipients

M. Kraljevic* [Basel, Switzerland], N. Khanna, M. Medinger, J. Passweg, Y. Chalandon, S. Masouridi, Levrat, N. Mueller, U. Schanz, C. Van Delden, D. Neofytos

3221 Using saliva for precision dosing of antifungal drugs: saliva population pharmacokinetic model

H. Kim* [Sydney, Australia], A. Martson, E. Dreessen, I. Spriet, S. Wicha, A. Melachlan, J. Alfenaar

4800 Pharmacokinetic evaluation of micafungin prophylaxis for invasive mould disease in childhood acute lymphoblastic leukaemia: part of the OPTIMA study

D. Bury* [Utrecht, Netherlands], R. Ter Heine, W. Tissing, E. Mulijwijk, T. Wolfs, R. Brüggemann

7419 Therapeutic drug monitoring of isavuconazole in patients undergoing antifungal therapy in Denmark

R. Jergensen* [Copenhagen, Denmark], M. Risum, M. Arendrup

Session accepted as Mini-oral ePoster Session

Population and pathogenesis in fungi

1775 \emph{NDT}80 transcription factor acts as a repressor of \emph{Candida parapsilosis} virulence attributes

J. Branco* [Porto, Portugal], C. Cruz, L. Rodrigues, T. Goncalves, I. Miranda, A. Rodrigues

1979 Prevention of pneumocystis pneumonia by Ibrexafungerp in a murine prophylaxis model

S. Barat, K. Borrato-Esada, A. Ashbaugh, D. Gonzalez* [Jersey City, NJ, United States], M. Cushion

2065 Differential innate immune responses of human macrophages and bronchial epithelial cells against \emph{Talaromyces marneffei}

C. Tsang* [Pokfulam, Hong Kong], Y. Tan, K. Kok, S. Lau, P. Wou

5459 Candidaemia management: can we do better?

5206 Mycobacterium \emph{microbiome} cross-talk analysis during acute pulmonary exacerbation: focus on \emph{cystic} \emph{fibrosis}

5014 Mycobacterium sequencing reveals a high fungal diversity in patients with severe atopic dermatitis

B. Schmid* [Zurich, Switzerland], E. Bersuch, A. Künstner, A. Fähnrich, H. Busch, M. Glatz, P. Bosshard

6617 Understanding the pathogenicity of \emph{Scedosporium} species, the emerging cystic fibrosis pathogens

M. Homa* [Szeged, Hungary], C. Szebenyi, O. Jager, C. Vágvölgyi, T. Papp
**Abstract Categories 2020**

**8567** Polyclonal antibody anti-CR3-RP Ab inhibits biofilm of *Candida albicans* and decreases an expression of the genes related to biofilm-formation and cell surface hydrophobicity. J. Dekkerova* [Bratislava, Slovakia], H. Bujdáková, S. Kendra

**4093** Identification, antifungal susceptibility profile, and biofilm formation of *Rhodotorula mucilaginosa* in China (August 2010 to July 2015): a multi-centre study. J. Huang* [Beijing, China], M. Xiao

**Session accepted as Paper Poster Session**

**Rare fungi: are they really so rare?**

**295** Characterisation of airborne fungi present in two hospitals in Kabale District, Uganda. A. Odebode* [Akoka, Nigeria], G. Niwamanya

**1217** Genotyping, phylogenetic analysis, and in vitro antifungal susceptibility profile of clinical isolates of *Neoscytalidium* species. M. Hedayati* [Sari, Iran], S. Heidari, M. Gheisari, M. Abastabar, M. Poorabdollah, M. Mirenagat, N. Basharzad, S. Ansari, V. Mortezaei, S. Seyedmousavi, A. Alastruey-Izquierdo

**2429** The clinical and economic burden of mucormycosis in Japan. R. Ueno* [Tokyo, Japan], S. Nishimura, G. Fujimoto, D. Ainiwaer, S. Kim

**2608** An updated analysis of the burden of fungal diseases in Uganda. F. Bangomin, B. Kirenga, R. Kwizera, D. Meya, D. Denning* [Manchester, United Kingdom]

**2656** Species distribution and antifungal susceptibility profile of the emerging yeast pathogen *Blastobasidium Badali*, C. Gibas, H. Patterson, D. McCarthy, J. Mele, H. Fan, N. Wiederhold* [San Antonio, United States]

The changing scenario of Candida infections
Session accepted as Paper Poster Session

Species distribution and antifungal susceptibility of yeast bloodstream isolates in adult patients at three teaching hospitals in central China
S. Yu* [Beijing, China], M. Zhou, Y. Xu

Epidemiology and antifungal susceptibility patterns of invasive fungal infections from 2012 to 2014 in a teaching hospital in central China
S. Yu* [Beijing, China], M. Zhou, Y. Xu

Epidemiology of nosocomial candidaemia in paediatrics: a multi-centre study in Iran
A. Jimenez* [Miami, United States], K. Sposato, G. Rosello, D. De Pascale, A. Flanagan Giroud, L. Abbo

Not all candidaemias are the same: utility of a rapid identification
C. Leli, L. Di Matteo, S. Bussu, V. Cavollo, A. Rocchetti* [Alessandria (AL), Italy]

Investigation of Candida parapsilosis outbreaks by microsatellite genotyping and emergence of clonal antifungal drug-resistant strains in a multi-centre surveillance in China
Z. Li* [Beijing, China], S. Yu, S. Chen, M. Xiao, F. Kong, Y. Xu

Evolution of candidaemia epidemiology and outcomes over the last 10 years: a single-centre study
J. Battistolo* [Lausanne, Switzerland], E. Glampedakis, L. Damonti, J. Poissy, T. Calandra, J. Pagani, P. Eggimann, P. Bochud, D. Marchetti, F. Lamoth

Changes in epidemiology, treatment and outcomes of candidaemia at a tertiary care children's hospital
A. Arrieta* [Orange, United States], N. Ashouri, D. Nieves, R. Adhikary* [Bangalore, India], B. Mv, S. Joshi, B. Hb, A. A

Candidaemia: a decade-long experience from India
R. Adhikary* [Bangalore, India], B. Mv, S. Joshi, B. Hb, A. A

Pathogens and efficacy of caspofungin therapy C. Cohen
N. Govender* (Johannesburg, South Africa), J. Todd, G. Rosello, D. De Pascale, A. Flanagan Giroud, L. Abbo

Species distribution and antifungal resistance of Candida spp. causing candidaemia: a multi-centre case-control-control study

Risk factors for candidaemia in hospitalised patients with liver cirrhosis: a multi-centre case-control-control study

The impact of candidaemia management on mortality: a 4-year retrospective study from a tertiary care hospital
A. Martins* [Porto, Portugal], C. Silva, J. Caldas, E. Alves Branco, S. Almeida Lacerda Pereira, B. Prista Leão, R. Filipe, S. Magalhães, M. Pinheiro, A. Silva-Pinto, A. Sarmento, L. Santos
8235 Characterisation of a Portuguese population with candidemia in a tertiary care hospital
C. Silva* [Santa Maria da Feira, Portugal], J. Coldes, A. Martins, S. Almeida Lacerda Pereira, E. Alves Branco, R. Filipe, B. Prista Leão, S. Magalhães, M. Pinheiro, A. Silva-Pinto, A. Sarmento, L. Santos

9159 Surveillance for control of antifungal resistance in Candida bloodstream infections fails to inform antifungal stewardship in European countries
L. Gala, A. Collegeri* [Spresiano, Italy], E. Carrara, N. Babu Rajendran, M. Compri, E. Tacconelli

9390 Update on Candida auris in Russia
N. Barantsevich* [Saint-Petersburg, Russian Federation], O. Orlova, L. Ivanova, I. Churkina, Y. Belsky, S. Andrey, A. Vetokhina, E. Barantsevich

Session accepted as Paper Poster Session
Treatment options in aspergillosis
624 Clinical experience with isavuconazole in Chinese healthy volunteers and Chinese patients with invasive aspergillosis
J. Zhang* [Shanghai, China], Y. Zhang, D. Wu, G. Cao, K. Hamed, A. Desai, J. Aram, X. Guo, R. Fayyad, O. Cornely

1720 Current use of baseline chest CT in haematology patients at high risk for invasive fungal infection
J. Stemler* [Cologne, Germany], C. Bruns, S. Mellinghoff, P. Köhler, O. Cornely

1844 Clinical and laboratory features of mixed invasive mycoses in adult haematologic patients with invasive aspergillosis

2919 Salvage treatment of invasive pulmonary aspergillosis with isavuconazole and caspofungin combination in a lung transplant recipient
P. Pavone* [Rome, Italy], C. Carillo, Y. Pecoraro, F. Venuta, C. Mastroianelli, G. Russo

3887 A surgical take on broncho-pulmonary Aspergillosis: 20 years of experience
L. Bertrand* [Munich, Germany]

4722 Proposition of a uniform methodological approach to attribution of invasive aspergillosis as a cause of death
R. Van Grootveld* [Leiden, Netherlands], R. Van De Peppel, H. Jolink, P. Van Der Borne, A. Bernards, M. Van Der Beek, M. De Boer

4818 Pharmacogenetic approach to the antifungal drug administration: clinical case
A. Taraskina, Y. Borzova, E. Desyatik, D. Vera, N. Regina, N. Vasilyeva* [Saint Petersburg, Russian Federation]

8013 Evaluation of the efficacy of combination of antifungals against invasive aspergillosis in an invertebrate animal model
S. Jemel* [Créteil, France], V. Jullien, E. Billaud, J. Guillot, F. Botterel, E. D'ettaorre

8676 Allergic bronchopulmonary aspergillosis (ABPA) complicating chronic obstructive pulmonary disease (COPD) without asthma: responses to antifungal therapy
S. Aggarwal* [Manchester, United Kingdom], C. Kosmidis

9427 Diagnostics and treatment of invasive aspergillosis in B-cell lymphoma patients after cytostatic chemotherapy and autologous stem cell transplantation

9449 Incidence, risk factors and clinical impact of invasive pulmonary aspergillosis in patients hospitalised with influenza infection
V. Bellelli* [Rome, Italy], G. Siccardi, L. Celoni, P. Vassalini, E. Congeduti, C. Borrazzo, M. Venditti, G. D'ettaorre

Session accepted as Mini-oral Flash Session
Yeast wars: the rise of auris
246 Delineation of the direct impact of Candida auris ERG11 mutations on clinical triazole resistance
J. Rybak* [Memphis, United States], C. Sharma, L. Doorley, G. Palmer, P. Rogers

3356 Differential resistance of Candida auris biofilms against surface disinfectants commonly used in the hospital
B. Zatorska, M. Diab-Elschahawi* [Vienna, Austria], D. Moser, E. Presterl

3646 Ibrexafungerp demonstrates potent and consistent in vitro activity against >400 global Candida auris isolates, including isolates with elevated MIC’s to echinocandins
S. Barat, K. Borroto-Esoda, D. Angulo Gonzalez* [Jersey City, NJ, United States]

3958 In vitro evolution reveals mutations in Candida auris EFG6 to confer high level amphotericin B resistance
J. Rybak* [Memphis, United States], K. Barker, J. Parker, Y. Li, J. Múnoz, G. Palmer, C. Cuomo, S. Kelly, P. Rogers

4126 Candida auris in a large healthcare system in South Florida: importance of active surveillance testing to prevent spread
A. Jimenez* [Miami, United States], K. Sposato, G. Rosello, D. De Pascale, J. Cardozo, O. Orazco, B. De Pascale, O. Martinez, V. Salazar, K. Deronde, A. Vega, L. Abbo
Abstract Categories 2020

7239 Candida auris compared to other Candida spp. candidaemia: a two-year experience in a Spanish tertiary hospital

9313 Echinocandin resistance in emerging multidrug-resistant yeast Candida auris and investigation into the mechanism of resistance
D. Sharma* (Chandigarh, India), R. Paul, S. Rudramurthy, S. Paul, H. Prakash, S. Bhattacharya, A. Chakrabarti

9353 Rapid identification of Candida auris from direct blood culture positive samples by MALDI-TOF MS from patients with candidaemia in a tertiary care hospital
R. Marak* (Lucknow, India), S. Yadav, A. Dixit

9422 Molecular and epidemiological characterisation of an outbreak of Candida auris in a Spanish hospital
E. Cortes-Acosta, I. Sigona-Giangreco, A. Ruiz* (Valencia, Spain), A. Martínez-Martínez, E. Valentín, J. Peman
ESCMID Mentorships

Improve your career and skills and benefit from experienced professionals in the field of CM and ID.

ESCMID members can be mentored by a mentor from our pool of ESCMID mentorship centres.

Abstract Programme

7. Parasitic diseases & International health

- Diagnostic parasitology
- Antiparasitic susceptibility & resistance
- Antiparasitic drugs & treatment
- Parasitic disease epidemiology
- Travel medicine & migrant health
- Food & water safety and environmental health
- International & public health
- Other
Falciparum infections in asymptomatic adults in forest a low transmission area in Amazonia, French Guiana

Epidemiological and laboratory features last 10 years: a systematic review

Plasmodium ovale curtisi and wallikeri infections in imported malaria: a 2013-2018 retrospective study from the French National Malaria Reference Centre

Neurologic complications in Chagas disease: results from a systematic review of published literature

Evaluation of salivary protein rTiSP14.6 as a marker of exposure to the bite of the insect Triatoma infestans, vector of Trypanosoma cruzi

Prevalence of positive serology for Trypanosoma cruzi in a sample population of migrants from El Salvador and Honduras living in the Metropolitan Area of Milan (MAM)

Screening and management of Chagas disease in at-risk blood donors in a non-endemic country: experience of a north-western tertiary care centre in Italy

Toxocariasis in children in south Russia: epidemiological and laboratory features

Deaths of emerging and re-emerging infectious diseases outbreaks, epidemics and pandemic in the last 10 years: a systematic review

High prevalence of Plasmodium falciparum and non-falciparum infections in asymptomatic adults in forest Ghana

Evaluation of cystic echinococcosis prevalence in an endemic region of Kazakhstan

Leptospirosis in hospitalised patients in Ambatondrazaka, Madagascar: incident cases and exposure factors
Difficult-to-treat mucocutaneous leishmaniasis in an elderly Italian traveller returning from Argentina resolved with combination treatment

Genetic polymorphism of metabolic enzymes of Leishmania spp. parasites isolated from different clinical types of cutaneous leishmaniasis patients

M. Nateghi Rostami* [Tehran, Iran], M. Hosseini, F. Darzi

Visceral leishmaniasis burden in Bologna province, Italy

G. Fornaro* [Bologna, Italy], G. Bonati, E. Vanino, I. Zaghi, F. Hatami, I. Alavidarazam* (Tehran, Iran), S. Shokouhi, N. Sethuraman, P. Kumar S, P. Selvakumaar, S. Nagusah, K. Abdul Ghafur* [Chennai, India], G. Palani, T. Ma, M. Nateghi Rostami* [Tehran, Iran], M. Hosseini, F. Darzi

Comparative inflammatory cytokines gene expression in culture of human macrophages infected with Leishmania tropica and Leishmania major parasites

D. Darzi* [Tehran, Iran], M. Nateghi Rostami, R. Davoodian

Leishmaniasis in immunocompromised individuals without HIV: not so different. A comparative analysis of 60 patients

C. Tortajada* [Valencia, Spain], L. Castellana, E. Calabuig, C. Corralata, A. Farga, M. Fernandez, J. Flores

Hunt for Leishmania RNA Virus (LRV) in transcriptome database of Leishmania species: which is best for bioinformatic analysis?

D. Kaya* [Istanbul, Turkey], D. Ozcan, D. Kurt, U. Sezerman

Genotypic investigation of Leishmania spp. in dog population of northern Greece

A. Papoutsis* [Thessaloniki, Greece], G. Chatzisimeonidis, N. Vastarouchas, A. Karamitros, N. Zoumpoulidis, U. Giannakou, E. Andreadou, T. Lialiaris

The impact of war on cutaneous leishmaniasis disease transmission and its control in Syria

R. Allan* [Haywards Heath, United Kingdom], G. Muhjazig

Resistant bacteria in retail meat

S. Malig* [Odense, Denmark], E. Knudsen, S. Hoegh, U. Justesen

Colistin-resistant bacteria in Indian raw food samples

K. Abdul Ghofur* [Chennai, India], G. Palani, T. Ma, N. Sethuraman, P. Kumar S, P. Selvakumaar, S. Nagusah, R. Antony

Botulism early recovery: one-decade experience in a referral centre

F. Hatami, I. Alavidarazam* [Tehran, Iran], S. Shakouhi, M. Mardani Dashti

Investigation of waterborne outbreaks due to drinking water consumption in Greece, 2004-2019 (1st semester): time to learn our lessons

Mass visitation of show caves as a threat to human health

R. Tomazin* [Ljubljana, Slovenia], T. Matos, J. Mulec

Detection of Legionella spp. and Legionella pneumophila in environmental samples using culture and live/dead-qPCR

M. Zamfir* [Munich, Germany], S. Walser-Reichenbach, S. Heinez, C. Herr

Evaluation of rapid extraction methods coupled with recombinase polymerase amplification assay for point-of-need diagnosis of post-kala-azar dermal leishmaniasis

Effective control strategies for cutaneous leishmaniasis after Syrian influx in Turkey

G. Unuvor* [Kayseri, Turkey], S. Topluoglu, T. Kayman, H. Ilter, F. Kara, E. Alp Mese

Leishmania species diagnosed in European specialised treatment centres in the period 2014-2019

Leishmanial Localised Lymphadenopathy (LLL) by Leishmania infantum: a benign disease different from visceral leishmaniasis

J. San Martin* [Fuenlabrada, Spain], J. Ruiz-Giardini, L. Horrillo, A. Castro, I. Garcia Arata, J. Garcia-Martinez, J. Jaqueti, L. Molina, B. Matia

Visceral leishmaniasis by Leishmania infantum in immunocompetent adults: update of the leishmaniasis outbreak in Madrid (Spain)

J. San Martin* [Fuenlabrada, Spain], J. Ruiz-Giardini, L. Horrillo, A. Castro, I. Garcia Arata, J. Garcia-Martinez, J. Jaqueti, L. Molina, B. Matia

Biomarkers help to stop secondary prophylaxis on Leishmania-HIV co-infected patients

Diagnosis of cutaneous leishmaniasis through shotgun metagenomics

C. Angebault* [Creteil, France], C. Bernincaud, F. Foulet, T. Duong, D. Vanessa, L. Chauvet, C. Rodriguez, F. Benetoul

Session accepted as Mini-oral ePoster Session

Leishmania in the spotlight

Evaluation of rapid extraction methods coupled with recombinase polymerase amplification assay for point-of-need diagnosis of post-kala-azar dermal leishmaniasis

Effective control strategies for cutaneous leishmaniasis after Syrian influx in Turkey

G. Unuvor* [Kayseri, Turkey], S. Topluoglu, T. Kayman, H. Ilter, F. Kara, E. Alp Mese

Leishmania species diagnosed in European specialised treatment centres in the period 2014-2019

Leishmanial Localised Lymphadenopathy (LLL) by Leishmania infantum: a benign disease different from visceral leishmaniasis

J. San Martin* [Fuenlabrada, Spain], J. Ruiz-Giardini, L. Horrillo, A. Castro, I. Garcia Arata, J. Garcia-Martinez, J. Jaqueti, L. Molina, B. Matia

Visceral leishmaniasis by Leishmania infantum in immunocompetent adults: update of the leishmaniasis outbreak in Madrid (Spain)

J. San Martin* [Fuenlabrada, Spain], J. Ruiz-Giardini, L. Horrillo, A. Castro, I. Garcia Arata, J. Garcia-Martinez, J. Jaqueti, L. Molina, B. Matia

Biomarkers help to stop secondary prophylaxis on Leishmania-HIV co-infected patients

Diagnosis of cutaneous leishmaniasis through shotgun metagenomics

C. Angebault* [Creteil, France], C. Bernincaud, F. Foulet, T. Duong, D. Vanessa, L. Chauvet, C. Rodriguez, F. Benetoul
Session accepted as Paper Poster Session

Malaria News

643 A systematic analysis of the direct antiglobulin test in post-artsunate delayed haemolysis during severe imported Plasmodium falciparum malaria: a multi-centre retrospective study
O. Paccoud* [Paris, France], X. Chamillard, K. Ndiaye, I. Vinatier, M. Khalloufi, C. Boulat, L. Surgers, B. Wyplosz, O. Bouchaud, S. Matheron, E. Caumes, S. Jauréguiberry

1461 Utility of multiplex PCR in the screening, diagnosis and follow-up of malaria in patients attended in a tropical medicine referral centre

2132 Specific antibody responses to recombinant UB05 and MSP3 proteins displayed through the surface of Coliphage Qβ in mother-neonate couples
A. Lissom* [Yaounde, Cameroon], R. Megnekou, C. Sanders, J. Djountu, L. Ngú, A. Waffo, G. Nchinda

2527 Imported malaria: the innovative approach of machine learning on clinical management and severity prediction
A. D’Abramo* [Rome, Italy], F. Rinaldi, L. Lepore, A. Corpolongo, L. Scorzolini, N. Bevilacqua, A. Mariano, A. D'Abramo* [Rome, Italy], F. Rinaldi, L. Lepore

3213 Genomic analysis and exploration of putative drug resistance loci in malaria parasites
J. Han* [Melbourne, Australia], J. Munro, M. Bahlo

5784 Short-term prognosis and factors associated with acute kidney injury in imported severe malaria: results of a multi-centre retrospective study
C. Pierre-Louis* [Saint-Mandé, France], E. Gaudray, T. Martinez, M. Boutonnet, S. De Rudnicki, P. Pasquier, C. Ficka, E. Peytel, L. Lachaud, M. Bailey, A. Bart, C. Ravel, E. Caumes, G. Van Der Auwera, J. Blum, D. Lockwood, P. Buffet*

7459 Ugandan increase in malaria cases is reflected in imported cases to Norway of which surprisingly many have mixed infections identified by PCR
H. Brekke* [Oslo, Norway], C. Fladeby, G. Løvgården, F. Pettersen, L. Dedi, F. Müller

9230 Do we re-admit after outpatient artemether-lumefantrine? Evaluating the safety and efficacy of an ambulatory guideline for the treatment of uncomplicated Plasmodium falciparum malaria in a busy district general hospital in east London, UK
W. Niven, J. Quinn, N. Studd, J. Healy, J. Abukar, A. Boyd

9564 Malaria outbreak response in a nomadic pastoralist setting, Kenya 2019
R. Rono* [Kabarnet, Kenya]

Epidemiology and genetic diversity of Plasmodium falciparum in Kobeni, south-eastern Mauritania
S. Diallo* [Dakar, Senegal], L. Basco

Patients presenting with malaria: are we missing opportunities to screen for other travel-associated infectious diseases?
E. Mcguire* [London, United Kingdom], J. Klein, A. Goodman

A glance at the endothelial activation in complicated and uncomplicated malaria
N. Makkar* [Chandigarh, India], P. Malhotra, J. Ahluwalia, R. Singh, R. Sehgal

Knowledge, attitude, and practice of Visiting Friends or Relatives (VFR) travellers towards prevention of malaria
F. Heinrich* [Hamburg, Germany], T. Brehm, M. Addo, I. Rolling

Ugandan malaria cases to Norway of which surprisingly many have mixed infections identified by PCR
H. Brekke* [Oslo, Norway], C. Fladeby, G. Løvgården, F. Pettersen, L. Dedi, F. Müller

Artesunate-containing therapies and abnormal haemoglobin: do we need to adapt the treatment?

Do we re-admit after outpatient artemether-lumefantrine? Evaluating the safety and efficacy of an ambulatory guideline for the treatment of uncomplicated Plasmodium falciparum malaria in a busy district general hospital in east London, UK
W. Niven, J. Quinn, N. Studd, J. Healy, J. Abukar, A. Boyd, K. Woods* [London, United Kingdom]

Economic evaluations of malaria interventions: a systematic review
A. Klicpera* [Vienna, Austria], A. Bank-Thompson

Session accepted as 2-Hour Oral Session

Malaria: still here?

306 Genomic analysis and exploration of putative drug resistance loci in malaria parasites
J. Han* [Melbourne, Australia], J. Munro, M. Bahlo

1465 Plasmodium vivax diversity, population structuration and history of origin in Sudan
M. Ali Albsheer* [Khartoum, Sudan], E. Iyasu, D. Keppe, E. Lo, M. Ibrahim, M. Hamid
Impact of chemoprophylaxis on the outcomes of 
Plasmodium vivax and Plasmodium ovale imported 
malaria cases among civilian travellers 
M. Le Goff* [Brest, France], E. Kendja, M. Thellier, 
R. Piarroux, P.Boelle, S. Joureugiberry

Failure of artemether-lumefantrine treatment for 
Plasmodium falciparum malaria imported from sub-
Saharan Africa to the UK 
H. Adler* [Liverpool, United Kingdom], J. Cruise, J. Jones, 
I. Slack, A. Neary, J. Van Aartsen, E. Carter, P. Hine, 
E. Okenyi, R. Taggart, D. Nolder, L. Stewart, C. Sutherland, 
S. Astan, T. Blanchard, T. O’Dempsey, M. Beadsworth, 
N. Beeching

Post-artesunate delayed haemolysis presenting with 
persistent direct antiglobulin test: are steroids a 
therapeutic option? 
T. Ascoli Bartoli* [Rome, Italy], L. Lepore, A. D’Abramo, 
A. Corpolongo, A. Mariano, N. Bevilacqua, M. Giancola, 
C. Palazzo, L. Scorzolini, P. Buffet, E. Ricastru

The first blood-stage controlled human malaria 
infected model in Europe for Plasmodium vivax 
vaccine efficacy testing 
A. Minassian* [Oxford, United Kingdom], 
Y. Themistocleous, S. Silk, J. Barrett, C. Nielsen, 
D. Quinkert, I. Poulton, F. Ramos Lopez, C. Mitton, 
R. Piarroux, M. Le Goff*, S. Jauréguiberry, 
E. Kendjo, M. Thellier, S. Jauréguiberry, F. Gay, 
J. Siriez, M. Danis, F. Bruneel, O. Bouchaud, 
S. Larréché, A. Taieb, C. Bernigaud, J. Guillot* (Créteil, France)

Medications to fight parasites: what’s new?

Mitofosine as a promising agent for chronic cutaneous 
leishmaniasis: an in vivo model 
V. Tunali* [Mugla, Turkey], I. Cavus, A. Yildrim, 
D. Zorbozan, M. Harman, C. Gündüz, A. Özbilgin, N. Turgay

Safety and efficacy of fumagillin for the treatment of 
testinal microsporidiosis: a French prospective 
cohort study 
A. Mailard* [Paris, France], A. Scemla, B. Laffy, 
M. Mohlau, J. Molina

Quinacrine is effective for treatment of resistant 
giardiasis 
K. Andersson Ydsten* [Stockholm, Sweden], U. Hellgren, 
H. Åsgeirsson

Leishmaniasis in Turkey: assessment of the efficacy of 
antimicrobial peptides against Leishmania tropica in 
vitro 
N. Unubol, I. Cavus, Ö. Kurt* [Istanbul, Turkey], 
A. Özbilgin, T. Kocogaz

In vitro activity of beauvericin against Sarcoptes scabiei: may a mycotoxin help for the control of 
sabies? 
C. Al Khoury, N. Nemer, G. Nemer, M. Kurban, 
C. Bernigaud, K. Fischer, J. Guillot* [Créteil, France]

Lemongrass oil: a promising acaridical and ovidicial 
agent against scabies? 
L. Melin, L. Buming, C. Bernigaud, J. Guillot* 
[Créteil, France], F. Fang

Implementation of intravenous artesunate for severe 
malaria in France: analysis of outcome in 1391 
patients 
C. Roussel, P. N’dour, E. Kendjo, S. Larréché, A. Taieb, 
B. Henry, B. Lebrun-Vignes, C. Chambrière, N. Argy, 
S. Houze, O. Mour, D. Courtin, A. Angoulvant, H. Delacour, 
F. Gay, J. Siriez, M. Danis, F. Bruneel, O. Bouchaud, 
V. Ok, M. Bouba, S. Escoda, F. Sorge, A. Mandelcwaig, 
A. Fay, P. Mariani, L. De Pontual

A systematic evaluation of the anti-plasmodial activity 
of low molecular weight heparin against human 
malaria parasite Plasmodium falciparum 
M. Hmoud* [Baghdad, Iraq], N. Harrocks

Imported schistosomiasis in children: a French 
prospective multi-centre study of prevalence, clinical 
features and diagnostic methods 
C. Leblanc* [Bondy, France], S. Brun, O. Bouchaud, A. Izri, 
M. Caseris, M. Husain, A. Bergevin, L. Pham, A. Paugam, 
S. Jauréguiberry, V. Levy, C. Bloch Queyrat, 
S. Jauréguiberry, F. Gay, J. Siriez, M. Danis, F. Bruneel, O. Bouchaud, 
S. Larréché, A. Taieb, C. Bernigaud, J. Guillot* (Créteil, France)

Is strongyloidiasis currently endemic in Croatia? 
N. Pshenichnaia* [Moscow, Russian Federation]

Frequency of Toxoplasma gondii infection in 
schizophrenic patients: a pilot study 
A. Pietrzyk, P. Smyk, P. Kochan, V. Lunde* [Oslo, Norway], 
H. Renneberg, K. Fus, B. Papir, A. Depukat, M. Bulanda

Antichonous human and canine Strongyloides 
stercoralis infection in Europe: a systematic review 
L. M. Ottino* [Florence, Italy], D. Buonfrate, P. Paradies, 
Z. Bisoffi, A. Antonelli, G. Rossolini, S. Gabrielli, 
A. Bartoloni, L. Zommarchi

Occurrence of sporadic human ascariasis in non-
endemic regions: the importance of zoonotic 
transmission from swine 
T. Fritsche* [Marshfield, United States], J. Meece, 
S. Meyer, K. Ortega, N. Wolff, M. Hall
4258 An outbreak of scabies in the north-east region of Ghana

4733 First study on Giardia intestinalis assemblages in Algerian individuals
S. Belkessa, D. Vincent Thomas López, H. Nielsen, K. Houali, F. Ghalmi, C. Stienstra

4948 Strongyloidiasis in patients with Chagas disease in Barcelona
E. Dopico* [Barcelona, Spain], L. Solsana, M. Aguilar, Y. Rando-Matos, L. Guerrero, G. López De Egea, J. Mascort, E. Sulleira

5322 Usefulness of qPCR for the assessment of vectorial competence of wild caught sand flies species: preliminary results
L. Remadi* [Monastir, Tunisia], N. Chargui, M. Jiménez, J. Mascort, E. Sulleira

5942 A rare case of paragonimiasis infected by Paragonimus ohirai
Y. Zhang* [Shanghai, China], W. Jin, O. Miao, J. Pan, B. Hu

6095 Prevalence and genetic diversity of Blastocystis in asymptomatic and symptomatic individuals from Puducherry, India
S. Padukone* [Puducherry, India], A. Selvarathinam, M. Kumar, J. Mandal, N. Rajkumari, B. Vishnu Bhat, R. Swaminathan, S. Paria

7416 Preliminary evidence of absence of cystic echinococcosis in the Dibrugarh district of Assam state, North-East India
R. Taye Gam, I. Phukan, S. Deb, A. Saikia, P. Sharma, N. Nirmoliya, B. Rupali, T. Manciulli* [Pavia, Italy]

7638 Estimation of cystic echinococcosis prevalence in an endemic region in Uzbekistan
A. Colpani* [Pavia, Italy], O. Achilova, G. D’Alessandro, M. Dell’Anna, M. Arcangeletti, C. Chezzi, F. De Conto

7707 Distribution during 10 years of the genotypes A and B of Giardia intestinalis among the infected subjects attending to an Italian tertiary care hospital
A. Calderara, S. Montecchini* [Parma, Italy], M. Buttrini, S. Rossi, F. Motta, G. Piccolo, M. Antonaci, M. Dell’Anna, M. Arcangeletti, C. Chezzi, F. De Conta

7963 Delayed diagnosis of neuroschistosomiasis in a non-endemic country: a tertiary referral centre experience
A. De Wilton* [London, United Kingdom], D. Aggarwal, P. Chiodini

8744 A case of cystic hydatid disease acquired in Ireland
C. Grant* [Dublin, Ireland], C. Conlon, C. Fleming, H. Tuite, E. Slattery

9133 Risk factors for epilepsy and cystercerosis in Abidjan, Ivory Coast: a case-control study
M. Soumahoro* [Abidjan, Côte d’Ivoire], J. Melki, Y. Kangah, A. Tanoh, N. Iano, M. Diandé, M. Camara, M. Ngouan, T. Sonan, B. Assi, R. Jambou

9362 Study of brain-derived neurotrophic factor gene expression in brain tissue of rat infected to acute and chronic toxoplasmosis: a study in animal model
M. Fallah* [Hamadan, Iran], M. Matini, A. Maghsoud, M. Arabestani, M. Shahbazi

9538 Genetic diversity of the Plasmodium vivax circumsporozoite protein in isolates from Brazilian Amazon rainforest and Rio de Janeiro Atlantic Forest

Session accepted as Paper Poster Session

Parasitic Diseases: diagnosis and treatment

784 Launch of a new faecal molecular external quality assessment scheme by UK NEQAS Parasitology
J. Shrivastava* [London, United Kingdom], A. Saez, P. Chiodini

983 New raw materials for serology immunoassay quality controls
P. Monsbrat* [Limoges, France], G. Champier, C. Dollack, T. Schumacher, M. Dardé, S. Hantz

1925 Preliminary results of microRNA expression profile in patients with cystic echinococcosis and identification of possible cellular pathways

2163 Chagas disease in Japan, 2012-2019: clinical presentation and diagnostic delay
K. Imai* [Saitama, Japan], N. Tarumoto, J. Sakai, T. Murakami, S. Maesaki, S. Miura, T. Maeda

2482 Molecular diagnosis of toxoplasmosis: impact of sample storage duration for five types of biological samples

2683 Clinical efficiency of anti-Blastocystis therapy in ulcerative colitis patients
A. Tsyglev* [Tashkent, Uzbekistan], S. Osipova

2687 Evaluation of endoperoxides and tetrahydropyrans as potential anti-leishmanial drugs
M. Ortizali, S. Varani* [Bologna, Italy], G. Cimato, R. Veronesi, M. Lombardo, C. Trombini, M. Monari, A. Quintavalla
Diagnostic value of the molecular detection of *Sarcopes scabiei* from a skin scraping in patients with suspected scabies

M. Bae* [Seoul, South Korea], J. Kim, J. Park, S. Bae, J. Jung, H. Cha, N. Jeon, H. Lee, M. Kim, S. Chang, S. Kim

Development of new bicyclic nitroimidazoles as antitubercular and antiparasitic agents

C. Wei Ang, A. Jarrad, A. Debnath, L. Tan, M. Sykes, Y. Wang, M. Butler, P. Bernhardt, N. West, V. Avery, A. Popat, S. Franzblau, M. Cooper, M. Blaskovich*

[Brisbane, Australia]

Pulmonary sparganosis: a case report with 20 months follow-up

Z. Lei, J. Liu* [Guangzhou, China], S. Zhu, Y. Pang, H. Ma, J. Zhu, L. Xu, B. Lin, Z. Gao

A new rapid test on whole blood and on serum for the toxoplasmosis screening in pregnancy

V. Meroni* [Pavia, Italy], G. Ferrari, F. Genco, E. Dore, B. Mariani, M. Furione, M. Zavattoni, L. Scudeller, F. Peyron

Diagnostic accuracy of toxoplasma Western blot test in suspected seroconversion in pregnancy: a multi-centre study

V. Meroni* [Pavia, Italy], A. Corcione, F. Genco, L. Scudeller, H. Pelloux, F. Hélène, M. Brenier-Pinchart, C. L'Ollivier, L. Paris

Chagas disease diagnosis: comparison between two different native antigen assays

J. Wang Wang* [Barcelona, Spain], B. Rivaja Sanchez, G. Fernández Rivas, M. Navarro Albareda, S. Roure, L. Matas Andreu

Diagnosis of amoebic liver abscess by detection of *Entamoeba histolytica* DNA in serum using quantitative PCR

G. Theo* [Paris, France], M. Gits-Muselli, N. Guigue, M. Picat, S. Hamane, S. Bretagne

Association between the *Blastocystis* spp. load and patient's socio-demographic and clinical profile in the north-eastern area of Spain

C. Motavelle Ochoa* [Zaragoza, Spain], E. Rubio, P. Chueca, P. Goñi, A. Betran Rosel

Diagnostic performance and validation of two ready-to-use real-time PCR assays for the detection of *Plasmodium* spp. and the principal species capable to infect human

C. Escolar* [Zaragoza, Spain], N. Martínez Camea, M. Hernández, P. Egido, A. Milagra, A. Rezusta

Comparison of the performance of hydralid fluid and the recombinant antigen recDipol in the diagnosis of cystic echinococcosis patients

E. Akdur Öztürk* [Izmir, Turkey], M. Akil, F. Bilgic, C. Sánchez Ovejero, R. Román, A. Casulli, M. Siles-Lucas, N. Altıntaş, A. Unver

Changes occurred in immunological and molecular determinations of toxoplasmosis in pregnancy and newborn children

C. Istrate* [Bucharest, Romania], C. Cretu, P. Mihaiescu

Toxoplasmosis screening in pregnant women: results of the recombinant antigen recDipol in the diagnosis of cystic echinococcosis patients

G. Hartmeyer* [Odense, Denmark], S. Hoegh, M. Kemp

MoCA-T as first option in the cystic echinococcosis treatment: what we have obtained

C. Popa* [Bucharest, Romania], C. Cretu, M. Petru Escu, L. Papa, C. Botezatu, P. Mihaiescu, B. Mastalier

Value of soluble programmed death-1 (sPD-1) and sPD-ligand-1 (sPD-L1) as early biomarkers for the post-surgical monitoring of cystic echinococcosis in Tunisian paediatric patients

E. Ben Salah* [Monastir, Tunisia], W. Sakly, C. Barrera, S. Mosbah, R. Farhani, A. Bellanger, A. Ksia, B. Gottstein, A. Nouri, H. Babba, L. Millon

Differentiation of *Blastocystis* subtypes by PCR and Sanger sequencing versus NGS-based total ribosomal DNA analysis

K. Ascuña Durand, R. Salazar Sanchez, L. Andersen, J. Ballon Echegaray, C. Stensvold*

[Copenhagen, Denmark]

Performance of a commercially available LAMP assay and RDT for diagnosing *Plasmodium falciparum* malaria at very low parasitemias in a controlled human malaria infection trial

R. Payne* [Sheffield, United Kingdom], N. Edwards, K. Ellis, Y. Thermistocleous, S. Silva, J. Barrett, A. Flaxman, D. Bellamy, R. Morter, T. Rawlinson, S. Draper, A. Minassian

Delayed haemolytic anaemia following artesunate treatment in a returning African traveller

R. Oconnor, F. Carroll* [Dublin, Ireland], C. Doyle, C. Merry, C. Bannan

Comparison of native and a new recombinant fusion protein (AgB8/1+AgB8/2+Ag5) for serological diagnosis of cystic echinococcosis

F. Bilgic* [Izmir, Turkey], D. Dirim Erdogan, C. Gundüz, E. Akdur Öztürk, M. Korkmaz

Laboratory capacity for the diagnosis of leishmaniasis in Greece, 2018: a national surveillance study

[Athens, Greece]

Application of MALDI-TOF MS for identification of helminths in clinical samples

I. Sy* [Homburg/Saar, Germany], T. Wendel, M. Feucheroles, A. Nimmesgern, A. Suermann, Y. Endriss, J. Utzinger, S. Poppert, S. Becker

An unusual case of recurrent lymphocytic meningitis

M. Raza* [Milton Keynes, United Kingdom], P. Kapila, K. Omar, R. Randhawa

Role of PRAS40/mTOR/Akt in the intracellular development of *Toxoplasma gondii* tachyzoites

M. González-Del Carmen, V. Cartés Mollinedo*

[Cordoba, Mexico], G. Rojas García
7282 Genetic variability of Trypanosoma cruzi, in clinical samples from Latin American immigrant patients, living in Barcelona, Spain
M. Tavares De Oliveira* (Barcelona, Spain), E. Sulleira Igual, A. Silgado Gimenez, M. De Lana, B. Zingales, J. Santana Da Silva, J. Marín-Neto, I. Molina

7363 Application of molecular techniques in the diagnosis and follow-up of patients with imported malaria in a non-endemic country

7422 Comparison of PCR assays for detection of Echinococcus multilocularis from human formalin-fixed paraffin-embedded tissue preparations
J. Knapp, F. Mannien, S. Felix, D. Florent, B. Heyd, C. Richau, C. Bresson Hadni, L. Millon* (Besançon, France)

7567 Evaluation of a multiplex real-time PCR for the diagnosis of intestinal protozoa
E. Oliva, A. Raglio* (Bergamo, Italy), S. Varani, N. Menegotto, R. Gargiulo, A. Bruno, S. Cavallari, M. Cappola, C. Farina

7645 Performance of the Allplex Assay in comparison to microscopy and in-house real-time PCR for the detection of helmiths in Tanzanian stool samples
R. Wampfley, B. Barda, M. Ruf* (Basel, Switzerland), J. Keiser

7993 Amphotericin B as rescue therapy for alveolar echinococcosis in patients with benzimidazole treatment failure or toxicity

8019 Genome sequencing of Leishmania infantum causing cutaneous leishmaniosis from a Turkish isolate: metagenomic study for evaluation of proteins with polymorphism
D. Goldemir* (Ankara, Turkey), S. Naibantaglu

8170 Neglected tropical diseases contribute to the number of years with civil war
K. Last* (Hamburg, Germany), C. Papan, C. Becker, N. Mutters

8239 Role of glucose transporters in the intracellular proliferation of Toxoplasma gondii
T. Fernández Rebolledo* (Veracruz, Mexico), W. Diaz Beltrán, M. González-Del Carmen

8607 Weekly surveillance of bacterial, viral and parasitic infections involving private and public medical analysis laboratories through 317833 diagnostic tests in the Provence-Alpes-Côtes-d’Azur region, 2014-2019

8625 Evaluation of the performance of a commercial rapid diagnostic test for cystic echinococcosis in a clinical setting
A. Vola* (Pavia, Italy), A. De Silvestri, M. Mariconti, R. Lissandrin, M. Maestri, A. D’Addiego, E. Brunetti, T. Manciulli

8670 Impact of hand hygiene intervention on hand washing ability of school-aged children
S. Khan* (Karachi, Pakistan), H. Ashraf, S. Ifikhar, N. Baig-Ansari

1335 Human dirofilariasis in a changing world, evolving zoonosis just under the skin
G. Straffolini, A. Calcagnà, S. Scabini, T. Lupia, G. Di Perri, R. Angilletta* (Turin, Italy), P. Caramella

1671 Imported malaria: overview of the diagnosed and suspected cases of malaria in a Spanish city (15 years of experience)

193
Abstract Categories 2020

9166 The bacterial gut microbiota during controlled human infection with Nectator americanus larvae
Q. Ducarmon, M. Haagerveef, J. Janse, A. Geelen, J. Koopman, R. Zwittink* [Leiden, Netherlands], J. Goeman, E. Kuiper, M. Roestenberg

Session accepted as 2-Hour Oral Session

2289 Increasingly limited options for the treatment of enteric fever in travelers returning to England, 2014-2017
M. Herdman* [London, United Kingdom], B. Karo, J. Dave, P. Katwa, J. Freedman, G. Godbole, S. Balosegaram

3351 Incidence of Doxycycline Responding Illnesses (DRI) in returning travellers with fever

5487 The role of genomics in typhoid control: sentinel traveller surveillance, in-host evolution and transmission dynamics
Z. Dyson* [Cambridge, United Kingdom], V. Balaji, F. Dadri, T. Dollman, A. Pollard, G. Dougan, K. Holt

6281 First European outbreak of eosinophilic meningitis in travellers returning from Cuba
S. Roure, G. Fernández Rivas* [Badalona, Spain], B. Rivaya Sanchez, G. Lladoís, L. Grau, L. Guarro, S. Poppert, M. Ruf, L. Valerio, B. Nickel, L. Matas Andreu

9548 Non-human primate injuries in returning travellers: implications for pre- and post-travel management
T. Rampling* [London, United Kingdom], S. Balijekar, M. Brodermann, M. Brown, N. Longley

Session accepted as 2-Hour Oral Session

64 Tuberculosis among migrant people in Sicily: a real-life report
G. Pipitone* [Palermo, Italy], T. Prestileo, A. Sanfilippo, F. Di Lorenzo, A. Ficalora, S. Corrao

957 Results of a schistosomiasis screening programme in an immigrant population

1789 Results of a screening programme for Strongyloidiasis in HIV-positive immigrants

2400 Improving adherence to treatment of malaria among immigrants
M. Rodriguez-Perez, A. Rodriguez-Guardado* [Oviedo, Spain]

2866 A machine learning model for evaluating Chagas disease screening in immigrant populations

3104 Should Chlamydia trachomatis be part of migrant screening?
M. Bonneton* [Paris, France], L. Surgers, V. Lalande, N. Valin, K. Lacombe

3506 Clinical and economic impact of three different strategies for the management of schistosomiasis in Sub-Saharan immigrants to Italy
A. Botta* [Florence, Italy], M. Tilli, A. Bartoloni, L. Zammarchi, S. Boccalini

4811 Chronic schistosomiasis and strongyloidiasis amongst Ethiopian immigrants in Netanya
T. Finn* [Netanya, Israel], F. Babushkin, K. Geller, T. Grossman, R. Cohen

7122 Country-specific approaches to latent tuberculosis screening and its current effectiveness in migrants to Europe

9548 Non-human primate injuries in returning travellers: implications for pre- and post-travel management
T. Rampling* [London, United Kingdom], S. Balijekar, M. Brodermann, M. Brown, N. Longley

Session accepted as Paper Poster Session

64 Travel medicine and migrant health

728 Ignatzschineria bacteraemia following maggot wound infestation
K. Nadrah* [Ljubljana, Slovenia], U. Glinšek Biškup, B. Šoba, V. Čvitković Špič, M. Mueller-Premru

1474 Knowledge and awareness of inadvertent use of yellow fever vaccine among renal transplant recipients
L. Cabral Miranda* [São Paulo, Brazil], F. Agena, A. Sartori, L. Azevedo, E. David-Neto, L. Pierrotti

1612 Review of enquiries to the UK national travel advice line by healthcare professionals regarding immunocompromised travellers
B. Merrick* [London, United Kingdom], S. Kanagarajah, D. Patel

1789 Results of a screening programme for Strongyloidiasis in HIV-positive immigrants

2301 Results of a screening programme for Strongyloidiasis in HIV-positive immigrants

2398 Outpatient clinic for tuberculosis screening: an opportunity to promote healthcare access among applicants for international protection
J. Testa* [Busto Arsizio, Italy], M. Pizzi, M. Farinazza, B. Menzaghi, F. Franzetti
2460  Encephalitis in French travellers, 2016-2019
A. Mailles* [Saint-Maurice, France], M. Martinot, X. Argemi, F. Bourdain, P. Jaquet, J. Krause, E. Canoui, J. Stahl

3162  An unusual case of a Spanish traveller patient with chyliuria and molecular diagnosis of schistosomiasis
M. Sempere Alcocer* [Nueva Andalucía, Spain], F. Jose M., C. Beatriz, H. Luis, J. Saugor, P. Fernández-Soto

3628  Imported leishmaniasis in a Parisian hospital, France: a 6-year experience
N. Aissioui* [Paris, France], S. Hamane, M. Gits-Muselli, N. Guigue, A. Petit, S. Delliere, A. Alanio, S. Brettegne

3982  Cognitive impairment following severe malaria in travellers
A. Duvignaud* [Bordeaux, France], B. Glize, H. Lemistre, P. Berreau, D. Nguyen, L. Martin, T. Pistone, A. Desclaux, D. Malvy

5563  Intestinal colonisation with extended-spectrum beta-lactamase-producing Escherichia coli after international trips in travellers attending a travel clinic in Rio de Janeiro
S. Tufic, L. De Araujo Longa, G. Caramano De Oliveira, L. Cecilio Vilar, V. Brígida De Carvalho, B. Meurer Mareira, K. Rodrigues* [Río de Janeiro, Brazil]

6368  Yellow fever enquiries to a national telephone advice line regarding travellers who are pre-conception, pregnant or breastfeeding
C. Patterson* [London, United Kingdom], S. Kanagarajah, D. Patel

7612  Screening for latent tuberculosis infection among asylum seekers in Brescia, Italy: results from the E-DETECT Project
V. Marchese* [Brescia, Italy], P. Zanotti, B. Formenti, B. Rossi, E. Girardi, L. Barcellini, G. Stancanelli, D. Cirillo, I. El Hamad, A. Matteelli

7947  Acquisition of antimicrobial resistance organisms by US international travellers

8069  Travel health advice: do travellers follow the recommendations?

8484  Evaluating the healthcare utilisation of undocumented migrants in the Helsinki and Uusimaa hospital district, Finland: a protocol for a register-based cross-sectional study
K. Rautila* [Helsinki, Finland], O. Helve, P. Tiittala

8160  Travel-related meningitis: results from a thirteen-year retrospective study
C. Pierre-Louis* [Saint-Mandé, France], F. Charton, L. Labarbe, M. Cabon, M. Gominet, D. Andriamanantena, C. Ficko

9201  Travel patterns and knowledge of risk of infections during international travels in solid organ transplantation

9232  Imported dengue fever in French travellers: a multicentre retrospective study
C. Pierre-Louis* [Saint-Mandé, France], C. Ficko, A. Perignon, C. Rapp, E. Caumes

9360  Sepsis caused by Salmonella Paratyphi B variant producing a blaOXA-48 in a traveller patient
A. Balandraud, L. Hadjadj, G. Dubourg, J. Rolain, S. Baron* [Marseille, France]

9451  Dengue fever in returning travellers: a retrospective study in London, UK
A. Duret* [London, United Kingdom], I. Suchett-Kaye, S. Adnan Aali, P. Papineni

9527  Microbiota modifications in travellers to tropical and subtropical areas

Session accepted as 1-Hour Oral Session
Travellers as vehicles of AMR

2118  ESBL-producing Enterobacteriaceae in patients with travellers’ diarrhoea: a prospective cohort study
D. Ljungquist* [Skäret, Sweden], S. Nematzadeh, C. Giske, F. Resman, K. Riesbeck, J. Tham

3675  Does our microbiome travel well? Microbiome resilience and acquisition of multidrug-resistant bacteria in travellers
M. Davies* [Birmingham, United Kingdom], J. Van Hattem, C. Schultsz, M. De Jong, D. Melles, A. McNally, W. Van Schaik, P. Wolffs, J. Penders

3769  Real-time sampling of travellers to Laos: epidemiology of mobile genetic elements
S. Dunn* [Birmingham, United Kingdom], A. Snaith, A. Kantele, E. Kuenzli, J. Corander, A. McNally

3966  The colonisation of Czech travellers and expatriates living in the Czech Republic by colistin-resistant Enterobacteriaceae including Escherichia coli harbouring mcr-1 genes on a plasmid or chromosome
M. Krutova* [Prague, Czech Republic], A. Baráková, E. Nyčova, G. Tereza, R. Karpiskova, O. Nýc, P. Drevinek, J. Tkadlec

8160  The rise and fall of a resistome: travel returners shed light on the dynamics of ESBL-producing Escherichia coli
A. Mari* [Basel, Switzerland], F. Bonfiglio, E. Kuenzli, D. Lang, D. Nagarth, H. Seth-Smith, A. Egli
Abstract Programme

- Intravascular catheter-related infections
- Other foreign-body and implant infections
- Surgical site infections
- Healthcare-associated pneumonia
- Nosocomial infection surveillance & screening methods
- Epidemiology and transmission (incl. observational studies)
- Infection control interventional trials (incl. microbiota transplantation)
- Disinfection & biocides
- Other
Abstract Categories 2020

Session accepted as Paper Poster Session

Advances in implant infection management

1295 Transjugular intrahepatic portosystemic shunt and infections: a single-centre retrospective study
A. Lombardi* (Pavia, Italy), M. Sambo, M. Colaneri, A. Cambianica, P. Sacchi, V. Zuccaro, A. Di Matteo, P. Quaretti, L. Maramarco, N. Cionfoli, M. Mandelli, R. Bruno

1430 Outcome impact of a highly bactericidal scheme as initial treatment of acute staphylococcal PJI

1545 Does iodine-impregnated incision drape prevent periprothetic joint infection? One-year follow-up of 1187 patients in a randomised controlled trial
A. Brun Hesselvig* (Dyssegaard, Denmark), M. Arpi, T. Bjarnsholt, A. Odgaard

2058 Arthroscopic debridement, antibiotic and implant retention (DAIR) with local administration of Exebacase (Lysin CF-301) (LysinDAIR) followed by suppressive tedizolid as salvage therapy in elderly patients for relapsing multidrug-resistant Staphylococcus epidermidis prosthetic knee infection
T. Ferry* (Lyon, France), B. Cecile, C. Kolenda, C. Cassino, C. Chidiac, T. Perpoint, C. Le Corvaisier, J. Josse, A. Souche, S. Lustig, F. Laurent

2268 Prosthetic joint infections treated with two-stage revision procedure: a case series

2400 Appropriacy of empirical antibiotic therapy in percutaneous endoscopic gastrostomy site infection among head and neck cancer patients: a 15-year retrospective study
S. Park* (Seoul, South Korea), J. Oh, J. Kim, E. Joo, J. Lee

2981 Ultrasound-guided local administration of personalised cocktail of bacteriophages followed by suppressive antibiotic therapy as salvage therapy in patients with relapsing total femur prosthetic joint infection (PJI)
T. Ferry* (Lyon, France), C. Kolenda, F. Craighero, S. Park*, S. Etienne, C. Chidiac, L. Gilles, F. Laurent

3224 Risk factors for treatment failure of prosthetic joint infections: a multi-centre prospective cohort study
L. Cardoso, J. Matos, L. Jorge, M. Carneiro, K. Morejon, B. Bassetti, M. Graf, C. Pilati, J. Rocha, R. Leme, M. Salles* (Sao Paulo, Brazil)

3312 Exploration of the added value of rifampicin to antibiotic regimens for the management of Cutibacterium periprosthetic joint infection

3405 Pseudomonas aeruginosa prosthetic joint infection: results from a prospective cohort
H. Prié* (Paris, France), V. Meyssonnier, Y. Kerroumi, B. Heym, O. Lidave, S. Marron, V. Zeller

Impact of multidisciplinary management on the outcome of aortic prosthetic vascular graft infections: a retrospective, single-centre experience
M. Puges* (Bordeaux, France), A. Cluzeaud, C. Cazanave, V. Brizzi, C. Caradu, E. Ducassee, X. Bérand

Risk factors for treatment failure in patients with deep spinal SSI with foreign bodies treated with debridement, antibiotic and implant retention (DAIR): an international multi-centre retrospective cohort study

Successful treatment of osteoarticular infections caused by quinolone-resistant Gram-negative bacilli with colistin plus ß-lactams: preliminary results of a prospective multi-centre clinical study

Features and outcomes of biliary tract-related bloodstream infections in patients with biliary prosthesis: results from the PROBAC study

Risk factors for prosthetic joint infections caused by Gram-negative bacteria: experience at an infectious disease referral centre
S. Tedeschi* (Bologna, Italy), L. Pancaldi, N. Rossi, E. Zamparini, M. Neri, M. De Paolis, A. Di Martino, P. Viale
Abstract Categories 2020

7507 Fungal prosthetic vascular graft infections: beware of aorto-enteric fistulas!
M. Pugès* [Bordeaux, France], X. Bérard, T. Caulier, L. Stecken, D. Leray, E. Senneville, I. Accoceberry, F. Gabriel, O. Robineau, C. Cazanave

8405 Enterococcus species involvement in vascular graft infections
J. Bauer* [Touroping, France], D. Leray, P.d’Elia, J. Sobocinski, O. Robineau, E. Senneville

8833 Optimising the microbiological diagnosis of prosthetic joint infection: a 5-year evaluation
L. Cottom* [Glasgow, United Kingdom], P. Wright

9509 Characteristics of vascular graft infection: a prospective single-centre cohort study
D. Margaryan* [Berlin, Germany], T. Khilaishvili, N. Cesta, M. De Mosi, A. Trampuz

57 Combined antibiotic stewardship and infection control measures to contain an outbreak of linezolid-resistant Staphylococcus epidermidis in an interdisciplinary intensive care unit
C. Papan* [Hamburg, Germany], F. Berger, K. Last, M. Hoffmann, H. Knall, M. Schrädter, T. Volk, U. Schlotthauer, B. Gärtnert, S. Becker

Infection control, antimicrobial consumptions and incidence of hospital-acquired Clostridioides difficile infection in acute care hospitals in Catalonia

Impact of antimicrobial stewardship and infection control programmes on the incidence of carbapenem-resistant Klebsiella pneumoniae: a nonlinear time-series analysis
M. Meschiari* [Modena, Italy], C. Nebot, A. Cea, M. Sarti, A. Bedini, G. Orlando, J. Lopez Lozano, C. Mussini, M. Luchter

Impact of antimicrobial stewardship and infection prevention interventions on a cluster of VIM-producing Pseudomonas aeruginosa in a large, academic health system in Miami, Florida
G. Rosello* [Miami, United States], A. Jimenez, K. Deronde, A. Bedini, G. Orlando, J. Lopez Lozano, C. Mussini
Impact of early carbapenemase notification on infection control management and antimicrobial stewardship
L. Perez* (Porto Alegre, Brazil), C. Magagnin, C. Dias, G. Narvaez

Exploring social links and networks of communication in relation to infection prevention and control and antibiotic stewardship across surgical specialties in South Africa
C. Bonaconsa, O. Mbabalu* [Cape Town, South Africa], A. Boutall, M. Hampton, A. Holmes, M. Mendelson, T. Pennel, E. Charani

Mapping the roles and responsibilities for infection prevention and antibiotic prescribing along the surgical pathway in India and South Africa: case studies
S. Singh, M. Mendelson, S. SURENDRAN, C. Bonaconsa, O. Mbabalu* [Cape Town, South Africa], V. Nampoothiri, A. Boutall, M. Hampton, P. Dhar, T. Pennel, C. Tarrant, A. Holmes, E. Charani

Modulating the microbiota of the hospital environment by microbial cleaning: impact on infections and antimicrobial resistance
M. D’Accolti, I. Soffritti, L. Lanzoni, M. Bisi, A. Volta, S. Mozzacane, E. Caselli* [Ferrara, Italy]

A combined strategy of antimicrobial stewardship and hospital-acquired infection control reduced the incidence of bacterial infection in a kidney transplantation programme [Hippomenes-PACTA-PROA study]

Is there any risk factor in terms of mortality in patients with nosocomial colistin-resistant Klebsiella pneumoniae infection?
Ç. Ataman Hatipoğlu, F. Erding, G. Ertem, S. Ceresa, E. Kaya Kilic, S. Altun Demircan, K. Arslan, A. Büyükdemirci, N. Tulek* [Ankara, Turkey], S. Kinikli

Clinical impact of infections caused by carbapenemase-producing Enterobacteriaceae

A retrospective study to evaluate the epidemiology, standard of care, outcomes and resource utilisation in patients with confirmed or suspected infection by a carbapenem-resistant Gram-negative organism in Spain: the CarBAR study part 1, epidemiology of Gram-negative organisms
J. Harcojeda* [Barcelona, Spain], M. Salavert, J. De La Torre Cisneros, J. Gracia-Ahufiger, J. Paño Pardo, H. Vilchez Rueda, N. Benito, A. Rivera, D. Sousa Regueiro, V. Estrada Perez, M. Ibarjurein Pinilla, D. Manissera, C. Langshaw, K. Tone, S. Lopes

The economic burden of carbapenem-resistant non-fermenting Gram-negative bacteria healthcare-associated infections
Y. Cai* [Singapore, Singapore], C. Wong, W. Lee, J. Teo, T. Lim, B. Tan, A. Kwa

Healthcare-associated bacteraemic urinary tract infections: results of the prospective multi-centre ITUBRAS-2 project

Flat lining of nine-year deaths rate throughout various carbapenem-resistant Gram-negative outbreaks at Saint George Hospital, Lebanon
A. Chamieh* [Marseille, France], O. Zmerli, S. Saliba, C. Ajif, G. Juvelekian, J. Rolain, E. Azar

Epidemiology, risk factors and outcomes of infections caused by carbapenem-resistant Gram-negative bacteria in paediatric intensive care unit
L. Celani, M. Ridoif, C. Borrazzo, M. Trancassini, G. Antonelli, P. Popoff, C. Mastroianni, G. D’etorre, P. Pavone* [Rome, Italy]

Seasonal patterns in the burden of common bacterial pathogens in south-east Michigan post-acute care facilities
M. Cassone* [Ann Arbor, United States], J. Mantey, K. Gontjes, B. Lansing, K. Gibson, L. Mody

Carbapenem-resistant Enterobacteriaceae infections: more could be worst?
**Abstract Categories 2020**

**Session accepted as Mini-oral ePoster Session**

**Clostridioides difficile: prevalence, diagnosis and outcomes**

3194  *Clostridioides difficile* NAAT-positive with toxin-negative test results: impact of antibiotic treatment on clinical outcomes  
J. Haque* [Milwaukee, United States], A. Dawson, K. Osinski, M. Thakkar, A. Yarur, L. Munoz-Price

A phase II open-label clinical trial of investigational microbiota-based drug RBX2660 for prevention of recurrent *Clostridioides difficile* infection: two-years evaluation of efficacy, durability, microbiome changes and participant demographics  
C. Reimer* [Copenhagen, Denmark], R. Grenstein, L. Bancke, C. Gonzalez, K. Blount

Microbiome analysis of faecal microbiota transplantation via lyophilised capsules for recurrent *Clostridioides difficile* infection  

**Session accepted as Paper Poster Session**

**Environmental contamination and infection prevention**

76  Architecture fundamentally influences opportunity costs during an outbreak in a neonatology unit: real-life data and simulation of room designs  
S. Scheithauer* [Göttingen, Germany], M. Kaase, D. Fenz, H. Küster, S. Horn, B. SiIwa

Risk factors of environmental dissemination of different multidrug-resistant organisms  
R. Saliba* [Bobigny, France], D. Seytre, G. Theo, T. Delerue, F. Joureguy, E. Carbonnelle, D. Karam Sarkis, T. Billard-Pomares, J. Zohar

Inhibitory effect of whole blood on the antiseptic action of E-101 solution, a myeloperoxidase-mediated formulation, compared to conventional wound cleansers  
G. Denys* [Indianapolis, United States], J. Carpenter, R. Allen, J. Stephens, Jr.

**Session accepted as 1-Hour Oral Session**

**Do you really want to know what is in your hospital room?**

2441  Short-term environmental contamination with MRSA explained by in-room activity of MRSA-colonised patients  
A. Wolfensberger* [Zürich, Switzerland], N. Mang, K. Gibson, M. Cassone, K. Gontjes, H. Sax, L. Mody

Variable number tandem repeat analysis on patient *Pseudomonas aeruginosa* (PsA) bacteraemia isolates and hospital shower water PsA strains to determine their links  
Ö. Yetiści [London, United Kingdom], P. Wilson, J. Turton, Z. Payne, S. Ali

When cold water is too warm: healthcare-associated Legionnaires’ disease associated with hot season  
F. Waldeck* [St. Gallen, Switzerland], P. Kohler, M. Frischknecht, R. Kuhn, M. Von Kietzell, W. Albrich, M. Schlegel

A simple cleaning intervention to prevent transmission of carbapenemase-producing *Enterobacteriales* from hospital sinks  
J. Kwong* [Melbourne, Australia], M. Leroi, T. Bannam, D. Edmonds, E. Grabsch, S. Narayanasamy, J. Greenough, C. Lane, M. Easton, B. Howden, P. Johnson, M. Grayson

Environmental contamination and infection: two-years *Clostridioides difficile* infection in adult patients admitted in Spanish hospitals: multi-centre, retrospective, observational study  

Microbiome characterisation of patients with *Clostridioides difficile* infection and colonised patients  
S. Vazquez Cuesta* [Madrid, Spain], N. Lozano, L. Villar Gamara, L. Alcalá, M. Marín, P. Muñoz, E. Bouza, E. Reigadas Ramirez

**Community-acquired *Clostridioides difficile* infection: a prospective study in an unselected population**  
L. Villar Gamara* [Madrid, Spain], S. Vazquez Cuesta, L. Alcalá, M. Marín, P. Muñoz, E. Bouza, E. Reigadas Ramirez

**Clinical and gut microbiome characterisation of *Clostridioides difficile* infection in immunosuppressed patients**  
S. Vazquez Cuesta* [Madrid, Spain], L. Villar Gamara, N. Lozano, L. Alcalá, M. Marín, P. Muñoz, E. Bouza, E. Reigadas Ramirez

**The sink as source of transmission of VIM metallo-
β-lactamase-producing *Pseudomonas aeruginosa* in the intensive care unit**  
V. Robin* [Brussel, Belgium], D. De Geyter, I. Wybo, F. Crombe, D. Pierard
Abstract Categories 2020

2326 Increases in environmental cleaning and reduction in in-hospital mortality in multi-patient rooms with single-use disinfection wipes hung at the patient bed: a prospective, crossover trial

2438 Genomic and environmental investigation of hospital room occupied by an imported case of meningitis due to extensively drug-resistant (XDR) *Pseudomonas aeruginosa*

2326 Influence of the Built Environment (BE) microbiota on the epidemiology of antimicrobial resistance at intensive care unit of a tertiary hospital

2438 Control of hospital-wide outbreak of OXA-48-producing *Enterobacteriaceae* outbreak

3398 Achieving sustained decolonisation of CPE in sinks

4136 Dynamics of *Staphylococcus aureus* in the hospital environment and in patients: is the environment identified as a reservoir?

A. Van Der Schoor (*Rotterdam, Netherlands), A. Voor In, T. Holt, C. Klaassen, J. Severin, D. Gommers, M. Bruna, J. Hendriks, M. Vos

3398 Activity of peracetic acid against MDR *Enterococcus faecium* and non-typhoidal Salmonella from diverse epidemiological and genetic backgrounds

A. Rebulo (*Porto, Portugal), B. Duarte, A. Freitas, A. Callejón, L. Vieira Peixe, C. Novais, P. Antunes

3403 Take care of the cents and the euros look after themselves? Antimicrobial activity of European money

J. Knoblich (*Hamburg, Germany), C. Belmar Campos, E. Klupp, G. Franke

3403 Systematic review of *Legionella* amelioration systems in healthcare facilities

J. Mcdanel, A. Marra, D. Diekema, E. Kiscaden, H. Healy, L. Herwald (*Iowa City, United States)

3403 Environmental epidemiological survey of carbapenem-resistant *Klebsiella pneumoniae* in 5 intensive care unit

Q. Shi (*Shanghai, China), Y. Huang, W. Sun, Y. Cui, B. Hu, X. Gao

3403 Elevated tolerance to disinfectants in a carbapenemase-producing *Klebsiella pneumoniae* isolate obtained from a duodenoscopy-associated outbreak

K. Konrat, M. Brunke (*Berlin, Germany), Y. Pfeifer, L. Becker, C. Schaudinn, B. Pieening, I. Schwebke, M. Arvand

3403 Dynamic interactions between methicillin-resistant *Staphylococcus aureus* and methicillin-sensibler *Staphylococcus aureus* contamination of the near patient and extended environment and patient colonisation revealed by whole genome sequencing in a tertiary referral hospital

P. Kinnevey (*Dublin, Ireland), A. Kearney, M. Earls, T. Poovelikunnel, G. Brennan, A. Share, H. Humphreys, D. Coleman

**Session accepted as Paper Poster Session**

**Epidemiology and surveillance of hospital-acquired infections**

| 81     | A regional survey on the level of implementation of key infection prevention and control structures in acute-care hospitals in Crete, Greece  |
|        | E. Astrinaki, E. Kritsotakis, E. Bolikas, E. Panagiotaki, D. Christofaki, A. Chalkiadaki, A. Salvaraki, E. Ioannidou, E. Stamati, G. Pavlidaki, E. Lagoudaki, M. Moustaki, V. Kataxaki, D. Stamati, M. Katsidioutati, S. Karakonstantis* [Heraklion, Greece], A. Gikas  |
| 460    | Prevalence of device use and transmission-based precautions in nineteen large Australian acute care public hospitals: secondary outcomes from a national healthcare-associated infection point prevalence survey  |
|        | P. Russo* [Melbourne, Australia], A. Stewardson, A. Cheng, T. Bucknall, B. Mitchell  |
| 669    | Incidence rate of health care associated infection in tertiary care children's hospital in Ukraine  |
|        | A. Odiannyk* [Kiev, Ukraine], K. Soiak, A. Aleksandrin  |
| 994    | Prospective surveillance of health-care associated infections in residents in long term care facilities in Graz, Austria  |
|        | E. König* [Graz, Austria], M. Haubenwallner, C. Pux, K. Prisching, W. Schippinger, E. Staisser, R. Krause, I. Zollner-Schweitz  |

**Beyond the contact precaution: what does the surveillance culture tell us about multidrug-resistant microorganisms in critically ill patients? Data of the Public Hospital of São Paulo City, Brazil**

|       | C. Abboud* [Sao Paulo, Brazil], E. Evangelista De Souza, D. Feriani, L. Gardiho Mutti Corvalha, A. Santos Ibanes, E. Vasconcelos, V. Barros Barbosa, F. Inoue, J. Monteiro  |

**Prospective genomic surveillance of multidrug-resistant organisms in Vietnamese intensive care units**

**Adherence to an admission screening for multidrug-resistant organisms in a tertiary care hospital in Switzerland**

|       | F. Waldecker* [St. Gallen, Switzerland], P. Kohler, M. Schlegel, E. Lemmenmeier  |

**Multidrug-resistant organisms (MDRO) colonisation pattern, prevalence and acquisition in a neonatal intensive care unit, evidence for guiding active surveillance cultures: a 2-year experience active surveillance process at Saint Joseph Hospital, Jerusalem**

|       | A. Sabateen* [East Jerusalem, Palestine]  |

**Multilevel analysis of the regional variation in healthcare-associated infections and antimicrobial use prevalence in acute-care hospitals in Greece**

|       | E. Kritsotakis, E. Astrinaki, T. Machaira, S. Karakonstantias* [Heraklion, Greece], A. Gikas  |

**Healthcare associated infections and outcomes: changes between 2013 and 2018 in Turkey**

**Hospital onset bloodstream infection (HOBSI) as a marker of the burden of hospital associated infection (HAI) at a tertiary care hospital in South India**

|       | R. Iyer* [Hyderabad, India], R. Jongam  |

**Active follow-up of patients colonised with highly-resistant microorganisms to discontinue isolation measures**

|       | C. Haanappel* [Rotterdam, Netherlands], A. Voor In, T. Holt, L. Bode, I. De Goeij, M. Vos  |

**Nosocomial bloodstream infection rates: exploration of a quality indicator for infection prevention**

|       | B. Laan* [Amsterdam, Netherlands], S. Geerlings, T. Holt, L. Bode, I. De Goeij, M. Vos, C. Haanappel* [Rotterdam, Netherlands], A. Voor In, T. Holt, L. Bode, I. De Goeij, M. Vos  |
Healthcare-associated infections, antibiotic use and resistance in Swiss long-term care facilities: a multi-centre point prevalence study

Automated detection of antimicrobial-resistant bacteria based on real-time microbiological data
V. Schechner* [Tel-Aviv, Israel], T. Grossman

Impact of applying mucosal barrier injury laboratory-confirmed bloodstream infection criteria in patients with solid tumours and haematologic malignancies

Mucosal barrier injury laboratory-confirmed bloodstream infection in oncology patients: descriptive analysis of epidemiological and laboratorial data

Increasing trends of emerging extensively drug-resistant bacteria cases at Lyon University Hospital, 2015-2019
E. Christelle* [Lyon, France], D. Hilliquin, E. Munier-Marion, E. Kuczewski, C. Dananché, C. Barreto, S. Gardes, B. Grisi, S. Gerbier Colomban, G. Jacqueline, C. Dupieux-Chabert, P. Vanhems

Polymerase chain reaction-based active surveillance of multidrug resistant pathogens in a paediatric intensive care unit: to screen or not to screen?
Ó. Martínez Expósito, E. Morteruel Arizkuren, J. Barrios Andrés, F. Pilar Orive, M. Aranzamendi Zaldumbide* [Barakaldo, Spain]

Effectiveness of monitoring colonisation by multidrug-resistant bacteria in polytrauma patients: 7 years of experience
S. Torri* [Milan, Italy], A. Bielli, V. Cento, G. Colombo, O. Chiara, F. Sammartano, C. Vismara, C. Perna, E. Mazzola

Evolution of multidrug-resistant organisms active surveillance strategy in a Portuguese acute care hospital, from 2015 to 2018
D. Peres* [Matosinhos, Portugal], A. Cipriano, V. Alves, F. Vieira, I. Devesa, I. Neves

Computerised registry as a potential tool for surveillance and management of complex bone and joint infections in France
Abstract Categories 2020

849 Baseline microbiology, susceptibility, molecular characterisation, and emergence of non-susceptibility in a recent randomised, controlled trial (RESTORE-IMI 2) comparing imipenem/cilastatin (IMI)/relebactam (REL) versus piperacillin/tazobactam (PIP/TAZ) for hospital-acquired or ventilator-associated bacterial pneumonia (HABP/VABP)

1345 Increased serum hydrogen sulfide as determinant of resolution of ventilator associated pneumonia caused by P. aeruginosa

G. Renieris* [Athens, Greece], K. Katrini, E. Karakike, N. Antonakos, A. Karageorgos, L. Sabrakos, E. Giamarellos-Bourboulis

1865 Risk score for non-ventilator-associated hospital-acquired pneumonia (nvHAP)

A. Wolfensberger* [Zürich, Switzerland], V. Kashalov, W. Jakob, S. Kuster, S. Balakrishna, R. Kouyos

2909 Impact of early appropriate antimicrobial therapy on new hierarchical endpoint for ventilator-associated bacterial pneumonia

E. Weiss, S. Rucklig, C. Dupuis, J. Zahar, J. Timsit* [Paris, France]

3006 Antimicrobial susceptibility and clinical characteristics of severe pneumonia due to Haemophilus influenzae: an observational study

P. Donnelly, M. Postorina, A. Stazzulla* [Melun, France], A. Pitsch, S. Jochmans, M. Monchi, V. Dubee, S. Diamantis

3027 Effectiveness of trimetoprim-sulfametoxazole for treatment of ventilator-associated pneumonia: a cohort study

3867 Health economics of nosocomial pneumonia in UK intensive care units: an exploratory study

A. Wagner, D. Turner, V. Enne* [London, United Kingdom], R. Baldan, C. Russell, D. Livermore

4306 Revision of clinical guidelines for hospital-acquired pneumonia led to a reduction in carabapenem prescriptions at a Swiss cantonal hospital

F. Schefer, T. Fehr, F. Fleisch, A. Cusini* [Chur, Switzerland]

4431 Clinical efficacy of ceftolozane-tazobactam versus other active agents for the treatment of bacteremia and nosocomial pneumonia due to drug-resistant Pseudomonas aeruginosa

M. Bassetti, D. Giacobbe, E. Rizzo, N. Castaldo* [Udine, Italy], C. Mussini, A. Cattelan, A. Russo, C. Mastroianni, A. Capone, M. Tumbarello, A. Vena

A prediction model for identification of patients at high risk for Staphylococcus aureus intensive care unit pneumonia and implications for trial design

Comparison of Hospital Resource Utilisation (HRU) among patients who received either ceftolozane-tazobactam (C/T) or meropenem in ASPECT-NP: a randomised, controlled, double-blind study of adult patients with Ventilated Nosocomial Pneumonia (V-NP)

L. Puzniak* [Kenilworth, United States], T. Lodise, J. Yang, R. Dillon, M. Kolle

Role of multidrug-resistant bacteria on nosocomial pneumonia mortality

Preliminary results for the evaluation of the impact of syndromic lower respiratory tract panel on antimicrobial management and infection control

R. Can Sarınoğlu* [İstanbul, Turkey], E. Tukenmez-Tigen, H. Bilgin, B. Aksu, V. Korten, G. Soyletir

Diagnostic test characteristics of radiographic keywords in the diagnosis of bacterial pneumonia

D. Albin* [Ann Arbor, United States], J. Pogue, L. Petty, J. Mills, K. Kaye

Incidence of ventilator-associated pneumonia in children intubated in paediatric intensive care unit

Double carbapenem therapy for isolated pneumonia in carbapenem-resistant Klebsiella spp. and Acinetobacter spp.

D. Akyol* [İzmir, Turkey], S. Chousein Memetali, M. Demir, G. Gülüyeva, U. Onal, H. Sipahi, S. Ulusoy, D. Sipahi

Impact of the Spanish Neumonia Zero project on ventilator-associated pneumonia rates

S. Carvalho Brugger* [Lleida, Spain], M. MiraLbés, B. Balsera, S. Rodriguez, M. Vallverdú, J. Caballero

The burden of nosocomial pneumonia caused by Pseudomonas aeruginosa and Staphylococcus aureus for ventilated patients in European intensive care units: a weighted multi-state analysis

M. Von Cube* [Freiburg, Germany], T. Bluhmki, K. Kaier, F. Sijfakis, O. Ali, J. Hasen, F. Paling, J. Kuytjman, S. Malhotra-Kumar, J. Beyersmann, M. Wolkevitz
Nontoxicigen Clostridioides difficile strains against C. difficile colonisation: an experimental study
J. Couturier* [Paris, France], L. Franconeri, C. Janoir, L. Ferraris, S. Hoyas, J. Aires, F. Barbut

The effects of antibiotic cycling and mixing on acquisition of antibiotic-resistant bacteria in the intensive care unit: a post-hoc analysis of a prospective cluster-randomised crossover study

Changing the hospital microbiome: a cluster-randomised controlled trial to analyse the influence of environmental cleaning on hospital-acquired infections using disinfectant, soap or probiotic agents
R. Leistner* [Berlin, Germany], B. Köhlmorgen, J. Golembus, D. Gruhl, E. Lemke, B. Raguse, G. Zakansky, P. Gastmeier

Impact of selective decolonisation of critically ill extreme elderly patients using invasive devices with chlorhexidine 2% daily bath on healthcare-associated infection rates
J. Delgado Correal* [Rio de Janeiro, Brazil], R. Rufino, M. Fornasari, C. Alburquerque, M. Martins, D. Santos, P. Damasco

Participatient: Patient Engagement Counter Catheter-associated urinary tract infections with an App (PECCA)
R. Bentvelsen* [Leiden, Netherlands], B. Loan, S. Geerlings, N. Chavannes, K. Veldkamp

Is it cost effective to use a 2% chlorhexidine gluconate wipes bath to reduce primary bloodstream infection? A quasi-experimental study experience
C. Abboud* [São Paulo, Brazil], D. Feriani, L. Gordillo Mutti Carvalho, A. Santos Ibanes, E. Vasconcelos, V. Barros Barbosa, E. Evangelista De Souza

Effectiveness of chlorhexidine-impregnated dressing and a bundle of interventions for prevention of central line-associated bloodstream infections
B. Madran* [Istanbul, Turkey], Ş. Keske, V. Bakır, O. Ergünül

Risk for antibiotic resistance in patients hospitalised with urinary tract infection: a matched case-control study using the French health insurance database

Prevalence and risk factors of inappropriate use of intravenous and urinary catheters in surgical and medical patients
B. Loan* [Amsterdam, Netherlands], M. Vos, J. Maaskant, M. Van Berge Henegouwen, S. Geerlings

Impact of a continuous improvement programme on central venous catheter care in reducing the incidence of primary bloodstream infection in neonatal intensive care unit
R. Cantarim Inacio* [São Paulo, Brazil], E. Medeiros

Short-term peripheral venous catheter-related bloodstream infections
T. Vu, J. Goritsas, H. Torres Diaz, K. Reveles, C. Dickerson, J. Cadena-Zuluaga* [San Antonio, United States]

Utilility of central venous catheter cultures in predicting blood culture susceptibilities in catheter-related bloodstream infections due to Staphylococcus spp.
H. Nomoto* [Tokyo, Japan], M. Ishikane, K. Mezaki, N. Ohmagari

Ultrasound guidance and risk for intravascular catheter-related infections among peripheral arterial catheters. A post hoc analysis of two large randomised controlled trials
N. Buetti* [Paris, France], S. Ruckly, J. Lucet, L. Bouadma, C. Schwobel, O. Mimoz, J. Timsit

Peripheral venous catheter-related bloodstream infection in hospitalised children: the role of Gram-negative bacteria
I. Berger* [Herzliya, Israel], T. Cohen, E. Rahmani, I. Levy, A. Lowenthal, L. Goldberg, Y. Levinsky, H. Ben Zvi, G. Scheuerman

Effectiveness of chlorhexidine dressings to prevent catheter-related infections: Does one size fit all? A systematic literature review and meta-analysis
M. Puig-Asensio* [Iowa City, United States], A. Marra, C. Childs, E. Perencevich, M. Schweizer

Differences in clinical characteristics and causative pathogens between central line-associated bloodstream infections and catheter-related bloodstream infections using modified definition in medical intensive care unit
J. Hyun, J. Yeom, J. Choi, N. Ku, S. Jeong, J. Ahn* [Seoul, South Korea]

Urinary catheter use in university hospital: a prospective intervention study
I. Vorta, M. Bojáre, U. Dumps, A. Vilde* [Riga, Latvia]

Catheter-associated bloodstream infections: Empirical antibiotic recommendations based on microbiological data
C. Collado Giner* [Palma De Mallorca, Spain], M. García-Gasolita, M. Arrizabalaga Asenjo, L. Ventayol-Aguiló, M. Perez-Seqo, M. Gallegos Alvarez, A. Payeras

The risk of microbial contamination associated with nine different needle-free connectors
Q. Shi* [Shanghai, China], Y. Cui, W. Sun, Y. Shen, X. Chen, J. Lin, B. Hu, X. Gao

An outbreak of Ralstonia picketti bloodstream infection among paediatric leukaemia patients
T. Bedir Demirdag, A. Parlakay, F. Bayrakdar, B. Gulhan, S. Kanik, S. Sütüük, I. Mumcuoglu* [Ankara, Turkey], B. Dinc, N. Yarali
Catheter-associated urinary tract infections in patients hospitalised in intensive care unit
M. Hamidi* [Algiers, Algeria], H. Belekhel, S. Yahia, D. Bougdal, S. Sadat, K. Guenane, M. Denia

Serum Galectin-3 status in hospitalised patients with catheter-associated asymptomatic bacteriuria
S. Ifitimi, A. Hernández-Aguilera, L. Ana Felisa, I. Pujal, F. Ballester, A. Castra, J. Camps* [Reus, Spain]

Successful reduction of urinary catheter days and inadequate catheterisation after introduction of a prevention bundle
M. Ciprian* [St. Gallen, Switzerland], M. Schlegel, M. Schwark-Bähler, P. Kohler, W. Albrich

Correlation of central line-associated bloodstream infections with employee turnover: continuity in nursing staff matters!
S. Kuster, M. Dunic, C. Falk, H. Sax, P. Schreiber* [Zurich, Switzerland]

Nation-wide survey of catheter-related bloodstream infections in medical, surgical and intensive care settings, 2019
M. Decalonne, F. Goube, R. Gimenes, A. Petiteau, A. Berger-Carbonne, S. Le Vu, N. Van Der Meer-Martquet* [Tours, France]

Short-term peripheral venous catheter-related bloodstream infections in French healthcare settings, 2019
M. Decalonne, R. Gimenes, F. Goube, A. Petiteau, A. Berger-Carbonne, S. Le Vu, N. Van Der Meer-Martquet* [Tours, France]

Local signs at insertion site and prediction of catheter-related infections in short-term central venous and arterial catheters in the intensive care unit: individual findings from four multi-centre randomised controlled trials
N. Buetti* [Paris, France], S. Ruckly, J. Lucet, L. Boudina, M. Garrouste-Orgeas, C. Schwebel, O. Mimos, B. Sauweine, J. Timsit

Surveillance of central venous catheter bloodstream infections in critical care units in England: April 2017-March 2019
S. Gerver* [London, United Kingdom], A. Zaidi, P. Wilson, R. Hope

Impact of the Spanish Bacteraemia Zero project on central line-associated bloodstream infection rates
S. Carvalho Brugger* [Leida, Spain], M. Vallverdú, M. Miralbés, B. Balsera, S. Rodriguez, S. Iglesias, J. Caballero

Indwelling time of peripherally inserted central line-associated bloodstream infections rates
L. Bouadma, M. Garrouste-Orgeas, C. Schwebel, O. Mimoz, N. Buetti* [Tours, France], M. Vidal, N. Mrozek, D. Martineau, B. Pereira, O. Lesens

Clinical implementation of routine whole genome sequencing for hospital infection control of multidrug-resistant pathogens
P. Harris* [Herston, Australia], B. Forde, A. Jennison, K. Hodge, G. Playford, J. Clark, S. Beatson, D. Paterson

Population structure of extended spectrum beta-lactamase-producing Klebsiella pneumoniae ST48 in a hospital setting and genomic plasticity driven by transposable elements
M. Nguyen Ngoc* [Antwerp, Belgium], F. Maechler, J. Rodriguez Ruiz, B. Xavier, C. Lammens, H. Goossens, P. Gastmeier, S. Malhotra-Kumar

Whole genome sequencing of bloodstream isolates of Staphylococcus aureus reveals prolonged transmission chains within neonatal intensive care units
C. Goswami, S. Fox, M. Holden, A. Leanord, T. Evans* [Glasgow, United Kingdom]

Impact of different components of a national intervention on CLABSI rates
D. Ben-David* [Tel Aviv, Israel], A. Vaturi, E. Soiter, E. Temkin, Y. Carmeli, M. Schwaber

Comparing ethanol lock therapy versus vancomycin lock on a salvation strategy for totally implantable vascular access device infections due to coagulase-negative staphylococci (the ETHALOCK study): a prospective randomised clinical trial
C. Theis* [Clermont-Ferrand, France], M. Vidal, N. Mrozek, D. Martineau, B. Pereira, O. Lesens

Impact of unrestricted movement of carbapenemase-producing Enterobacteriaceae [CPE] carriers on transmission of CPE in nursing homes: a prospective cohort study
K. Linn* [Singapore, Singapore], P. Hon, H. Xiaowei, S. Syed Husen, L. Chan, J. Ng, O. Ng, S. Vasoo, M. Ling, D. Fisher, K. Marinimuthu

Endemic extended-spectrum beta-lactamase-producing Klebsiella pneumoniae in a neonatal intensive care unit in Greece
G. Kalageras, M. Miliotopoulou, E. Bouzavatoglou, A. Doudoulakakis, N. Girmizis* [Patras, Greece], A. Nika, A. Papaiaiannou, M. Tsolia, I. Spiliopoulou, E. Lebessi

Impact of unrestricted movement of carbapenemase-producing Enterobacteriaceae [CPE] carriers on transmission of CPE in nursing homes: a prospective cohort study
K. Linn* [Singapore, Singapore], P. Hon, H. Xiaowei, S. Syed Husen, L. Chan, J. Ng, O. Ng, S. Vasoo, M. Ling, D. Fisher, K. Marinimuthu

Linking advanced molecular diagnosis with infection control: is that effective?
K. Linn* [Singapore, Singapore], P. Hon, H. Xiaowei, S. Syed Husen, L. Chan, J. Ng, O. Ng, S. Vasoo, M. Ling, D. Fisher, K. Marinimuthu

Session accepted as 2-Hour Oral Session
Household transmission of ESBL-producing *Escherichia coli* and *Klebsiella pneumoniae* after hospital discharge of an ESBL carrier

Variation in strain types of extended spectrum beta-lactamase-producing *Enterobacteriaceae* in long-term care facilities: a multi-centre, prospective cohort study

Modelling pathogen transmission in intensive care units by integrating screening and antibiogram data
T. Pham* (Utrecht, Netherlands), M. Kretzschmar, X. Bertrand, M. Bootsma

---

### Session accepted as 2-Hour Oral Session

**Meeting the challenges of implant infections’ diagnosis and management**

1160 **Streptococcal and *Staphylococcus aureus* prosthetic joint infections: are they really different?**

3004 **A second surgical debridement for acute periprosthetic joint infections should not be discarded**

3176 **Retrospective study of nosocomial infections in patients with extracorporeal membrane oxygenation therapy in a coronary unit**

5556 **Analysis of treatment failures of haematogenous prosthetic joint infections: new infections occur more often than infection persists or relapses**
N. Renz* (Berlin, Germany), A. Rakow, C. Perka, A. Trampuz

---

Nasal colonisation with *Staphylococcus aureus* is a risk factor for ventricular assist device infection in the first year after implantation: a single-centre cohort study

Tolerance of prolonged oral tedizolid (TDZ) antibiotic therapy for peri-prosthetic joint infections (PJIs): results of a pilot multi-centre French study
E. Senneville* (Tourcoing, France), A. Dinh, T. Ferry, D. Robineau

Diagnostic accuracy of synovial cell count at reimplantation in periprosthetic knee infection undergoing two stage procedure
T. Ascione* (Naples, Italy), P. Pagliano, M. Mariconda, A. Baldini, G. Balato

Spinal implant-associated infections: results from a four-year prospective cohort study
D. Margaryan* (Berlin, Germany), N. Renz, P. Vajkoczy, A. Trampuz

---

Nasal colonisation by *Staphylococcus aureus* in nursing home residents in Crete, Greece
K. Moschou, P. Ioannou* (Heraklion, Greece), E. Moraitaki, D. Stafylaki, E. Boutakoglou, V. Koutsouroumpsi, S. Maraki, G. Samonis, D. Kerferidis

Hospital organisation, management and implementation of culture of excellence in infection control and prevention of hospital-acquired infections at Ziv medical centre, Israel
J. Tarabeia* (Zefat, Israel), S. Edelstein, M. Sudri, H. Ben-Amram, S. Zarka

Rethinking the involvement of patients in infection prevention and control and antimicrobial stewardship
H. Seale* (Sydney, Australia)

Effective utilisation of limited isolation rooms to provide safe patient care and staff safety in lower-middle-income country
R. Roshan* (Karachi, Pakistan), Z. Rafique

An agent-based model to simulate the transmission of glycopeptide-resistant enterococci in hospital according to several control strategies
S. Debosscher, T. Lavigne* (Strasbourg, France), F. Severac, C. Méard, N. Meyer, J. Gaudart

Evaluation in general practice of the patient’s feelings about a recent hospitalisation and isolation for a multidrug-resistant infection
D. Hereng, A. Dinh, S. Bessis, S. Siméon, M. Mott, B. Davido* (Garches, France)

Presence of multidrug-resistant bacteria on uniforms of healthcare professionals in healthcare settings in Cyprus: implications for targeted infection control interventions
P. Lena, S. Karageorgos, D. Larnisios, P. Papageorgis, C. Tsiloutis* (Nicosia, Cyprus)
Abstract Categories 2020

5007 Nurse density matters in antimicrobial resistance: A 30-country observational modeling study
H. Kaba, E. Kuhlmann, S. Scheithauer* [Göttingen, Germany]

5223 Interest of a systematic surgical mask wearing policy to decrease nosocomial flu burden at hospital
V. Forget, S. Gros, E. Barneoud-Roussel, M. Demange, M. Ravry, A. Fourneret-Vivier, M. Paggio, L. Combrin, J. Gosjean, A. Pellicier, C. Dumillard, A. Wielandts, I. Guinot, E. Forestier* [Chambéry, France], F. Mallaual

6507 Omitting the nightly dose of selective digestive tract decontamination provides equally effective decontamination of potential pathogenic bacteria: a cost reducing and sleep-promoting intervention
J. De La Court* [Amsterdam, Netherlands], T. Groot, K. Sigaloff, H. Van Der Spoel, R. Schade

8016 Predict to prevent: system dynamic modeling for healthcare-associated influenza
M. Sansone* [Gotenborg, Sweden], L. Andersson, J. Westin, R. Norden

9205 Relevance of intra-hospital patient movements for the spread of healthcare-associated infections: a mathematical modelling study

9260 The dissemination and reservoirs of ESBL-producing Escherichia coli in intensive care unit
L. Baomo* [Guangzhou, China], C. Zhuo, Y. Guo

9364 Patient perceptions of antimicrobial resistance: are we getting the right messages across?
J. Doukrou Calsina, T. Planche, C. Suarez* [London, United Kingdom]

Session accepted as Paper Poster Session

Outbreaks’ epidemiology and management

508 Investigation of an Enterobacter cloacae OXA-436 carbapenemase outbreak: when everything goes down the drain
A. Holm* [Odense, Denmark], A. Toft, M. Nordestgaard, A. Hammerum, H. Hasman, M. Kemp, U. Justesen

2616 Challenges in investigation and control of invasive group A Streptococcus outbreaks associated with community health services delivered at home

3336 Outbreak of an uncommon rifampicin-resistant blaNDM-1 Citrobacter amalonaticus strain in a digestive rehabilitation centre: the putative role of rifaximin
G. Royer* [Crétel, France], F. Fourreau, C. Gomart, A. Maurand, B. Hacquin, D. Ducellier, F. Cizeau, S. Lo, C. Cordonnier Jourdin, M. Darty, J. Decousser

4233 Adenovirus-associated epidemic keratoconjunctivitis outbreak in a tertiary hospital
E. Miró* [Barcelona, Spain], M. Del Cuerpo, C. Berengua, P. Marin, J. Vela, V. Pomar, N. Rabella

4472 Epidemiology of nosocomial highly resistant microorganism outbreaks in the Netherlands
A. Reuland* [Utrecht, Netherlands], A. Schoffelen, F. Bijkerk, P. Bergervoet, S. De Greeff, C. Vandenbroucke-Grauls

5154 Investigating a cluster of community-acquired methicillin-resistant Staphylococcus aureus infections in a school in Eastern Switzerland
F. Waldeck* [St. Gallen, Switzerland], N. Oliver, S. Monse, D. Reinholz, A. Walt, M. Schlegel, S. Seiffert, C. Kahler

5603 A leak in compliance with ventilation system maintenance instructions resulted in an aspergillosis outbreak

7208 Partnering with bedside nurses: questionnaire-based approach during an outbreak of carbapenem-resistant Acinetobacter baumannii in two separate intensive care units
S. Kim, H. Seo, S. Oh, S. Seo, B. Lee, E. Bum, J. Eun, J. Chae, K. Lee, T. Kim* [Ulsan, South Korea]

7451 Outbreaks of multidrug-resistant Klebsiella pneumoniae in neonatal intensive care units in Ghana: a case for improved surveillance and infection control

8472 Identifying nosocomial transmission of influenza and associated deaths: a prospective, observational study
L. Snell* [London, United Kingdom], J. Vink, H. Mitchell, C. Beviz, M. Kabia, J. Edgeworth, G. Nebbia

8566 Long-lasting outbreak of Serratia marcescens in a veterinary hospital due to contaminated chlorhexidine

8741 Prospective surveillance of multidrug-resistant Gram-negative bacteria in a UK intensive care unit using whole genome sequencing

9773 Hospital outbreak of carbapenem-resistant Enterobacteriaceae associated with an OXA-48 plasmid hosted mainly by Escherichia coli ST399
1096  Antimicrobial prophylaxis administration after umbilical cord clamping in caesarean section does not increase risk for surgical site infection: a prospective analytic study with 55,301 patients
R. Sommerstein* [Bern, Switzerland], J. Marschall, A. Atkinson, D. Surbek, M. Dominguez, N. Troillet, A. Widmer

1251  Implementation of appropriate antibiotic prophylaxis in surgery: high benefit with no risk
B. Madran* [Istanbul, Turkey], Z. Akbulut, S. Tanju, Ş. Keske, S. Ersu, M. Kapadaglı, S. Pala, Ş. Dilege, Ö. Ergönü

1773  Multiple evaluation of surgical antimicrobial prophylaxis in Japanese university hospitals

2068  Effects of a strict postoperative glycemic control on surgical site infection's incidence following liver transplantation: a randomised clinical trial
R. Oliveira* [São Paulo, Brazil], J. Mancero, J. Tanner, V. Brito Poveda

2564  Single dose cefazolin is feasible in orthopaedics: behavioural change success with collaborative working
F. Erdinç, N. Tüek* [Ankara, Turkey], B. Alemdaroğlu, S. İltar, G. Ertem, S. Kinikli, C. Ataman Hatipoğlu

2768  Efficacy of fosfomycin-trometamol versus fluoroquinolone single-dose as prophylaxis for transrectal ultrasound-guided prostate biopsy

2841  Bacterial contamination of collagen membranes in dental surgery
A. Rachkov* [Minsk, Belarus], T. Shevelo

2850  Improvement of infection rates and hand hygiene adherence in pre-post comparison after introduction of an infection-prevention-meaasures-bundle implemented by an infection prevention link physician
M. Neuwirth* [Cologne, Germany], F. Mattner, R. Galante, I. Dombrowski, R. Otchwemah

3168  Impact of beta-lactam allergy label on preoperative antibiotic prophylaxis
C. Nguyen* [Chicago, United States], K. Petrucci, E. Daily, A. Brown, J. Pisano, N. Petit

3714  Current practices and evaluation of barriers and facilitators to surgical site infection prevention measures in Jimma, Ethiopia
A. Lang* [Rochester, United States], L. Berman, B. Gelano, D. Yilma, D. Siraj, D. Shirley

4029  Social and physical opportunities to improve surgical antimicrobial prophylaxis prescribing: utilisation of the behaviour change wheel
C. Jerana, A. Rajkhowa, K. Thursky* [Melbourne, Australia], C. Marshall, T. Peel, D. Ayton

4444  Epidemiology of cardiac surgical site infection in England, 2018/19
T. Lamagni* [London, United Kingdom], K. Cooper, C. Wloch, P. Harrington

4549  Assessing the impact of interventions designed to reduce the rate of postoperative sternal wound infection at a tertiary cardiothoracic centre
T. Locke* [Sheffield, United Kingdom], H. Parsons, N. Briffa, T. De Silva, T. Darton

5166  Prophylactic antibiotics administration in low- and middle-income countries: what are the consequences on antibiotic resistance? A systematic review

5350  Successful introduction of a bundle of measures to reduce surgical site infection by Staphylococcus aureus in patients undergoing coronary artery bypass grafting
E. Evangelista De Souza, L. Gordinho Mutti Carvalho, D. Feriani, A. Santos Ibañes, V. Barros Barbosa, E. Vasconcelos, C. Abboud* [São Paulo, Brazil]

6244  Effects of a carbapenem-sparing regimen for treating post-surgical intra-abdominal infections: a case-control study
F. Giovannenzen* [Rome, Italy], E. Taddet, R. Murri, L. Ceralini, E. Biracchi, F. Taccari, R. Caudea, M. Fantoni

6418  Mediastinitis: an incidence study and case series in an elderly adult centre

7661  Bacterial contamination of collagen membranes in dental surgery
A. Rachkov* [Minsk, Belarus], T. Shevelo

7765  Risk factor for nosocomial and surgical site infection after cardiac surgery
M. Pérez-Rodríguez* [Vigo, Spain], B. Vilas, A. Sousa, J. Lugo, M. Pereira, D. Lima, A. Nodar, R. Longueira, V. Del Campo, J. Legarra, M. Crespo

F. Nacinovich* [Buenos Aires, Argentina], P. Fernandez Oses, N. Spinelli, M. Viruel, F. Piccinini, M. Camporrotondo

9594  Airborne antibiotic-resistant Staphylococcus epidermidis in inpatient wards linked to deep surgical site infections
A. Johansson* [Umeå, Sweden], M. Widerström, T. Monsen, A. Larsen, M. Stegger
Validation of a semi-automated surveillance of surgical site infections: improving exhaustiveness, representativeness and efficiency
R. Molheira* [Porto, Portugal], N. Rocha Pereira, R. Dura, C. Pereira, C. Alves, S. Correia

Surgical site infections in orthopaedic surgery: a retrospective analysis of the risks associated with multi-drug resistant bacteria isolation

Antimicrobial stewardship and perioperative antimicrobial prophylaxis: results of an educational intervention
F. Segala* [Rome, Italy], R. Murri, E. Teddei, F. Giovannenze, P. Del Vecchio, E. Briocchi, F. Taccari, R. Cauda, M. Fantoni

Built environment microbiological surveillance in a large intensive care unit revealed abiotic reservoirs of highly persistent clones of Klebsiella species [K. pneumoniae, K. oxytoca, K. variicola]

Automated surveillance of urinary tract infections in a tertiary care hospital in Stockholm
S. Van Der Werff* [Stockholm, Sweden], E. Thiman, H. Tanushi, J. Karlsson Valik, A. Henriksson, M. Alam, H. Dalianis, A. Ternhag, P. Naucler

Intestinal colonisation by carbapenemase-producing Enterobacteriaceae detected by polymerase chain reaction in patients with negative cultures: do they really have an increased risk of infection?

Minimizing pseudo-cluster suggestions in infection control surveillance using pathogen DNA sequencing and artificial intelligence
D. Chen, Md, R. Sussens, Bsn, Rn, Cíc, M. Quinn, Bsn, Rn, Cíc, G. Wang, M. Chanza, Bo, W. Huang, C. Scurlock, Md, Mba, C. Becker, Md, Phd, J. Fallon, Md, Phd, K. Hansen, Phd, Ms, D. Heller, Bs, Emr, J. Ashworth, Mscs, Mt [Ascp], M. Fortunato-Habib, Dnp, Ms, Bs, Rn, J. Carmona, B. Gross* [Cambridge, United States]

Shared hospital epidemiology of respiratory viruses: a 3-year analysis using multiplex PCR in a university hospital
A. Valdes, B. Visseaux* [Paris, France], D. Bouzid, N. Fidouh, B. Descamps, D. Van-Gysel, F. Lenne, V. Goldstein, J. Lucet

The epidome: a species-specific approach to quantify population dynamics and heterogeneity of Staphylococcus epidermidis colonisation and infection in primary samples
A. Robinson, T. Johannesen, E. Mamsen, S. Iversen, S. Baig, J. Jensen, B. Söderquist, P. Andersen, M. Stegger* [Copenhagen, Denmark]

Active surveillance mitigates the risk of donor-derived infections in solid organ transplant recipient: the role of infection control
M. Campanella* [Palermo, Italy], A. Medaglia, E. Conoscenti, S. Caruso, G. Panarello, V. Lamonaca, F. Barbera, F. Monaco, A. Pasquariello, F. Cardinale, D. Di Carlo, P. Conaldi, P. Grossi, M. Mularoni

Performance of a computerised decision support system for the semi-automated detection of healthcare associated infections: an explorative pilot study
A. Ranzi* [Milano, Italy], G. Catho, A. Metsini, W. Zingg, B. Hurtner

Stay in the emergency department increases the risk of colonisation by carbapenem-resistant Enterobacteriaceae in the intensive care unit
M. Solomão, M. Freire* [Sao Paulo, Brazil], I. Bosczowski, S. Raymundo, A. Guedes, A. Shafferman, Levin

Risk factors for healthcare-associated infections caused by cefepime resistant Pseudomonas aeruginosa in a tertiary care hospital in Serbia
I. Petrovic* [Kragujevac, Serbia], Z. Djordjevic, M. Folic, S. Jankovic

Predictors of vancomycin-resistant enterococci gut microbiome colonisation among patients with Clostridioides difficile infection 6.4.1
E. Zasowski* [Vallejo, United States], M. Ali, A. Anugo, K. Dotson, B. Endres, K. Garey

Risk factors for colonisation with carbapenemase-resistant Acinetobacter baumannii in hospital
M. Meschieri* [Modena, Italy], K. Shanik, S. Selmi, M. Sarti, G. Orlando, M. Menozzi, C. Mussini

Risk factors associated with carbapenemase-producing Enterobacteriaceae infection

Epidemiology and dissemination of multidrug-resistant Pseudomonas aeruginosa colonisation in an intensive care unit
M. Portillo* [Pamplona, Spain], J. Lobo, A. Bacaicoa, J. Otero, A. Navascués Ortega, C. Ezpeleta Baquedano
Stigma in MDRO carriers exposed to isolation precautions: an exploratory quantitative questionnaire study
R. Wijnakker* [Leiden, Netherlands], M. Lambregts, B. Rump, K. Veldkamp, R. Reis, L. Visser, M. De Boer

Gastrointestinal colonisation by vancomycin-resistant enterococci and carbapenem-resistant Gram-negative bacteria in an endemic setting: prevalence, risk factors, and outcomes
A. Vasilakopoulou, P. Karakosta, S. Vourli, A. Tarpazti, A. Papadomanolaki, P. Varda, M. Kostoula, A. Antoniadou, S. Pournaras* [Athens, Greece]

Hospital related factors associated with multidrug-resistant organism acquisition: a multilevel case control study
N. Nasir* [Karachi, Pakistan], S. Khan, S. Rozi, N. Baig-Ansari, N. Khan, N. Rehmani, R. Roshan, B. Jamil, F. Mahmood

The impact of medical drugs on the acquisition of ESBL-producing Enterobacteriales: a matched case-control study
P. Klauke* [Berlin, Germany], F. Schwab, P. Gastmeier, F. Maechler

Gut colonisation with carbapenemase-producing Enterobacteriales: predicting factors for prolonged colonisation among adults
L. Dortet, L. Escaut, G. Cuzon, I. Bukreyeva, N. Fortineau, T. Naas* [Le Kremlin Bicêtre, France]

Invasive Acinetobacter baumannii infections in paediatric infectious disease intensive care unit
L. Stemberger Marić* [Zagreb, Croatia], N. Krajcar, N. Papic, I. Butić, G. Tesovic

Identifying drivers of acquisition of extended-spectrum beta-lactamase producing Enterobacteriales in Malawi using whole genome sequencing and mathematical modelling
J. Lewis* [Liverpool, United Kingdom], M. Mphasa, R. Banda, E. Smith, C. Jewell, B. Faragher, N. Thomson, N. Feasey

Risk factors for mortality in bloodstream infections in cancer patients
A. Ulu, S. Kamur, F. Kuscu, A. İnal* [Adana, Turkey], B. Kurtaran, Y. Tasova

What is the role of colonisation by carbapenem-resistant Enterobacteriaceae in older people who live in nursing homes? A multi-centre study
P. Favier* [Buenos Aires, Argentina], N. Carrión, R. Martins, E. Serio, M. Gallino, D. Torres, C. Raffo

Colonisation and infection with ESBL-producing and carbapenem-resistant Enterobacteriaceae in kidney transplant recipients: risk factors, impact on renal graft function and use of hospital resources
E. Solis, A. Palmiso, O. Simonetti* [Parma, Italy], M. Cotrufo, P. Fenaroli, U. Maggiore, E. Fiaccadori, C. Ferrari, A. Degli Antoni

Antibiotic exposure and the risk of CRE acquisition
N. Hassoun Kheir* [Haifa, Israel], K. Hussein, M. Saffuri, S. Badaan, S. Peleg, Y. Geffen, M. Paul

Relationship between local-area socioeconomic status and rates of bloodstream infection and Clostridioides difficile infection
S. Thelwall* [London, United Kingdom], R. Hope, S. Hopkins

Gram-negative screening the neonatal unit: can we predict bloodstream infections?
V. Price* [Birmingham, United Kingdom], J. Swindells

Risk factors for colonisation with multiple species of extended-spectrum beta-lactamase producing Enterobacteriales: a case-case-control study
I. Vock* [Basel, Switzerland], L. Aguilar Bultet, A. Egli, P. Tamma, S. Tschudin-Sutter

Infections in patients colonised with extended-spectrum beta-lactamase-producing Enterobacteriales: a retrospective cohort study
I. Vock* [Basel, Switzerland], L. Aguilar Bultet, A. Egli, P. Tamma, S. Tschudin-Sutter

Patient transfers as a risk factor for Clostridioides difficile infection: a case-control study
J. Edman-Waller* [Gothenburg, Sweden], S. Suominen, M. Werner

Faecal microbiota transplantation in the treatment of Clostridioides difficile infection
R. Stebel* [Brno, Czech Republic], L. Vožitálová, R. Vysák, P. Hůsa

Efficacy of pulsed xenon ultraviolet disinfection of multidrug-resistant bacteria and Clostridioides difficile spores
H. Kitagawa* [Hiroshima, Japan], K. Tadera, T. Hara, S. Kashiyama, H. Ohge

Approaches to identify new onset diarrhoea among hospitalised patients and the frequency of stool sample collection for Clostridioides difficile infection: a pilot for the CLOUD Louisville study
S. Furmanek, S. Pena-Oliva, R. Carrico, E. Gonzalez, K. Ford* [Collegeville, United States], S. Gray, J. Ramirez

Session accepted as Paper Poster Session
Update on Clostridioides difficile infection

Session accepted as Mini-oral ePoster Session
Understanding risk factors for HAI to tailor infection control

Identification of individual risk factors for acquisition of vancomycin-resistant Enterococcus faecium (VRE) during an outbreak in an university hospital and implication in prevention strategies
T. Abrassart* [Mons, Belgium], H. Strale, D. Martiny, B. Byl

Is there an increased risk for Clostridium difficile infection months after hospitalisation in a room occupied previously by a patient with C. difficile?
H. Zayyad* [Yafia, Israel], A. Peretz, S. Cohn, K. Labay
1851  An ultrasensitive test for the detection of Clostridiodes difficile toxins in stool samples using a single-molecule counting method
D. Straus* [Chelmsford, United States], A. Zuniga, A. Garces, A. Tempesta, A. Williams, B. Lauzier, J. Hickey, S. Gite, S. Clancy, Y. Rosario, J. Bowers

4059  Incidence and economic burden of Clostridioides difficile infections in inpatient settings of the German health care system: preliminary results of the ISIB study
Y. Khodamoradi* [Frankfurt, Germany], R. Cruz Aguilar, T. Schmidt-Wilcke, E. Schalk, S. Schmediek, I. Wieters, C. Lübbert, A. Stallmach, W. Holtmeier, S. Graefe, A. Ullah, M. Vehreschild

2279  Evaluation of an ultrasensitive test for the detection of Clostridium difficile and other enteric pathogens
M. Bonten, O. Cornely, J. Vehreschild

2624  Clostridioides difficile burden of disease in adults: early experiences of a prospective population-based surveillance study of hospitalised CDI cases in the inpatient module of the City of Louisville diarrhoea (CLOUD) study
S. Penna-Oliva, S. Furmanek, R. Carrico, J. Zampano, E. Gonzalez* [Collegeville, United States], J. Ramirez

2829  Factors associated with the recurrence of Clostridioides difficile infection in a university hospital

3942  Clostridioides difficile ribotypes 001 and 176 with reduced susceptibility to moxifloxacin are the main cause of healthcare-associated C. difficile infections in Slovakia
A. Plankaova, A. Soltésová, J. Škalová, P. Drevinek, V. Čapek, M. Krutova* [Prague, Czech Republic]

4280  Characterisation and comparison of farm animal and human Clostridioides difficile isolates in Italy
V. Spagglia* [Rome, Italy], F. Barbanti, M. Vescovi, R. Cerutti, C. Gaspano, S. Faccini, M. Merenda, C. Rossignoli

4281  Real-life experience with bezlotoxumab for the prevention of recurrent Clostridioides difficile infection

4453  An outbreak of Clostridioides difficile infections due to a 027-like PCR ribotype 181 in Slovakia
M. Kachrimanidou* [Thessaloniki, Greece], A. Baktash, D. Dimagliou, F. Netsika, O. Tsachouridou, D. Papadopoulou, E. Pratantariou, L. Skoura, M. Symeon, E. Kuijper

4859  Factors associated with the recurrence of Clostridioides difficile infection in a hospital university

4861  Impact of a dedicated Clostridioides difficile infection isolation ward on clinical outcomes
M. Varadarajan* [Orpington, United Kingdom], G. Barlow

5182  Heterogeneity of Clostridioides difficile infection testing and the impact on missed diagnoses: results from COMBACTE-CDI
V. Viprey, D. Ewin, W. Spittal, J. Vernon, A. Benson, G. Davis, M. Wilcox

5313  Predicted risk and observed occurrence of Clostridioides difficile infection in patients with community-acquired bacterial pneumonia treated with omadacycline or moxifloxacin
M. Rodriguez* [San Antonio, United States], K. Wright, B. Noble

5416  Impact of immunosuppression on Clostridioides difficile infection
E. Kuijper* [Lausanne, Switzerland], M. Papadimitriou

5461  Healthcare resource utilisation for treatment of Clostridioides difficile infection across 12 European countries: health economic results of COMBACTE-CDI
S. Wingen-Heimann* [Cologne, Germany], L. Lurienne, K. Davies, A. Benson, G. Davis, V. Viprey, M. Wilcox, M. Bonten, O. Martín Segarra, L. Alcalá, M. Marín, P. Muñoz, E. Reigadas Ramirez

3115  Key differences between community and in-patient Clostridium difficile infection: results from COMBACTE-CDI case-control study
K. Davies* [Leeds, United Kingdom], V. Viprey, D. Ewin, W. Spittal, J. Vernon, A. Benson, G. Davis, M. Wilcox

3529  An outbreak of Clostridioides difficile infections in a university hospital

3676  Effectiveness and safety of levulinic acid as prophylaxis for Clostridioides difficile infections in high-risk patients
A. Casapao* [Jacksonville, United States], L. Nilles, C. Sothoron, C. Tucker, A. Pirasteh

3744  Predicted risk and observed occurrence of Clostridioides difficile infection in patients with community-acquired bacterial pneumonia treated with omadacycline or moxifloxacin
M. Rodriguez* [San Antonio, United States], K. Wright, B. Noble

5182  Current diagnosis, management and control strategies for Clostridioides difficile infection in Europe
M. Cataldo* [Rome, Italy], G. Granata, N. Petrosillo, K. Davies

5461  Epidemiology and outcomes of Clostridioides difficile infections among allogeneic haematopoietic cell transplant recipients in Switzerland: 2009-2019
Abstract Categories 2020

5567  Outcome of Clostridioides difficile infection in patients that are PCR positive: comparison of toxin positive with toxin negative cases  
C. Johnston* [Swansea, United Kingdom], B. Carter, S. Weinberg, A. Holborow, A. Bone, J. Blyth, J. Walters, M. Perry, T. Morris, H. Hughes, J. Hargreaves, C. Richards, J. Harris, B. Healy

5615  European and national Clostridioides difficile infection surveillance  
K. Vendrik* [Leiden, Netherlands], T. Van Der Kooi, V. Viprey, K. Davies, E. Kuijper

5689  Possibilities of implementation of lactobacilli’s antagonistic properties for Clostridioides difficile growth suppression  
M. Sukhina, A. Sofin* [Moscow, Russian Federation], A. Zagaynova

5886  Risk factors for Clostridioides difficile infection among hospitalised patients in Brazilian centres: a multi-centre prospective study  

6354  Faecal microbiota transfer in real-life is more effective for recidivant Clostridioides difficile infection than for highly resistant bacteria decolonisation  

6626  Association between first episode Clostridioides difficile infection management and recurrence in a tertiary hospital  

6680  Changing epidemiology of Clostridioides difficile infection in a French university hospital  
N. Khanafær* [Lyon, France], L. Ottra, V. Pergay, O. Dauwalder, F. Vandenesch, P. Vanhems

6695  Oral vancomycin prophylaxis for primary and secondary prevention of Clostridioides difficile infection in patients treated with systemic antibiotic therapy: a systematic review and meta-analysis  
A. Maraoło* [Naples, Italy], E. Zappulo, R. Scatto, G. Granata, R. Andini, E. Durante Mangoni, N. Petrasillo, I. Gentile

6713  A comparative study to assess the prevalence and risk factors for Clostridioides difficile infection in patients with and without inflammatory bowel disease in a tertiary care hospital in northern India  
U. Ghoshal* [Lucknow, India], N. Tejan, R. Singh, A. Pandey, U. Ghoshal

7095  Is there any association between microbiological variables and toxigenic Clostridioides difficile infection (CDI) in a tertiary hospital?  

7112  Bezlotoxumab in real-life treatment of Clostridioides difficile infections in a tertiary centre in Spain  
M. Olmedo Sampería, M. Kestler Hernandez* [Madrid, Spain], M. Valerio Minero, M. Machado, A. Alvarez-Uria, B. Padilla, P. Muñoz, E. Bouza

7116  Clinical outcomes in oncological patients with Clostridioides difficile infection in Catalonia: a cohort study  

7495  Predictors of asymptomatic Clostridioides difficile colonisation on admission: prospective cohort study in a French university hospital  
N. Khanafær* [Lyon, France], S. Bennia, G. Martin-Gaujard, L. Juillard, T. Rimmelé, L. Argaud, D. Martin, P. Cassier, F. Vandenesch, P. Vanhems

7509  Local and national diagnostic and typing capacity for Clostridioides difficile infection, Europe, 2018  
S. Roda, E. Kanitz* [Vienna, Austria], D. Schmidt, E. Kuijper, C. Suetsens, P. Kinross

7510  Delafloxacin activity against moxifloxacin-resistant Clostridioides difficile clinical isolates  
S. Rodriguez-Pallarés* [Cádiz, Spain], F. Galan-Sanchez, J. Arca Sudrez, F. Cano, M. Rodriguez-Iglesias

7667  Does the new recommendations of treatment for non-severe Clostridioides difficile-associated diarrhoea ensure a better outcome?  
M. Lupsé* [Cluj-Napoca, Romania], I. Darau, C. Diaconu, K. Kamladi, K. Mamani, M. Planta, N. Todar

7840  The association of antibiotics and Clostridioides difficile infections in allogeneic stem cell recipients  
C. Jakab* [Cologne, Germany], M. Vehreschild, U. Holtick, C. Scheid, A. Walker, N. Jazmati, C. Carnely, J. Vehreschild

8468  Faecal lactoferrin is associated with severity at presentation but not relapse risk in Clostridioides difficile infection  

8591  An intervention bundle to improve compliance with clinical guidelines for Clostridioides difficile infection: a quasi-experimental study  

8726  Clostridioides difficile infection in haematological patients: a 14-year experience  
Abstract Categories 2020

8730 Epidemic *Clostridioides difficile* isolates are significantly more lethal and persist at higher rates than non-epidemic isolates in hamsters following vancomycin treatment
M. Pulse* [Fort Worth, United States], J. Vitucci, W. Weiss, J. Simecka

8754 Epidemiology and risk factors for *Clostridioides difficile* at a referral cancer centre in Mexico: a case-control study
F. Rivera* [Tlajpan, Mexico], D. De-La-Rosa-Martinez, E. Rivas-Pichon, B. Garcia-Pineda, P. Cornejo, D. Vilar

8794 Prevalence and outcome of *Clostridioides difficile* infection in a multi-centre study in Southern Brazil
A. Maestri, S. Rabani, H. Paz Morales, L. Ferrari, F. Tuan, A. Lasso, C. Marcon, K. Nogueira* [Curitiba, Brazil]

8947 National reporting of severe *Clostridioides difficile* infections in Germany between 2014 and 2018
N. Schmidt* [Berlin, Germany], A. Reuss, D. Altmann, M. Diercke, T. Eckmanns

---

Session accepted as Paper Poster Session

843 Impact of coagulate-negative staphylococci positive blood culture occurring in early postoperative cardiac surgery
M. Thyg* [Paris, France]

1078 Rapid detection of methicillin-resistant *Staphylococcus aureus* in patients with late hospital-acquired/ventilator-associated pneumonia
L. Bussini* [Bologna, Italy], C. Monari, R. Pascale, M. Rinaldi, S. Ianniruberto, E. Rosselli Del Turco, S. Ambretti, M. Giannella, P. Viale

1285 Epidemiology typing and molecular analysis of vancomycin-resistant *Enterococcus faecium* in haemat-oncological patients
M. Bezdiček* [Brno, Czech Republic], M. Nykrynova, K. Dufkova, K. Plevová, M. Lengerova

2291 Rapid molecular screening for vancomycin-resistant *Enterococcus faecium* [VRE] allows to expedite evaluation of VRE-exposed patients and is cost saving
A. Büchler* [Basel, Switzerland], S. Raggiozina, D. Goldenberger, M. Wicki, A. Egli, A. Widmer

2324 Modelling the impact of antibiotic use and infection control agents on the incidence of methicillin-resistant *Staphylococcus aureus* incidence rates in hospital, informed by identifying antibiotic usage thresholds utilising non-linear time series analysis
S. Gardner* [Northern Ireland, United Kingdom], P. McCarron, G. Conlon-Bingham, D. Farren, M. Scott, K. Burnett

2547 *Staphylococcus aureus* intestinal colonisation in patients undergoing bowel preparation for colonoscopy
J. Gagnaire* [Saint-Etienne, France], L. Rinaldi, F. Grattard, A. Carriçao, E. Del Tedesco, N. Williet, J. Rigail, E. Botelho-Nevers, X. Roblin, P. Verhoeven, P. Berthelot

---

Session accepted as Paper Poster Session

8535 Adaptation and validation of a quantitative *vanA/vanB* PCR on a high-throughput PCR system
A. Both* [Hamburg, Germany], L. Berneking, B. Berinson, H. Rohde, M. Lutgehetmann

9355 Comparison of the Panther Fusion MRSA assay with conventional culture for patient swabs in Ames transport medium with charcoal
N. Otten, R. Jansen, D. W. Van De Laar* [Amsterdam, Netherlands]

---

951 Computerised Tomography (CT) as a risk factor for the acquisition of carbapenem-resistant *Acinetobacter baumannii*
Z. Dadon, E. Ben-Chetrit* [Jerusalem, Israel], M. Dahan, O. Benjaminov, P. Levin

Abstract Programme

9. Experimental Microbiology, Microbial Pathogenesis & Biofilm

• Microbial pathogenesis & virulence
• Host-pathogen interaction
• Preclinical biofilm studies
• Experimental and cellular microbiology
• Other
Antibiofilm strategies

Session accepted as Paper Poster Session

218 Binding interference between Bartonella adhesin A and fibronectin as a novel therapeutic concept to treat bacterial infections
D. Vaca, A. Thibau, J. Malmström, L. Happonen, V. Kempf* (Frankfurt, Germany)

1571 Effect of hybrid organo-inorganic sol-gel coating loaded with antifungals on Candida strains
D. Romero, J. Aguilera-Correa, A. Garcia-Casas, B. Toirac, A. Jimenez-Morales, J. Esteban-Moreno* (Madrid, Spain)

1795 Anidulafungin-loaded hybrid organo-inorganic sol-gel coating can prevent the prosthetic joint infections provoked by Candida albicans
H. Garlito-Diaz, B. Toirac, A. Garcia-Casas, A. Jimenez-Morales, J. Esteban-Moreno* (Madrid, Spain), J. Aguilera-Correa

2193 Proof of concept: efficacy of surgical titanium implants coated with linear gentamicin against osteomyelitis in pigs

2256 Polyarginine nanocapsules carry and deliver genetic material inside bacteria
L. Alvarez-Fraga, J. Recente-Campo, K. Conde* (Coruña, Spain), A. Cés-Martinez, J. Vazquez-Ucha, A. Becerra, G. Bou Arevalo, M. Alonso, M. Poza Dominguez

2286 Destruction of Staphylococcus aureus biofilm matrix by innovative combination therapies between antibiotic and non-antibiotic substances
J. Liu* (Toulouse, France), A. Bousquet-Melou, J. Madec, M. Hoenni, A. Ferran

2790 Evaluation of biofilm formation and removal efficacy of three medical-device detergents by bacterial and yeast species
K. Park* (Songpa-Gu, South Korea), K. Hur, H. Sung, M. Kim

2880 Nonsteroidal anti-inflammatory drugs as a promising alternative to antibiotics to combat methicillin-resistant Staphylococcus aureus biofilms
V. Silva* (Vila Real, Portugal), J. Pereira, L. Matez, J. Capelo, G. Igrejas, P. Poeta

3009 Activities of eight antifungal agents against Candida auris biofilms
A. Chatzimoschou, J. Meis* (Nijmegen, Netherlands), E. Rolides

3341 Micafurazole/dominiphen bromide: a fungicial combination treatment against biofilms of variousazole-sensitive and azole-resistant Candida spp.
J. Tits* (Heverlee, Belgium), F. Cools, P. Cos, K. Verbruggen, J. Berman, B. Cammue, K. Thewisren

3526 Unravelling the anti-biofilm mechanism of action of an antimicrobial peptide: an atomic force microscopy study
A. Silva Herdade* (Lisbon, Portugal), S. Dias, S. Pinto, A. Coutinho, M. Cestanho, A. Veiga

Microbial biosurfactants: a new approach for the control of polymicrobial biofilm development on biomedical materials
C. Ceresa* (Novara, Italy), E. Fedeli, F. Tessarola, D. Maniglia, E. Tambone, M. Rinaldi, I. Banat, M. Diaz De Rienzo, L. Fracchia

Rhamnolipid coating reduces formation of Candida albicans-Staphylococcus aureus mixed biofilm on titanium implants: an in vitro study

Vaccinium macrocarpon urine metabolites inhibit Candida albicans adhesion and biofilm formation
E. Ottaviano* (Milan, Italy), G. Baron, L. Fumagalli, P. Allegretti, A. Riva, G. Morace, G. Aldini, E. Borghi

Polyphasic validation of a nisin-biogel aiming at the control of canine periodontal disease
E. Cunha* (Lisbon, Portugal), F. Bernardino De Freitas, B. Sào Braz, J. Moreira, L. Tavares, A. Veiga, M. Oliveira

Local anti-Pseudomonas IgY therapy prevents pyelonephritis in a novel murine experimental model
M. Pays Bendixen* (Copenhagen, Denmark), F. Schwartz, S. Baekdahl, L. Christophersen, I. Bull Rasmussen, M. Joergensen, C. Johann Lerche, K. Thomsen, N. Høiby, C. Moser

Cationic antimicrobial polymers as new anti-biofilm agents
R. Garcia Maset* (Coventry, United Kingdom), F. Harrison, S. Perrier

Prevented ciprofloxacin resistance development in Pseudomonas aeruginosa urinary tract infection model
A. Laulund* (Sæborg, Denmark), F. Schwartz, L. Christophersen, K. Thomsen, D. Ciofu, H. Tøstrup Pedersen, N. Høiby, C. Moser

Human milk oligosaccharides exhibit biofilm inhibition and eradication activity against biofilms formed by yeast isolated from cystic fibrosis patients
S. Jarzynka* (Warsaw, Poland), A. Bialkowska, B. Garcewksa, E. Augustynowicz Kopeć, G. Olędzka

Adequate exposure time of cold atmospheric pressure plasma on Staphylococcus aureus biofilms
F. Fahmide* (Tehran, Iran), P. Ehsani, S. Atyabi

Ability of antibiotic-loaded bone cement to prevent bacterial adhesion, biofilm formation and selection of resistance
A. Bidossi* (Milan, Italy), M. Bottagisio, E. De Vecchi

Session accepted as 1-Hour Oral Session

Bacteria dwelling in cystic fibrosis lungs

Trophic cooperation promotes Pseudomonas aeruginosa and Staphylococcus aureus survival in cystic fibrosis patients
L. Camus* (Lyon, France), B. Paul, S. Bastien, A. Doleans, S. Elsen, V. Vandenesch, K. Moreau

**218** ABSTRACT BOOK – 30th ECCMID 2020
Abstract Categories 2020

3456 Interleukin 1-α and vascular endothelial growth factor support the growth and persistence of biofilm-growing Cutibacterium acnes in individuals with acne

4494 Biofilms and catheter-related bloodstream infections: a tale of two kingdoms
V. Borges, S. Wenner, I. Nogueira, I. Faria, M. Pessanha, C. Verissimo, R. Sabino, J. Rodrigues, R. Matias, F. Martins, P. Carvalho, J. Gomes, L. Jordao*
[Lisboa, Portugal]

5412 Microbial aetiology of prosthetic joint infections: what’s growing in the cultures?
E. Piehl* (Providence, United States), V. Lopes, A. Caffrey, K. Laplante

6142 Intracellular persistence of uropathogenic Escherichia coli is undetectable in urinary bladders from mecillinam-treated pigs
K. Stærk* (Odense, Denmark), R. Grønnemose, Y. Palarasah, H. Kolmos, L. Lund, T. Andersen

7585 Development of in vitro and ex vivo wound biofilm models for the assessment of wound dressings
K. Tiirik* (Tartu, Estonia), L. Preem, K. Sagar, M. Putrins, T. Tenson, K. Kogermann

8242 Within-host genetic diversity of Staphylococcus epidermidis in prosthetic joint infections: consequences for microbiological diagnosis
M. Widerstrom* (Umeå, Sweden), M. Stegger, I. Yu, B. Mcdonald, A. Mcnally

9556 Adaptation to host of a Staphylococcus schleiferii responsible of an elbow prosthetic infection
A. Bidossi, M. Bottagisio, E. De Vecchi* [Milan, Italy]

Microbiological factors of Escherichia coli from adult patients with bacteraemia and sepsis/septic shock from 21 hospitals in Spain: PROBAC-EC study

Insights into reservoir and pathogenicity of Escherichia coli ST183: role of haemolysin A operon duplication in severity of uropathogenic infections
M. Ksiezarek* [Porto, Portugal], Á. Novais, H. Felga, F. Mendes, M. Escobar, L. Vieira Peixe

Novel putative AHL-lactonases widely distributed across diverse carbapenemase-producing Enterobacteriaceae
M. Lopez* (A Coruña, Spain), N. Ellaby, N. Woodford, M. Ellington, M. Tomas

Mouse colonisation by multidrug-resistant Escherichia coli in the absence of antibiotic selection
C. Connor* [Birmingham, United Kingdom], A. Zucolota, I. Yu, B. Mcdonald, A. McNally

Contribution of microbial virulence factors on mortality in adult patients with bacteraemia due to Escherichia coli presenting with sepsis/septic shock: exploratory analysis of the PROBAC-EC cohort

Proton pump inhibitors increase the digestive carrying of OXA-48-producing Enterobacteriaceae in a mouse model
F. Javaudin* [Nantes, France], O. Le Bastard, M. Dion, Y. Bezabih, E. Montassier, E. Batard

ESBL-producing Escherichia coli causing community-onset bloodstream infection and the association of bacterial clones and virulence genes with septic shock
I. Fröding* [Stockholm, Sweden], B. Hasan, I. Sylvin, P. Naucier, C. Giske

Comparison of β-lactamase-producing Escherichia coli ST131 C1-M27 and ST131 non-C1-M27 by whole genome analysis using next-generation sequencing in Japan
N. Noguchi* [Tenri, Japan], A. Nakamura, M. Kamatsu

Association of the prophage BTP-1 with anti-virulence of Salmonella typhimurium sequence type 313
A. Herrero* [Copenhagen, Denmark], M. Spiegelhauer, P. Guerra, J. Olsen

Session accepted as Paper Poster Session

Escherichia coli and Salmonella pathogenicity and virulence

571 Proton pump inhibitors increase the digestive carrying of OXA-48-producing Enterobacteriaceae in a mouse model
F. Javaudin* [Nantes, France], O. Le Bastard, M. Dion, Y. Bezabih, E. Montassier, E. Batard

6456 Genetic architecture of interspecies hybrids
K. Bartke* [Uppsala, Sweden], L. Garoff, D. Huseby, G. Brandis, D. Hughes

2007 Association of the prophage BTP-1 with anti-virulence of Salmonella typhimurium sequence type 313
A. Herrero* [Copenhagen, Denmark], M. Spiegelhauer, P. Guerra, J. Olsen

Microbiological factors of Escherichia coli from adult patients with bacteraemia and sepsis/septic shock from 21 hospitals in Spain: PROBAC-EC study

Insights into reservoir and pathogenicity of Escherichia coli ST183: role of haemolysin A operon duplication in severity of uropathogenic infections
M. Ksiezarek* [Porto, Portugal], Á. Novais, H. Felga, F. Mendes, M. Escobar, L. Vieira Peixe

Novel putative AHL-lactonases widely distributed across diverse carbapenemase-producing Enterobacteriaceae
M. Lopez* [A Coruña, Spain], N. Ellaby, N. Woodford, M. Ellington, M. Tomas

Mouse colonisation by multidrug-resistant Escherichia coli in the absence of antibiotic selection
C. Connor* [Birmingham, United Kingdom], A. Zucolota, I. Yu, B. Mcdonald, A. McNally

Contribution of microbial virulence factors on mortality in adult patients with bacteraemia due to Escherichia coli presenting with sepsis/septic shock: exploratory analysis of the PROBAC-EC cohort

Proton pump inhibitors increase the digestive carrying of OXA-48-producing Enterobacteriaceae in a mouse model
F. Javaudin* [Nantes, France], O. Le Bastard, M. Dion, Y. Bezabih, E. Montassier, E. Batard

6456 Genetic architecture of interspecies hybrids
K. Bartke* [Uppsala, Sweden], L. Garoff, D. Huseby, G. Brandis, D. Hughes

7006 Genome wide mutations in a clinical Escherichia coli isolate with a DNA mismatch repair gene defect after exposure to remnants of a phagemid-containing Escherichia coli
J. Stohr* [Breda, Netherlands], M. Kluytmans - Van Den Bergh, C. Verhulst, J. Rossen, J. Kluytmans

Within host genetic comparison of Escherichia coli strains isolated from patients with urosepsis
A. Cuénod* [Basel, Switzerland], J. Agnetti, H. Seth-Smith, O. Grüniger, J. Reist, S. Tschudin-Sutter, S. Bassetti, N. Thomson, A. Egli
Abstract Categories 2020

Microbial predictive virulence factors for pyelonephritis caused by extended-spectrum beta-lactamase-producing Escherichia coli in children harbouring such strains in their gut microbiota

B. Philippe* [Paris, France], A. Birgy, C. Levy, F. Madhi, E. Sobral, R. Cohen, S. Bonacorsi

Depicting the pathogenicity and genomic traits of hypermucoviscous Enterobacteriaceae clinical isolates N. Rodriguez Medina* [Cuernavaca, Mexico], U. Garza-Ramos, H. Valdivinos-Torres

Ocbinidine: new insights in the detailed killing mechanism on Gram-negative bacteria at a cellular and molecular level

N. Molanovic* [Graz, Austria], A. Oen, G. Pabst, K. Lohner

Session accepted as Paper Poster Session

Gram-Positives: Pathogenicity, identification and treatment

Characterisation and virulence of fibronectin-binding protein of Streptococcus intermedius

M. Sasaki* [Shiawagun, Japan], Y. Kadama, T. Ishikawa, Y. Shimoyama

Reduced production of bacterial membrane vesicles predicts mortality in ST145/USA600 methicillin-resistant Streptococcus aureus bacteriaemia

S. dey* [detroit(Michigan), United States], S. Gudipati, C. Giuliani, M. Zervos, J. Monk, R. Szubin, S. Jorgensen, G. Sakoulas, A. Berti

Characterisation of a fibronectin binding protein in the virulence of Streptococcus parasanguinis FW213

Y. Chen* [Taoyuan, Taiwan]

esp17 and its importance in dry stress resistance

N. Kordzakhia* [Tbilisi, Georgia]

Combined inhibition of CD14 and C5 in Enterobacteriaceae and its importance in dry stress resistance

C. Giuliano, M. Zervos, J. Monk, R. Szubin, S. Jorgensen, G. Sakoulas, A. Berti

Inter- and intra-clonal diversity in Streptococcus haemolyticus prosthetic joint infection

A. Both* [Hamburg, Germany], J. Huang, M. Oi, S. Weisselberg, H. Buettner, C. Lausmann, M. Alawi, P. Hoffke, H. Rohde

Platelet trends early during Staphylococcus aureus bacteraemia are predictive of persistence and mortality

B. Lee* [Los Angeles, United States], C. Kelsam, K. Tan, A. Wong-Beringer

The type I histidine triad protein HtspA contributes to the capsule development and virulence of Streptococcus suis serotype 2

X. Pan* [Nanjing, China], Z. Shao, M. Li, H. Ni

Characterisation of biofilm formation by Staphylococcus pseudointermedius on a variety of medical devices

C. Pesset, M. Antunes, C. Fonseca, M. Ferreira, I. Teixeira, E. De Oliveira Ferreira, B. Penna* [Rio de Janeiro, Brazil]
Abstract Categories 2020

4570 Genome-wide transcriptional responses of *Escherichia coli* with different levels of zinc tolerance to zinc chloride exposure

V. Johanns, S. Wolf, L. Epping, A. Lübke-Becker, T. Semmler, B. Walther* [Berlin, Germany], L. Wieler

5035 *Klebsiella pneumoniae* type VI secretion system allows the implantation and survival of the pathogen within the intestinal microbiota

T. Mercieca, L. Nakusi, S. Bornes, C. Besnard, E. Rifa, S. Thell, C. Forestier, S. Miquel* [Clermont-Ferrand, France]

584 Acylated homoserine lactone- (AHL) mediated quorum sensing in dental plaque: an opportunity for novel antimicrobial treatment of oral diseases

A. Muras, P. Otero-Casal, A. Otero* [Santander de Compostela, Spain]

5257 A widespread toxin-antitoxin system exploiting growth control via alarmone signalling

6300 A high-throughput real-time liquid-based *Caenorhabditis elegans* model for assessing the virulence of clinical encapsulated multidrug-resistant *Klebsiella pneumoniae* isolates

A. Gancz* [Ariel, Israel], D. Cohen-Eli, S. Navon-Venezia

7061 Meningococcal disease-associated prophage-like elements are present in *Neisseria gonorrhoeae* and some commensal *Neisseria* sp.

B. Al Suwayyid, D. Speers, M. Wise, G. Coombs, C. Kahler* [Perth, Australia]

</table>

2696 Genome-based analyses of *Klebsiella pneumoniae* to detect possible host-associations, host-adaptation and effects on virulence

K. Klaper* [Wernigerode, Germany], L. Heinrich, R. Gerlach, S. Fuchs, Y. Pfeifer, G. Werner

3657 A novel chaperone-usher pill system associated to the worldwide-disseminated high-risk clone *Klebsiella pneumoniae* ST-15

E. Gato* [A Coruña, Spain], B. Rodiño-Janero, M. Pérez-Vázquez, A. Romero, G. Bou Arevalo, A. Pérez

4950 Food and clinical human isolates of *Klebsiella pneumoniae*: is there correlation between multidrug resistance and biofilm formation capacity?

5930 Influence of biofilm formation on clinical outcome and their associated genetic virulence factors in *Klebsiella pneumoniae* bloodstream infections in India

D. Naveen Kumar* [Sheffield, United Kingdom], K. Asokan, K. Vasudevan, D. Murugan, E. Karunakaran, P. Monk, V. Balaji

6013 Effect of the capsule exchange between serotype K1 and K20 *Klebsiella pneumoniae* on serum killing, neutrophil phagocytosis and mice lethality

E. Liu, J. Chang, J. Lin, F. Chang* [Taipei, Taiwan]

6228 Prevalence of virulence factors in colonising and infecting *Klebsiella pneumoniae* isolates obtained from a German multi-centre surveillance study

K. Lucassen* [Calâgna, Germany], J. Kahn, J. P. Antoniou, J. Wille, A. Walker, Y. Steizer, V. Persy, H. Seifert, P. Higgins

6978 Characterisation of virulence in KPC-2-producing *Klebsiella pneumoniae* CG258 from an outbreak in high complexity hospital in Brazil

T. Rezende* [São Paulo, Brazil], C. Morais, J. Monteiro, C. Abbboud, J. Setubal, A. Pignatari, C. Kiffer

8050 Diversity of capsular switch among carbapenemase-producing *Klebsiella pneumoniae*

A. Chiarelli* [Paris, France], N. Cabanel, R. Bonnin, P. Glaser

8449 Contrastng molecular epidemiology of *Klebsiella* spp. and *Escherichia coli* bloodstream infections in Oxfordshire (UK) 2009-2017

S. Lipworth* [Oxford, United Kingdom], K. Vhta, J. Kavanagh, L. Barker, K. Chau, S. George, A. Vaughan, D. Griffiths, M. Morgan, M. Andersen, K. Jeffery, T. Peto, D. Crook, N. Stoesser, A. Walker

8764 Genomic characterisation and pathogenicity determination of the classical, hypermucoviscous and hypervirulent *Klebsiella pneumoniae* isolates in Mexico

U. Garza-Ramos* [Morelos, Mexico], J. Rodríguez-Santiago, A. Sagal-Prado, J. Silva-Sanchez

9052 In vivo virulence of different clones of OXA-48-producing *Klebsiella pneumoniae* in Galleria mellonella infection model

A. Leal, L. Forcellleda Espino, A. Rodríguez-Guardado, F. Vazquez, M. Rodicio, J. Fernández* [Oviedo, Spain]

Do we need to screen the colibactin genomic island (CGI) for diagnosis of colorectal cancer? Paradigm of *Klebsiella pneumoniae*

M. Ben Khedher, S. Khabthani, R. Ruimy, J. Rolain, M. Ben Khedher, S. Khabthani, R. Ruimy, J. Rolain, S. Diene* [Marseille, France]

Co-aggregation of uropathogenic *Klebsiella oxytoca* with *Klebsiella pneumoniae* and probiotic *Escherichia coli* on the cell line

A. Giliazeva* [Senftenberg, Germany], J. Noack, A. Mardanova

9477 Novel biofilm models and methods

454 Combined effects of low incubation temperature, minimal growth medium and low hydrodynamics optimise *Acinetobacter baumannii* biofilm formation

E. Eze* [KwaZulu-Natal, South Africa]

2048 Formation of enterobacterial aggregates in presence of bovine synovial fluid

A. Macias-Valcayo* [Madrid, Spain], J. Aguiler-Corra, A. Staarts, T. Gupta, D. Dusane, P. Stoodley, J. Esteban-Moreno
Detection of microorganisms in sonicated titanium screw model after in vitro biofilm production using culture, MALDI-TOF MS and qPCR
J. Cieslinski, V. Stadler Tasca Ribeira, L. Kraft, P. Suss, E. Rosa, L. Morella, M. Pilionetto, J. Teilles*
[Sao Paulo, Brazil], F. Tuon

It’s a trap! The development of a versatile drain biofilm model
K. Ledwoch* [Cardiff, United Kingdom], J. Maillard, P. Norville

Galleria mellonella as a novel in vivo drug discovery platform using bioluminescent KAPE pathogens
V. Francis* [Exeter, United Kingdom], A. Smith, C. Kemmer, V. Trebosc, B. Schellhorn, R. Tittball, O. Champion

The efficiency of antimicrobial coatings in whole blood: development of a realistic in vitro model
J. Valtin* [Dresden, Germany], C. Werner

A five-species biofilm model for confirming the potential of a nisin-biogel aiming at canine periodontal disease control
E. Cunha* [Lisbon, Portugal], S. Rebelo, L. Tavares, M. Carreira, M. Oliveira

Effect of Bdellovibrio bacteriovorus on clinical pathogens and biofilms
S. Kahraman, Y. Tekintas* [Izmir, Turkey], F. Cilli, M. Hosgar-Limoncu

A new ultra-fast specimen preparation method for SEM visualization of bacterial biofilms
I. Chebotar* [Moscow, Russian Federation], A. Subbot, Y. Bocharova, N. Fedorova, I. Novikov

Investigation of electric signaling in bacterial biofilms with the Specialised Thin Agar Method (STAM)
J. Assmann* [Berlin, Germany], S. Bürge, C. Schaudinn, B. Wolther

Study of microbial adhesion to nanostructured and nanostructured orthoprosthetic material through dynamic models
S. Leonetti* [Pisa, Italy], B. Tuvo, B. Campanella, M. Onor, S. Legnaiali, E. Bramanti, A. Baggiani, M. Totaro, P. Parchi, B. Casini

In vitro model of Pseudomonas aeruginosa pulmonary biofilm to evaluate the efficacy of cationic antibiotics
R. Awad* [Poitiers, France], F. Tewes, S. Marchand, W. Couet, M. Nasser

Acinetobacter baumannii and Klebsiella pneumoniae: intelligent design of phage cocktails against multidrug-resistant pathogens
M. Jalasvuori* [Jyvaskyla, Finland], K. Kaskinen, M. Yläne, R. Penttinen

Exploiting CRISPR-Cas9 to eradicate ESBL genes and tracing conjugative plasmids within complex microbial communities at single-cell resolution
R. Penttinen* [Turku, Finland], L. Ambrosio Leal Dutra, P. Ruotsalainen, O. Franz, C. Given, K. Nurminen, P. Salmi, M. Tiirala, M. Jalasvuori

Session accepted as Paper Poster Session

Overcoming infections caused by non-fermenters

Filamentous bacteriophage [PF-8] in Pseudomonas aeruginosa isolates belonging to the international cystic fibrosis clone [CC274]

The in vitro effect of azithromycin on P. aeruginosa biofilms
A. Jimenez San Mauro, N. Heiby, O. Ciofu* [Copenhagen, Denmark]

Ceftolozane/tazobactam for multidrug-resistant Pseudomonas aeruginosa in a swine model of severe pneumonia

First evidence of systemic efficacy of a pathogen-targeted, engineered lisyn [GN-370] against carbapenem-resistant Pseudomonas aeruginosa in a rabbit pneumonia model
D. Lehoux* [Yonkers, United States], W. Abdelhady, Y. Xiong, K. Sauve, J. Oh, A. Watson, S. Swift, C. Cassino, A. Beyer, R. Schuch

Efflux pump inhibitors based on novel cyclic peptides as an approach against ESKEPAE pathogens
J. Moreno Morales* [Barcelona, Spain], C. Cosgaya Castro, C. Ballesté, E. Giralt, J. Vila Estape

Co-evolutionary adaptations of Acinetobacter baumannii and an OXA-23-encoding plasmid under carbapenem pressure
L. Zhang* [Hangzhou, China], X. Hua, Y. Yu

Effects of ceramergins to intracellular Pseudomonas aeruginosa infections formed in human airway epithelial cells
Ö. Oyardı* [Istanbul, Turkey], C. Bozkurt Guzel, P. Savage

Modulation of antibiotic-associated virulence of Pseudomonas aeruginosa in cystic fibrosis bacterial biofilms
M. Hassan, N. Harrington* [Coventry, United Kingdom], F. Harrison
In silico and in vitro investigation of a novel putative toxin-antitoxin system in Acinetobacter baumannii
S. El-Banna* [Cairo, Egypt], R. Samir, R. Aziz, N. Maneib

The solitary parE-type toxin gene in Pseudomonas aeruginosa sequence type 111 clinical isolates collected in a paediatric intensive care unit in Moscow
Y. Bocharova* [Moscow, Russian Federation], T. Savinova, D. Shagin, I. Chebator

Estimation of the prevalence of the plasmid-encoded septocin gene in carbapenem-resistant Acinetobacter baumannii
N. Rakovitsky* [Tel Aviv, Israel], S. Frenk, P. Elmalih, R. Roy, E. Temkin, D. Schwartz, Y. Carmeli, J. Lelouche

Comparative in vitro activities of eravacycline and various antibiotics against multidrug-resistant clinical strains of Acinetobacter baumannii isolated from intensive care units
M. Ataman* [Istanbul, Turkey], E. Mataraci-Kara, B. Ozbek Çelik

Comparative metabolomics of Pseudomonas aeruginosa in response to polymyxin B
M. Hussin* [Melbourne, Australia], M. Han, B. Tsuji, R. Hancock, T. Veikov, J. Li

Carbapenem-resistant Acinetobacter baumannii fitness in murine model is associated with 14-day mortality in humans
A. Nutman* [Tel-Aviv, Israel], J. Lelouche, E. Temkin, G. Daikos, A. Skiada, J. Wain, G. Langridge

Plasticity in a bacterial global regulator drives the switch to antibiotic resistance and virulence

The profile of virulence gene exoS, exoT, exoU and exoY from gene encoding effector protein type III secretion system of Pseudomonas aeruginosa in clinical isolates in Sanglah Hospital Bali
I. Saputra* [Bali, Indonesia], N. Mertiawati, N. Fatmawati

Host adaptive changes of Staphylococcus aureus through respiratory colonisation and bloodstream infection
A. Carrera-Salinas* [L’Hôpital de Llobregat, Spain], A. González Díaz, D. Vázquez-Sánchez, J. Sañudo, M. Mrakovcic, M. Domínguez Luzon, S. Niemann, S. Martí

Lower respiratory tract infection by Staphylococcus aureus in mechanically-ventilated patients: genotypical and phenotypical characterisation
A. Lacoma* [Badalona, Spain], M. Loabei, G. Godoy, B. Muriel-Moreno, J. Moreno, F. Arméstcar, C. Prat

In-host evolution of methicillin-resistant Staphylococcus aureus within individual carriers using core genome multi-locus sequence typing and single-nucleotide polymorphism analysis
A. Compillay Lagos* [Örebro, Sweden], M. Sundqvist, F. Dyrkell, M. Stegger, B. Säderquist, P. Mölling

Unravelling the mechanism of virulence of M1 protein of Streptococcus pyogenes
E. Torres Sangiao* [Santiago de Compostela, Spain], L. Happonen, F. Palm, P. Pyl, O. Shannon, C. García-Riestra, J. Malmström

Bronchial abundance of Streptococcus as a potential biomarker for lung cancer

Transcriptome analysis of pneumococci isolated from meningitis patient’s cerebrospinal fluid identifies multiple genes important for pathogenesis, including a novel operon of unknown function
E. Wall* [London, United Kingdom], J. Guerra-Assunção, M. Yang, S. Panagiotou, T. Audshasai, R. Aprianto, E. Ramos Sevillano, V. Terra, D. Van De Beek, J. Veening, M. Mrakovcic, M. Domínguez Luzon, S. Niemann, S. Martí

Enterococcus faecalis inhibits Klebsiella pneumoniae growth in polymicrobial biofilms
V. Ballén Torres* [Barcelona, Spain], S. Soto

Microdiversity of Enterococcus faecalis isolates from infective endocarditis
G. Royer* [Crêteil, France], L. Raisin, S. Lo, D. Vanessa, H. Jacquier, R. Lepeule, V. Fihman, P. Lim, C. Rodriguez, P. Woerther
Identification of new small-RNAs involved in growth and virulence of Enterococcus faecium

Development of a new murine model for Enterococcus faecium intestinal colonisation
S. Reissier* (Rennes, France), V. Bordeaux, F. Brice, V. Cattoir, M. Revest

Abstract Categories 2020

Session accepted as 2-Hour Oral Session
Understanding and treating biofilms

Staphylococcus aureus inhibits opsonophagocytosis and modulates neutrophils extracellular traps formation efficiently during the early stages of biofilm formation
A. Sultan* (Rotterdam, Netherlands), N. Lemmens-Den Toom, A. Verbon, W. Van Wamel

Co-infection with Staphylococcus aureus after primary influenza virus infection results in endothelial damage
S. Deinhardt-Emmer* (Jena, Germany), A. Van Krüchten, E. Schicke, K. Rennert, S. Ludwig, Z. Cseresnyes, M. Figge, A. Mosig, R. Heller, B. Löffler, C. Ehrhardt

Methicillin-resistant Staphylococcus aureus USA300 persister cells show chaperone upregulation in contrast to planktonic cells and the biofilm phenotype

Sub-inhibitory concentrations of mupirocin stimulate Staphylococcus aureus biofilm formation by up-regulating cdiA
Y. Jin* (Hangzhou, Zhejiang Province, China)

Genomic adaptation of Staphylococcus aureus in a diabetic foot environment
C. Pouget* (Nimes, France), M. Hosny, A. Pantel, B. La Scola, F. Laurent, A. Sotta, C. Dunyach-Remy, J. Lavigne

The mouse ear skin model reveals specific innate immune signatures into study of the dynamics of innate immune responses against to Staphylococcus aureus biofilms
A. Abdul Hamid* (Clermont-Ferrand, France), A. Cara, A. Diot, J. Josse, E. Billard, F. Laurent, P. Guérard

Candida albicans adhesion to central venous catheters: impact of yeast and hyphae morphotypes
J. Jung* [Hamburg, Germany], C. Mischo, G. Gunaratnam, C. Spengler, S. Becker, K. Jacobs, M. Bischoff

Three-dimensional in vitro Staphylococcus aureus abscess communities are not affected by antibiotics or neutrophils
M. Hofstee* [Davos Platz, Switzerland], M. Riol, K. Thompson, M. Stoddart, S. Zaai, F. Mariarty

An innovative model to analyze anti-biofilm immune response in vivo
L. Sauvat* (Clermont-Ferrand, France), A. Abdul Hamid, C. Blavignac, F. Laurent, O. Lesens, P. Guérard

Non-steroidal anti-inflammatory drug administration impairs antibiotic treatment of orthopaedic device-related infection in a rat model
F. Mariarty* (Davos, Switzerland), G. Richards, K. Thompson

What happens when the host and pathogen meet

A pathogen and a non-pathogen spotted fever group Rickettsia trigger differential proteome signatures in macrophages
P. Cardoso Curto* [Cantanhede, Portugal], C. Santa, P. Allen, B. Mananas, I. Simoes, J. Martinez

Impact of corticosteroids on alveolar macrophage interaction with mucorales
F. Arrivé* (Poitiers, France), K. Brunet, J. Martellosia, I. Lamarche, S. Marchand, B. Rammaert

Insight into Chlamydia trachomatis persistence
C. Faschi, M. Bortolotti, C. Zalamboni, R. Fato, L. Polito, A. Bolognesi, A. Marangoni* [Bologna, Italy]

Evaluation of neuro-filament light chain as a biomarker for neuronal damage in experimental pneumococcal meningitis
N. Le* (Bern, Switzerland), D. Grandgirard, J. Kuhle, D. Leppert, S. Leib

Estrogen enhances host-pathogen interactions in ex vivo and in vitro models of the inflammatory phase of age-related impaired healing
M. El Mohtadi* (Manchester, United Kingdom), K. Whitehead, N. Dempsey-Hibbert, J. Ashworth

Perinatal hormones favor CC17 Group B Streptococcus intestinal translocation through M cells and hypervirulence in neonates
C. Hays, G. Touak, A. Bouaboud, A. Fouet, J. Guignot, C. Payart, A. Tazi* [Paris, France]

Markers of inflammation, neural injury and regeneration in a neonatal mouse model of Listeria monocytogenes meningococcal sepsis

Impact of interferon gamma on Staphylococcus aureus internalisation within human osteoblasts
C. Pierre, A. Souché, L. Abad, P. Verhoeven, J. Josse, T.erry, F. Laurent, F. Valour* (Lyon, France), A. Diet
Abstract Programme

10. Immunology & Vaccinology

- Host genetics: infection susceptibility & immunodeficiency
- Clinical epidemiology of infections in immunocompromised hosts
- General vaccinology (incl. policy, social aspects)
- Antiviral vaccines
- Antibacterial vaccines
- Immune response to infection (excl sepsis biomarkers)
- Other
966 Ceftazidime-avibactam for the treatment of carbapenemase-producing Enterobacteriaceae bacteraemia in oncohaematological patients: calm after the storm

1521 Predictors of mortality in solid-organ transplant recipients with bloodstream infections due to carbapenemase-producing Enterobacteriales: the impact of cytomegalovirus disease and lymphopenia

1816 Burden of surgical site infections after solid organ transplantation in the Swiss transplant cohort study

2108 Pre-emptive therapy utilisation after haematopoietic cell transplantation
G. Papanicolaou* (New York, United States)

2121 Bloodstream infection survey in high-risk oncology patients (BISHOP) with fever and neutropenia (FN) in the United States: Gram-negative susceptibility and treatment patterns

3161 Infectious complications in kidney transplant recipients: a prospective cohort study

6606 Burden of viral infections among autologous stem cell transplant patients: a prospective longitudinal study

7744 Short versus extended antibiotic treatment with a carbapenem for high-risk febrile neutropenia in haematology patients (SHORT trial): results from a randomised multi-centre non-inferiority trial

8752 Infectious complications after chimeric antigen receptor modified T cells in adolescent and young adult relapse/refractory B cell precursor acute lymphoblastic leukaemia: report of the French experience

8938 Home-based care of low-risk febrile neutropenia in children: an implementation study in a tertiary paediatric hospital

1664 Validation of a machine learning model for prediction of mortality among patients with community-acquired pneumonia
L. Ward* (Aalborg, Denmark), M. Mogensen, R. Méndez, P. Gonzalez-Jimenez, C. Collizón Campos, A. Ceccato, A. Torres, R. Menendez

3545 Can machine learning predict a positive blood culture?
B. Mcfadden* (Perth, Australia), M. Reynolds, T. Inglis

7478 A machine learning-based model to predict bloodstream infections
R. Murri* (Rome, Italy), G. De Angelis, C. Masciocchi, B. Posteraro, N. Capacchiano, A. Marchetti, A. Damiani, P. Sergi, G. Scambia, R. Cuda, V. Valentini, M. Fantoni, M. Sanguinetti

7615 Artificial intelligence to support antibiotic decision-making processes in haematological patients with febrile neutropenia

8115 Supervised machine learning algorithms to predict the patient outcome during febrile neutropenia
C. Jakob* (Cologne, Germany), M. Schons, M. Stecher, F. Fuchs, A. Walker, O. Carnely, J. Vehreschild
**Abstract Categories 2020**

---

**Session accepted as** Paper Poster Session

**Epidemiology and prevention of infection in immunocompromised hosts**

52  *Clostridioides difficile* infection in immunocompromised hospitalised patients is associated with a high recurrence rate

A. Atamna* [Petah Tikva, Israel], T. Avni, J. Bishara

5686 Interplay between inflammation and infection in a single-centre cohort of patients with X-linked agammaglobulinemia

---

2093 Epidemiology of *Pseudomonas jiroveci* pneumonia in HIV-negative patients from 2005-2014 in the United States

B. Hollenbeck* [Boston, United States], K. Counterman, G. Miley

2779 Infectious complications of patients with breast cancer treated with palbociclib: unexpected serious and opportunistic infections

3808 TB screening and treatment in an Italian cohort of haematopoietic stem cell transplant recipients

A. Della Vecchia* [Genoa, Italy], C. Di Grazia, A. Dominiello, A. Raiola, E. Angelucci, M. Bassetti, V. Claudia, M. Mikulska

---

4076 Strategy for cytomegalovirus reactivation prevention with ganciclovir and high dose of valacyclovir in allogeneic stem cell transplantation

M. Lopez* [Bogota, Colombia], E. Pedraza, J. Figueroa, E. Mora, M. Gomez, S. Ardila, A. Guarin, O. Peña, C. La Madrid, G. Lopez, L. Villamizar, D. Diaz

5413 Antifungal prophylaxis in acute myeloid leukaemia patients receiving chemotherapy is cost-effective in a resource-limited country

T. Pungprasert* [Lampang, Thailand], P. Phikulsod, V. Srinanprasert, D. Dhirachaikulpanich, N.untai, S. Maneean

5632 Treating nocardiosis with cotrimoxazole monotherapy in solid organ transplant recipients: real-life data from a multi-centre retrospective study

5686 The effectiveness of antibiotic prophylaxis in the prevention of respiratory tract infections in antibody-deficient patients: a single-centre cohort study

M. Albur* [Bristol, United Kingdom], A. Grammatikos, S. Johnston

---

**Session accepted as** Paper Poster Session

**Evaluating host responses to diagnose infection**

437 Dynamic monitoring of sTREM-1 and other biomarkers in biliary tract infection

J. Jiang* [hangzhou, China], D. Yu

1528 Comparison of host immune responses in *vivo* versus *ex vivo* lipopolysaccharide stimulation in humans using an immune transcriptomic profiling panel

D. Tawfik* [Lyon, France], J. Lankelma, L. Ganee, E. Cerrato, A. Pachot, W. Wiersinga, J. Textoris

1655 Comparison of prognostic capacity of presepsin and procalcitonin in adult septic patients: results from a prospective observational study in two university clinical centres

A. Aliu Bejta* [Pristhine, Kosovo], S. Namani, B. Halili, D. Plana-Hajdari, B. Baršić, A. Atež

1726 Reactive hyperaemia measured by peripheral arterial tonometry correlates with glycocalyx degradation and the presence of sepsis in the critically ill patient

L. Malheiro* [Porto, Portugal], R. Garcia, M. Vaz-Da-Silva, S. Martins, A. Sarmenta, L. Santos

4008 Comparison of a cartridge-based host gene expression test to a manual method for use in the diagnosis of sepsis

W. Sinclair* [Salt Lake City, United States], J. Mccleave, P. Sillekens, I. Keuleers, T. Vanhoey, S. Cermelli, B. Lopansri
Host biomarkers to differentiate bacteraemias from microbiologically proven viral infection in adults with acute fever episodes attending outpatient clinics in Tanzania

Predictive value of CD4+T helper lymphocytes, associated biomarkers and procalcitonin in the prognostication of polytrauma patients with sepsis
S. Khurana* [Delhi, India], P. Mathur, N. Bhardwaj, S. Kumar, S. Sagar, R. Aggarwal, K. Soni, R. Malhotra

The REAnimation Low Immune Status Markers study: phenotypic and functional alterations of innate immune response in critically ill patients

Proprotein convertase subtilisin/kexin type 9 (PCSK9) is elevated in bloodstream infections and correlates with C-reactive protein
C. Pollotto* [Perugia, Italy], V. Scaglione, S. Bastianelli, C. Bisti, D. Francisci

Proinflammatory biomarkers are not useful as sepsis outcome predictors in patients older than 75
S. Mitic* [Novi Sad, Serbia], S. Adamovic, A. Vukelic, B. D. Bjelic, L. Chetkovich

Regulation of intestinal bacterial translocation by intestinal lamina propria dendritic cells expressing TLR5 after trauma/haemorrhagic shock
Z. Yun* [Hangzhou, China], J. Zhang, C. Zhang

Generation of protective antibodies against heterologous Acinetobacter baumannii isolates
G. Kamuyu* [London, United Kingdom], S. Willcocks, F. Agostini* [Oullins Cedex, France], M. Delles

The role of liposome positive charge on immune responses generated in BALB/c mice immunized with Leishmania homologue of receptors for Activated C Kinase (LACK) of Leishmania major
M. Soosaraei* [Sari, Iran]

Serum active Granzyme A: a new biomarker that contributes to the pathogenesis of peritoneal sepsis

Bacterial DNA promotes tau and beta-amyloid aggregation and is suggested as a novel therapeutic target for Alzheimer’s disease
G. Tetz* [New York, United States], S. Pritzkow, M. Pinha, N. Mendez, C. Sota, V. Tetz

Efficacy of memory B lymphocytes in experimental model of pneumonia caused by Pseudomonas aeruginosa
T. Cebrero Cangueiro* [Seville, Spain], G. Labrador Herrera, M. Carretero Ledesma, Y. Smani, J. Pachon-Diaz, M. Pachon-Ibáñez

Efficacy of immunoglobulin enriched in IgM, alone and in combination, in experimental model of pneumonia caused by Pseudomonas aeruginosa
T. Cebrero Cangueiro* [Seville, Spain], G. Labrador Herrera, M. Carretero Ledesma, Y. Smani, J. Pachon-Diaz, M. Pachon-Ibáñez

Host responses to infection evaluated in vitro and in vivo

Regulation of intestinal bacterial translocation by intestinal lamina propria dendritic cells expressing TLR5 after trauma/haemorrhagic shock
Z. Yun* [Hangzhou, China], J. Zhang, C. Zhang

 invocation of innate immunity pulmonary mechanism after influenza virus infection of mice model
F. Riviere* [Bretigny sur Orge, France], C. Vigne, J. Burger, A. Garnier, J. Tournier, E. Billon-Denis

Investigation of the pro-autophagic effect of IL-36α and lipopolysaccharide in THP-1 cell line
Z. Al-Luhaibi* [Szeged, Hungary], K. Megyeri, G. Seprényi

Monocyte progenitors are effector cells in mycobacterial infections
A. Hanrath* [Newcastle upon Tyne, United Kingdom], C. Hatton, C. Browne, J. Vowles, S. Cowley, W. James, S. Hambleton, D. Duncan

Investigation of the pro-autophagic effect of IL-36α and lipopolysaccharide in THP-1 cell line
Z. Al-Luhaibi* [Szeged, Hungary], K. Megyeri, G. Seprényi

Monocyte progenitors are effector cells in mycobacterial infections
A. Hanrath* [Newcastle upon Tyne, United Kingdom], C. Hatton, C. Browne, J. Vowles, S. Cowley, W. James, S. Hambleton, D. Duncan

Pharmaceuticals of radiolabeled anti-mousePD-L1 in immune-challenged tumour-bearing mice
G. Sandker, P. Wierstra, J. Molkenboer-Kuenen, M. Gotthardt, G. Adema, J. Bussink, S. Heskamp, E. Aarnsten* [Nijmegen, Netherlands]

Cell immunity in maxillofacial actinomycescises disease
N. Agayeva* [Baku, Azerbaijan], V. Marimanov, E. Agayeva, H. Aliyeva, R. Bayramova

Inflammatory response of murine macrophages and alveolar epithelial cells following exposure to Aspergillus fumigatus spores
F. Agostini* [Gullins Cedex, France], M. Delles, T. Déméauté, G. Devouassoux, A. Bentaher, J. Menotti

NK cell deficiency and cryptococcosis
M. Martinot* [Colmar, France], C. Fornier, S. Li, C. Pipероглу, C. Démerle, M. Mohseni-Zadeh, C. Mody, F. Vely

Characterisation of immune response of patients with rheumatic disorders and latent tuberculosis infection
E. Petruccioli, V. Vanini, G. Ippolito, D. Goletti* (Rome, Italy)

Tuberculosis impacts immune-metabolic pathways resulting in perturbed cytokine responses
2669 Streptococcus pneumoniae intracellular survival in THP-1 macrophages activated with different doses of lipopolysaccharide
P. Conde, N. Vázquez Burgos* (Malins de Rei, Spain), R. López, L. Fernandez Barat, A. Torres

2688 Toll like receptors, IFN-lambdas and IFN-stimulated genes expression in cystic fibrosis patients with rhinovirus infection

2921 Bacteremia with ESBL-producing Enterobacteriaceae is associated with increased levels of IgG antibodies specific to CTX-M-15 and/or CTX-M-27
T. Sahlinström, D. Ljungquist* (Skäret, Sweden), Y. Su, F. Resman, E. Mattsson, J. Thom, K. Riesbeck

445 Immunisation: new challenges and new solutions
Session accepted as Paper Poster Session

4608 Live probiotic vaccine against influenza virus infection
T. Gupalova, Y. Desheva, G. Leontieva, E. Kuleshevich, T. Kramskaya, E. Bormotova, A. Tsapieva, A. Suvorov*

600 Impact of a catch-up strategy of Tdap vaccination during hospitalisation on vaccination coverage among people over 65 years of age in Sarthe: the HOSPIVAC study
S. Bianchi* (Le Mans, France), N. Crochette, L. Hery, S. Laforest, J. Toque, J. Vaux

5764 Th2 response may be deleterious to protect against Staphylococcus aureus bacteremia
A. Le Bot* (Rennes, France), V. Bordeau, S. Reissier, S. Dian, C. Gonzalez, M. Greogio, M. Lesouhaitier, Chabeskaia, F. Bricé, M. Revest

6943 Utility of early kinetics of TTVDNA in stool for the prediction of intestinal graft versus host disease in the allogeneic haematopoietic stem cell transplantation setting

Session accepted as Paper Poster Session

668 Analysis of the vaccination coverage in a dispensary in Mayotte, an overseas department and region of France
C. Pascol* (Blavaoy, France), O. Lesens

7383 Association of IL-27 and STAT3 genetic polymorphism on the susceptibility of tuberculosis in western Chinese Han population
M. Li* (Chengdu, China), L. Jiao, W. Min Jin, H. Bai, Q. Wu

7525 Innate immunity measured by leukocyte deformability predicts outcomes in undifferentiated emergency department patients with urinary symptoms
C. Thomas, M. Musso, D. Hamer, R. Sheybani, T. Caffery, H. Tse, A. Shah, H. O’Neal Jr*

8221 Controlled human infection with Neisseria lactamica induces B cell responses that are cross-reactive with Neisseria meningitidis
A. Dale* (Southampton, United Kingdom), A. Theodosiou, J. Laver, E. Roche, A. Hill, A. Gorringe, M. Polak, A. Vaughan, R. Read

5514 Pentameric IgM does not improve clinical outcome in adults with sepsis after major abdominal surgery

4044 Is associated with increased levels of IgG antibodies specific to CTX-M-15 and/or CTX-M-27

G. Cimino, P. Palange, A. Pierangeli, C. Scagnolari, M. Mazzone, P. Pafundi, M. Montanaro, P. Saturnino

S. Chabelskaia, F. Brice, M. Revest

Session accepted as Paper Poster Session

7525 Physicochemical characterisation of aluminium hydroxide and aluminium phosphate and their potential adjuvant function in combination with squalene emulsion for EV71 vaccine development
M. Huang* (Zhunan, Taiwan)

2640 Utility of early kinetics of TTVDNA in stool for the prediction of intestinal graft versus host disease in the allogeneic haematopoietic stem cell transplantation setting

J. Michon* (Caen, France), A. Fournier, X. Lecoutour, R. Verdon, J. Michon

Factors influencing vaccination coverage among children aged 2–3 months in Afghanistan
M. Mohammad Yousuf* (Kabul, Afghanistan), A. Aalemi, K. Shahpar

395 The economic burden of Clostridioides difficile infection in patients with haematological malignancies: a case-control study
L. Duhalde, L. Lurienne* (Paris, France), S. Wingen-Heimann, L. Guillou, R. Buffet, P. Bandinelli
936 Risk factors and clinical characteristics of virus infection after haematopoietic stem cell transplantation
G. Koğar Ünivar* (Kayseri, Turkey), Z. Tun Yuce, A. Ulu Kilic

1895 Dalbavancin as definitive therapy for Gram-positive infections in patients with haematologic malignancies and haematopoietic cell transplant recipients
C. Howard* [Morgantown, United States], A. Cumpston, D. Stain

4889 Infections in haematological patients receiving CD19 CAR-T cell immunotherapy: real-life data
C. Cardoso* [Barcelona, Spain], J. Delgado, V. Ortiz-Maldonado, P. Puerta, E. Moreno, M. Chumbita, N. Garcia-Pouton, A. Urbano-Ispizua, J. Esteve, M. Juan, A. Sariano, C. Garcia Vidal

5088 Trends in Gram-negative bacteraemia in adult febrile neutropaenic cancer patients in a high-resistance setting during the last decade
C. Ayaz, E. Bilgin, G. Hazırolan, B. Sancak, M. Akova* [Ankara, Turkey]

5470 Catheter-related and non-catheter-related bloodstream infections in oncological patients

5474 Infectious complications during anti-CD19 targeted chimeric antigen T cell receptors [CAR-T] immunotherapy in relapsed/refractory aggressive B cell non-Hodgkin lymphomas [NHL]: observational retrospective study in one centre

6970 Predictive value of a positive Pneumocystis jirovecii DNA result in the diagnosis of Pneumocystis jirovecii pneumonia in haematological patients

7421 Infections associated with kinase and antiapoptotic Bcl-2 inhibitors in a cohort of real-life haematological patients

7604 Incidence and utility of follow-up blood cultures in haematology/oncology patients with Gram-negative bacteraemia
A. Clemmons* [Augusta, United States], D. Chastain, H. Young, M. Hayashi, E. Kennedy, C. Bland

7710 Clinical characteristics and mortality-related factors of bloodstream infections in patients with acute leukaemia: a single-centre experience with 152 patients
G. Mendez, C. Niveyro* [Posadas, Argentina], P. Villaiba, K. Salvatierra, C. Villaiba, H. Bernard

7863 The management of Enterococcus bloodstream infections in cancer patients: impact of central venous catheters
H. Awadh, M. Khalil, A. Chaftari* [Houston, United States], J. Fares, Y. Jiang, R. Wilson Dib, S. Ali, R. Hachem, I. Raad

7994 Potential role of procalcitonin in antimicrobial stewardship programme in febrile neutropenic cancer patients
P. Chaftari* [Houston, United States], A. Chaftari, R. Hachem, S. Yeung, Y. Jiang, A. Malek, V. Mulanovich, I. Raad

8178 Application of WISCA [Weighted Incidence Syndromic Combination Antibiotic] to guide empiric therapy in oncological paediatric patients with febrile neutropenia
E. Barbieri* [Padova, Italy], D. Bottiglengia, P. Costenaro, A. Marzolla, M. Petris, M. Pierobon, G. Biddeci, C. Giaquinto, A. Biffi, D. Donà

8465 Infectious complications in patients with relapsed/refractory Hodgkin’s lymphoma during new agents’ therapy

9053 Trends in antimicrobial resistance in Gram-negative pathogens among haematological patients: results of multi-centre study
G. Klyasova* [Moscow, Russian Federation], A. Korobova, S. Khrulnova, A. Fedorova Mironova, I. Frolova, K. Tandilova, A. Vetokhina, I. Molchanova, O. Kutsevalova

9131 Carbapenemase-producing Klebsiella pneumoniae belonging to sequence type 23 is a predictor of poor outcome in haematological patients
K. Tandilova* [Moscow, Russian Federation], G. Klyasova, S. Khrulnova, P. Elena, S. Kravchenko, E. Gribanova, E. Zvankov, G. Galstyan, V. Savchenko

9377 Discontinuation of antimicrobial therapy during fever of unknown origin in adult neutropenic patients according to ECIL-4 criteria: RELAPS, a descriptive cohort study

9542 Outcome of infections caused by carbapenemase-producing Enterobacteriales in patients with haematological disorders
K. Tandilova* [Moscow, Russian Federation], G. Klyasova, S. Khrulnova, P. Elena, S. Kravchenko, E. Gribanova, E. Zvankov, G. Galstyan, V. Savchenko
Abstract Categories 2020

9566 Cytomegalovirus reactivation in allogeneic stem cell transplant recipients: frequency, time to reactivation and dynamic of viremia in different types of donors and in repeated episodes
M. Garnica* [Rio de Janeiro, Brazil], S. Dalcolmo, B. Gaio, I. Alves, M. Valetim, A. Moialino

1577 Efficacy of beta-lactam/beta-lactamase inhibitors to treat extended-spectrum beta-lactamase-producing Enterobacteriaceae bacteraemia secondary to urinary tract infection in kidney transplant recipients

1883 Post-transplant lymphoproliferative disorders and association of antiviral prophylaxis in a nationwide cohort study

2187 Risk factors for developing BK virus associated nephroptathy: a single-centre retrospective cohort study of kidney transplant recipients
C. Larant* [Uppsala, Sweden], G. Westman, A. Bergqvist, B. Von Zur-Mühlen, B. Eriksson

2509 Hospital-acquired pneumonia in liver transplant recipients
V. Khillan* [New Delhi, India], G. Pindi, V. Pamecha, P. Kale

3373 High-dimensional single cell analysis identifies unexpected distribution of T cell populations in liver transplanted HIV-positive patients

3581 Epidemiology and outcomes of microbiologically documented bacterial foodborne infections in solid organ transplant recipients: a 10-year nationwide cohort
L. Van Den Bogaart* [Lausanne, Switzerland], A. Egli, L. Walti, D. Neofytos, C. Garzoni, K. Boggian, C. Berger, N. Mueller, D. Manuel, M. Mombelli

Session accepted as Paper Poster Session

Infections after solid organ transplant

429 Late-onset Pneumocystis jirovecii pneumonia in renal transplant recipients
A. Cruz* [Sterling Heights, United States], C. Jarrin Tejada

1577 Efficacy of beta-lactam/beta-lactamase inhibitors to treat extended-spectrum beta-lactamase-producing Enterobacteriaceae bacteraemia secondary to urinary tract infection in kidney transplant recipients

5968 Measles seropositivity in renal transplant recipients in the presence of ongoing outbreaks: a single centre analysis
F. Wagner, D. Sidler, M. Barbani, F. Suter-Riniker, P. Jent, C. Hirsle, L. Walti* [Bern, Switzerland]

5297 Impact of pretransplant norfloxacin prophylaxis on multidrug-resistant post–liver transplant infections

5409 Investigating the microbiological growth of donor organ preservation fluid in liver and kidney transplantation
J. Helliwell, N. Cutmore* [Leeds, United Kingdom], N. Young

5638 Risk factors for carbapenem-resistant Enterobacteriaceae acquisition among kidney transplant recipients
M. Freire* [Sao Paulo, Brazil], L. Carvalho, F. Spadao, F. De Paula, W. Nahas, E. David Neto, L. Pietrrotti

5361 Usefulness of human cytomegalovirus (HCMV)-specific immunological monitoring in the management of HCMV infection in lung transplant recipients

5409 Protective role for cytomegalovirus-specific neutralising antibodies in kidney transplant recipients treated with T-cell-depleting agents

6841 Infections due to multidrug-resistant bacteria among Swiss solid organ transplant recipients between 2012 and 2017

7210 Brucellosis in different types of transplantation
M. Rabiei, F. Imanzade, I. Alavidarazam* [Tehran, Iran], S. Shokouhi
Early cytomegaloovirus reactivation and bacterial infections affect the mortality of patients after kidney transplant
I. Spalliera* (Rome, Italy), M. Iannetta, N. Cesta, M. De Masi, V. Malagnina, C. Cerva, L. Ferraris, L. Tati, G. Tison, M. Andreoni, L. Sarmati

Session accepted as Mini-oral Flash Session
Moving targets: vaccines and the changing epidemiology of measles and pneumococcal disease

Increase in potentially measles-susceptible young healthcare workers in South Korea
Y. Kim* (Wonju, South Korea), B. Ha, H. Jeong, G. Hwang, Y. Uh, I. Jung, H. Kim

Comparison of early effects of Streptococcus pneumoniae vaccination policies on nasopharyngeal carriage in a Palestinian population
M. Ramlawi* (Jerusalem, Palestine), K. Azmi, Z. Abdeen

Vaccination perception and factors influencing MMR vaccination decisions during a university measles outbreak in a country with a high vaccine hesitancy
J. Michon* (Caen, France), A. Fournier, F. Appia, S. Villedieu, A. Leprieur, C. Porterie, R. Verdon, A. Baldolli

Vitamin D3 supplementation with a daily dose of 400 or 1200 IU results in similar antibody concentrations to measles, mumps and rubella in vaccinated 2-year-old Finnish children

The proportion of invasive pneumococcal disease and pneumococcal pneumonia in UK adults potentially covered by the 13-valent and the next-generation of pneumococcal conjugate vaccines under development

Invasive pneumococcal disease among adults in Germany, nine years after PCV13 introduction
M. Van Der Linden* (Aachen, Germany), A. Itzek, S. Perniciaro, M. Imöhl

Streptococcus pneumoniae: serotype distribution in adults with invasive disease after 8 years of systematic vaccination of children with PCV13

Potential coverage of invasive pneumococcal disease by current and next generation of anti-pneumococcal vaccines in children and adults in Spain
S. De Miguel, M. Domenech, J. Sempere, I. Del Rio, B. López Ruiz, F. González Camacho, J. Yuste* (Madrid, Spain)

Mapping a nosocomial outbreak of measles, coinciding with a period of sustained transmission in south London in 2018

A prolonged measles outbreak in a vaccine refusing community, Austria, 2019
L. Henszel* (Vienna, Austria), D. Schmid, A. Grisold, H. Holzmann

Stenotrophomonas maltophilia bloodstream infections in umbilical cord blood transplant recipients

Shortened antibiotic treatments for Gram-negative bacteriaemia in cancer patients: less is possible

Incidence of bloodstream infection from multidrug-resistant bacteria in haematological patients with rectal colonisation
M. Peradotto* (Turin, Italy), G. Bianco, M. Boattini, A. Bondi, M. Iannacccone, Z. Teresa, R. Cavallo, C. Costa

Breakthrough blood culture isolates whilst on broad spectrum antimicrobial therapy for high-risk neutropenic fever: more common and resistant that previously thought
A. Douglas* (Parkville, Australia), S. Tio, K. Thursky, L. Worth, A. Bajel, M. Slavin

Optimal treatment duration of Pseudomonas aeruginosa infections in allogeneic haematopoietic cell transplant recipients

Intestinal colonisation by multidrug-resistant Enterobacteriaceae and infections in patients receiving an allogeneic haematopoietic stem cell transplantation: the ENTHERE-SCT Study (PI16/01415)

Haematology/oncology patients might have different risks for MDR according to different types of chemotherapy
J. Barbosa* (São Paulo, Brazil), K. Yaqub Ibrahim, P. Banazzi, D. Peixoto, R. Ito, E. Abdala, M. Freire
Impact of non-use of levofloxacin prophylaxis during neutropenia on reduction of resistance among Gram-negatives causing bloodstream infection in haematopoietic stem cell transplantation patients: very successful preliminary data

T. Guimaraes* [São Paulo, Brazil], F. Spadao, L. Caroline, M. Nascimento, V. Rocha, S. Figueiredo Costa

The probability of infection caused by carbapenemase-producing Enterobacteriales (CPE) in haematological patients with rectal carriage of CPE

K. Tandilova* [Moscow, Russian Federation], G. Klyasova, S. Khrulnova, P. Elena, S. Kravchenko, E. Gribanova, E. Zvankov, G. Galstyan, V. Savchenko

Identification of anti-TPI H8 antibody-epitope analogues as putative active vaccine against Staphylococcus aureus

L. Rummler* [Cologne, Germany], S. Mertins, M. Kroenke, A. Klimka

Novel lipid A mimetics [BECC438 and BECC470] act as potent adjuvants in bacterial and viral subunit vaccines

E. Harberts, D. Varisco, A. Jain, R. Ernst* [Baltimore, United States]

Novel lipid A mimetics act as potent adjuvants in bacterial and viral subunit vaccines

E. Harberts, D. Varisco, A. Jain, R. Ernst* [Baltimore, United States]

Susceptibility to Group A Streptococcus invasive infections in children: preliminary results of a multicentre prospective study in France: the STREPTOPEDIA study

High-frequency of Specific Polysaccharide Antibody Deficiency [SPAD] in adults with unexplained recurrent and/or severe bacterial infections: the SPIDAC French Study

Integrating genome-wide association study with bulk and single-cell RNA sequencing reveals a role for LY8 in the anti-Candida host response

V. Kumar* [Groningen, Netherlands], D. De Vries, V. Matzarakis, O. Bakker, H. Brugge, H. Westra, M. Netea, L. Franke, M. Van Der Wijst

The difficulties of differentiating central nervous system infection from disease relapse in a cohort of adult patients with haematological malignancy: 10 years’ experience from a central London hospital

E. Lim, R. Gnanadurai, M. Escobedo-Cousin, L. Bell* [London, United Kingdom], N. Mccann, J. Ellis, D. Ming, K. Cwynarski, R. Miller, E. Wall, R. Heyderman, H. Hyare

Epidemiology, clinical characteristics and outcomes of central nervous system infections in solid organ transplant recipients: a nationwide cohort study

L. Van Den Bogaart* [Lausanne, Switzerland], D. Nefytyos, L. Walti, N. Mueller, N. Khanna, K. Boggian, K. Hadaya, C. Garzoni, M. Mombelli, O. Manuel

The contribution of host genetics to infection risk

L. Van Den Bogaart* [Lausanne, Switzerland], D. Nefytyos, L. Walti, N. Mueller, N. Khanna, K. Boggian, K. Hadaya, C. Garzoni, M. Mombelli, O. Manuel

Increased risk of bacteraemia caused by Staphylococcus aureus or Escherichia coli in patients with C10X polymorphism in the NLRP3 inflammasome gene CARD8

Genetic score involving polymorphisms of innate immune receptors for predicting cytomegalovirus infection in solid organ transplant recipients: a prospective multi-centre cohort study

M. Bodro Marimont* [Barcelona, Spain], C. Cervera, F. Lozano, L. Linares, J. Liopis, G. Sanclemente, M. Fernandez Ruiz, M. Farinas, S. Cantisan, M. Montejo Baranda, E. Cordero Matias, I. Orial Bermúdez, M. Marcos, M. Moreno Camacho

Maraviroc in PML-IRIS associated with immunotherapies: a case series

Human polyomaviruses in the cerebrospinal fluid of neurological patients

S. Delblue* [Milan, Italy], D. Franciotta, M. Dolci, S. Lucia, R. Ticozzi, S. D’Alessandra, G. Campisciano, M. Comar, P. Ferrante, M. Ciotti

ESCMID Observerships

Update and improve your clinical and laboratory skills!

The ESCMID Observership programme is an opportunity for ESCMID members to visit an ESCMID Collaborative Centre (ECC) to observe good clinical and laboratory practice. We have two types of ESCMID Observerships:

ESCMID Funded Observerships
Apply during the call for one of the valuable funded observerships. There are two calls per year, with 50 places available per call for ESCMID Young Scientist Members. More information is available at the ESCMID website. Important dates and deadlines will be announced via our newsletters as well as the ESCMID social media channels.

ESCMID Unfunded Observerships
Apply anytime throughout the year for a visit in another country lasting between one day and one month. This observership type is open for all ESCMID members and more information is available at the website below.

www.escmid.org/observerships

Abstract 1

The impact of microbiome DNA enrichment methods on host DNA depletion efficiency and bacterial community structure of infected tissue samples

Fatemah Sadeghpour Heravi1, Martha Zakrzewski2, Karen Vickery1, Honghua Hu1

1Macquarie university, Sydney, Australia, 2QIMR Berghofer Medical Research Institute, Brisbane, Australia

Background: Shotgun metagenomic sequencing is a genome-wide sequencing approach to explore bacterial communities directly from their habitat or infected sites. However, extracting high-quality bacterial DNA with minimum host DNA contamination from infected tissue samples suitable for metagenomics studies is very challenging. Although metagenomics has shown great promise in environmental samples, it is particularly difficult in infected tissue samples with a great amount of host DNA contamination. The co-extraction of host DNA with bacterial DNA can mask the microbial signals in the sequencing process.

Materials/methods: In this study, we evaluated the impact of different microbiome DNA enrichment methods (NEBNext Microbiome DNA Enrichment kit, Molzym Ultra-Deep Microbiome Prep, QIAamp DNA Microbiome kit, and HostZERO microbial DNA kit) on host DNA depletion efficiency and bacterial composition of infected tissue samples (diabetic foot infection) using quantitative real-time PCR and 16S ribosomal RNA sequencing methods. The host DNA depletion ratio and the microbial profile of diabetic foot infections were compared before and after applying the selected microbiome enrichment kits.

Results: Molzym extracted the lowest amount of bacterial load with a high level of host DNA contamination. In contrast, HostZERO and QIAamp methods recovered the highest amount of bacterial genomes with a minimum amount of host DNA contamination, attesting to the efficacy of these two methods in shotgun metagenomic sequencing studies. Microbial composition was also highly similar between the original and enriched samples processed by NEBNext, resembling most of the predicted taxa in the control sample. Also, ten of the sixteen genera predicted in the control sample were recovered by all the enrichment methods of which the NEBNext method recovered all of the genera and Molzym recovered the lowest number of bacterial genera.

Conclusions: Our findings can provide a useful guideline for scientists in selecting DNA enrichment methods, particularly those who wish to deplete a high amount of host DNA contamination and preserve a high amount of bacterial DNA load from infected tissue samples for shotgun metagenomic sequencing.

**Bacteraemia with anaerobic bacteria and association with colorectal cancer**

Ulrik S. Justesen*1; Stig Lønberg Nielsen2; Thøger Gorm Jensen3; Ram B. Dessau1,4; Jens Kjelseth Møller5; John E. Coia6; Steen Lomborg Andersen7; Court Pedersen2; Kim Oren Gradel8

1Odense University Hospital, Department of Clinical Microbiology, Odense, Denmark, 2Odense University Hospital, Department of Infectious Diseases, Odense, Denmark, 3Slagelse Hospital, Department of Clinical Microbiology, Slagelse, Denmark, 4University of Southern Denmark, Department of Regional Health Research, Odense, Denmark, 5Lillebælt Hospital, Department of Clinical Microbiology, Vejle, Denmark, 6Sydvestjysk Sygehus, Department of Clinical Microbiology, Esbjerg, Denmark, 7Sygehus Sønderjylland, Department of Clinical Microbiology, Sønderborg, Denmark, 8Odense University Hospital, Center for Clinical Epidemiology, Odense, Denmark

**Background:** Studies have reported an association between Bovis group streptococci, *Clostridium septicum* and colorectal cancer (CRC). Recently associations between different *Bacteroides* spp., *Fusobacterium nucleatum* and CRC have also been reported. We wanted to investigate this further in a large scale study.

**Materials/methods:** We performed a population-based cohort study including data on blood cultures from 2007 to 2016 covering a population of more than 2 million people. We combined blood culture data with the national register for colorectal cancer (Danish Colorectal Cancer Group Database) and identified incident CRC after bacteraemia. The risk of incident CRC until 2018 was investigated for *Bacteroides* spp., *Clostridium* spp. and *Fusobacterium* spp. and compared with Bovis group streptococci, *Escherichia coli*, *Staphylococcus aureus* and negative blood culture controls matched 1:5 by age and sex.

**Results:** We included 45,760 bacteraemia episodes, of which 492 (1.1%) were diagnosed with CRC after the bacteraemia; 241 (0.5%) within 1 year. The risk of CRC for selected bacteria is shown in Table 1 (results for *E. coli* and *S. aureus* are not shown but were similar to negative blood cultures). Most anaerobic species were associated with a considerable increased risk of CRC (up to 40 times) compared with negative blood cultures.

**Conclusions:** In this large scale cohort study, it was found that in patients with bacteraemia caused by selected anaerobic bacteria the risk of incident CRC was increased up to 40 times compared with patients with bacteraemia caused by non-anaerobic bacteria or negative blood cultures. Bacteraemia with certain anaerobic bacteria could potentially result in a recommendation of further evaluation for CRC in selected patients.

**Table 1.** No. bacteraemia episodes followed by CRC/total no. episodes [%]

Crimean-Congo haemorrhagic fever in an emergency department in Spain

Lia Monsalve-Arteaga1, Moncef Belhassen García1,2, Juan-Luis Munoz-Bellido1,2, Montserrat Alonso Sardón2, Anabel Negredo3, María Paz Sanchez Seco1, Fernando De Oru Manchón1, Nuria Leralta1, Isabel Bas García1, Jesús Sánchez Serrano2, Jorge García Criado2, Antonio Muro Alvarez2, Amparo López Bernús2

1Universidad de Salamanca, Salamanca, Spain; 2Complejo Asistencial Universitario de Salamanca, Salamanca, Spain; 3Instituto de Salud Carlos III, Majadahonda (Madrid), Spain

Background: Crimean-Congo haemorrhagic fever (CCHF) is a widespread tick-borne viral disease caused by the homonymous virus (CCHFV), a Nairovirus of the Nairoviridae family. It has been implicated in severe viral haemorrhagic fever outbreaks. During the summer of 2016, the first two cases of this disease were reported in Spain. Nowadays, this disease is difficult to get eradicated because of its enzootic life cycle. The aim of this study was to determine the presence of CCHF among patients coming for a febrile illness to Complejo Asistencial Universitario de Salamanca (CAUSA), Salamanca, western Spain, during the spring-summer periods in 2017 and 2018.

Materials/methods: We evaluated prospectively patients older than 18 years, who came to the Emergency Department of CAUSA presenting fever as the only or main symptom. We determined specific IgM and IgG antibodies against CCHFV by the VertoCrimea ELISA kit-test (Vector-Best, Russia), an in-house ELISA and two immunofluorescence assays (Euroimmun, Germany) against two different glycoproteins [nucleoprotein and glycoprotein], and an in-house nested RT-PCR. Details were collected from the medical records.

Results: 133 patients were selected for the study. Mean age (±SD) was 67.63 years (±18.8). 81 patients (60.9 %) were male. Most patients were diagnosed as genitourinary or respiratory syndromes. The 3rd most frequent diagnosis was acute undifferentiated febrile illness. Three patients had anti-CCHFV IgG antibodies, suggesting a past infection. Two patients were found to have anti-CCHFV IgM antibodies, and one of them was also positive by RT-PCR. Both patients lived in the province of Salamanca (western Spain). One patient was involved in animal husbandry. None of these two cases were associated to a nosocomial outbreak.

Conclusions: This study suggests that CCHF is an identifiable cause of febrile illness in Spain, and therefore should be suspected when a patient comes to the emergency department with fever and hepatic impairment, and/or haemorrhagic phenomena, especially in spring and summer seasons, and if they have risk activities. All of this, in order to establish support treatment and isolation measures as soon as possible, thus reducing the risk of mortality and nosocomial outbreaks.

Figure 1: Acute and past infections by CCHFV identified in Spain

Abstract 19

**Genetic characterisation of co-circulating community *Staphylococcus aureus* and *Streptococcus pyogenes* causing skin and soft tissue infections in Gambia**

Alexander Keeley*1, Saikou Y Bah1,2, Edwin Armitage1, Elina Senghore2, Jarra Manneh2, Saffiatou Darboe1, Abdul Karim Sesay2, Bruno Pichon3, Ulf Schaefer3, Claire Turner1, Thushan I De Silva1,2

1The University of Sheffield, The Florey Institute, Sheffield, United Kingdom, 2Medical Research Unit The Gambia at the London School of Hygiene and Tropical Medicine, Faraja, Gambia, 3Public Health England, National Infection Service, London, United Kingdom

**Background:** *Staphylococcus aureus* and *Streptococcus pyogenes* are major global pathogens. Infection ranges from asymptomatic carriage to fatal invasive infection. Understanding the transmission dynamics and genetic diversity within low- and middle-income countries (LMIC) with a high burden of disease is required for effective vaccine development and public health interventions. We aimed to characterize the genetic diversity of *S. aureus* and *S. pyogenes* causing skin and soft tissue infection (SSTI) in children in The Gambia using whole genome sequencing.

**Materials/methods:** A point prevalence study of pyoderma was conducted over 4 months in randomly-selected census-derived geographical clusters of Sukuta, a peri-urban area in The Gambia. Swabs from pyoderma lesions were cultured for *S. aureus* and *S. pyogenes*. A single colony of each bacteria was sub-cultured, DNA extracted and sequenced using an Illumina MiSeq platform. Multi-locus sequence typing (MLST, MOST), de novo assembly (SPAdes), gene annotation (prokka), emm typing (CDC-typing-tool), core genome determination (roary) and maximum likelihood phylogenetic tree construction (RAxML) were used to analyse sequence data.

**Results:** Of 1441 children from nine geographical clusters, 251 (17.4%) had pyoderma. Of these, *S. aureus* was isolated from 202 children (80.5%) and *S. pyogenes* from 129 (51.4%). Co-infection was seen in 104 children (41.4%), which is comparable to the limited data from LMICs. Thus far sequence data from 93 *S. aureus* isolates and 105 *S. pyogenes* isolates were suitable for analysis. The predominant *S. aureus* MLST clonal complexes (CC) were CC15 (29%), CC152 (20.4%), CC1 (14%) and CC5 (12.9%), collectively representing 76.3% of all sequenced isolates. *S. pyogenes* showed no emm-type predominance, with no single emm-type representing more than 5.7% of sequenced isolates and 44 distinct emm types. Within the three geographical clusters with the largest number of pyoderma cases, a single CC type was responsible for 25.5 – 35.7% of *S. aureus* infections, compared to 8.7 – 12.0% caused by any single *S. pyogenes* emm-type.

**Conclusions:** Our study provides the first whole genome sequence analysis of co-circulating community *S. aureus* and *S. pyogenes* causing SSTI from The Gambia. Further detailed interrogation of the larger dataset is ongoing, including evidence for transmission using combined epidemiological and genetic data.

**Abstract 24**

**High-dose ceftaroline fosamil recommendations for paediatric patients with *Staphylococcus aureus* complicated skin and soft-tissue infections using an extrapolation approach**

Phylinda Chan*, 1 Margaret Lynn Mcfadyen1, Andrea Quaye2, Heidi Leister-Tebbe3,4, Vicky Hendrick1, Jennifer Hammond1, Susan Raber5

1Pfizer, Sandwich, United Kingdom, 2Pfizer, Tadworth, United Kingdom, 3Pfizer, Collegeville, United Kingdom, 4Pfizer Inc, Collegeville, United States, 5Pfizer, La Jolla, United States

Abstract third-party references: Study sponsored by Pfizer.

**Background:** For adults and adolescents (aged 12 to <18 years with body weight ≥33 kg), the standard ceftaroline fosamil dose is 600 mg by 5–60 min intravenous (IV) infusion every 12 h (q12h) for complicated skin and soft-tissue infections (cSSTIs) caused by *Staphylococcus aureus* with ceftaroline minimum inhibitory concentration (MIC) ≤1 mg/L, whereas a “high dose” of 600 mg by 2-h IV infusion q8h is approved in Europe for MICs of 2 or 4 mg/L, based on population pharmacokinetic (PopPK) analyses and Phase III clinical trial data (NCT01499277). We conducted further PopPK analyses to support high-dose recommendations for paediatric patients (aged 2 months to <18 years) with cSSTI caused by *S. aureus* with suspected high MIC (2 or 4 mg/L).

**Materials/methods:** A PopPK model for ceftaroline fosamil and ceftaroline based on adult (n=944) and paediatric (n=304) data was used to simulate steady-state ceftaroline exposures and perform probability of target attainment (PTA) simulations for various paediatric high-dose regimens and renal function categories. PTA was calculated as the percentage of simulated patients achieving free ceftaroline plasma concentrations above the MIC per dosing interval (%fT>MIC) of 27%, 31% and 35% (*S. aureus* PK/pharmacodynamic targets for stasis, 1-log10 and 2-log10 kill, respectively). Exposures and PTA were matched to adults with normal renal function (body surface area-normalised creatinine clearance ≥80 mL/min/1.73 m²) receiving ceftaroline fosamil 600 mg by 2-h IV infusion q8h. Safety/tolerability data were extrapolated from paediatric trials of higher ceftaroline fosamil doses.

**Results:** For the proposed ceftaroline fosamil high-dose regimens [Table], across paediatric age groups and renal function categories, simulated ceftaroline exposures were similar to adults with normal renal function, with PTA >99% for MIC of 2 mg/L, and PTA similar to or higher than that in adults with normal renal function (>80%) for MIC of 4 mg/L.

**Conclusions:** These analyses support the extrapolation of efficacy based on PTA from adult to paediatric patients (aged 2 months to <18 years) with cSSTI caused by *S. aureus* with ceftaroline MICs of 2 or 4 mg/L at the proposed ceftaroline fosamil high-dose regimens for paediatric patients.
Table. Steady-state exposures and PTA based on simulations for paediatric patients (aged 2 months to <18 years) with normal renal function or renal impairment, at the proposed high-dose regimens of ceftaroline fosamil for treatment of cSSTI with MIC >1 mg/L

Metatranscriptomic analysis reveals active bacterial communities in diabetic foot infections

Fatemah Sadeghpour Heravi*1, Martha Zakrzewski2, Karen Vickery3, Honghua Hu4

1Macquarie university, Sydney, Australia, 2QIMR Berghofer Medical Research Institute, Brisbane, Australia

Background: DNA sequencing approaches have identified the complexity of bacterial communities present in diabetic foot infections. Despite the extended view of diabetic foot ulcers (DFUs) and diabetic foot infections (DFIs) microbiota, little is known about which active bacteria, bacterial pathways, and resistance genes are pertinent to infection, and if any differences in function are associated with increased infection severity.

Materials/methods: In this study, we applied RNA sequencing (metatranscriptomics) of DFI tissue samples to analyze the bacterial taxonomic composition, function, and antibiotic resistance of the active DFI microbiota at mild, moderate and severe stages of infection. Total RNA was extracted from infected tissue samples and rRNA was depleted. Putative bacterial mRNA was sequenced using the Illumina TruSeq protocol. Human RNA was filtered and quality control and trimming were performed on the sequencing reads. Bacterial mRNAs were mapped to bacterial genomes using Kraken, KEGG and CARD databases to identify the taxonomic composition, functional pathways, and antibiotic resistance profile of active DFI microbiota.

Results: Taxonomic profiling of bacterial transcript indicated that the main features in DFI consisted of fourteen bacterial phyla. Bacterial transcripts assigned to genera Spiroplasma, Vibrio, and Mycoplasma were significantly different between different infection severity (Anova, p<0.05). Mild and severe stages were dominated by the species Staphylococcus aureus and Porphyromonas asaccharolytica, respectively. The functional activity profile of the DFI microbiota was comprised of 132 metabolic pathways of which ribosome and thiamin being among the most highly expressed pathways. Moreover, a total of 131 antibiotic resistance genes, primarily involved in the expression of multidrug efflux pumps/exporters, and resistance to beta-lactam, macrolide, and tetracycline antibiotics were identified in the active DFI microbiota.

Conclusions: Taxonomic profiling, functional characterization and antibiotic resistance identification of the transcriptionally active microbial community analyzed in this study may help to provide an understanding of the role of key microorganisms in DFI and their association with disease severity. Such information may be clinically useful allowing replacement of DFI empirical therapy with targeted treatment.

Abstract 35

Evaluation of EUCAST rapid antimicrobial susceptibility testing (RAST) directly from blood culture bottles

Siti Nur Mahirah Bte Waled¹, Ying Tong Soo¹, Sally Ng², Ying Hua Peh², Ka Lip Chew*²

¹Ngee Ann Polytechnic, Singapore, Singapore, ²National University Hospital, Singapore, Singapore

Background: Rapid antimicrobial susceptibility testing (RAST) method for direct disk diffusion from positive blood cultures (BCs) with shortened incubation time was released by EUCAST in late 2018. An evaluation was performed for Gram-negative BC isolates at a 24-hour laboratory in a tertiary hospital.

Materials/methods: BCs positive with Gram-negative bacilli between 23/4/2019 and 21/6/2019, and forty-one spiked isolates were included. RAST was performed using six disks (ceftazidime, piperacillin-tazobactam, meropenem, ciprofloxacin, gentamicin, and amikacin) and compared against the routine method, Vitek 2 (bioMérieux). An audit of Vitek turnaround-time was also performed.

Results: Sixty-eight Escherichia coli (EC), forty-seven Klebsiella pneumoniae (KP), and thirty-three Pseudomonas aeruginosa were included. Categorical agreement (CA), very major errors (VME), and major errors (ME) were determined among interpretable results. The highest error rates were MEs in piperacillin-tazobactam for EC at 4 hours (7/11, 63.6%), and PA at 6 hours (1/1, 100%). Combined results of all isolates are presented in the table. Median turnaround-time to availability of Vitek results was 19.58 hours for EC (IQR: 17.38 – 21.38 hours), 19.43 hours for KP (IQR: 17.72 – 20.67 hours), and 23.3 hours for PA (IQR: 21.32 – 24.35 hours).

Conclusions: Introduction of RAST could significantly shorten turnaround-time of susceptibility testing. With the exception of piperacillin-tazobactam, the absolute number of errors for the majority of drug-bug combinations was low. A larger-scale evaluation is required to confirm these findings.

Mass-Up: free software for the analysis of mass spectra biomarkers

Maria Ercibengoa1, Ana Perez Gavilan1, Marta Alonso Asencio1, Miriam Alkorta Gurrutxaga1, Gustavo Cilla1, Jose Maria Marimon*1

1Biodonostia, Infectious Diseases Area, Respiratory Infection and Antimicrobial Resistance Group; Osakidetza Basque Health Service, Donostialdea Integrated Health Organisation, Microbiology Department, 20014 San Sebastian, Spain, San Sebastian, Spain

Background: In Clinical Microbiology, MALDI-TOF analysis of proteins is mainly used to obtain mass spectra for bacterial identification. Furthermore, discriminatory mass peaks [biomarkers] have been searched to identify different strain-specific traits such as antimicrobial resistance or virulence determinants. “Mass-up” is an open-source software that can be used in the analysis of MALDI-TOF-obtained spectra that allows the quick and easy identification of specific mass-peaks.

Materials/methods: This study was performed in the Microbiology Department of Donostia University Hospital (Basque Country, Spain). Mass-up software was used to find biomarkers to differentiate between Shigella spp. and Escherichia coli studying the MALDI-TOF mass spectra of 40 clinical isolates (4 S. boydii, 1 S. dysenteriae, 10 S. flexneri, 11 S. sonnei, 14 E. coli) and 6 reference strains (S. boydii CECT583, S. dysenteriae CECT584, S. flexneri CECT4804, S. sonnei CECT457, S. sonnei CECT4887 and E. coli ATCC25922). Mass-up software was also used to try to discriminate between S. aureus and MRSA (methicillin-resistant S. aureus) by analysing the mass spectra of 32 MRSA and 9 S. aureus clinical isolates based on described biomarkers [reviewed in Østergaard C. et al. Int J Med Microbiol. 2015;305:838.] To identify specific biomarkers, bacterial mass spectra were analysed using the Mass-up software [http://www.sing-group.org/mass-up/] developed by the University of Vigo (Galicia, Spain). This software allows in ten easy steps to perform different analysis such as quality control, discriminatory peaks discovery [biomarkers], principal component analysis, hierarchical clustering, biclustering and classification analysis on the aligned peak list.

Results: No species-specific peaks were observed in the mass spectra of E. coli and Shigella isolates: their differentiation was not possible. In addition, probably due to variation in the methodologies, previously reported biomarkers to differentiate between S. aureus and MRSA only partially matched with our findings. Some of the 44 MRSA biomarkers analyzed were found in both S. aureus and MRSA isolates, enabling the differentiation of 28/41 (68.3%) of the strains.

Conclusions: Mass-up is an easy-to-use, quick, free and reliable tool for the analysis of MALDI-TOF-obtained mass spectra. Using Mass-up no biomarkers could be found to differentiate between E. coli and Shigella species or between S. aureus and MRSA.

1 JMI Laboratories, North Liberty, United States, 1Amplyx Pharmaceuticals, San Diego, United States

Abstract third-party references: This study was performed by JMI Laboratories and supported by Amplyx Pharmaceuticals, which included funding for services related to preparing this abstract.

Background: Existing antifungal agents are active against many common opportunistic fungal pathogens; however, breakthrough fungal infections occur and often involve less frequently encountered yeast and mould isolates. These rarer isolates tend to exhibit diminished susceptibility to current agents. Manogepix (APX001A) is a novel inhibitor of the fungal Gwt1 enzyme [required for acylation of inositol during glycosylphosphatidylinositol anchor biosynthesis. The prodruk fosmanogepix, is being evaluated in Phase 2 clinical trials for invasive candidiasis/candidemia, Candida auris infections, invasive aspergillosis, and Cryptococcus meningitis. Manogepix is active against Candida [except C. krusei], Aspergillus, and difficult-to-treat moulds including Fusarium and Scedosporium species. In this study, we evaluated the in vitro activity of manogepix (MGX), anidulafungin (ANF), micafungin (MCF), fluconazole (FLU), and others against 1,294 clinical fungal isolates collected worldwide during 2018.

Materials/methods: Fungal isolates were collected from 69 medical centers in 24 countries in North America (46.3%), Europe (36.5%), Asia-Pacific (11.3%), and Latin America (5.9%). Among the isolates tested, 75.0% were Candida, 4.2% were non-Candida yeasts, including 33 Cryptococcus neoformans var. grubii (2.6%), 19.0% were Aspergillus, and 1.9% were other moulds. All isolates were tested by CLSI reference broth microdilution.

Results: MGX (MIC50/90, 0.008/0.03 mg/L) was the most potent antifungal agent tested against Candida isolates [Table]; ANF, MCF, and FLU MIC90 values were 64-, 32-, and 128-fold higher, respectively. MGX (MIC50/90, 0.25/0.5 mg/L) was 2-8-fold more active than ANF, MCF, and FLU against C. neoformans var. grubii. Similarly, MGX (MIC50/90, 0.06/1 mg/L) was 24-fold more active than ANF, MCF, and FLU against other yeast. Against Aspergillus, MGX (MIC50/90, 0.008/0.015 mg/L) was comparable in activity to ANF and MCF. MGX (MICvar, 0.03 mg/L) was ≥128-fold more active than ANF and MCF against Scedosporium isolates.

Conclusions: MGX demonstrated potent antifungal activity against Candida, Aspergillus, C. neoformans, and less common non-Aspergillus moulds including Scedosporium. Notable activity was seen against C. auris, echinocandin-resistant Candida, azole-resistant Aspergillus, and Scedosporium isolates. Further clinical development of fosmanogepix in difficult-to-treat resistant fungal infections is warranted.

Abstract 46

**Post-viral fatigue in dengue infection**
Chathurani Sigera¹, Chaturaka Rodrigo², Senaka Rajapakse³, Praveen Weeratunga³, Nipun Lakshitha De Silva³, S Deepika Fernando⁴

¹University of Colombo, Department of Parasitology, Faculty of Medicine, Colombo, Sri Lanka; ²University of New South Wales, Randwick Campus, Department of Pathology, School of Medical Sciences, Randwick, Australia; ³University of Colombo, Department of Clinical Medicine, Faculty of Medicine, Colombo, Sri Lanka

**Background:** Dengue is the most significant mosquito borne viral infection in the world in terms of morbidity. Post-viral fatigue (PVF) is observed after a dengue infection in both adults and children, but not studied extensively in the adult population.

**Materials/methods:** A prospective study was carried out to assess the incidence of fatigue in hospitalized dengue patients after 2 months of their hospital discharge. Non-pediatric (>12 years of age) and non-pregnant patients with an acute febrile illness (≤ 3 days) admitted to National Hospital of Sri Lanka from January 2018 to April 2019 were included this study. Dengue fever was confirmed with NS1 antigen testing or RT-qPCR. PVF was measured by contacting the patients, using the fatigue questionnaire developed by Dittner et al in 2004. The score of 4 or above consider as the cut off for fatigue. Demographic characteristics and clinical data of the patients were also collected.

**Results:** A total of 104 patients were recruited to the study (mean age – 34 years, SD ± 14.9, males – 61%): 69 dengue patients and 35 non-dengue patients. Out of 69 dengue patients, 27 (26%) were diagnosed with dengue hemorrhagic fever and 15 (14%) with severe dengue. PVF was present in 16 patients (13 dengue patients and 3 without dengue). There was no difference of development of fatigue between dengue and non-dengue patients (p<0.05).

Among dengue patients, symptoms of vomiting and bleeding, decreased hemoglobin level and decreased hematocrit within the first three days of fever showed a significant association with PVF (p<0.05). But after correction for multiple comparisons by Bonferroni correction, none of the variables showed a significant association with PVF. Severity of dengue and presence and absence of plasma leakage (p<0.05) had no association with PVF. Among non-dengue patients, only increased aspartate aminotransferase level showed a significant association with PVF (p<0.05) but it was not significant when corrected for multiple comparisons.

**Conclusions:** Severely symptomatic disease in early dengue fever may be associated with PVF but none of the predictors were significantly associated with PVF in this study after corrections for multiple comparisons. Financial assistance from, University of Colombo is gratefully acknowledged.

Background: Recent studies portend a rising global spread and adaptation of human- or healthcare-associated pathogens, thereby challenging the prevailing concepts of disease acquisition and transmission of these pathogens in the hospital setting. Global genome-based collections are missing for the emerging pathogen Stenotrophomonas maltophilia, listed by the World Health Organization as one of the leading drug-resistant nosocomial pathogens worldwide.

Materials/methods: Here, using a novel whole genome multilocus sequence typing scheme, we analyzed an international collection of 1,305 isolates of the emerging, multidrug-resistant, opportunistic pathogen Stenotrophomonas maltophilia from 22 countries to infer population structure, clonality, and transmission dynamics at a global level.

Results: We show that the S. maltophilia complex is divided into 23 monophyletic lineages, most of which harboured strains of all degrees of human virulence. Lineage Sm6 comprised the highest rate of human-associated strains, linked to key virulence and resistance genes. Transmission analysis identified a number of potential outbreak events of genetically closely related strains isolated within days or weeks in the same hospitals.

Conclusions: This first, large scale sequencing study at global scale for S. maltophilia provides evidence for the global prevalence of particular circulating lineages with hospital-linked clusters collected within short time interval suggesting transmission. This emphasizes the need to instate or re-enforce hygiene and infection control practices to minimize in hospital spread of these pathogens.
Figure: Spatiotemporal cluster analysis of 1,205 S. melliloti complex strains.  

a. The coloured ranges across the outer nicks and branches indicate the 23 lineages. The black dots indicate the location of the genome datasets used for whole genome Multilocus sequencing typing scheme generation. The rings, from inside to outside: 1) the isolation source of the strains classified as either environmental, anthropogenic, human, or unknown; 2) the detailed isolation source of strains similar to the first ring with the human strains subclassified into human-invasive, human-non-invasive, and human-respiratory; 3) the city of isolation; 4) the year of isolation (where available), with light colours representing earlier years and darker brown colours more recent isolation dates. The outer rings in black to grey indicate the single linkage-derived clusters based on the number of allelic differences between any two strains for 100 (d100 clusters) and 10 (d10 clusters) allelic mismatches. Red dots on the nodes indicate support values of 100%. 

b. Distribution of the number of wgMLST allelic differences between pairs of strains among the 1,205 S. melliloti complex strains.

**Abstract 52**

**Clostridioides difficile infection in immunocompromised hospitalised patients is associated with a high recurrence rate**

Alaa Atamna*, Tomer Avni, Jihad Bishara

1Beilinson hospital, Petah Tikva, Israel

Abstract third-party references: Rabin medical center, Beilinson hospital

**Background:** Clostridioides difficile infection (CDI) may pose a serious threat to immunocompromised patients (IMC). Herein, we evaluated the clinical outcomes of IMC patients with CDI.

**Materials/methods:** All consecutive hospitalized patients between January 1, 2013 and December 31, 2018 with laboratory confirmed CDI, were included in the study. Subjects were divided into two groups: IMC patients and controls. Primary outcome was the recurrence rate of CDI (rCDI) at 30/90 days after the first CDI episode. Secondary outcomes included 30/90 day all-cause mortality, length of hospital stay (LOS) and readmission rates. A multivariate analysis adjusted other risk factors for recurrence. An analysis of IMC patient subgroups (based on type of IMC conditions) was also performed. Results are reported as odds ratios (OR) with a 95% confidence interval (95% CI).

**Results:** A total of 573 patients were included, amongst them 149 IMC patients (36 solid organ transplants, 38 undergoing chemotherapy, 62 haematological conditions, 13 receiving high dose prednisone) and 424 controls. IMC patients were younger, independent and exhibited less significant comorbidities. On multivariable analysis, the rate of rCDI was significantly higher in IMC patients (OR 2.7, 95% CI 1.6-5). rCDI was also associated with vancomycin therapy, haemodialysis and previous hospitalizations. Mortality, LOS, CDI complications and rehospitalization rates were similar in both.

**Conclusions:** IMC patients with CDI have an increased risk of 90 days rCDI. Vancomycin treatment for CDI endangers recurrence in IMC patients. Further research should explore other therapies for IMC patients with CDI with alternative agents such as Fidaxomicin and Bezlotoxumab.

Abstract 57

Combined antibiotic stewardship and infection control measures to contain an outbreak of linezolid-resistant *Staphylococcus epidermidis* in an interdisciplinary intensive care unit

Cihan Papan*1, Fabian Berger1, Katharina Last1, Mathias Hoffmann1, Heike Knoll1, Matthias Schröder3, Thomas Volk1, Uwe Schlotthauer1, Barbara Gärtnert1, Sören Leif Becker1

1Saarland University Hospital, Centre for Infectious Diseases, Institute of Medical Microbiology and Hygiene, Homburg, Germany, 2Saarland University Hospital, Hospital Pharmacy, Homburg, Germany, 3Saarland University Hospital, Department of Anaesthesiology, Critical Care and Pain Medicine, Homburg, Germany

**Background:** *Staphylococcus epidermidis* constitutes a major part of the human skin flora, but can cause healthcare-associated infections, especially in immunocompromised patients. The imprudent use of linezolid has been linked to the emergence of linezolid-resistant *S. epidermidis* (LRSE). We report an outbreak in an interdisciplinary intensive care unit (ICU) and the effects of combined antibiotic stewardship and infection control measures.

**Materials/methods:** Microbiological and infection surveillance data were reviewed to identify all LRSE between November 2018 and October 2019 detected in clinical or screening samples. Quantitative data on the use of antibiotics with Gram-positive coverage were obtained in defined daily doses (DDD) per 100 patient-days (PD). An antibiotic stewardship intervention was started in May 2019, focusing on linezolid restriction and promoting vancomycin, wherever needed. In addition, a catheter-care bundle as an infection control measure was initiated. We compared data from the pre-intervention period (November 2018 through April 2019) to the post-intervention period (June 2019 through October 2019).

**Results:** Infection control measures were implemented immediately upon outbreak recognition. In the pre-intervention period, LRSE were isolated from 16 patients, 6 of which were blood culture isolates. The average consumption of linezolid and daptomycin decreased from 7.6 DDD/100 PD and 16.5 DDD/100 PD per month in the pre-intervention period to 2.5 DDD/100 PD and 2.4 DDD/100 PD per month in the post-intervention period, respectively. Conversely, vancomycin consumption increased from 0.6 DDD/100 PD per month to 3.9 DDD/100 PD per month. In the post-intervention period, three LRSE isolates were detected in clinical or screening samples, while the total number of all *S. epidermidis* isolates from blood cultures dropped from 74 (of 840 ordered blood cultures; 8.8%) in the pre-intervention period to 27 (of 617 ordered blood cultures; 4.4%) in the post-intervention period.

**Conclusions:** Complementing infection control measures by targeted antibiotic stewardship proved to be beneficial in the efforts to contain this LRSE outbreak in an interdisciplinary ICU. Next-generation sequencing results will help to clarify the genetic relatedness of the isolates (results pending). Follow-up measures and a high level of alertness are critical in order to sustain this favorable outcome.

Abstract 64

Tuberculosis among migrant people in Sicily: a real-life report

Giuseppe Pipitone*, Tullio Prestileo*, Adriana Sanfilippo2, Francesco Di Lorenzo2, Antonio Ficalora2, Salvatore Corrao2

1Università della Campania L. Vanvitelli, Naples, Italy, 2A.R.N.A.S. Civico Di Cristina Benfratelli, Palermo, Italy

Abstract third-party references: on behalf of I.T a.C.A. (Immigrant Take Care Advocacy) team, Palermo

Background: From 2014 to 2017, the number of migrants who came to Italy via the Mediterranean route has reached an unprecedented level. The majority of refugees and migrants were rescued in the Central Mediterranean and disembarked in the Sicily region. Tuberculosis represent a social disease and migration, as a social determinant of health, increases tuberculosis-related morbidity and mortality. In May 2014 the World Health Assembly passes a resolution in which calls on governments to adapt and implement the “end tuberculosis strategy”. Early diagnosis, particularly in high-risk group, such as migrants, is the first step to achieve the aim. This study aims to estimate the frequency of both tuberculosis and latent tuberculosis infection among migrant population, from 2011 to 2017, afferent to the permanence centers of different Sicilians cities.

Materials/methods: Migratory phenomenon shown different scenario and socio-political context among years. Consequently, methodology used for taking charge, diagnostic procedure and the data collection have not always been homogeneous, highlighting possible sample bias, often justified by the critical nature of the migratory phenomenon and the need to ensure early correct diagnosis and treatment. In the most cases observed, the screening was done by Mantoux or quantiferon test and was carried out 4-6 weeks after arrival and, in any case, within 2 months of landing. In all migrant with the screening test positive it was performed x-ray chest and smear examination.

Case definition: Latent tuberculosis infection case: defined by positivity of Mantoux or quantiferon test with x-ray chest and smear examination negative.

Active tuberculosis case: radiological and/or clinical and/or sputum positivity in a patient with a Mantoux/quantiferon positivity.

Results: From 2011 to 2017 we evaluate a total of 6,020 migrants, all African. 4,711 males, 1,309 females with an age range from 16 to 29 years. tuberculosis infection was diagnosed in 1,304 people (21,6%); active tuberculosis disease was diagnosed in 185 (3,1%) people, 50 of these (0,8%) were bk-positive on the smear.

Conclusions: Despite the particular vulnerability of this cohort, the frequency of a smear positive tuberculosis infection was less than 1%, data already seen in other Italian experiences.

Impact of referral bias on prognostic assessment in infective endocarditis: insights from a population-based cohort

Magali Collonnaz*1, Marie-Line Erpelding1, François Alla2, François Goehringer1, François Delahaye4, Bernard Iung5, Vincent Le Moing6, Bruno Hoen3, Christine Selton-Suty7, Nelly Agrinier1

1CHRU de Nancy - Hôpitaux de Brabois, CIC-EC, Vandœuvre-lès-Nancy, France, 2University of Bordeaux, Bordeaux Population Health Research Center, Pessac, France, 3CHRU de Nancy - Hôpitaux de Brabois, Infectious and tropical diseases, Vandœuvre-lès-Nancy, France, 4Hôpital Louis Pradel - HCL, Cardiology, Bron, France, 5Bichat-Claude Bernard Hospital, Cardiology, Paris, France, 6Hospital Center Université De Montpellier, Infectious and tropical diseases, Montpellier, France, 7CHRU de Nancy - Hôpitaux de Brabois, Cardiology, Vandœuvre-lès-Nancy, France

Background: Most prognostic studies on infective endocarditis (IE) are derived from samples of patients managed in tertiary hospitals, mixing patients admitted directly and referred secondarily to tertiary hospitals, which may introduce referral bias. We aimed to assess this bias.

Materials/methods: We analysed data from a population-based cohort study conducted in France in 2008. A total of 497 patients with Duke-Li definite IE were included. Patients had been admitted directly to a tertiary hospital (group T), or admitted to a non-tertiary hospital and referred secondarily to a tertiary hospital (group NTT) or not (group NT). We compared patients’ characteristics, 1-month, 3-month and 1-year survival rates between groups. Using Cox models, we identified prognostic factors first in the whole sample, and then in the pooled (NTT+T) group.

Results: Compared to group T patients (N=291), group NTT patients (N=144) were more often males (81.3% vs 72.5%, p=0.046), injection drug users (9.7% vs 4.5%, p=0.033), had higher proportions of echocardiographic abnormalities (97.2% vs 91.1%, p=0.017) and of indications for valve surgery (78.5% vs 64.3%, p=0.003). Compared to group NT patients (N=62), group NTT patients were more often males (81.3% vs 67.7%, p=0.034) and presented more often with indications for valve surgery (78.5% vs 19.4%, p<0.001). One-year survival was higher in (NTT+T) patients than in NT patients (73.0% vs 56.1%, p=0.01). The same prognostic factors were identified across groups, although the magnitude of their effect (HR estimates) differed.

Conclusions: When derived from samples mixing IE patients admitted directly and secondarily referred to tertiary hospitals, validity of patients’ characteristics description and survival estimates is threatened by referral bias. Studies based on these heterogeneous samples also result in biased estimation of HRs.

Abstract 76

**Architecture fundamentally influences opportunity costs during an outbreak in a neonatology unit: real-life data and simulation of room designs**

Simone Scheithauer*1, Martin Kaase1, Diana Fenz1, Helmut Küster1, Sebastian Horn2, Bodo Sliwa3

1Institute of Infection Control and Infectious Diseases, Göttingen, Germany, 2Clinic for Pediatric Cardiology and Intensive Care, Göttingen, Germany, 3Central Division Executive Board/Medical and Performance Controlling, Göttingen, Germany

**Background:** Limiting the spread of nosocomial pathogens and stopping outbreaks at an early stage are fundamentally relevant aims of infection control especially in neonates. Timely isolation of infected from exposed and non-infected babies is a cornerstone in termination of outbreaks. However, rising costs challenge hospitals without the opportunity to reimburse lost revenues. The aim of this investigation was to define the best room design during an outbreak from the cost perspective.

**Materials/methods:** An outbreak of *Serratia marcescens* in a neonatal ICU and a neonatology ward including six patients and 34 contacts was assessed. Opportunity costs based on the G-DRG system were calculated for real-life scenario (ICU: two 2-bed, one 3-bed, two 4-bed, one 5-bed room; neonatology: two 3-bed, two 4-bed, one 7-bed room) and compared to simulation A (ICU: two 1-bed, four 2-bed, two 3-bed, one 4-bed room; neonatology: two 1-bed, four 2-bed, one 3-bed, two 4-bed rooms) and simulation B (four 1-bed, others 2-bed rooms; neonatology: five 1-bed, others 2-bed rooms), respectively.

**Results:** Patients were enrolled during 05-07/2018. In the real-life setting a total of 128 (N1(ICU)=29 and N2(neonatology ward)= 99) bed-days could not be served, thereof 97 due to isolation of colonized or infected patients and 31 due to isolation of contacts. This resulted in opportunity costs of 130.379€.

In simulation A the number of contacts was reduced by 41% to 20, the number of bed-days not served due to isolation was reduced by 23% to 99, and finally the costs were reduced by 23% to 100.839€, respectively.

In simulation B the number of contact patients was reduced by 76% to 8, the number of bed-days not occupied for isolation was reduced by 42% to 74, and finally the costs were reduced by 42% to 75.375€, respectively.

**Conclusions:** Room design has a relevant impact on patients at risk for infection. Moreover, room design with rooms caring for less patients saves costs during an outbreak. These findings should be a) verified for transferability and generalizability, b) assessed for potential shortcomings and c) taken into account for planning and constructing new wards or hospitals.

A regional survey on the level of implementation of key infection prevention and control structures in acute-care hospitals in Crete, Greece

Eirini Astrinaki1, Evangelos Kritsotakis2, Emmanouil Bolikas1, Evangelia Panagiotaki1, Despoina Christofaki1, Anthi Chalkiadaki4, Apostolia Salvaraki1, Eleni Ioannidou1, Eleni Stamataki2, Georgia Pavlidaki1, Eirini Lagoudaki2, Maria Moustaki7, Vasileia Athina Katakaki1, Despoina Stamataki3, Maria Katsidoniotaki8, Stamatis Karakonstantis4*, Achilleas Gikas1

1University Hospital of Heraklion, Infection Control Committee, Iraklio, Greece, 2University of Crete, School of Medicine, Heraklion, Greece, 3Venizeleio General Hospital, Infection Control Committee, Heraklion, Greece, 4Agios Nikolaos General Hospital, Infection Control Committee, Agios Nikolaos, Greece, 5Rethymnon General Hospital, Infection Control Committee, Rethymnon, Greece, 6Chania General Hospital, Infection Control Committee, Chania, Greece, 7Sitia General Hospital, Infection Control Committee, Sitia, Greece, 8Ierapetra General Hospital, Infection Control Committee, Ierapetra, Greece

**Background:** Data on assessment of Infection Prevention and Control (IPC) programmes in Greek hospitals are scarce. We conducted a situational survey on the level of implementation of the WHO guidelines on core components of IPC programmes aiming to identify local strengths and gaps that can inform planning and promote the use of standardized IPC assessment tools.

**Materials/methods:** The survey took place on August 2019 including all of 7 hospitals in one health region in Greece. The WHO IPC Assessment Framework (IPCAF) was completed through discussions between an external assessor and Infection Control Committee members. ICPAF is a facility-level diagnostic tool to identify areas for improvement based on 81 IPC indicators grouped into 8 sections reflecting the WHO IPC core components. An associated scoring system (maximum score, 800), classifies the level of IPC promotion and practice as inadequate (score, 0-200), basic (201-400), intermediate (401-600), or advanced (601-800).

**Results:** Surveyed hospitals had 2,166 beds and admitted 183,129 patients in 2018 (6.6% and 7.3% of the country’s total, respectively). The overall mean IPCAF score for all hospitals was 465 out of 800 (range 340-618), corresponding to an intermediate level of IPC. Only 1 (14%) hospital achieved an advanced IPC level, whereas 3 (43%) hospitals attained an intermediate level and 3 (43%) hospitals had a basic level. More profound variability was found between the respective core components of IPC. A high mean score of 90 out of 100 (range, 85-95) was obtained in relation to built environment, materials and equipment for IPC. Basic or intermediate scores were obtained regarding the implementation of IPC programmes (mean, 72; range, 58-95), guidelines (mean, 63; range, 43-88) and surveillance activities (mean, 47; range 25-83). Particularly low scores were revealed for education and training (mean, 47; range, 25-85), multimodal strategies (mean, 39; range, 10-85), monitoring/audit and feedback (mean, 47; range, 15-68), and workload and staffing (mean, 46; range, 35-55).

**Conclusions:** Surveyed hospitals in Greece are, on average, at an intermediate level of IPC implementation. This IPCAF-based survey helped us recognise areas for improvement in IPC and motivated regional hospitals to develop long-term improvement plans.

Abstract 97

**Vimentin may inhibit dengue virus invasion of HBMEC cells**

Jianhai Yu*1, Xujuan Li1, Xiaoen He1, Xuling Liu1, Wei Zhao1

1Southern Medical University, Guangzhou, China

**Background:** Dengue virus (DENV), belongs to the genus flavivirus, caused dengue fever prevalent in tropical and subtropical regions whose epidemic has intensified in recent years. Vimentin, one of the cytoskeletal components involved in the infection of DENV, was observed to reorder significantly during infection. However, the mechanism of infection is still poorly understood.

**Materials/methods:** A vimentin knockout human brain microvascular endothelial cells (HBMEC) cell model was first exploited to clarify the role of vimentin when DENV2 invasion the cells, and we further built a knockout SV129 suckling mouse model for DENV2 infection. Finally, the dynamic changes of vimentin in vitro and the changes of disease course in vivo were combined to demonstrate the relationship between vimentin and dengue infection.

**Results:** Phosphorylation and soluble percentage of vimentin were observed to change dynamically during DENV2 infection of HBMEC, suggesting that DENV2 infection regulates these dynamic changes. During this process, the phosphorylation reaction of vimentin has a certain consistency with the dynamic change of the percentage of soluble, and the two may be related. Compared with the control group, the DENV2 viral load detected in vimentin knockout HBMEC cells was significantly increased. Interestingly, 4-5 days after the suckling mice injected DENV2, SV129 (vim-knockout) had higher viral loads in serum and brain tissue, and this result is consistent with the cell experiments. Compared with SV129, SV129 (vim-knockout) suckling mice not only have disordered cerebral cortical nerve cells, but also disappeared in the molecular layer, outer cone layer, outer granular layer, inner cone layer, inner granular layer, and a large number of necrotic apoptosis, which confirmed that vim-knockout mice were more susceptible to DENV2 infection and caused severe brain damage based on animal models.

**Conclusions:** DENV2 infection can cause cell vimentin to rearrange, and both dynamic changes are highly correlated during the infection process. Presence of vimentin may inhibit viral infection to reduce disease or affect disease course. This helps to identify a possible host-targeted antiviral strategy to combat DENV infection, or avoids potential resistance of direct-acting antivirals.

Abstract 101

A new nano-sized formulation of amphotericin B-loaded chitosan with remarkable improved antileishmanial effects for the treatment of *Leishmania major*

Tahereh Zadeh Mehrizi1, Mostafa Haji Molla Hoseini2, Nariman Mosaffa2, Mehdi Shafiee Ardestani2, Ali Khamesipour4, Mohammad Banifazi1, Hasan Ebrahimi Shahmabadi3, Amitis Ramezani*1

1Department of Clinical Research, Pasteur Institute of Iran, Tehran, Iran, 2Department of Medical Immunology, School of Medicine, Shahid Beheshti University of Medical Sciences, Tehran, Iran, 3Faculty of Pharmacy, Tehran University of Medical Sciences, Tehran, Iran, 4Tehran University of Medical Sciences, Tehran, Iran, 5Iranian Society for Support of Patients with Infectious Diseases, Tehran, Iran, 6Rafsanjan University of Medical Sciences, Rafsanjan, Iran

**Background:** This study aims to improve the *leishmania major*’s pathological effects through increasing the dose of loaded amphotericin B (Amp) into nanochitosan.

**Materials/methods:** Nanochitosan was synthesized and loaded with Amp using phase separation method. To perform this, a novel solvent was designed. The therapeutic effects of the synthesized nanodrug were evaluated in vitro and in vivo environments using pathological studies.

**Results:** A nanodrug was synthesized with the high drug loading efficiency (90%) and cellular uptake (98.6%) which released Amp in a slow drug release manner. To evaluate the toxicity effects of the nanodrug, MTT assay and balb/c mice peritoneal macrophages were used. The results showed that Amp-chitosan (AK) caused a significant decrease in the toxicity effects of Amp by 100%. Also, the efficacy of the nanodrug to inhibit the promastigotes and amastigotes of the parasite (*leishmania major*) was evaluated and the results showed that the nanodrug inhibited the parasite by 85%.

To evaluate the potency of the nanodrug in vivo environment, a novel solvent was prepared which could dissolve Amp-nanochitosan10 mg/kg (AK10 mg/kg). Then, the toxicity effects of the formulation (AK10 mg/kg) were evaluated using measurement the kidney and liver related enzymes and pathological studies. The results showed that the nanodrug had no toxicity effects. Next, the potency of AK in the treatment of *leishmania major*-infected balb/c mice was evaluated. For this purpose, the lesion size was measured using a caliper and the results showed that the nanodrug was completely effective to reduce the lesion size and improve the wound healing. These results were confirmed by pathological studies. The potency of the nanodrug to inhibit the parasite burden was also evaluated using limited dilution assay (LDA) and popliteal lymph node and the results showed that AK10 mg/kg was effective to inhibit the parasite by 83% (p<0.001).

**Conclusions:** Increasing the therapeutic dose of AK to 10 mg/kg was found critical in the treatment process and caused *l. major*’s pathological effects to be successfully treated in vitro and in vivo environments.

**Comparison of molecular rapid diagnostic testing panels for Gram-negative bacteraemia using Desirability Of Outcome Ranking Management of Antimicrobial Therapy (DOOR-MAT)**

Kimberly Claeys*, Richard Smith, Surbhi Leekha, J. Kristie Johnson

1University of Maryland School of Pharmacy, Baltimore, United States; 2University of Maryland School of Medicine, Baltimore, United States

**Background:** Rapid diagnostic tests (RDTs) are becoming increasingly employed to assist in the management of gram-negative bacteraemia. Given the diversity of pathogenic organisms and resistance mechanisms, clinical data regarding optimal management using RDT is lacking. Moreover the choice of optimal RDT platform remains elusive, as comparisons are limited to sensitivity and specificity in small samples. This study compared a key clinical outcome, potential antimicrobial decisions, based on results of different commonly used RDT platforms, using a novel methodology termed Desirability of Outcome Ranking Management of Antimicrobial Therapy (DOOR-MAT).

**Materials/methods:** Retrospective observational study at University of Maryland Medical Center from 08/2018 – 11/2019 of adult patients with gram-negative bacteremia comparing Verigene® Blood Culture (VBC) to BioFire® FilmArray® Blood Culture Identification (BCID) and BCID 2 research use only (RUO) panels for clinical blood cultures. Verigene was part of standard of care, BCID and BCID 2 were run on discarded frozen samples. The RDT results and local susceptibility data were applied by an Infectious Diseases-trained pharmacists to make decisions regarding potential antimicrobial selection. DOOR-MAT, a partial credit scoring system, was used to compare antimicrobial decisions as a function of final phenotypic susceptibility patterns as determined by VITEK® 2 automated susceptibility testing. DOOR-MAT scores were compared between panels using Kruskal-Wallis with p < 0.05 statistically significant.

**Results:** A total of 103 patients with positive clinical cultures for gram-negative bacteria were included. The average DOOR-MAT score for VBC was 85.8 (SD 25.7) and median score was 100 (IQR 62.5, 100). BCID resulted in an average score of 60.8 (SD 33.4) and median 50 (IQR 50, 100). BCID 2 (RUO) demonstrated an average score of 89.7 (SD 24.7) and median score 100 (IQR 100, 100). Overall, BioFire® FilmArray® BCID 2 (RUO) produced the highest scores for optimal therapy. There was a significant difference in DOOR-MAT scores (p < 0.0001) between tested panels.

**Conclusions:** The BioFire® FilmArray® BCID 2 (RUO) performed best among the three panels tested. Use of a partial credit scoring system such as the DOOR-MAT allows for comparisons between RDT systems beyond sensitivity and specificity allowing for enhanced clinical interpretation.

Abstract 107

Risk factors for non-ventilator-associated hospital-acquired pneumonia in patients outside the intensive care unit
Viacheslav Kachalov1*, Werner Jakob2, Stefan P. Kuster1, Roger Kouyos1, Suraj Balakrishna1, Aline Wolfensberger1

1 University Hospital Zurich, Division of Infectious Diseases and Hospital Epidemiology, Zurich, Switzerland, 2 University Hospital Zurich, Department of Medical Data Management Systems, Zurich, Switzerland

Background: Hospital-acquired pneumonia in non-ventilated patients (nvHAP) belong to the most common healthcare-associated infections. As understanding of risk factors for nvHAP is key for targeting prevention measures to patients at highest risk, this study aimed to investigate risk factors for nvHAP in patients outside the intensive care unit (ICU).

Materials/methods: We included patients ≥18 years of age who were discharged during the years 2017 and 2018 from the University Hospital Zurich, Switzerland. A total of 29 potential risk factors - both constant and time-varying - were extracted from electronic medical records, including demographic data, signs and symptoms (many assessed by daily nursing assessments), procedures, medication, and devices. Hazard ratios for nvHAP were derived from univariable and multivariable Cox proportional hazards models. Patient days on ICUs were excluded from analyses.

Results: We included 69'559 patients of whom 396 (0.57%) had nvHAP. Median age was 57 years (Interquartile range [IQR]: 39-72) and 34'558 (49.7%) patients were male. Independent risk factors for nvHAP were: age ≥60 years (hazard ratio [HR]: 1.54, 95% confidence interval [CI]: 1.22-1.96), male sex (HR: 1.66, CI: 1.34-2.07), affiliation to high risk clinic (HR: 1.35, CI: 1.07-1.71), impaired activity and mobility (HR: 2.38, CI: 1.72-3.31), acute problems with breathing (HR: 1.60, CI: 1.21-2.13), being “at risk for delirium” (HR: 1.55, CI: 1.08-2.23), impaired consciousness (HR: 1.69, CI: 1.16-2.47), drugs for acid related disorders (HR: 1.37, CI: 1.05-1.78), antineoplastic agents (HR: 1.71, CI: 1.18-2.47), antibiotics (HR: 1.41, CI: 1.10-1.81), antimycotics (HR: 2.00, CI: 1.42-2.81), opioids (HR: 1.37, CI: 1.05-1.78), swallowing difficulty without tube feeding (HR: 1.89, CI: 1.32-2.71), and tube feeding (HR: 2.06, CI: 1.49-2.86).

Conclusions: We identified several modifiable and non-modifiable risk factors for nvHAP. The modifiable risk factors like impaired activity and mobility, might be conditions potentially targetable by specific prevention measures. Non-modifiable risk factors like male gender, older age or swallowing difficulties will allow to identify high-risk patients and focus nvHAP prevention efforts on these patients.

Abstract 118

Olorofim for a case of severe disseminated Lomentospora prolificans infection
Shio Yen Tio*1,2, Karin Thursky1,2, Gwyneth Ng2, John H. Rex3, Dennis Carney1,2, Monica Slavin1,2
1The Royal Melbourne Hospital, Parkville, Australia, 2Peter MacCallum Cancer Centre, Melbourne, Australia, 3F2G Ltd, Eccles, United Kingdom

Abstract third-party references: F2G, Ltd.

Background: Though rare, invasive Lomentospora prolificans infection causes significant morbidity and mortality particularly in immunocompromised patients. Mortality rate is least 65%, and near 100% if infection becomes disseminated. We describe a case of disseminated Lomentospora prolificans infection in an immunosuppressed patient who failed to respond to conventional therapy, and was commenced on Olorofim under clinical trial [NCT03583164].

Case report: A 56-year-old lady developed disseminated Lomentospora prolificans infection following HyperCVAD cycle-1b for T-cell acute lymphoblastic leukemia (T-ALL), including fungaemia, endophthalmitis, lumbar spine (L4/5 vertebrae) and presumed pulmonary involvement [avid pulmonary nodule on Positron Emission Tomography (PET)]. Voriconazole and terbinafine were immediately started. She was unable to achieve therapeutic voriconazole levels despite measures to augment levels, and had worsening PET uptake in the lumbar spine. Lomentospora prolificans was again isolated from lumbar vertebral biopsy after 3 months of combination regime. Failure of medical therapy prompted surgical debulking and spine stabilisation surgery. Patient then developed new PET uptake at aortic root and aortic valve five months after spinal surgery. Serial echocardiography showed progressive moderate to severe aortic regurgitation. Eleven months into management of the infection, Olorofim was started at loading dose 180mg followed by 60mg twice daily (BD), and later increased to 90mg BD as guided by drug levels. Serial PET scan over six months demonstrated improvement in uptake at aortic root and lumbar spine, despite needing radiotherapy and Pralatrexate to control relapsed T-ALL (Figure 1). As of November 2019 patient has been on Olorofim for a year without adverse effects. Regular therapeutic drug monitoring confirmed stable drug levels. She is well, active and has gained weight since on Olorofim. Her vision is stable and reports of no further back pain.

Conclusions: Lomentospora prolificans is routinely intrinsically resistant to all antifungals, hence poses a therapeutic challenge. An open-label single-arm phase Ib study of F901318 is currently underway. Olorofim monotherapy has successfully controlled a case of osteomyelitis due to this pathogen, demonstrating its potential use in treatment of resistant invasive mould infections in patients lacking suitable alternative treatment options.

Figure 1. Serial PET showing improvement in metabolic uptake at aortic root and lumbar spine.

Abstract 119

Dynamic in vitro pharmacodynamics evaluation of piperacillin/tazobactam-tobramycin combination therapy against Escherichia coli and Klebsiella pneumoniae clinical isolates

Chandra Batta Sumi*1, Aaron Heffernan2, Saiyuri Naicker1, Kyra Cottrell3, Patrick Harris2, Fekade Bruck Sime1, Jason Roberts1,2,3,4,5

1The University of Queensland, Centre for Transnational Anti-Infective Pharmacodynamics, School of Pharmacy, Woolloongabba, Australia, 2Griffith University, School of Medicine, Gold Coast, Australia, 3The University of Queensland Centre for Clinical Research, Brisbane City, Australia, 4Royal Brisbane and Women’s Hospital, Department of Intensive Care Medicine, Brisbane, Australia, 5Royal Brisbane and Women’s Hospital, Pharmacy Department, Brisbane, Australia

Background: Piperacillin/tazobactam monotherapy has been associated with increased mortality for treating patients with ceftriaxone-resistant Escherichia coli or Klebsiella pneumoniae bloodstream infection; however this leads to a reliance on carbapenem therapy. Consequently, rationally optimized antibiotic combination therapy could be a promising carbapenem-sparing approach to maximize bacterial killing and suppress the emergence of resistance. A piperacillin/tazobactam-tobramycin combination was tested against less-susceptible extended-spectrum beta-lactamase (ESBL) producing E. coli and K. pneumoniae clinical isolates using the dynamic hollow-fiber infection model (HFIM).

Materials/methods: Piperacillin/tazobactam and tobramycin pharmacokinetics observed in critically-ill patients were simulated in the HFIM over 168h (initial inoculum ~10^7 CFU/ml). We evaluated piperacillin/tazobactam (4/0.5g every 6h, given as 0.5h and 3h infusions, and 16/2g continuous infusion) alone and in combination with tobramycin (7mg/kg daily) regimens against CTX-M-55 producing E. coli 50 (EC50) and SHV-106 producing K. pneumoniae 68 (KP68) clinical isolates (MIC 8mg/L).

The total and less-susceptible bacterial populations were quantified using cation-adjusted Mueller-Hinton agar with and without antibiotic at a concentration fourfold the baseline MIC respectively.

Results: For all dosing regimens of piperacillin/tazobactam monotherapy against EC50 and KP68, there was an initial 4 log_{10} bacterial kill over 8h [Figure 1]. However, regrowth of a less-susceptible subpopulation exceeded the initial inoculum within 24h for all dosing regimens tested. The MIC of resistant subpopulations exceeded 256mg/L after 72h. Tobramycin monotherapies, displayed rapid initial killing (≥6 log_{10} at 8h) followed by extensive regrowth within 24h. A combination of piperacillin/tazobactam and tobramycin against EC50 and KP68 achieved synergistic killing (≥6 log_{10} at 8h) and prevented regrowth throughout the 7-day HFIM course.

Conclusions: This study shows that piperacillin/tazobactam monotherapy (C_{min}/MIC >5) was insufficient to achieve sustained bacterial killing and suppress resistant subpopulation against EC50 and KP68. Piperacillin/tazobactam-tobramycin combination therapy provided rapid bacterial killing and suppressed the emergence of resistance over 7-days. These results support the re-evaluation of the potential clinical utility of combination therapy against less-susceptible ESBL producing isolates as a carbapenem-sparing approach.
Figure 1: Effect of each dosing regimen on the total bacterial population using simulated human exposures of piperacillin and tobramycin against ESB-producing EC50 and KP68 (q6h, every 6 h; q24h, every 24 h)

Microscopic agglutination test in determining leptospirosis seroprevalence in Western Province, Sri Lanka

Thilini Nisansala Giguruwa Gamage1, Manjula Weerasekera1, Nilantha Ranasinghe1, Chandika Gamage1, Chamil Marasinghe4, Neluka Fernando1, Lilani Karunanayake1, Chinthika Gunasekara1

1University of Sri Jayewardenepura, Department of Microbiology, Faculty of Medical Sciences, Nugegoda, Sri Lanka, 2Base hospital, Panadura, Sri Lanka, 3University of Peradeniya, Department of Microbiology, Faculty of Medicine, Peradeniya, Sri Lanka, 4University of Sri Jayewardenepura, Department of Medicine, Faculty of Medical Sciences, Nugegoda, Sri Lanka, 5Medical Research Institute, National Reference Laboratory for Leptospirosis, Department of Bacteriology, Boralla, Sri Lanka

Background: Leptospirosis is a globally distributed zoonosis common in tropical regions, including Sri Lanka. Microscopic agglutination test (MAT) is considered to be the gold standard in leptospirosis diagnosis, which uses panels of live leptospires representing the circulating serovars from the area. MAT provides epidemiological data on infecting serovars. In this study, we analyzed MAT results of confirmed cases of leptospirosis in Western province, Sri Lanka to determine commonly infecting serovars.

Materials/methods: This was a prospective hospital based study carried out during 2017 in 2 selected hospitals in Western province of Sri Lanka. Clinically suspected leptospirosis patients were recruited according to Communicable Disease Epidemiology Profile Sri Lanka, WHO. Leptospirosis was confirmed by either single MAT titre ≥1:320 or by positive polymerase chain reaction (PCR). MAT was carried out at the Medical Research Institute, Sri Lanka which is the national reference laboratory for leptospirosis and consists of a panel of 15 Leptospira serovars.

Results: Out of 172 clinically suspected patients, 42.44% were confirmed leptospirosis patients by either MAT (50.68%) or PCR (67.12%). Of the 37 MAT positive patients, 29 (78.37%) were positive for L. interrogans serovar bakeri, strain L79 in Tarassovi. Two patients were positive for L. interrogans serovar poi, Strain Poi in Javanica, while one patient each was positive for L. interrogans serovar cynopteri, strain 3522C in Cynopteri and L. interrogans serovar bangkinang, strain Bangkinang 1 in autumnalis respectively. Four patient sera was found to be positive for two serovars (L. interrogans serovar bakeri, strain L79 in Tarassovi with one of the following serovars: serovar rathnapura, strain wimalasena in Grippotyphosa, serovar bangkinang, strain Bankinang 1 in autumnalis, serovar pyrogenes, strain Salinem in pyrogenes and serovar australis, strain Ballico in Autumnalis) each having similar MAT titres, while 9 were positive for two serovars with a MAT titre ≥1:320 including serovars namely serovar australis, serovar bataviae, serovar bakeri, serovar icterohaemorrhagiae, serovar canicola, serovar bangkinang, serovar hebdomadis, serovar poi and serovar pyrogenes.

Conclusions: L. interrogans serovar bakeri, strain L79 in Tarassovi was the predominant serovar identified in this study among patients of leptospirosis in the Western province, Sri Lanka.

Sexually-transmitted infections in soldiers: a cross-sectional assessment and a review of literature

Carina Gottwald¹, Norbert G. Schwarz², Hagen Frickmann* ³,⁴

¹Bundeswehr Military Medical Department Wilhelmshaven, Wilhelmshaven, Germany, ²Bernhard Nocht Institute for Tropical Medicine Hamburg, Hamburg, Germany, ³Bundeswehr Hospital Hamburg, Hamburg, Germany, ⁴University Medicine Rostock, Rostock, Germany

Background: Sexually transmitted infections (STI) show a wide prevalence range in military forces, ranging up-to more than 40 per cent in cross-sectional studies. Scarce information is available on STI in soldiers from Europe. Therefore, we have performed a retrospective assessment on prevalence and determinants of occurrence of STI in German paratroopers and navy soldiers by anonymously analyzing medical records from the medical departments of two German barracks.

Materials/methods: Medical records from 80 paratroopers and 80 navy soldiers were screened for records of STI as well as documented medical history associated with the likely mode of transmission next to information on risk factors as well as diagnostic and therapeutic management.

Results: Proportions of suspected STI were 17.5% and 20%, proportions of diagnosed STI 13.9% and 11.3% for predominantly male paratroopers and navy soldiers, respectively. On average, acquisition of STI occurred in the second half of the third decade of the patients’ life. The proportion of infected officers was higher in the population of the navy soldiers, while more infected privates were among the paratroopers. Living as singles or unmarried but with a primary partnership was the most frequently observed lifestyle. Only one case of STI acquisition on deployment was documented for the navy soldiers and no such incident for the paratroopers, although nearly half of the assessed patients in both groups had deployment experience. In a relevant minority of about 20%, partner therapy was neglected and especially for the navy soldiers, considerable delay between onset of clinical symptoms and medical assessments was registered. While pharmacological therapy was always performed and adherence with national guidelines was acceptable with more than 80%, adherence with diagnostic therapy control was poor with proportions round about 50%, while clinically apparent recurrences were occasionally observed.

Conclusions: Although clinical hints for STI were frequently observed, clinical management was usually restricted to syndrome-based antibiotic treatment without detailed diagnostic workup. Altogether, occurrence of STI was comparable with reports from other armed forces, stressing an ongoing need for preventive medical approaches.

Assessment of trimethoprim-sulfamethoxazole susceptibility testing methods for fastidious Haemophilus spp.

Yanik Sierra Urueña1, Aida González Díaz2, Fe Tubau3, Anna Carrera-Salinas1, Javier Molerés3, Paula Bajanca-Lavado1, Junkal Garmendia2,3, M Ángeles Domínguez Luzon1,5, Carmen Ardanuy Tisaire1,2,6, Sara Martí1,2

1Bellvitge University Hospital, L’Hospitalet de Llobregat, Spain, 2ISCIII, Research Network for Respiratory Diseases [CIBERES], Madrid, Spain, 3Instituto de Agrobiotecnología, CSIC-Gobierno, Navarra, Spain, 4National Institute of Health, Haemophilus influenzae Reference Laboratory, Department of Infectious Diseases, Lisbon, Portugal, 5ISCIII, Spanish Network for Research in Infectious Diseases [REIPI], Madrid, Spain, 6University of Barcelona, Department of Pathology and Experimental Therapeutics, Faculty of Medicine, Barcelona, Spain

Background: Several discrepancies were found in clinical routine regarding trimethoprim-sulfamethoxazole (SXT) susceptibility determination depending on antimicrobial susceptibility (AST) method used and growth media. We aimed to compare the determinants of SXT resistance with established susceptibility values for fastidious Haemophilus spp., in order to provide recommendations for optimal SXT measurement.

Materials/methods: We collected 50 strains each of Haemophilus influenzae and Haemophilus parainfluenzae at Bellvitge University Hospital. SXT susceptibility was tested by microdilution, E-test, and disc diffusion using both Mueller-Hinton Fastidious (MH-F) and Haemophilus Test Medium (HTM) following EUCAST and CLSI criteria respectively. Mutations in folA, folP and additional determinants of resistance were identified in whole-genome sequenced isolates.

Results: Strains presented generally higher rates of SXT resistance when grown on HTM than on MH-F, independent of the methodology used [average MIC 2.6-fold higher in H. influenzae and 1.2-fold higher in H. parainfluenzae]. The main resistance-related mechanisms were as follows: I95L and F154S/V in FolA; 3 and 15 base pair insertions and substitutions in folP; acquisition of sul genes; and FolA overproduction potentially linked to mutations in -35 and -10 promoter motifs. Of note, 2 of 19 H. influenzae strains (10.5%) and 9 of 33 H. parainfluenzae strains (27.3%) with mutations and assigned as resistant by microdilution were inaccurately considered susceptible by disc diffusion. This misinterpretation was resolved by raising the clinical resistance breakpoint of the EUCAST guidelines to ≤30 mm.

Conclusions: Given the routine use of disc diffusion, a significant number of strains could potentially be miscategorised as susceptible to SXT despite having resistance-related mechanisms. A simple modification to the current clinical resistance breakpoint given by the EUCAST guideline for MH-F ensures correct interpretation and correlation with the gold-standard method of microdilution.

Abstract 151

**A meta-analysis of the burden of non-typhoidal Salmonella in humans in the Middle East and North Africa**

Rami Al Rifai*1

1United Arab Emirates University, Institute of Public Health, College of Medicine and Health Sciences, Al Ain, United Arab Emirates

**Background:** To enhance efforts related to controlling foodborne pathogens in the Middle East and North Africa (MENA), we quantified the overall regional and country-specific NTS prevalence in different human populations and identified the most common serotypes.

**Materials/methods:** Published literature of NTS prevalence was systematically reviewed and reported following PRISMA guidelines. Pooled NTS prevalence measures were estimated using a random-effects model.

**Results:** We identified 46 research reports that reported 84 NTS prevalence measures in 15 countries in MENA. The pooled NTS prevalence in MENA was estimated at 6.6% (95% confidence interval (CI): 5.4–7.9%). The highest pooled prevalence measures were in Morocco (17.9%, 95% CI: 5.7–34.8%), Tunisia (10.2%, 95% CI: 4.3–18.0%), and Sudan (9.2%, 95% CI: 6.5–12.2%) while the lowest were in Jordan (1.1%, 95% CI: 0.1–3.0%), Oman (1.2%, 95% CI: 1.2–1.3%), and Palestine (1.2%, 95% CI: 0.4–2.1%). NTS pooled prevalence in gastrointestinal asymptomatic and food handlers population groups was 11.4%, and 3.8%, respectively. *S. Enteritidis* (29.8%) and *Typhimurium* (23.6%) were the most common.

**Conclusions:** NYT is a common foodborne pathogen in MENA countries, particularly in North African countries. Findings inform the scientific community, the public, and the decision makers with NTS prevalence and gaps in evidence in MENA to support control and prevention strategies.

Abstract 152

Whole genome sequencing of *Pseudomonas aeruginosa* isolates from across the United Kingdom: population structure and molecular predictors of resistance

Timothy David Planche*1,2, Adam Witney1, Adela Alvarez Buylla3, Mike Allen3, Eric Manu3, Irene Monahan1, Mandy Wootton4

1St George’s, University of London, Institute of Infection and Immunity, London, United Kingdom, 2St George’s University Hospitals NHS Foundation Trust, SouthWest London Pathology, London, United Kingdom, 3Merck Sharp & Dohme Ltd, Hertfordshire, United Kingdom, 4Public Health Wales NHS Trust, Specialist Antimicrobial Chemotherapy Unit, Cardiff, United Kingdom

**Background:** *Pseudomonas aeruginosa* (PSA) infections are difficult to treat due to virulence and antibiotic resistance. We present a large whole genome sequencing (WGS) study of PSA from non-cystic fibrosis (CF) patients to examine the epidemiology, virulence and resistance to anti-pseudomonal antibiotics, including ceftolozane/tazobactam (C/T).

**Materials/methods:** 1,123 consecutive, clinically relevant, non-CF PSA isolates from 14 participating centres from Jan/15-Apr/2018 were studied. In vitro activity of C/T and nine other antibiotics were evaluated using EUCAST disc diffusion testing, a subset of 159 isolates (C/T diameter ≤26mm) tested by broth microdilution (BMD) with 7 antibiotics. Data were collected on the infection site, specimen and ward type.

304 isolates were chosen for WGS on Illumina HiSeq platform. Isolates were chosen based on C/T BMD (MIC ≥4 µg/mL) plus control isolates based on site and resistance pattern (1:8 ratio). Assembled sequences were annotated then the contigs screened using abricate: on CARD for resistance, VFDB for virulence factors. Reference alignment was performed to identify known resistance mutations. In addition, Multi-Locus Sequence Types (MLST) were generated from assemblies.

**Results:** 26/1,123 (2.3%) isolates were resistant to C/T and 10 had an MIC ≥ 4 µg/mL. MLST were identified in 281/304 (92%) isolates with 106 distinct MLSTs. 14 MLST comprised 50% of isolates. Dendrogram and analysis of virulence genes showed two PSA populations, one containing the exoS type III secretion systems, and the other exoU.

BMD of 159 isolates found sensitivity to colistin (93%), C/T (84%), ceftazidime (66%), piperacillin/tazobactam (61%) and imipenem (71%). Beta-lactamase sequences were found in 10/26 (38%) C/T resistant isolates, however no resistance mechanism was found for 16/26 (62%). Similarly, beta-lactamases were found in 10/46 (22%) of carbapenem resistant isolates. Carbapenemases detected were IMP, VIM, NDM, but also unusual carbapenemases including OXA-119, OXA386 DIM1 and L1 (only reported in Stenotrophomonas).

**Conclusions:** Clinically significant PSA in non-CF patients has a diverse population across the UK with a division into 2 groups based on type III secretion systems. The majority of resistance in PSA to beta-lactams is not due to carbapenemases. Several unusual or unique carbapenemases to PSA were identified. C/T was the most effective beta-lactam against PSA.

Abstract 154

Munjal Patel1, Parul Patel2, Naveen Daryani1, William Copalu2, Pooja Kulikarni2, David W. Hilbert1, Katherine Young1, Matthew L. Rizk1

1Merck & Co., Inc., Kenilworth, United States, 2Certara Strategic Consulting, Sheffield, United Kingdom

Abstract third-party references: This work was supported by Merck Sharp & Dohme Corp., a subsidiary of Merck & Co., Inc., Kenilworth, New Jersey, USA (MSD)

Background: Imipenem/cilastatin and relebactam (IMI/REL)—a fixed-dose combination of imipenem, a carbapenem antibacterial agent, cilastatin, a renal dehydropeptidase, and relebactam, a β-lactamase inhibitor—was compared with piperacillin/tazobactam for the treatment of patients with HABP/VABP in a phase 3 clinical trial. We developed population pharmacokinetic models, integrating data from this trial with prior phase 1–3 data, to evaluate the effects of covariates on imipenem and relebactam exposure and analyze the probability of target attainment (PTA) among patients with HABP/VABP.

Materials/methods: A previous population pharmacokinetic model was updated with data from the phase 3 trial (NCT02493764) to include patients who were exposed to a ≥1.25-g IMI/REL dose (500 mg imipenem, 500 mg cilastatin, and 250 mg relebactam) and had ≥1 measurable postdose concentration. The updated population pharmacokinetic model, comprising data from 1 197 participants among 12 completed phase 1–3 trials, was used to assess the effect of clinical covariates on imipenem and relebactam pharmacokinetic parameters. Joint PTA analyses were performed to assess achievement of pharmacokinetic/pharmacodynamic targets.

Results: A 2-compartmental model with first-order elimination best described both the imipenem and relebactam plasma concentration–time profiles. Significant covariates for both imipenem and relebactam included body weight on clearance (CL) and central volume of distribution (V1), creatinine clearance (CrCL) on CL and V1, and ventilation status on V1 (but not on CL). Among patients with normal renal function (90 mL/min ≤ CrCL < 150 mL/min), area under the concentration–time curve (AUC) and maximum plasma concentration (Cmax) were higher in patients with HABP/VABP compared with healthy participants, while AUC, Cmax, and CL were comparable across ventilated and nonventilated patients with pneumonia (Table). Among patients with HABP/VABP, joint PTA was >98% regardless of renal clearance or ventilation status.

Conclusions: Inclusion of data from patients with HABP/VABP into the imipenem and relebactam population pharmacokinetic models demonstrated that pharmacokinetic exposures are higher in patients with HABP/VABP compared with healthy participants. The joint PTA was sufficient to justify the 1.25-g IMI/REL dose administered every 6 hours in this patient population. No dose adjustments are required for patients with HABP/VABP based on ventilation status.

Table. Summary of steady-state pharmacokinetic exposures in healthy participants and patients with pneumonia with normal renal function (90 mL/min ≤ CrCL < 150 mL/min)

Abstract 159

**Plasma levels of hepcidin, a potential biomarker during septic shock**
Jon Olinder*1, Cecilia Rydén Rubin2, Heiko Herwald3

1Helsingborgs hospital, Infectious Disease Department, Helsingborg, Sweden, 2Helsingborgs hospital, Infectious Disease Department, Helsingborg, Sweden, 3Lund University, Department of Clinical Sciences, Lund Division of Infection Medicine Biomedical Center [BMC], Lund, Sweden

**Background:** Septic shock is a severe infectious condition with high mortality despite intensive care treatment. In conditions of acute systemic inflammation e.g. sepsis, iron metabolism, in which hepcidin plays a key role, is disturbed. The objective for this observational prospective study was to explore whether hepcidin has a potential as a biomarker for septic shock complementary to conventional biomarkers, i.e. procalcitonin (PCT), C-reactive protein (CRP) and white blood count (WBC).

**Materials/methods:** Patients with septic shock (n=81) or non-infectious conditions (n=44) who fulfilled the pre-set clinical and ethical inclusion criteria were included within an hour of admittance to the Intensive Care Unit (ICU) at Helsingborg hospital, Sweden. Patients were included at random, blood samples taken every day for 7 consecutive days. Adequate microbiological tests and cultures were obtained before or at inclusion. Sequential Organ Failure Assessment (SOFA)-score as well as plasma levels of hepcidin, WBC, CRP, PCT, and lactate, were determined directly after inclusion and then every morning for seven consecutive days. Alterations of hepcidin and conventional biomarkers in the group with septic shock are presented descriptively.

**Results:** Hepcidin was significantly elevated in patients with septic shock (median 41 nmol/L; reference interval 1-12 nmol/L, p-value<0.001), compared to non-septic patients (median 14.5 nmol/L, p-value<0.001). Maximal plasma levels of hepcidin were seen on Day 1 in the group with septic shock, whereafter levels declined steadily with a time course similar to lactate. PCT, CRP, lactate, and WBC demonstrated a dynamic pattern as expected from previously published results, whereas WBC and lactate were not significantly elevated. The linear graph presented shows the dynamics of the biomarkers in the group with septic shock (n=81). The median inclusion value of each biomarker was indexed to 100% and the daily change from the arrival value was calculated.

**Conclusions:** Hepcidin was shown to be a rapidly changing biomarker in septic shock, the initial high values were significantly higher in patients with septic shock compared to non-septic patients. Hepcidin decreased rapidly within the first 48 hours upon recovery of the patients, superior to PCT, CRP, lactate and WBC.
Abstract 174

Primary care re-consultation after hospitalisation for community-acquired pneumonia in England: a large population-based cohort study

Vadsala Baskaran*1,2, Wei Shen Lim2, Tricia McKeever1

1University of Nottingham, Nottingham, United Kingdom, 2Nottingham University Hospitals NHS Trust - City Hospital Campus, Nottingham, United Kingdom

Abstract third-party references: This study was supported by the National Institute for Health Research (NIHR) Nottingham Biomedical Research Centre (BRC).

Background: There is paucity of information on the burden of disease during recovery from community acquired pneumonia (CAP). This study aims to describe primary care re-consultations within 30 days after hospitalisation for CAP.

Materials/methods: Adults aged ≥18 with the first ICD-10 code for CAP (J12- J18) recorded in Hospital Episode Statistics (HES) between July 2002 and June 2017 were included. Patients were followed-up for 30 days from hospital discharge. Re-consultation was defined as recording of any medical Read codes (excluding admin-related codes) in a primary care database of anonymised medical records from general practitioners (Clinical Practice Research Datalink) after the discharge date. Re-consultation was counted as a single episode if there were multiple Read codes recorded in a day per patient.

Results: There were 93,687 patients with CAP. Excluding patients who died (n=5,456; 5.8%) or were readmitted within 30 days of hospital discharge (n=13,729; 15.1%), 38.7% (n=29,037) re-consulted primary care at 30 days for any reason. The highest rate of re-consultation was within 7 days (26 per 100 person-days).

Multivariate analysis found the strongest predictor for re-consultation was higher number of primary care consultations in the previous 2 years. Patients were less likely to re-consult if they were females, aged ≥65 years, from more deprived areas (Carstairs index=3) and if they had a Charlson comorbidity index score of between one and four.

Of those who re-consulted, 43.2% (n=12,546) re-consulted primary care twice or more. A large proportion of patients re-consulted for a respiratory disorder (37.5%, n=10,880) whilst a lower proportion re-consulted for a cardiac disorder (7.1%, n=2066). At re-consultation, 30.8% (n=8,951) received a further course of antibiotics; most (76.9%, n=6,884) received a single course of antibiotic. Penicillins (41.9%, n=5290) and macrolides (21.9%, n=2762) were the commonest antibiotics prescribed.

Conclusions: A high burden of re-consultation is placed on primary care following hospital admission for CAP. Approximately 40% re-consult primary care more than once following CAP. Of those who re-consult, 30% are prescribed a further course of antibiotics.

Abstract 179

**A rapid direct from specimen MALDI-TOF MS diagnostic for bacterial and fungal pathogens**

David Goodlett* 1,2, Matthew Sorensen 1, Francesca Gardner 1, Lisa Leung 1, Courtney Chandler 1, Erik Nilsson 4, Robert Ernst 1

1University of Maryland School of Dentistry, Baltimore, United States, 2University of Gdańsk, Gdańsk, Poland, 3Institute for Marine and Environmental Technology, Pataigin, Baltimore, United States, 4Institute of Marine and Environmental Technology (IMET), Pataigin, Baltimore, United States

**Background:** Pathogen identification from single colonies by matrix-assisted laser desorption/ionization time-of-flight mass spectrometry (MALDI-TOF MS) analysis of high abundance proteins is now well established in large hospitals in the EU and US. We present updates to BACLIB, a MALDI-TOF MS method previously shown to utilize mass spectra of readily extracted bacterial lipids as chemical barcodes for identification and speciation (Leung et al. Sci Repo 2017). Unlike protein-based methods, direct from specimen identification is possible and we now show that the same extraction protocol allows fungi to be identified.

**Materials/methods:** Microbial lipids were extracted directly on a MALDI plate. Mass spectra were acquired in negative ion mode on a Bruker Microflex using the matrix norharmane. A mass spectral library was developed with over 2000 primary clinical and laboratory isolates, including Gram-negative and -positive bacteria, acid-fast bacteria including Mycobacterium tuberculosis, filamentous fungi, and over 15 Candida species. For unknown identification, mass spectra were submitted to a secure web service machine-learning software platform called Postal Service [unpublished] that reported speciation and resistance profiles by comparison to the library.

**Results:** Time required for a single analysis (from colony selection to identification) by BACLIB is approximately 60 minutes. Postal Service independently identified over 150 bacterial and fungal species (and where appropriate subspecies) with confidence scores similar to protein-based results reported for the Bruker Biotyper and bioMérieux VITEK MS platforms. BACLIB was also able to identify pathogens directly from blood bottles, but also urine, BALs and wound effluent, without culture on solid medium and determine antimicrobial peptide resistance (i.e. colistin) as well as identification from polymicrobial mixtures (Fondrie et al. Sci Repo 2018).

**Conclusions:** Previously, BACLIB has been shown to be a novel diagnostic approach for identifying Gram-negative and -positive bacteria from single colonies and mixtures, but here we report its use for identification of budding yeast and filamentous fungi. BACLIB can stand alone or strengthen the overall diagnostic power of microbial speciation using current protein-based diagnostics in clinical microbiology laboratories. Postal Service allows BACLIB to work via an internet-based approach that is capable of independently reporting speciation and where appropriate, antimicrobial peptide resistance patterns.

**Abstract 193**

### Antimicrobial susceptibility of *Streptococcus pneumoniae* strains, isolated from children carriers after PCV10 in Bulgaria

Mariya Malcheva*, Ivan Simeonovski, Viktoria Levterova, Nadia Brankova, Todor Kantardjiev

1National Center of Infectious and Parasitic Diseases, Sofia, Bulgaria

**Background:** Bulgaria introduced PCV10 in 2010 in the National Immunization Calendar. Prior the vaccine invasive *S. pneumoniae* isolates were analyzed and the dominant resistant serotypes were 19F, 6B, and 19A. In the current study we aim to detect the serotype distribution and patterns of resistance in vaccinated healthy children.

**Materials/methods:** Vaccinated healthy children n=834, aged 1 to 6 years were sampled in the period 2017-2019 by a nasopharyngeal swab. Specimens were cultured on Columbia CNA Agar with 5% Sheep Blood and optochin disk, 37°C for 24 hours, in an aerobic atmosphere enriched with CO2. Identification of *S. pneumoniae* was done by the presence of alpha-hemolysis and inhibition by optochin. Typing of cultures was made by DNA based methods - conventional PCR and the Operon S.PneumoStrip kit. Antibiotic susceptibility testing was done with the disc-diffusion method for oxacillin (MIC Benzylpenicillin and Ampicillin), tetracycline, erythromycin, clindamycin, vancomycin, teicoplanin, linezolid, norfloxacin, trimethoprim-sulfamethoxazole (TMP-SMX). Interpreted by the EUCAST Clinical Breakpoint Tables v. 9.0.

**Results:** The total number of isolated strains was 174 (21% culture positive samples). Each sample was typed and predominantly there were the non-vaccine serotypes – 6C (27%), 24 B/F (12.5%), 3 (11%), 11A/D (10%) and 23A (7.5%) from all cultures respectively. The antimicrobial susceptibility of *S. pneumoniae* cultures to different agents during the study period was: 100% to vancomycin, teicoplanin and linezolid, 96.5% to norfloxacin, 93% to sulfamethoxazole / trimethoprim, 85.6% to oxacillin (at screening), 58% to tetracycline, 50% to clindamycin and 48.9% to erythromycin. Multidrug resistant (MDR) strains that were not sensitive to at least three antimicrobial classes were 44% of the isolated strains. Erythromycin-resistant pneumococci in the study were 51.2% of all cultures, most of them co-resistant to clindamycin.

**Conclusions:** The high macrolide resistance detected in carriage corresponds to the data from invasive *S. pneumoniae* isolates in the ECDC report and can serve as a tool for measuring resistance patterns in the country. There were less serotypes expressing β-lactam non susceptibility in low levels mainly serotypes 19A, 24 B/F, 35B that are non-vaccine clones.

Abstract 195

Implementation and one-year results of antimicrobial stewardship programme in a tertiary reference hospital in San Jose, Costa Rica

Manuel Ramirez-Cardoce*1, Cristina Fernandez-Barrantes1, Elvira Segura-Retana1, Esteban Avendano-Fernandez1

1San Juan de Dios Hospital, Costa Rican Social Security System, San Jose, Costa Rica

Background: Antimicrobial Stewardship Programs (ASP) are relatively new in Latin America when compared to other regions, in most cases as individual projects, in response to rising rates of resistance and adverse effects associated with inappropriate antimicrobial utilization, and not in answer to official national policies. This study evaluated the impact of a multidisciplinary, rounding-based APS strategy on antimicrobial utilization (AU), prescribing practices and health-care associated infection (HAI) rates.

Materials/methods: This is a one-year review of implementation of ASP in early 2018 in a tertiary-reference hospital in San Jose, Costa Rica. Multidisciplinary ASP committee was established with representation from infectious diseases, clinical pharmacy, infection control, nursing, microbiology and epidemiology. The hospital implemented targeted stewardship efforts in Orthopaedics and Traumatology, with initial focus on advanced education, daily audit and feedback for targeted antibiotics. We created a checklist of CDC Core Elements for committee review. The primary objective of this initiative was to evaluate changes in AU and to determine HAI rates within the program over time. Subgroup analysis evaluated annual antimicrobial cost. Descriptive statistics were performed on all continuous and categorical data as appropriate.

Results: Baseline overall AU analysis was based on 2017 and the intervention period included 2018. Baseline overall AU in 2017 was 425 DDD/100PD. We observed a decline in overall AU in 2018 (257 DDD/100PD). Targeted analysis revealed decline from 2017 to 2018 in carbapenems (32 vs 15 DDD/100PD), colistin (9 vs 3 DDD/100PD) and cefotaxime (26 vs 15 DDD/100PD), as well in ampicillin and cephalotin (66 vs 9 DDD/100PD, and 25 vs 8 DDD/100PD, respectively). Overall decline was also noted in rates of HAI and Clostridium difficile infections (CDI). Decline in overall antimicrobial cost was noted from 2017-2018 ($166,340.6 vs $128,418.3).

Conclusions: We present implementation of an effective health system wide multidisciplinary ASP. With ASP efforts over one year, we were able to show decline and positive correlation in overall as well as targeted AU and HAI rates. We also noticed a decline in antimicrobial cost in this timeframe.

Abstract 203

Diffusion of KPC-carbapenemases among urinary tract isolates of Klebsiella pneumoniae in Croatia

Branka Bedenic*,1,2,3, Sanda Sardelic4, Natasa Beader1, Sandra Šuto5, Maja Bogdanić6, Gernot Zarfel7, Jasmina Vranes8

1School of Medicine, University of Zagreb, Clinical Department for Clinical and Molecular Microbiology, Zagreb, Croatia, 2University Hospital Center Zagreb, Clinical Department for Clinical and Molecular Microbiology, Zagreb, Croatia, 3School of Medicine, University of Zagreb, Clinical Department for Clinical and Molecular Microbiology, Zagreb, Croatia, 4University Hospital Centre Split, Split, Croatia, 5Teaching Institute for Public Health “Dr. Andrija Štampar”, Department for Microbiology, Zagreb, Croatia, 6Croatian Institute for Public Health, Department for virology, Zagreb, Croatia, 7Medical University of Graz, Institute for Microbiology, Hygiene and Environmental Medicine, Graz, Austria, 8School of Medicine, University of Zagreb, Teaching Public Health Institute Andrija Štampar, Zagreb, Croatia

**Background:** Recently, emergence of carbapenem-resistance was observed among Klebsiella pneumoniae causing urinary tract infections in Croatia. Isolates confirmed to harbour KPC carbapenemases were further characterized on molecular level.

**Materials/methods:** The antimicrobial susceptibility to a wide range of antibiotics was determined by broth microdilution method. The transferability of meropenem resistance was determined by conjugation (broth mating method) employing E. coli A15R strain resistant to sodium azide. Genes encoding broad and extended-spectrum β-lactamases, plasmid-mediated AmpC β-lactamases, group A and B carbapenemases, and carbapenem hydrolyzing oxacillinases (blaOXA-48), respectively, were determined by PCR. Plasmids were characterized by PCR based replicon typing (PBRT).

**Results:** In total 23 KPC positive urinary isolates were analysed. Twenty isolates were collected in the University Hospital Centre Split and three in the nursing homes located in Zagreb County. The isolates were uniformly resistant to all tested antibiotics (including ceftaroline and ceftolozane/tazobactam) with the exception of variable susceptibility to gentamicin and uniform susceptibility to sulphamethoxazole/trimethoprim and ceftazidim/avibactam. Only one strain was resistant to colistin with MIC value of 4 mg/L. Sixteen isolates transferred meropenem resistance to E. coli recipient strain by conjugation with the frequency ranging from 7.8x10⁻⁸ to 4.2x10⁻⁵. Other resistance markers to gentamicin, ciprofloxacin, chloramphenicol and tetracycline were not cotransferred alongside with meropenem resistance. PCR was positive for blaKPC and blashv genes in all isolates whereas eleven isolates tested positive also for blaTEM genes. Sequencing revealed blaSHV-1 and blaTEM-1 genes. PBRT revealed the presence of FII plasmid in the three ESBL positive isolates from the nursing homes.

**Conclusions:** The study showed dissemination of KPC producing K. pneumoniae in urinary tract isolates in Croatia. Sulphamethoxazole/trimethoprim, ceftazidime/avibactam and colistin remain so far as the only therapeutic options although the colistin resistance already arose. Two different clones of KPC positive K. pneumoniae were observed: one with additional ESBL detected in the nursing homes and the other without ESBL identified in the University Hospital. At the national level the spread of carbapenemase-producing isolates began with OXA-48 producing strains, but KPC isolates recently emerged in southeast geographic region of Croatia posing a new epidemiological and therapeutical challenge.

Abstract 208

**Antileishmanial effects of amphotericin B-chitosan, amphotericin B-dendrimer, betulinic acid-chitosan and betulinic acid-dendrimer in the treatment of Leishmania major: real-time PCR assay plus**

Tahereh Zadeh Mehrizi1, Mehdi Shafiee Ardestani2, Mostafa Haji Molla Hoseini1, Ali Khamesipour4, Nariman Mosaffa5, Mohammad Banifazl6, Hasan Ebrahimi Shahmabadi7, Amitis Ramezani*1

1Pasteur Institute of Iran, Tehran, Iran, 2Tehran University of Medical Sciences, Tehran, Iran, 3Shahid Beheshti University of Medical Sciences, Tehran, Iran, 4Center for Research and Training in Skin Diseases and Leprosy, Tehran University of Medical Sciences, Tehran, Iran, 5Department of Medical Immunology, School of Medicine, Shahid Beheshti University of Medical Sciences, Tehran, Iran, 6Iranian Society for Support of Patients with Infectious Diseases, Tehran, Iran, 7Rafsanjan University of Medical Sciences, Rafsanjan, Iran

**Abstract third-party references:** Part of PhD student thesis in Pasteur institute of Iran

**Background:** Amphotericin B (A) and Betulinic acid (B) are antileishmanial agents with low water solubility and high toxicity.

**Materials/methods:** To increase the solubility and reduce the toxicity, they were loaded into chitosan nanoparticles (K) with the size of 102 nm and Anionic Linear Globular Dendrimer (D) with the size of 90 nm for the first time and used as the nanoformulations for the treatment of *Leishmania major*.

**Results:** The drug loading efficiency of 90% for Amphotericin B-chitosan (AK), 93% for Betulinic acid-chitosan (BK), 84% for Amphotericin B-dendrimer (AD) and 96% for Betulinic acid-Dendrimer (BD) was obtained. The characterization results confirmed that A and B were loaded into nanoparticles physically. The drug solubility rate was increased by 478 folds in AD and 790 folds in BD and by using a novel solvent, these values were increased by 80 folds for AK and 300 folds for BK. Also, the results of drug release studies showed that the all nanodrugs showed the slow drug release pattern with cellular uptake of 98.6% for AK10 µg/ml, 98% for BK20 µg/ml, 64% for AD50 µg/ml and 94.6% for BD40 µg/ml. Moreover, the nanocarriers reduced the toxicity effects of A and B by 100% in vivo and in vitro environments. AK10 mg/kg and BK20 mg/kg caused a reduction in the parasite burden by 83% [P<0.001], while AD50 mg/kg and BD40 mg/kg reduced toxicity effects to a lesser extent. Overall, all of the synthesized nanodrugs were found to be completely effective in the improvement of the pathological effects caused by *leishmania major* by 100% in infected footpad.

**Conclusions:** The results of this study showed that AK and BK were effective to a large extent in the treatment of *leishmania major* infectious [P<0.001], suggesting that AK and BK can be considered as suitable alternatives of choices drugs.

Abstract 216

**Evaluation of newly formatted *Aspergillus* lateral flow assay for IgG antibody detection in chronic pulmonary aspergillosis**

Anna Yang*, Yimin Wang**, Binghuai Lu**

* Tianjin Era Biology Technology Co., Ltd., Tianjin, China
** 1. Department of Respiratory and Critical Care Medicine, China-Japan Friendship Hospital, Beijing, China
** 2. Microbiology and Infection Laboratory, China-Japan Friendship Hospital, Beijing, China

**Background:** Detecting *Aspergillus*-specific IgG is critical to diagnosing chronic pulmonary aspergillosis (CPA). Existing assays are often costly and require sophisticated equipment, making them unsuitable for use in low- and middle-income countries where tuberculosis prevalence is high. It is necessary to diagnosis CPA in early stage to distinguish it from tuberculosis with similar presenting conditions. Genbio Pharmaceutical Co., Ltd. has recently commercialized a lateral flow assay based on immunochromatographic technology that detects *Aspergillus* IgG antibody in 10 minutes without any instruments.

**Materials/methods:** 137 CPA patient serum and control patient serum collected from the China-Japan Friendship Hospital (Beijing, China) were evaluated. Samples were applied to the FungiXpert® Aspergillus IgG Detection K-Set (Lateral Flow Assay) for IgG antibody detection and results were read qualitatively. Outcomes were compared with *Aspergillus* IgG titers in CPA patients, measured by Platelia™ Aspergillus IgG. Gradient dilutions were performed on samples that both assays were positive, then detect the samples repeatedly by FungiXpert® kit and results were semi-quantitatively.

**Results:** For proven CPA patients versus controls, sensitivity and specificity for the FungiXpert® Aspergillus IgG were 97.87% and 99.0%, respectively. And, the routinely-used Platelia™ Aspergillus IgG exhibited 95.74% sensitivity for the same cohort (cut off of 10 AU/mL). For the 45 samples that both assays were positive, the semi-quantitative results of FungiXpert® were similar to the titers of Platelia™ for each sample.

**Conclusions:** The FungiXpert® Aspergillus IgG lateral flow assay exhibits excellent sensitivity and specificity for serological diagnosis of CPA. Due to the short run time, simplicity, and limited resources needed, the Aspergillus IgG lateral flow assay is a suitable diagnostic tool for CPA in resource-constrained settings.

Abstract 218

**Binding interference between Bartonella adhesin A and fibronectin as a novel therapeutic concept to treat bacterial infections**

Diana Vaca¹, Arno Thibau², Johann Malmström³, Lotta Happonen³, Volkhard Kempf*²

¹Frankfurt am Main, Institute for Medical Microbiology and Infection Control, Frankfurt am Main, Germany, ²Frankfurt, Institute for Medical Microbiology and Infection Control, Frankfurt, Germany, ³Lund, Division of Infection Medicine, Lund, Sweden

**Background:** Bartonella henselae is a facultative intracellular bacterium, responsible for various human diseases like cat scratch disease and vascular proliferations [bacillary angiomatosis]. Bartonella adhesin A (BadA), a trimeric autotransporter adhesin, is a major pathogenicity factor of *B. henselae* mediating bacterial adherence to endothelial cells and extracellular matrix (ECM) proteins. The identification of specific binding sites between BadA and ECM proteins might give insights about the use of BadA-specific antibodies or peptides interfering with fibronectin binding ["anti-ligands"] to treat bacterial infections by a new class of antibiotics. The project aims the detailed analysis of fibronectin and BadA binding as the basis of the interaction between BadA and ECM proteins in host-cell adhesion processes, and the design of adhesion-inhibiting peptides for later anti-ligand application.

**Materials/methods:** *B. henselae* strains (wildtype and BadA deficient) were exposed to fibronectin and human endothelial cells to study binding interactions using *in vitro* infection models. A broad screening of fibronectin binding sites was performed using standardized *in vitro* binding assays. The relation between fibronectin and BadA was analyzed using mass spectrometry. As further steps, fibronectin will be genetically modified [e.g. deletion/modification of the identified binding domains]. Finally, after definition of the BadA-fibronectin binding sites, synthetic molecules will be generated for the inhibition of bacterial adhesion.

**Results:** We expect the definition of the fibronectin domains involved in the bacterial adhesion process to use this information in the generation of artificial peptides for bacterial adherence inhibition to host cells [anti-ligands]. To this purpose binding experiments using fibronectin fragments were performed showing binding with a 70 kDa fragment located at the N-terminal of the fibronectin molecule. To further analyze this interaction, crosslinking and mass spectrometry analysis using the complete fibronectin molecule and proteolytic fragments were performed to describe the sequence of amino acids involved in this interaction.

**Conclusions:** The project aims the detailed analysis of fibronectin and BadA binding as the basis of the interaction between BadA and ECM proteins in host-cell adhesion processes, and the design of adhesion-inhibiting peptides for later anti-ligand application.

Identification of novel pathogenicity factors in Bartonella bacilliformis

Alexander Dichter1, Sara Garcia Torres1, Sabrina Becker1, Meritxell Garcia Quintanilla1, Volkhard Kempf*1

1Frankfurt, Institute for Medical Microbiology and Infection Control, Frankfurt, Germany

Background: Carrion’s disease is a vector-borne biphasic illness restricted to the South American Andes. The causative agent of this neglected disease is Bartonella bacilliformis. The pathogen infects human erythrocytes causing a serious, acute hemolytic anemia called “Oroya fever” with mortality rates as high as 80% in untreated patients. In a second chronic phase the infection of endothelial cells results in the formation of blood-filled nodular hemangiomas in the skin (“verruga peruana”). Underlying molecular mechanisms of host infection are still widely unknown. Trimeric autotransporter adhesins (TAAs) play an essential role in bacterial pathogenicity, and are encoded in all Bartonella spp. Bartonella bacilliformis adhesin A (BbadA), has been identified in the genome of B. bacilliformis.

Materials/methods: Molecular genetic strategies using bacterial mutants (e.g., transposon mutagenesis library, promoter library) and recombinant protein expression strategies (e.g., heterologous expression library) are used to identify immunodominant proteins and pathogenicity factors of B. bacilliformis. The genomes of B. bacilliformis (strains KC583 and KC584) are sequenced using PacBio technology. Deletion mutants of BbadA and flagellin are generated using homologue recombination techniques. We want to predict possible immunodominant outer membrane proteins by using reverse vaccinology. A genomic deletion of bbadA and subsequent infection experiments with erythrocytes and endothelia cells will be performed to characterize the role of BbadA in the infection process.

Results: A genomic DNA expression library containing random genomic B. bacilliformis DNA inserts was established in E. coli BL21 (DE3). The development of a high throughput screening for immunodominant proteins is still ongoing. Electron microscopy clearly reveals the presence of BbadA on the surface of B. bacilliformis. Furthermore, the deletion of bbadA leads to a reduction in cell adhesion to endothelial cells. Western blot analysis with recombinant BbadA or flagellin reveals immunodominance using rabbit-anti B. bacilliformis serum.

Conclusions: The object of this work is the identification and characterization of immunodominant proteins of B. bacilliformis and the genetic and functional characterization of BbadA and flagellin. Furthermore, potential target proteins will be analyzed for diagnostic and therapeutic usability and to establish a basis for the development of a vaccine.

Abstract 223

Evaluation of diagnostic method with sonication and culturing of orthopaedic implant-associated infection at Karolinska University Hospital, Sweden

Baharak Saeedi1, Dalila Kartout Boukdiri*1,2,3

1Karolinska University Hospital, 141 86, Sweden, 2Karolinska University Hospital, Stockholm, Sweden, 3Karolinska University Hospital, clinical microbiology, Stockholm, Sweden

Background: Despite known low sensitivity, culture of prosthesis tissue specimens in Fastidious Anaerobe Broth (FAB) is a routine procedure in many laboratories. For increasing the chance to detect more positive specimens in order to improve the diagnosis of prosthesis infections caused by the bacteria that are apt to form biofilms, our laboratory in Stockholm since November 2018 has introduced a new method with sonication fluid inoculated into blood culture from prosthesis material in combination with culturing of periprosthetic tissue specimens in FAB. The aim of this retrospective study is to compare the results obtained after sonication and culturing of the prosthesis/implant with tissue-culture.

Materials/methods: The materials used in this study is the prosthesis/implant and infected tissues taken from the patients with suspected orthopedic implant-associated infection during November 2018 until October 2019. Data are obtained from the results recorded in the laboratory analysis system. In this study we considered include only patients with delivery of material both from prosthesis/ implant and infected tissues. The prosthesis has been sonicated and the fluid of sonication were inoculated into a blood culture bottle. All tissues have also been cultured into a FAB according to routine procedures.

Results: A total of 88 patients’ sample were analyzed with both sonication and FAB Culture at Karolinska laboratory/Huddinge during study period. Of these samples 47 showed growth and 41 samples showed no growth with sonication method which showed a total of 83% agreement with FAB culture method. The disagreement was found in 15 samples. Of these samples 12 were positive with just sonication and 3 samples were just positive in FAB with growing of Cutibacterium acnes.

Conclusions: Overall this study shows that after introduction of sonication in routine diagnostic method, we have increased the possibility to detect 25% more bacteria, but sonication is still not optimal method for detection of low growth bacteria. At this moment it is necessary to combined both methods for detection of low growth bacteria such as Cutibacterium Acnes.

Abstract 227

Genome-wide analysis of resistance-related transposable elements in multidrug-resistant Haemophilus parainfluenzae clinical isolates

Yanik Sierra Urueña*1, Aida González Díaz1,2, Dàmaris Berbel Palau1,2, Anna Carrera-Salinas1, Daniel Antonio Vázquez-Sánchez1,3, Meritxell Cubero1,2, Fe Tubau1,2, Jordi Càmara1,2, Carmen Ardanuy Tisaire1,2, Sara Martí1,2

1Hospital Universitari Bellvitge. IDIBELL., Microbiology Department., Hospitalet de Llobregat, Spain, 2ISCIII, Research Network for Respiratory Diseases (CIBERES), Madrid, Spain, 3ISCIII, Spanish Network for Research in Infectious Diseases (REIPI), Madrid, Spain, 4University of Barcelona, Dept. of Pathology and Experimental Therapeutics, School of Medicine, Barcelona, Spain

Background: Haemophilus parainfluenzae is emerging as an opportunistic multidrug-resistant (MDR) pathogen. Since data about the acquisition of resistance are scarce, we aimed to determine the contribution of mobile transposable elements (Tn) to enhance antimicrobial resistance in clinical H. parainfluenzae isolates.

Materials/methods: All the available MDR H. parainfluenzae strains (n=57) collected at Hospital Universitari de Bellvitge between 2013 and 2017 were characterized by Next-Generation Sequencing (Illumina MiSeq). In-silico screening of mutations targeting genes was performed with Geneious R9, using the closed genomes of H. parainfluenzae T3T1 and H. influenzae Rd KW20 as references. The acquired resistance mechanisms were screened using Abricate v0.8.0 for ResFinder databases. The antimicrobial susceptibility was tested by microdilution following EUCAST guides.

Results: Tn-family elements were identified in 47 of the 57 MDR H. parainfluenzae strains. Overall, 38.6% (22/57) of the strains carried two or more Tn-elements conferring them resistance to at least three antimicrobial families; eleven of them (19%) had the three transposable elements detected. Tn-elements distribution was as follows: Tn10 which harboured efflux-related genes associated with tetracycline resistance (tetBCDR) was carried by 66.7% (38/57) of the strains, of which 15 also contained a catA2 related to chloramphenicol resistance. Additionally, a Tn3 that included a blaTEM-1 involved in ampicillin resistance was found in 54.4% (31/57) of the strains. Finally, 21.1% (12/57) of the strains presented a Tn6026-like, similar to that identified in Enterobacteriaceae and linked to aminoglycoside and co-trimoxazole resistance. Among this group, 8 strains harboured the strB-strA-sul2 cluster and aph(3’)-Ia; 2 strains lacked the sul2 gene; 1 strain had an additional ant(2’)-Ia; and 1 strain harboured aac(3’)-Ia instead of aph(3’)-Ia, also conferring aminoglycoside resistance. These Tn structures were identified forming part of an integrative conjugative element (ICE) derived from H. influenzae (ICEHin1056) and H. parainfluenzae (ICEHpaT3T1), that also included genes involved in replication, secretion (type IV system), and integration. Concomitantly, 31.6% (18/57) of the strains acquired the MEGA-element linked to tetracycline (tetM) and azithromycin (mefA and msrD) resistance.

Conclusions: The acquisition of transferable elements is common among H. parainfluenzae and responsible for the multidrug resistance, becoming a reservoir and contributing to the spread of antimicrobial resistance.

Abstract 228

**Gut microbiome interferes with host tryptophan metabolism pathway and regulates basal anxiety-like behaviour**

Jazib Shafiq*, Bilal Khan, Ghulam Abbas, Ayaz Ahmed

1University of Karachi, International Center for Chemical and Biological Sciences, Karachi, Pakistan, 2Dow University of Health Sciences, Department of Molecular Pathology, Karachi, Pakistan, 3Ziauddin University, Department of Pharmacy, Karachi, Pakistan

**Background:** Host-microbiome interactions has emerged as promising research field to understand complexity of this symbiotic relationship. Microbiome–gut–brain axis is bidirectional communication system involved in regulation of host brain development and functions. Gut microbiome communicates with brain via neural, endocrine and immune pathways. Germ free mice have decrease basal anxiety levels due to alterations in their brain ultrastructure. The aim of this study was to explore the microbiome related changes in host basal anxiety levels with mechanistic insights in conventional laboratory mice.

**Materials/methods:** Gut dysbiosis mice model was developed using combination of non-absorbable antibiotics and anxiety level was evaluated using EPM. Neurochemical changes in brain were analyzed with HPLC. 16S rRNA sequencing of fecal content was performed to study gut microbial profiles, data was processed using standard bioinformatics tools, taxonomic and statistical analysis was performed on MEGAN and STAMP. Transcription levels of specific genes were analyzed using RT-qPCR.

**Results:** Behavioral analysis showed anxiolytic – like behavior in dysbiosis group. The hippocampus of antibiotic treated mice showed significant decrease in levels of tryptophan, serotonin and 5-HIAA. Beta diversity analysis showed taxonomic shift of microbial communities among groups. At genus level control group microbiome was dominated by *Muribaculum*, *Clostridium* and *Bacteroides*, while dysbiosis group showed dominance of *Klebsiella*, *Escherichia* and *Enterobacter*. Gene expression studies showed down regulation of serotonin transporter in mice hippocampus.

**Conclusions:** Our data suggest that taxonomic shift in gut microbiome can modulate host anxiety levels via interfering with its tryptophan metabolism pathway, as low levels of tryptophan in brain attributes to the reduce synthesis of serotonin which regulate basal anxiety – like behavior. This study highlights gut microbiome as drug and drug target due to inter-individual differences in gut microbial profiles and will further lead to advancement in personalized medicine by inclusion of individual’s microbiome profile.

Misuse of tampons and menstrual toxic shock syndrome in France: a community-based case-control study

Amaury Billon¹, Marie-Paule Gustin², Anne Tristan¹, Claude Alexandre Gustave¹, Philippe Vanhems², Gerard Lina*¹

¹Université Lyon 1 / Hospices Civils de Lyon, Centre National de Référence de Staphylocoques - Institut des Agents Infectieux, Lyon, France, ²Equipe Épidémiologie et Santé Internationale, Centre International de Recherche en Infectiologie, Lyon, France

Background: Menstrual tampons are widely used in western countries. Here we assessed whether tampon misuse was associated with increased risk of menstrual toxic shock syndrome (MTSS).

Materials/methods: We conducted a community-based, nationwide, case-control study in France, including women with MTSS diagnoses reported to the French National Staphylococcal Center of Lyon between 2011–2017. Controls were women with no MTSS history. Using a standardized questionnaire, we collected information regarding tampon use during a 6-month period. Associations between tampon misuse and MTSS were assessed using logistic regression models stratified by residential area.

Results: We analyzed data from 181 subjects (age≤30 years; 55 cases and 126 controls). Compared to controls, cases more frequently reported maximum tampon wear of >6 hours (62% vs. 41%, P<0.05), overnight tampon use (77% vs. 54%, P<0.05), and not having read and followed tampon instructions (65% vs. 42%, P<0.05). In univariate analysis, MTSS risk was two-fold higher with tampon use for >6 consecutive hours [odds ratio (OR)=2.3, 95% CI: 1.2–4.6, P<0.05], and three-fold higher with tampon use during sleep for >8 hours (OR=3.2, 95% CI: 1.4–7.7). In multivariate logistic regression analysis, maximum tampon use for >6 hours (OR=2.3; 95% CI: 1.04–4.6), and not reading and following the tampon instructions (OR=2.25; 95% CI: 1.15–4.39) were independent MTSS predictors.

Conclusions: MTSS risk can be reduced by using sanitary napkins overnight, using tampons for <6 consecutive hours, and receiving education about tampon use and its relation with MTSS. These findings have major public health implications for women’s health.

Abstract 235

Effects of previous antibiotic exposure on the clinical course of pneumonia in the elderly: a single-centre prospective observational study

Serkan Surme², Ilker Inanc Balkan³, Osman Bayramlar⁴, Ritvan Kara Ali³, Bilgul Mete³, Gunay Can³, Fehmi Tabak³, Nese Saltoglu*¹

¹Istanbul University-Cerrahpasa, Cerrahpasa Medical Faculty, Istanbul, Turkey, ²Istanbul University, Istanbul Medical Faculty, Istanbul, Turkey

Background: The aim of this study was to investigate the effects of previous antibiotic exposure on the outcomes of pneumonia in the elderly population.

Materials/methods: In this prospective observational study, the patients with pneumonia were stratified into two groups as younger (18 to 64 years) and older (≥65 years). A "poor prognosis" was assessed as the development of septic shock associated with infection and/or the need for intensive care and/or death within 30 days. Poor prognostic indicators for each group were determined and compared.

Results: There were 184 pneumonia episodes in 155 patients. The median age of the cases was 72 (range, 18-104) of whom 127 (69%) were ≥65 years old and 110 (59.8%) were male. Mental status changes were significantly more frequent in the elderly group (p=0.04). Pseudomonas species (n=11, 29.7%) was the most common agent, followed by Streptococcus pneumoniae (n=6, 16.2%), Haemophilus influenzae (n=5, 13.5%), Acinetobacter species (n=4, 10.8%) and Staphylococcus aureus (n=4, 10.8%). The rates of carbapenem resistance were high; 45.4% in Pseudomonas spp. and 50% in Acinetobacter spp. And 25% of Staphylococcus aureus strains were methicillin resistant. Multivariate regression analysis determined three variables that could be potential independent risk factors for poor prognosis in the elderly: dyspnea at the onset (OR:5.85, CI:5.18-6.52, p=0.01), previous antibiotic use within the last 3 months (OR:2.97, CI:2.51-3.43, p=0.02), and acute renal failure (OR:2.51, CI:2.06-2.96, p=0.04). A receiver operating characteristic analysis showed that the area under the curves of procalcitonin and C-reactive protein (CRP) as indicators of poor prognosis in the elderly were 0.846 (p<0.001) and 0.650 (p=0.008) respectively (Figure 1). In addition, mental status changes (p<0.001), the CURB-65 score (p<0.001), and the pneumonia severity index (PSI) (p<0.001) were associated with poor prognosis.

Conclusions: Previous antibiotic exposure, serum procalcitonin and CRP levels along with the PSI and the CURB-65 scores should minutely be evaluated in terms of need for hospitalization and intensive care. Furthermore, local epidemiology and resistance profiles should be taken into consideration for appropriate antimicrobial therapy.

Figure 1. Receiver operating characteristic curves of serum parameters for prediction of poor prognosis of elderly with pneumonia

Abstract 244

Hospital-acquired influenza characteristics and its correlation with the population-based surveillance in a tertiary care center in Istanbul

Huseyin Bilgin a,b, Emine Avci c, Gulcan Culha b, Nazli Pazar b, Seval Guneytepe b, Isil Sagir b, Rabia Can Sarmoglu d, Esra Baran e, Uluhan Sili f, Volkan Korten c

1Marmara University Pendik Research and Training Hospital, Infectious Diseases and Clinical Microbiology, Istanbul, Turkey, 2Department of Communicable Diseases, General Directorate of Public Health, Turkish Ministry of Health, Ankara, Turkey, 3Marmara University Pendik Research and Training Hospital, Infection Prevention and Control, Istanbul, Turkey, 4Marmara University Pendik Research and Training Hospital, Medical Microbiology, Istanbul, Turkey

Background: Influenza virus related respiratory infections causes major mortality and morbidity. Hospital acquired seasonal influenza (HA-SI) is reported up to 55% of inpatient influenza cases in Geneva University Hospital. Also, the proportion of HA-SI is correlated with the population-based influenza surveillance in some studies. We investigated the incidence of HA-SI and correlation with national influenza surveillance (NIS) data in a tertiary care center in Istanbul, Turkey.

Materials/methods: This is a retrospective study which includes seasonal influenza cases between October 2018 and March 2019. (The Sofia Influenza A+B Fluorescent Immunoassay, Quidel, USA) and/or Influenza A/B RT-PCR test (The Film Array Respiratory Panel, Biomerieux, France or Xpert Flu, Cepheid, USA). Cases were defined as HA-SI when symptoms onset and/or positive influenza PCR ≥ 72 hours after hospital admission, without previous respiratory symptoms or with negative influenza screening. The correlation between HA-SI and NIS data was analyzed using interclass-correlation test.

Results: During the study period 4423 patients tested for influenza and 786 (17.8%) of them were found positive. Out of 786 patients 119 were inpatients (15.1%) Of these 119 patients 29 (24.6%) were defined as HA-SI. Influenza-A represents the 88.2% of all inpatients with influenza and 89.7% of HA-SI. Majority of HA-SI cases occurred in medical wards (65.5%) and intensive care units (17.2%). The incidence density of HA-SI was 16.1 per 10,000 patient-admissions for the given period. Weekly rate of HA-SI cases and weekly NIS data for of sentinel inpatient influenza rate were significantly correlated. Whereas the NIS data for outpatients showed no correlation with HA-SI rates (Figure-1). The influenza vaccination coverage of health-care-workers was 10% for 2018-2019.

Conclusions: This study shows that during the 2018-2019 influenza season nearly 25% of the inpatient influenza cases acquired from the hospital. The data show the potential room for improvement in our medical center. Education about infection-prevention and control measures for influenza and achieving high vaccination coverage for health-care-workers and patients must be a priority. Also, the population-based surveillance can estimate the burden of HA-SI in our medical center which can be used to guide the institutional policies for influenza management in our medical center.

Abstract 245

Carbapenem antimicrobial stewardship programme

José Francisco García-Rodríguez *, Belén Bardán-García 1, Pedro Miguel Juiz González 1, Hortensia Alvarez-Díaz 1, Ana Mariño-Callejo 1

1 University Hospital of Ferrol, Ferrol, Spain

Background: The prevalence of carbapenem resistance throughout the world is increasing and carbapenems are considered critically important antimicrobials by the WHO. The aim of study is to evaluate clinical and antibiotic resistance impact of carbapenems Antibiotic Stewardship Programs (ASP).

Materials/methods: Descriptive study between January-2012/December-2018, pre-post-intervention. A carbapenems ASP was initiated in January 2015, in patients who started treatment with carbapenems (meropenem/ertapenem). An infectious diseases physician performed treatment recommendations to prescribers. Prospective information was collected to evaluate adequacy of carbapenems prescription to local guidelines and to compare results between cases with accepted or rejected intervention. Cases with carbapenems prescription during the last 4 months of 2014 were retrospectively reviewed, this sample of the pre-intervention period was used to compare with patients who started treatment with carbapenems during the intervention period. Appropriate treatment with carbapenems was considered when it was prescribed in patients with: 1. Severe sepsis; 2. history of ESBLs colonization; or 3. hospital-acquired infection in which a broad-spectrum antibiotic treatment was considered necessary. Analysis was performed to verify variables associated with any significant change in clinical evolution, carbapenems consumption, hospital-acquired multidrug-resistant (MDR) bloodstream infections (BSIs) and 30-day all-cause crude death in MDR-BSIs.

Results: Adequacy of carbapenems prescription improved progressively over time, after ASP implementation (p <0.001). Interventions on prescription were performed in 416 (34.5%) patients without carbapenems justified treatment (meropenem 389/ertapenem 27), in 339 (81.5%) intervention was accepted and in 77 was not. Intervention acceptance was associated with shorter duration of treatment (11.3±10.2 vs 13.4±8.6) and inpatient days (18.4±16.8 vs 27.3±23.6, p=0.002), without differences in clinical evolution. During the 2015-2018 period meropenem consumption in DDD/100 patients-day decreased compared with 2012-2014 [Rate ratio 0.61; 95%CI: 0.58-0.64, p<0.001], and ertapenem consumption increased somewhat [Rate ratio 1.07; 95%CI: 0.94-1.22]. Hospital-acquired MDR-BSIs rate and 30-day all-cause crude death in MDR-BSIs deceased [0.66; 95%CI: 0.44-1.00, p=006] and [RR 0.60; 95%CI: 0.28-1.34, p=0.29], respectively, coinciding in time with ASP start-up.

Conclusions: The decrease and better use of carbapenems achieved was associated with shorter duration of treatment and of inpatient days, without differences in clinical evolution, and with a decrease of hospital-acquired multidrug-resistant bloodstream infections rate.

Delineation of the direct impact of Candida auris ERG11 mutations on clinical triazole resistance

Jeffrey M. Rybak*1, Cheshta Sharma1, Laura A. Doorley1, Glen E. Palmer1, P. David Rogers1

1University of Tennessee Health Science Center, Department of Clinical Pharmacy and Translational Science, College of Pharmacy, Memphis, United States

Background: Candida auris has emerged as a healthcare-associated multi-drug resistant pathogen of great clinical concern. When isolated, approximately 90% of all clinical C. auris isolates are highly resistant to fluconazole, the most widely utilized antifungal, with modal MIC ≥256mg/L. While the majority of fluconazole-resistant clinical isolates are found to possess one of three different mutations in ERG11, the gene encoding the target of the triazoles, it remains unknown whether these mutations alone explain the high level of fluconazole resistance present among clinical C. auris isolates.

Materials/methods: To assess the direct contribution of all three clinically relevant C. auris ERG11 mutations, ERG11 alleles encoding the amino acid substitutions VF125AL, Y132F, and K143R, as well as a wildtype control were introduced into the fluconazole susceptible clinical isolate AR0387 using CRISPR-Cas9 mediated transformation system. Introduction of ERG11 mutations were confirmed using Sanger sequencing. Additionally, the K143R encoding mutation present in the highly fluconazole-resistant clinical isolate AR0390, was corrected to the ERG11 wildtype sequence. In vitro antifungal susceptibility testing was then performed using CLSI broth microdilution methodology.

Results: Introduction of each of the three mutant ERG11 alleles into the AR0387 fluconazole-susceptible background was observed to increase fluconazole MIC by 8 to 16-fold, while fluconazole MIC were unchanged upon introduction of the wildtype control allele. The MIC for the other clinically available triazoles were more minimally impacted by any of the three ERG11 mutations, with the most prominent change observed in voriconazole MIC (2 to 4-fold change). In the AR0390 fluconazole-resistant clinical isolate background, correction of the K143R encoding mutation to the wildtype sequence led to a corresponding 8-fold decrease in fluconazole MIC, and 4-fold decrease in voriconazole MIC, while the MIC of other triazole antifungals was unchanged.

Conclusions: Taken together, the findings of this study demonstrate mutations in C. auris ERG11 significantly contribute to the fluconazole resistance, but alone cannot explain the substantially elevated MIC observed among clinical isolates of C. auris. Further research is needed to identify additional mechanisms contributing to fluconazole resistance in clinical isolates of C. auris.

Presenter email address: jrybak@uthsc.edu
Abstract 248

Stay in the emergency department increases the risk of colonisation by carbapenem-resistant Enterobacteriaceae in the intensive care unit

Matias Salomão¹, Maristela P. Freire*, Icaro Boszczowski², Sueli Ferreira Raymundo², Ana Rubia Guedes², Anna Sara Shafferman Levin¹

¹Faculdade de Medicina da Universidade de Sao Paulo, Sao Paulo, Brazil, ²Hospital das Clinicas Faculdade de Medicina da Universidade de Sao Paulo, Sao Paulo, Brazil

Background: Carbapenem-resistant Enterobacteriaceae [CRE] colonization on admission to the intensive care unit (ICU) is common and the impact that hospitalization in the emergency department (ED) has on colonization is unknown. CRE-colonization on admission to ED was described in approximately 7% of patients of our hospital and one third of patients arrive in the ICU from ED. This study aimed to evaluate the impact of previous hospitalization in the ED on CRE-colonization at ICU admission.

Materials/methods: Hospital das Clinicas (HC) is a 2,200-bed public tertiary-care hospital in São Paulo, the largest hospital complex in Latin America. The ED is a very busy unit, with more than 69 thousand emergency consultations performed per year. In order to monitor and control colonization by CRE, all patients admitted to ICUs are routinely submitted to CRE surveillance cultures on admission to the unit. This is a retrospective case-control study that covered the period from September 2015 to July 2017, with 103 cases and 201 controls, analyzing ED hospitalization and other risk factors for colonization by CRE on ICU admission. Cases were patients colonized by CRE on admission to ICU and controls were patients admitted to ICU not colonized by CRE on admission.

Results: We found ED stay longer than 2 days (OR: 2.60; 95%CI: 1.35-4.99; p: 0.004), transfer from another institution (OR: 2.61; 95%CI: 1.43-4.74; p: 0.002), use of carbapenem on ICU admission (OR: 4.56; 95%CI: 1.92-10.83; p: 0.001), dialysis (OR: 2.94; 95%CI: 1.05-8.24; p: 0.04), and upper digestive endoscopy (OR: 4.15; 95%CI: 1.14-15.07; p: 0.031) as risk factors for CRE colonization on ICU admission.

Conclusions: This is the first study to demonstrate that prolonged ED stay (> 2 days) is a risk factor for CRE colonization on admission to the ICU. Other risk factors were transfer from another hospital, use of carbapenem, dialysis, and upper digestive endoscopy. The implications of these findings should lead to interventions in the ED if we are to control CRE in other hospital units.

Abstract 256

Evaluation of a novel method for detection of carbapenem hydrolysis with an automated software (Clover BioSoft) by MALDI-TOF MS

Eva Gato¹, Gema Méndez², Luis Mancera Pascual², Germán Bou Arevalo¹, Marina Oviaño García*¹

¹Complejo Hospitalario Universitario A Coruña, a Coruña, Spain, ²Clover BioSoft, Granada, Spain

Background: Rapid detection of Carbapenemase-producing Enterobacterales (CPE) is one of the main goals of microbiology laboratories. One of the recommended methodologies by the EUCAST guidelines is using MALDI-TOF MS for measuring the hydrolysis of carbapenems. However, all assays evaluated are single center studies and no multicenter evaluation has ever been made to standardize the methodology as recommended. Here, we expose our first objectives of a further multicenter study, that is the development of a universal and in-house protocol for measuring carbapenem hydrolysis by MALDI-TOF MS and the development of an automated software (Clover BioSoft) for spectra interpretation.

Materials/methods: A total of 81 Enterobacterales fully characterized, 50 CPE and 31 isolates with different resistance mechanisms (not carbapenemases) or no resistance mechanisms at all, were submitted to a standard operating procedure, using imipenem as carbapenem and 30 min of incubation. The developed software (Clover BioSoft) allows the semi-quantification of the hydrolysis of imipenem. For the calculation of the ratio of hydrolysis (RH), two different analyses were applied. The first one (a) took into account the intensity and the second one (b) the area of imipenem mass peaks (Image 1). The procedure was performed in parallel with the only commercially available method, the MBT STAR®-Carba IVD Kit in the MBT STAR®-BL IVD Module (Bruker Daltonik) following manufacturer’s instructions (c).

Results: According to the sensitivity analysis (ROC curve) the AUC was 0.994 (a), 0.990 (b) and 0.977 (c), proving our in-house method with the developed software (a) as best method. The optimum cut-off for the RH was ≥ 0.5 for positivity with a 94% sensitivity and 100% specificity. The negative cut-off is established for a RH ≤ 0.2 with 100% sensitivity and 90% specificity.

Conclusions: The optimized methodology proved useful for detection of CPE in less than 1 hour with a novel and online software (Clover BioSoft). The next phases of the study will include an international and multicenter validation of the technology for CPE detection in both MALDI biotyper (Bruker Daltonik) and VITEK MS (BioMérieux) systems.

Image 1. Boxplot diagram for imipenem hydrolysis with the main carbapenemases included in the study.

Abstract 260

The role of food and environment in the transmission of Clostridioides difficile
Su-Chen Lim1, Peter Moono2, Daniel R. Knight3, Thomas Victor Riley1,2,3,4

1Edith Cowan University, Perth, Australia, 2The University of Western Australia, Perth, Australia, 3Murdoch University, Perth, Australia, 4PathWest Laboratory Medicine, Perth, Australia

Background: Clostridium difficile is the most common cause of healthcare-related diarrhea in high-income countries. However, with increased reports of (i) community-associated C. difficile infection (CA-CDI), (ii) the findings of clinically-important C. difficile in animals, food and the environment, and (iii) whole-genome sequencing (WGS) showing that the majority of hospital-associated CDI cases are genetically distinct from one another, the traditional notion that CDI is primarily a hospital infection transmitted between symptomatic patients is currently being challenged. Yet, little is known about the possible role of community reservoirs in the transmission of CDI.

Materials/methods: Food and environmental samples were collected in Western Australia (WA). Enrichment culture, toxin profiling, PCR ribotyping and antimicrobial resistance (AMR) susceptibility testing were performed. WGS and core genome single nucleotide variant (cgSNV) analysis were carried out on a selection of C. difficile ribotypes (RTs) that frequently cause CDI in humans and animals.

Results: A high prevalence of C. difficile was found in retail vegetables (30.0%), compost (27.2%) and public lawn (58.5%) in WA. A diversity of strains was isolated including RTs associated with CDI in humans and animals [RTs 014/020 (28.3%) and 056 (3.0%)]. Food and environmental C. difficile displayed AMR patterns comparable to already published data of human and animal isolates with multidrug resistance only detected in compost isolates. Two clusters of human and food/compost RT 056 strains with ≤2 SNV suggest a very recent shared ancestry, consistent with recent transmission.

Conclusions: Currently, there are ample published genomic data that demonstrate CDI has a zoonotic and/or anthropogenic transmission, with little to no evidence of an epidemiological link between humans and animals. Food and the environment are likely acting as a conduit between the two hosts, in part due to the practice of recycling human and animal waste for agricultural use and decades of antimicrobial use/misuse in production animals that has amplified C. difficile in animals and promoted AMR. Community acquisition of C. difficile from reservoirs is undoubtedly contributing to CA-CDI and asymptomatic colonization. To address this CDI issue, a One Health approach is needed.

Epidemiological and clinical characteristics of patients with *Campylobacter* bloodstream infection: a retrospective case-control study

Luba Taü*1,2, Ohad Shalom1,2, Amos Adler1,3, Yael Paran1,2, Ronit Cohen-Poradosu1,2, David Shasha1,2, Ronen Ben-Ami1,2

1Ichilov, Tel Aviv-Yafo, Israel, 2Tel-Aviv University, Tel Aviv-Yafo, Israel, 3Ichilov, Tel Aviv-Yafo, Israel

**Background:** *Campylobacter* is a frequent cause of sporadic enterocolitis, but is considered a rare cause of bloodstream infection.

**Materials/methods:** We performed a single center retrospective case-control study comparing patients with *Campylobacter* bloodstream infection (C-BSI) (cases) to nonbacteremic patients with positive *Campylobacter* stool culture (controls) from 2007 through 2016. Case and control patients were matched by age and sex at a ratio of 1:2. Demographic characteristics, clinical features and microbiology data were extracted from patient medical records. Death within 30 days of culture, hospital stay duration, need for intensive care and recurrent hospitalization were compared between groups.

**Results:** We identified 42 patients with C-BSI and matched them with 83 nonbacteremic patients with positive *Campylobacter* stool culture. The rate of C-BSI increased sharply in 2014, with 38 cases (90%) identified from 2014 to 2016. Case patients were more likely than controls to be infected with *C. jejuni* (85% vs. 59%, *P*=0.008). Cases and controls did not differ in age, sex and comorbidities (median Charlson score 5 in both groups). Cases were more likely to present with fever (78% vs 53%, *P*=0.006) and functional deterioration (19% vs 4%, *P*=0.008), whereas control patients were more likely to have abdominal pain (54% vs 28%, *P*=0.008) and diarrhea (94% vs 57%, *P*<0.001). More patients with C-BSI were treated with PPI at baseline (55% vs 34%, *P*=0.056) and had a report of recent antibiotic exposure (33% vs 11%, *P*=0.002).

C-BSI was associated with higher 30-day mortality (19% vs. 2.4%, *P*=0.002), more frequent need for intensive care (11.9% vs. 1.2%, *P*=0.008) and doubling of the median hospital duration (6 days vs. 3 days, *P*<0.001). Rates of recurrent hospitalization were similar. Neutropenia and hematological malignancy were associated with higher mortality rate.

**Conclusions:** C-BSI is identified more frequently in recent years, possibly as a result of improved sensitivity of blood culture systems. Compared with nonbacteremic patients with positive stool culture, patients with C-BSI had significantly higher rates of death and other adverse outcomes. Previous antibiotic exposure, PPI use and infection with *C. jejuni* were identified as risk factors for C-BSI.

**Presenter email address:** luba_omsk@hotmail.com
Abstract 267

Acute cholangitis secondary to choledocholithiasis in older population: subtle presentation and severe illness
Ahmed Hamdi1,2, Sarwat Khalil1, Madiha Fida1, Elena Beam1

1Mayo Clinic, Rochester, United States, 2University of Minnesota, Minneapolis, United States

Background: Acute cholangitis continues to be a serious and possibly life-threatening diagnosis despite the advances and widespread availability of abdominal imaging and endoscopic intervention.

The classic Charcot’s triad lacks sensitivity and is reported to be positive in only 30% of acute cholangitis cases. Older population, defined in different studies by age >65 to >80 years old, are higher risk group with sparse literature regarding differences in clinical presentation and outcome.

Materials/methods: Retrospective chart review of 383 cases with acute cholangitis secondary to biliary stones managed between January 2012 and December 2017.

We reviewed clinical presentation, diagnostic criteria, disease severity, microbiology and 30 day outcome of acute cholangitis in patients aged >75 years.

Results: Our sample included 183 patients aged >75 years, 107 (58%) males, median age was 85 years (IQR 80-89) and 11/183 (6%) were immuno-suppressed.

The clinical presentation was with abdominal pain in 160 (87.4%), subjective fever in only 102 (55.7%), jaundice in 62 (33.8%) and altered mentation in 39 (21.3%). At time of presentation, LFTs of >1.5 upper normal limit was found in 171 (94%), abnormal WBC count (>10 or <4) was found in 150 (82.8%), total bilirubin of >= 2 mg/dL was in 145 (80%) and abnormal abdominal imaging was found in 167 (92%).

Severity of cholangitis following 2018 Tokyo guidelines was grade III in 46%, grade II in 45% and grade I in 9%.

Blood cultures were positive in 79/155 (51%). This was with gram-negative organisms in 63/79 (80%), gram-positive organisms in 7/79 (9%) and polymicrobial in 9 (11%).

Biliary drainage was pursued in 178 (97.2%). This was with ERCP in 170 (95%) cases. Overall mortality was 11/183 (6%).

Conclusions: Compared to younger population, acute cholangitis in patients >75 years is characterized by high-grade disease but with a more subtle clinical presentation. This group was found to have higher incidence of altered mentation but absence of fever in almost half of the cases. Laboratory blood testing and radiological imaging were abnormal in more than 80% of the cases.

Our findings suggest need for a high index of suspicion to pursue appropriate treatment and timely source control.

Adjunction of daptomycin for the treatment of bacterial meningitis: in vitro study

Thomas Maldiney, Dorian Bonnot, Nelson Anzala, Sandrine Albac, Delphine Labrousse, Emmanuelle Varon, Catherine Neuwihr, Delphine Croisier, Pascal Chavanet

University Hospital Dijon-Bourgogne, Dijon, France, Vivexia, Dijon, France, Hospital Center Intercommunal De Créteil, National Reference Centre for invasive Streptococcus pneumoniae, Créteil, France

Background: Due to intrinsic virulence factors, Streptococcus pneumoniae is responsible for the highest morbimortality associated with bacterial meningitis worldwide. Despite a global reliance on the use of beta-lactam antibiotics, several studies suggest a significant risk of worsening cerebral lesions owing to the release of pro-inflammatory toxins during bacterial cell lysis. As non-bacteriolytic antibiotic may help containing an excessive inflammatory host response, the adjunction of daptomycin is currently under clinical evaluation in a multicenter phase II study to improve the prognosis and survival of pneumococcal meningitis (AddaMAP, NCT03480191). However, its impact on the activity of standard treatment for other bacterial meningitis remains unknown. The present project aims at evaluating in vitro the antimicrobial activity of daptomycin-based associations against the most frequent species associated with bacterial meningitis.

Materials/methods: National Reference Centers were contacted for an epidemiological selection of the most relevant strains regarding five bacterial species: Streptococcus pneumoniae, Neisseria meningitidis, Listeria monocytogenes, Haemophilus influenzae and Streptococcus pyogenes. The antimicrobial activity of amoxicillin, cefotaxime, and rifampicin - either alone or in association with daptomycin - was explored through the determination of minimal inhibitory concentration (MIC), fractional inhibitory concentration index (FICI) and Time-Kill Kinetics Assay (TKA) using broth microdilution method.

Results: All species taken together, the adjunction of daptomycin had no deleterious impact on the antimicrobial activity of amoxicillin, cefotaxime and rifampicin in vitro. Regarding Gram-positive bacteria, FICI values confirmed a significant improvement of growth inhibition due to the adjunction of daptomycin, up to a synergistic effect with FICI largely below 0.5 for Streptococcus pyogenes. In addition, TKA analysis showed increased bactericidal activity with daptomycin, as demonstrated by the reduction of integrated AUC/24h by a factor varying from 1.5 to 3, depending on the species and antibiotic (Figure). Finally, lipopeptide-based associations did not modify the activity of beta-lactam antibiotics or rifampicin against Gram-negative bacteria, notably Neisseria meningitidis.

Conclusions: These results bring comforting evidence towards the potential of daptomycin adjunction in the treatment of bacterial meningitis. Such additional in vitro data constitute critical supplementary information supporting the ongoing AddaMAP clinical trial.

Assessment of the quality of data supporting the efficacy of new antibiotics for multidrug-resistant bacteria

Dafna Yahav1, Noam Tau2, Daniel Shepshelovich*3

1Rabin Medical Center, Beilinson Hospital, Petah-Tikva, Israel, 2Chaim Sheba Medical Center, Ramat Gan, Israel, 3Rabin Medical Center, Beilinson Hospital, Petah-Tikva, Israel

Background: Infections caused by multidrug resistant (MDR) bacteria are major public health threat. We aimed to assess the data supporting US Food and Drug (FDA) approval of new agents aimed to treat MDR bacterial infections, and the data provided by post-marketing studies.

Materials/methods: We identified all drugs with in-vitro activity against MDR bacteria initially approved by the FDA between January 2010 and December 2018. Characteristics of trials supporting approval and regulatory pathways were collected from Drugs@FDA. Characteristics of post-marketing studies were extracted from drug labels and ClinicalTrials.gov entries effective on June 1, 2019.

Results: Initial approval of 11 newly approved antibiotics with anti-MDR activity was supported by 20 trials, all with non-inferiority design. All initially approved indications were for common infections, mostly acute bacterial skin and skin-structure infections, regardless of causative microorganism. The proportion of MDR bacteria in most trials was low (<10% for Gram-negative infections, <1% for Gram-positive pneumonia). Most trials (90%) excluded immunocompromised and critically ill patients. Of 16 additional post-marketing phase III trials identified through ClinicalTrials.gov, only 2 exclusively included infections caused by MDR bacteria, comprising 116 patients. No drug was granted accelerated approval, which would mandate post-marketing efficacy studies.

Conclusions: The approval of new drugs presumed to have clinical activity versus MDR bacteria is supported by trials evaluating infections caused by non-MDR organisms, using non-inferiority design and excluding the patients most likely to require these agents. Subsequent post-marketing efficacy data against these organisms are scarce. Healthcare professionals and regulators should demand more robust data to support clinical decision making.

Screening of Chlamydia trachomatis and Neisseria gonorrhoeae in female sex workers: pooled versus single site testing

Nick Verougstraete1, Vanessa Verbeke1, Anne-Sophie De Cannière2, Elizaveta Padalko1, Liselotte Coorevits*1

1Ghent University Hospital, Ghent, Belgium, 2, Violett VZW, Ghent, Belgium

Background: As the majority of women infected with Chlamydia trachomatis (CT) and Neisseria gonorrhoeae (NG) are asymptomatic, targeted screening of patients in specified risk groups is indicated in order to reduce transmission and (long-term) complications. Testing of extra-genital is warranted for optimal detection and treatment of those infected. As this comes with a substantial cost, analysis of a pooled sample from vaginal and extra-genital sites could be beneficial. In this study, we evaluated the feasibility of CT/NG testing in pooled versus single site samples in a large cohort of female sex workers.

Materials/methods: We sampled 501 women with the Abbott multi-ColleCTSpecimen Collection Kit in the pharynx (taken by the physician), vagina and rectum (either self-collected or by the physician). For each woman, all three samples were vortexed and 400 µL of transport medium was pooled into an empty tube. The pooled sample was tested for CTand NG alongside each single-site sample using the Abbott RealTime CT/NG assay on the m2000sp/rt system.

Results: Overall, 5.1% of sex workers were positive for CT; 2.0% were positive for NG and 1.4% were co-infected, resulting in an overall prevalence of 6.5% for CT and 3.5% for NG. From the 42 women positive on at least one single-site sample, only 5 had a negative result on the pooled sample resulting in a sensitivity of 94% for CT and 82% for NG. The false negative pooled samples were from women with a single-site NG (n=3) or CT (n=2) infection with low bacterial load. Inadequate self-sampling was ruled out as a possible cause of false negativity, as the number of samples from infected women collected by the physician was comparable to the number of self-collected samples. Testing extra-genital samples led to a significantly higher detection rate, as 40% of the CT and 60% of the NG infections would have been missed if only vaginal samples were tested.

Conclusions: Pooling samples is a cost-effective strategy for the detection of CT and NG in females, with minimal decrease in sensitivity. By reducing costs, more extra-genital samples can be tested, resulting in higher detection rates.

Abstract 288

**Patient transfers as a risk factor for Clostridioides difficile infection: a case-control study**

Jon Edman-Wallér*1,2, Sakari Suominen3,4, Maria Werner1

1Southern Älvsborg Hospital, Borås, Sweden, 2Gothenburg University, Göteborg, Sweden, 3University of Skövde, Skövde, Sweden, 4University of Turku, Turku, Finland

**Background:** Clostridioides difficile (previously Clostridium difficile) is a spore-forming bacterium; the spores are highly resilient and can survive for long periods in the hospital environment despite cleaning and disinfection efforts. Most Clostridioides difficile infections (CDI) are hospital-acquired. Colonization of spores or vegetative bacteria in the large intestine is necessary for infection to occur, and the risk of infection is modulated by the state of the intestinal microbiome and the host’s immune status. Patient transfers within and between wards are commonplace in modern healthcare, exposing patients to more areas of the hospital environment where spores may exist. We hypothesised that frequent transfers between wards and/or rooms within a ward is a risk factor for developing CDI.

**Materials/methods:** A case-control study of all hospital-acquired CDI cases at Södra Älvsborg Hospital, Borås, Sweden, during two years: 2012 and 2015 (n=65). A random selection of patients tested negative for CDI served as control group (n=101). Odds ratios were calculated by univariate logistic regression followed by multivariate logistic regression for variables where there was a statistically significant difference in the univariate analysis. These covariates were room transfers, transfers or ward, use of proton pump inhibitors, and use of antibiotics.

**Results:** The number of patient transfers both between and within wards was significantly higher in the case group in univariate analysis, however, there was no significant difference between groups when data were adjusted for other known risk factors. In the multivariate analysis, time of care was the only statistically significant variable (OR per additional day of care: 1.07, 95% confidence interval: 1.02-1.07).

**Conclusions:** The study could not demonstrate patient transfers as an independent risk factor for CDI, but underlines the importance of time of care as a risk factor for CDI.

Abstract 292

**Risk of invasive pneumococcal infection in patients with asplenia/hyposplenism: a nationwide population-based study compared to the general population**

Ji-Man Kang* 1, Eun Hwa Kim1, Minkyung Han1, Inkyung Jung1, Kyong Ihn1, Jong Gyun Ahn1

1Yonsei University College of Medicine, Seoul, South Korea

**Abstract third-party references:** This study was supported by Basic Science Research Program through the National Research Foundation of Korea (NRF) funded by the Ministry of Education [2019032869]

**Background:** Asplenia is a well-known risk factor of invasive pneumococcal infection (IPI), but nationwide cohort studies have not been conducted on how the risk increases in patients with asplenia compared to the general population.

**Materials/methods:** All cases of newly-diagnosed asplenia that were claimed to the National Health Insurance Service in South Korea from January 2009 to December 2018 were included. Information were extracted from Health Insurance Review and Assessment Service database. Asplenia patients were defined as those who were diagnosed with congenital asplenia/hyposplenism or underwent splenectomy. To compare the incidence of IPI between these patients and the general population, we used the case definition and the 2017 data of National Infectious Disease Surveillance System at Korean Center for Disease Control.

**Results:** Over a period of 10 years, a total of 2,1376 cases were identified; 20,524 cases (96.0%) underwent splenectomy and 852 cases (4.0%) had diagnosis of congenital asplenia/hyposplenism. Fifty-seven patients had an IPI, and one was accompanied by *H. influenza* infection. Six deaths (10.5%) were reported within 2 weeks of antimicrobial treatment. The incidence of IPI was 36.4 per 100,000 person-year, and the cumulative incidence of IPI was 0.1%, 0.4%, and 0.6% at 1-year, 5-year, and 8-year, respectively. The 8-year cumulative incidence rate of infection in the group aged under 5 years old was 14.2%, which was significantly higher than that in other age groups (0.5%, p<0.0001 by log-rank test). The relative risk of IPI in asplenia group was 37.6 times higher than that in the general population. In particular, the standardized incidence ratios (SIRs) in the age groups of 5 to 19, 20-39, and under 5 were 349.0, 342.2, and 225.8, respectively.

**Conclusions:** To our knowledge, this is the largest population-based study to show a significant increase of IPI in asplenia patients compared to the general population. Our findings reinforce that asplenia patients, especially those aged under 5 years, are at a very high risk for IPI.

**Presenter email address:** umi87c@yuhs.ac
Sexually-transmitted infections detection using real-time PCR Allplex in the east coast of Spain

Begoña Fuster Escrivá*, Manuel Belda1, Maria Dolores Ocete2, Concepción Gimeno Cardona3

1consorcio hospital general universitario de valencia, Valencia, Spain

**Background:** Worldwide sexually transmitted infections (STIs) stand as a major global health concern, and more than a million of STIs are acquired per day. Common bacterial agents causing STIs are: *Chlamydia trachomatis*, *Neisseria gonorrhoeae*, *Mycoplasma genitalium*, and *Trichomonas vaginalis*. The aim of this study has been to establish the prevalence of STIs in the area of Consorcio Hospital General de Valencia, Spain during a two-year period of time.

**Materials/methods:** A total of 4541 clinical specimens from different anatomical sites (urine and endocervical, pharyngeal and anal swabs) according to the reported type of sexual practices (vaginal, oral and/or anal intercourse) of 3894 participants were included in the study. Testing was performed using the multiplex RT-PCR Allplex® STI Essential Assay (Seegene, Seoul, Korea). This assay can simultaneously detect 7 STI pathogens (*C. trachomatis*, *N. gonorrhoeae*, *T. vaginalis*, *M. genitalium*, *M. hominis*, *U. urealyticum* and *U. parvum*).

**Results:** Global sexually-transmitted infection rates in our area are around 40%. In the table below there is the distribution of the different infections and the number of cases for each infection. *Chlamydia trachomatis* and *Neisseria gonorrhoeae* co-infections were detected in four cases, whereas co-infections of different species of Mycoplasma and Ureaplasma were found in more than 20% of the cases.

<table>
<thead>
<tr>
<th>Sexually-transmitted microorganism</th>
<th>Number of cases (%)</th>
</tr>
</thead>
<tbody>
<tr>
<td><em>Chlamydia trachomatis</em></td>
<td>326 (8%)</td>
</tr>
<tr>
<td><em>Mycoplasma genitalium</em></td>
<td>104 (3%)</td>
</tr>
<tr>
<td><em>Mycoplasma hominis</em></td>
<td>494 (14%)</td>
</tr>
<tr>
<td><em>Ureaplasma parvum</em></td>
<td>1013 (29%)</td>
</tr>
<tr>
<td><em>Ureaplasma urealyticum</em></td>
<td>498 (14%)</td>
</tr>
<tr>
<td><em>Neisseria gonorrhoeae</em></td>
<td>188 (5%)</td>
</tr>
</tbody>
</table>

**Conclusions:** Untreated STIs can lead to serious long-term health consequences, especially for adolescent girls and young women. Testing STI with multiplex PCR allows a more accurate diagnosis and covers the main agents causing these type of infections that could not be diagnosed otherwise. This is of major importance, as nowadays we are attending to a notorious increase in the rate of sexual infections that need to be detected and treated.

**Characterisation of airborne fungi present in two hospitals in Kabale District, Uganda**

Adeyinka Odebode* 1, Gerald Niwamanya 2

1 Kabale University, Kabale, Uganda, 2 Kabale University, kabale, Uganda

**Background:** Fungi are an increasing public health problem worldwide because they have a great impact on human health and on different areas of our activities. Fungi infection are a serious threat to quality of human life. Hospital environments contain different types of microorganisms such as airborne fungi which causes fungal diseases. In the present study, the total count and diversity of airborne filamentous and yeasts fungi were investigated in indoor air of selected wards of two major hospitals in Uganda. The study also examined the proportion in fungal infection cases most commonly reported in the two hospitals.

**Materials/methods:** Samples of indoor air from Outpatient ward, Maternity, Pediatrics and Emergency wards were collected by open plate technique on Potato dextrose agar media once a week. Samples were collected in triplicates. The cultures were then examined and evaluated according to macroscopic and microscopic examination criteria for genotypic identifications. The obtained results were analyzed by SAS and Plotly software.

**Results:** A total of 22 different fungi species were isolated from the two hospitals with *Aspergillus flavus* (17.9%) followed by *Aspergillus fumigatus* (12.3%), yeast (9.6%), *Penicillium citrinum* (8.5%), as the most abundant and frequently surveyed fungal species in the two hospital while *Trichoderma*, *Nigrospora* and *P. marneffei* had the least values of spore count in all locations. All the wards showed high rates of contamination by various fungi. However, the analysis of the data showed that indoor air of OPD department (28.4%) had the highest number of fungi colonies in Kabale hospital while maternity ward (31.1%) had the highest for Rugarama hospital with the highest fungal pollution. Females also had more asthma cases for Kabale hospital with patient’s ages 6-59 years visiting the hospital for either asthma or fungi infection cases while for Rugarama hospital, fungi infection cases was more prevalent. Rainfall and relative humidity were positively correlated with high fungi load in the atmosphere of the two hospitals.

**Conclusions:** Data on the abundance/prevalence of fungi spores in hospital environment of sub-Saharan Africa is limited. Therefore, it is important to evaluate and strengthen the infection prevention practice of the hospital.

Abstract 301

Whole genome analysis of vancomycin-resistant Enterococcus faecium causing nosocomial outbreaks suggests the occurrence of few endemic clonal lineages in Bavaria, Germany

David Eisenberger*, Christian Tuschak¹, Silke Nickel¹, Verena Lehner-Reindl¹, Christiane Höller¹, Bernhard Liebl¹, Giuseppe Valenza²

¹Bavarian Health and Food Safety Authority, Erlangen, Germany

Background: Among clinical isolates of vancomycin-resistant Enterococcus faecium (VREfm), sequence type (ST) 117 and ST80 are highly prevalent in German hospitals and represent a frequent cause of nosocomial outbreaks. In this study, we investigated the genetic diversity of clinical isolates of VREfm recovered from different nosocomial outbreaks in Bavaria, Germany, by whole-genome sequencing (WGS).

Materials/methods: Between January 2018 and April 2019, 100 non-replicate clinical isolates of VREfm originating from nosocomial outbreaks at eight different hospitals in Bavaria were investigated for genetic diversity by WGS using the Illumina MiSeq platform (Illumina Inc., San Diego, USA) and laboratory procedures according to the manufacturer’s instructions. Afterwards, complex types (CTs) were identified by a gene-by-gene approach based on 1423 genes (core genome multilocus sequence typing, cgMLST) using SeqSphere+ software version 6.0.2 (Ridom GmbH, Muenster, Germany). Furthermore, a single-nucleotide polymorphisms (SNP)-analysis was conducted for all VREfm strains using BioNumerics 7.6 software (Applied Maths, Sint-Martens-Latem, Belgium).

Results: Most of the isolates of this study (84%) belonged to three major clonal groups: ST80/CT1065like vanB (n = 45; 6 hospitals), ST117/CT71like vanB (n = 20; 5 hospitals) and ST78/CT894like vanA (n = 19; 3 hospitals) (Figure 1). Isolates of the predominant lineage ST80/CT1065like vanB occurred in 6 different Bavarian hospitals and showed by SNP analysis a maximum difference of 34 SNPs.

Conclusions: Whole-genome analysis of VREfm causing nosocomial outbreaks suggests the occurrence of few endemic clonal lineages (ST80/CT1065like vanB, ST117/CT71like vanB and ST78/CT894like vanA) in Bavarian hospital settings.

Figure 1: Minimum-spanning-tree of all vancomycin-resistant Enterococcus faecium (VREfm) isolates of this study based on core genome multilocus sequence typing (cgMLST).

Abstract 303

Management of tuberculosis: are the practices homogeneous in Europe?

Frédéric Méchaï*, Hugues Cordel¹, Lorenzo Guglielmetti¹,², Alexandra Aubry¹,², Mateja Jankovic Makek³, Miguel Viveiros⁶, Miguel Santin⁶, Delia Goletti⁸, Emmanuelle Cambau⁹

¹APHP, Infectious disease Unit, Avicenne Hospital, Université Paris 13, IAME, INSERM, Paris, France, ²APHP, Infectious Disease Unit, Avicenne Hospital, Paris, France, ³APHP, Groupe Hospitalier Universitaire Sorbonne Université, Hôpital Pitié-Salpêtrière, Centre National de Référence des Mycobactéries et de la Résistance des Mycobactéries aux Antituberculeux, Paris, France, ⁴Sorbonne Université, INSERM, U1135, Centre d’Immunologie et des Maladies Infectieuses, Cimi-Paris, Paris, France, ⁵Clinic for Lung Diseases, University of Zagreb School of Medicine and University Hospital Centre Zagreb, Zagreb, Croatia, ⁶Global Health and Tropical Medicine, GHTM, Instituto de Higiene e Medicina Tropical, IHMT, Universidade Nova de Lisboa, UNL, Lisboa, Portugal, ⁷Service of Infectious Diseases, Tuberculosis Unit, Bellvitge University Hospital-IDIBELL, University of Barcelona, L’Hospitalet de Llobregat, Barcelona, Spain, ⁸Translational Research Unit, Department of Epidemiology and Preclinical Research, “L. Spallanzani” National Institute for Infectious Diseases (INMI), IRCCS, Roma, Italy, ⁹AP-HP, Hôpital Lariboisière, Service de Bactériologie/ Groupe Hospitalier Universitaire Sorbonne Université, Hôpital Pitié-Salpêtrière, Centre National de Référence des Mycobactéries et de la Résistance des Mycobactéries aux Antituberculeux, Paris, France

Background: Tuberculosis remains a global burden. This study aims to evaluate and to compare practices regarding the diagnosis, isolation and treatment of tuberculosis (TB) in Europe.

Materials/methods: A survey was conducted from November 2018 to April 2019 within the ESCMID study group for mycobacterial infections (ESGMYC). The practices observed were compared to the main international guidelines.

Results: Among 136 ESGMYC members, 58 responded to the questionnaire representing 14 countries. The participants are working in an infectious diseases (67%, n=43) or clinical microbiology (30%, n=19) department. In their practice, two (20.7%) or three sputum samples (79.3%) were collected for the diagnosis of pulmonary TB. If a patient was unable to provide a sputum sample, the alternatives were induced sputum (n = 37 / 67.2%), bronchoscopy (34 / 58.6%), and gastric aspiration (15 / 25.9%). Nucleic acid amplification tests were performed by 41 (64%) respondents whatever the smear result and by 47 (73%) in case of smear-positive specimens, to detect mutations conferring resistance to rifampicin by 84% (n= 52), to isoniazid by 29% (n=18), and to other drugs by 7% (n=4) of 62 respondents. NAAT and adenosine deaminase measurement were used for extrapulmonary TB diagnosis in 83.6% and 40.4% of cases, respectively. For isolation duration, 21 respondents (42.9%) are keeping isolation until smear negativity. An initial treatment without ethambutol was offered by 14% (n=9) of respondents. Corticosteroid therapy, cerebrospinal fluid opening pressure testing, and repeated lumbar puncture were carried out for central nervous system TB by 79.6%, 51.9% and 46.3% of the respondents, respectively. For patients with HIV-TB coinfection, the preferred antiretroviral therapy included dolutegravir 50mg BID (56.8%). For HIV-positive patients with latent TB, all respondents offered preventive treatment.

Comparing with the recommendations of the main guidelines, the practices are not totally consistent.

Conclusions: This study shows heterogeneous practices within Europe, particularly for diagnosis and isolation, although the role of rapid molecular testing seems to be important in most centers. Recent international recommendations are not followed. Better dissemination of these recommendations in collaboration with ESCMID and the promotion of studies validating good TB management practices in the European context are necessary.

Abstract 306

Genomic analysis and exploration of putative drug resistance loci in malaria parasites

Jiru Han*, 1,2, Jacob Munro1, Melanie Bahlo1,2

1University of Melbourne, Faculty of Medicine, Dentistry and Health Sciences, Parkville, Australia, 2Walter and Eliza Hall Institute of Medical Research, Population Health and Immunity Division, Parkville, Australia

Abstract third-party references: The University of Melbourne, Walter and Eliza Hall Institute of Medical Research

Background: Plasmodium falciparum (Pf), the major parasite causing malaria, accounts for over 90% of malaria deaths, and demonstrates considerable resistance to current antimalarial drugs. Whole-genome sequencing can be employed to identify regions that are under high drug selective pressure, notably by looking at the single nucleotide polymorphism (SNPs), copy number variants (CNVs), and short tandem repeats (STRs). Here, we re-analysed data from a published study in which Cowell et al. set out to identify drug resistance inducing variants, which were either SNPs, CNVs or STRs.

Materials/methods: The druggable-genome dataset was downloaded from the NCBI Sequence Read Archive which contains 237 P.falciparum strains, resistant to 31 diverse compounds derived from 3 background strains: 3D7 (168), 7G8 (5) and Dd2 (64). As there is a considerable difference between the genome of 3 background strains, reads were aligned to corresponding reference genome, compared to only single reference genome (3D7) in Cowell et al. We used our in-house pipelines to re-analyse the SNPs and CNVs, and HipSTR to analyse STRs, which were not analysed in Cowell et al. Variants were then compared between isogenic parent and offspring compound-resistant clones to explore mutations possibly associated with drug resistance.

Results: Our results showed that alignment to the appropriate reference genome greatly reduces the number of variants, allowing causative variants to be better identified. We identified 305 putative drug resistance genes from 307 samples, 146 genes from Dd2 samples, and 7 genes from 7G8 samples. Among them, 68 genes were observed in multiple, independent clones, 4 of which were known drug resistance loci (pfcm, pfcr, pfmdr and pfmrp). Additionally, 17 genes were identified as associated with multi-drug resistance. Compared with Cowell et al., we have 20 putative drug resistance genes that are identical between their and our analysis, 6 genes identified only by them, and 45 genes unique to our analysis.

Conclusions: This study presents a comprehensive analysis of the different types of genomic variations to identify mutations possibly associated with drug resistance. This information can be used for the investigation of drug resistance mechanisms and help in designing combination drug therapies to overcome emerging drug-resistance.

Abstract 314

**Fully automatic (1-3)-β-D-glucan test for the invasive fungal detection**

Li Alana*, Lizhong Han

1Genobia Pharmaceutical Co., Ltd, Tianjin, China, 2Ruijin Hospital, Shanghai Jiao Tong University School of Medicine, Shanghai, China

**Background:** Invasive fungal disease threatens millions of human’s life every year, people are exploring the diagnosis solutions currently. Fungus (1-3)-β-D-Glucan (BG) test is a widely recommended and used technology for the detection of pan-fungal infections. However, BG test has high requirements for the personnel operation and requires very careful operation because (1-3)-β-D-Glucan is a substance that also exists in the environment. Era Biology’s FungiXpert Fully Automatic Kinetic Tube Reader (IGL-200) was introduced to make BG test automated. This technique would allow elimination of contamination origin from human operation and reduce the operational error.

**Materials/methods:** The aim of this study was to evaluate the performance of fully automatic BG test. The evaluation test was performed at Ruijin Hospital, Shanghai Jiao Tong University School of Medicine, a total 140 serum samples were involved and collected on site. Samples were tested by both manually (performed on kinetic tube reader MB-80X) and automatically (performed on Fully Automatic kinetic tube reader IGL-200) immediately after collection. The reagent used in this program is Goldstream® Fungus (1-3)-β-D-Glucan Test (Chromogenic Method). The final detection results were compared with clinical evidences and diagnostic from hospital.

**Results:** Compared with results performed on MB-80X and fully automatic IGL-200, the total coincidence rate of IGL-200 results was 97.85% (137/140). Among the 3 inconsistent samples, one is the special hemolysis sample; one sample showed weak positive on IGL-200 and in indeterminate with manual operation. Another inconsistent sample was clinically proved to be negative but show positive on MB-80X with unknown cause, which was suspected to be the result of man-made contamination. For the experiment on IGL-200, there is no complicated procedures but only need place the reagents and samples on the rack, much easier for laboratory.

**Conclusions:** The BG test on Fully Automatic Kinetic Tube Reader IGL-200 has a high agreement rate and low contamination rate compared with manual operation. IGL-200 permits a quick result and convenient operation, benefits clinical laboratory with its high efficient and intelligent. BG test automated with IGL-200 is a significant diagnostic method.

Abstract 318

Renal function and albumin are drivers for exposure of flucloxacillin in critically ill patients
Nynke Jager*1,2, Reinier Van Hest1, Roger Brüggemann2, Jeffrey Lipman1,4, Jason Roberts1,4

1The University of Queensland, University of Queensland Centre for Clinical Research, Brisbane, Australia, 2Radboud University Medical Center, Nijmegen, Netherlands, 3Academic Medical Centre, Amsterdam, Netherlands, 4Royal Brisbane and Women’s Hospital, Herston, Australia

Background: Our objective was to describe population pharmacokinetics (PPK) of flucloxacillin in critically ill patients and to identify covariates that can explain variability in PK behavior, in order to optimize flucloxacillin dosing regimens.

Materials/methods: First, we developed a PPK model and estimated between patient variability (BPV) through non-linear mixed effect analysis, using total and unbound concentrations obtained from adult critically ill patients treated with intermittent flucloxacillin for (suspected) infections. Second, we identified covariates that could explain BPV. Third, the impact of the identified covariates on flucloxacillin exposure and probability of PK/PD target attainment (PTA, 100% ft>MIC, ECOFF S. aureus cloxacillin 0.50mg/L) was evaluated by Monte Carlo simulations and externally validated in two critically ill patient cohorts.

Results: Thirty-five patients yielded 79 total and 104 unbound flucloxacillin plasma concentrations. In a two-compartment model with non-linear protein binding, BPV of the maximum binding capacity decreased from 42.2% to 30.4% upon inclusion of serum albumin concentrations (ALB). BPV of unbound clearance decreased from 88.1% to 71.6% upon inclusion of estimated glomerular filtration rate (eGFR, CKD-EPI). The model with ALB and eGFR performed statistically significantly better than the model without covariates in the external patient cohorts: median absolute percentage error (MAPE) of population predicted concentrations decreased from 55.3 to 39.6% (p=0.004) for total and from 59.2 to 51.7% (p=0.01) for unbound flucloxacillin in the Nijmegen dataset, and from 70.3 to 33.4% (p=0.0005) for unbound flucloxacillin in the Brisbane dataset. The PTA was 91% for patients with eGFR 33ml/min and 1g q6h, 87% for patients with eGFR 96ml/min and 2g q4h and 71% for patients with eGFR 153ml/min and 2g q4h.

Conclusions: For patients with high creatinine clearance infected with moderately susceptible pathogens, therapeutic drug monitoring is advised as a risk for underexposure exists even with the currently used highest dosing regimens. When total flucloxacillin concentrations are measured and converted using protein binding values from the literature, there is a risk of underestimating unbound concentrations, especially in patients with hypoalbuminemia.

Figure 1. Simulated flucloxacillin concentration-time profiles: (A) total and (B) unbound concentrations after 1g q6h; (C) total and (D) unbound concentrations after 2g q4h.

Rapid semi-quantitative format PCR for the detection of *Pneumocystis jirovecii* replacing the direct examination

Alix Coste¹, René Brouillet¹, Jean-Gaël Diserens¹, Milo Moraz¹, Frederic Lamoth², Philippe Hauser¹, Gilbert Greub², Katia Jaton*¹

¹University Hospital Lausanne, Institute of Microbiology, Lausanne, Switzerland, ²University Hospital Lausanne, Institute of Microbiology - Service of Infectious Diseases, Lausanne, Switzerland

**Background:** *Pneumocystis jirovecii* (PCJ) is an opportunistic pathogen causing infection in immunocompromised patients. Conventional diagnostic is done on respiratory samples by microscopy. However PCR exhibits a higher sensitivity and allows accurate quantification. At the CHUV we developed a quantitative RT-PCR on our molecular platform and the PCJ DNA copy number was correlated with clinical significance ([P#2194, ECCMID 13-16 April 2019 Amsterdam, Netherlands]). However our platform has a TAT of 4 hours and is opened 5/7 days a week. We, thus decided to transfer this home-brew PCR on the rapid BD MAX™ system (BD Diagnostics) providing results in 90 minutes, 7/7 days a week. We now aimed to extrapolate PCJ quantity from the obtained BD MAX™ system Ct in order to give to clinicians a clinical significant result.

**Materials/methods:** A prospective study on 247 patient respiratory samples was performed to compare both PCR systems: quantification (Ct=copy number/ml) home-brew PCR on the platform and semi-quantification (Ct) on the BD MAX™ system.

**Results:** On 247 samples, 8 were not taken into account in our analysis due to technical problems on one or another platform. On the 239 remaining samples, 18 were not concordant due to very low quantities (high Ct value) of DNA, not corresponding to clinical significant amount of PCJ. On the 49 positive on both platforms, a good correlation (R² = 0.93) of the Ct values between the two systems was observed with an average of 0.68 +/- 1.3 Ct difference (BD MAX™ system Ct - molecular platform Ct).

**Conclusions:** These results allow us to extrapolate PCJ DNA copy number for a given Ct value obtained with the rapid BD MAX™ system allowing the clinicians to interpret a positive result according to the clinical situation. Due to these results, direct examination was stopped for PCJ and replaced by the rapid PCR system 7/7 days a week.

Systemic antifungal therapy (AFT) with isavuconazonium sulfate (ISAVUSULF) or other AFT in adults with invasive mucormycosis (IM) or invasive aspergillosis (IA) caused by a non-fumigatus species (IA-nf): A multi-centre, non-interventional registry study

Abstract third-party references: This abstract was submitted by Cello Health MedErgy, on behalf of the authors. Editorial assistance was provided by Cello Health MedErgy, funded by Astellas Pharma Global Development, Inc., Northbrook, IL, USA.

Background: ISAVUSULF is the prodrug of isavuconazole, a broad-spectrum mould-active triazole antifungal used for the treatment of IM and IA in adults. This real-life registry examined all-cause mortality (ACM) in adults treated with ISAVUSULF or other systemic AFT for IM or IA-nf.

Materials/methods: Multicentre, noninterventional registry of adult patients with proven/probable IM or IA-nf according to European Organisation for Research and Treatment of Cancer/Mycoses Study Group criteria who received systemic AFT. There were no exclusions based on liver/renal dysfunction. Cumulative data from 33 US centres for participants treated from January 2016 through November 2018 were analysed. Patients were stratified into primary ISAVUSULF, salvage ISAVUSULF for refractory infection/intolerance to another AFT or as oral step-down/maintenance, or other AFT groups (see table for group definitions). ACM was assessed at days 42 and 84 post-AFT initiation. Investigators assessed adverse drug reactions (ADRs) suspected to be related to ISAVUSULF. ADRs for other AFT were only reported during use of ISAVUSULF for non-treatment reasons (prophylaxis or empirical therapy for <4 days) (n=7).

Results: 204 patients were enrolled (104 ISAVUSULF and 100 other AFTs). Seventy-four (71.2%) received ISAVUSULF as primary AFT (24 ISAVUSULF-monotherapy and 50 ISAVUSULF-combination therapy) and 30 (28.8%) as ISAVUSULF-salvage treatment (11 monotherapy and 19 combination therapy). Baseline characteristics were similar in both ISAVUSULF and other AFT groups (Table). Most IA-nf infections affected the lungs±other organs while most IM infections were extrapulmonary (Table). Primary ISAVUSULF, salvage ISAVUSULF and other AFT day 42 ACM rates were 14.8%, 0% and 17.8%, respectively, for IA-nf and 33.3%, 20.0% and 41.3% for IM, respectively (Table). Fourteen ISAVUSULF-treated patients experienced ADRs [primary ISAVUSULF: 7/74 (9.5%); salvage ISAVUSULF: 7/30 [23.3%]; and other AFT 0/7 [0%]]. ADRs leading to ISAVUSULF discontinuation were experienced by 4/74 (5.4%) patients in the primary ISAVUSULF and 3/30 (10%) in the salvage ISAVUSULF groups. Only 3 patients developed serious ADRs: 1/74 (1.4%) and 2/30 (6.7%) in the primary and salvage-ISAVUSULF groups, respectively. No fatal ADRs were reported.

Conclusions: ISAVUSULF, either as monotherapy or combination therapy, is well tolerated, and ACM results are consistent with previous reported results in adult patients with IA-nf or IM.

Abstract 334

Prevalence of the suggestion of the influenza vaccine to pregnant women among gynaecologists and obstetricians

Irem Akdemir*, Ayşe Nur Usturalı Mut, Gulce Aydin, Fatih Keskin, Kemal Osman Memikoglu, Alpay Azap

1Ibn Sina University Hospital, Infectious Disease and Clinical Microbiology, Ankara, Turkey, 2Ankara University, Public Health, Ankara, Turkey, 3Edirne Sultan Murat 1. State Hospital, Edirne, Turkey

Background: Influenza is a systemic infectious disease and pregnancy is a factor that increases the mortality of the disease. Therefore, it is recommended that all pregnant women receive an influenza vaccine. However, rates of influenza vaccination in pregnant women are low. The aim of this study is to estimate the prevalence of Gynecologists and Obstetricians (GOs) recommending the influenza vaccine to their pregnant patients.

Materials/methods: This study was designed as a cross-sectional survey. The population of the study was calculated to be 364 people based on a 95% confidence interval and a 5% margin of error. The data were collected through a questionnaire consisting of 17 questions, distributed through a Facebook group.

Results: Of the physicians participating in the study, 43.5% reported that they recommended the influenza vaccine to pregnant women and 62.8% reported that 50% or more of the pregnant women to whom they recommended the vaccine, rejected the vaccine. According to a Multivariate Logistic Regression analysis, three factors increased the rate of physicians not recommending vaccination: their age, not having had an influenza vaccination themselves, and not knowing that the cost of the vaccine would be reimbursed. The mean age of the 384 GOs participating in the study was 39.7 ± 10.2 years.

Conclusions: Vaccinating pregnant women is necessary because of increased influenza mortality during pregnancy. Even though GOs are not vaccination practitioners in routine pregnancy follow-up, they can contribute to vaccination rates by recommending vaccination. Physicians’ application of scientific knowledge and transfer of this knowledge to their patients will contribute to increased adult immunization rates.

Abstract 335

Risk factors for mortality in patients with pulmonary mucormycosis

Hyo-Ju Son*, Joon-Seon Song, Sungim Choi, Jiwon Jung, Min-Jae Kim, Yong Pil Chong, Sang-Oh Lee, Sang-Ho Choi, Yang Soo Kim, Jun-Hee Woo

1 Asan Medical Center, University of Ulsan College of Medicine, Seoul, South Korea, 2 Dongguk University Ilsan Hospital, Goyang, South Korea

Background: Pulmonary mucormycosis (PM) results in serious burden in terms of morbidity and mortality in immunocompromised patients. However, there are limited studies with small number of patients on prognostic factors in patients with PM.

Materials/methods: Adult patients who were diagnosed with proven and probable PM according to the modified definitions of the EORTC/MSG criteria were enrolled at a tertiary hospital, Seoul, South Korea, between 1992 and 2014 (retrospectively) and 2015 and 2019 (prospectively). Proven PM was defined as positive fungal culture results for mucormycosis from lung biopsy specimens and/or histologic evidence of tissue invasion of hyphae with positive mucormycosis immunohistochemistry test result. Probable PM was defined as the presence of host and clinical factors together with mycological evidence of mucormycosis agents in non-sterile culture. Risk factors for 90-day mortality of PM were analyzed.

Results: A total of 52 patients including 34 (65%) patients with proven PM and 18 (35%) with probable PM were enrolled. The 90-day mortality rate was 46% (24/52). Neutropenia, thrombocytopenia, use of voriconazole at clinical suspicion, positivity of non-sterile culture, use of corticosteroids, and treatment without surgery were more common in fatal patients than non-fatal patients. Voriconazole use at clinical suspicion for invasive mold pneumonia (adjusted OR 7.78, \( P = 0.004 \)) and prolonged neutropenia (adjusted OR 5.45, \( P = 0.02 \)) were independent risk factors for mortality. Voriconazole use at clinical suspicion was related with positive galactomannan [GM] assay (adjusted OR 6.48, \( P = 0.01 \)) and history of invasive pulmonary aspergillosis (adjusted OR, 7.35, \( P = 0.04 \)).

Conclusions: About half of patients with PM died within 90-day of diagnosis, and these fatal outcomes were common in patients with prolonged neutropenia and empirical voriconazole use. Cautious use of voriconazole is needed even in patients with positive GM results and prior history of invasive pulmonary aspergillosis in whom PM cannot be ruled out in differential diagnosis.

Abstract 343

Expediting antibiotic therapy management of critically ill patients with pneumonia by the detection of the main carbapenemase and ESBL-encoding genes directly from bronchoalveolar lavage

Matteo Boattini*1, Gabriele Bianco1, Marco Iannaccone2, Cristina Costa3, Rossana Cavallo1

1Microbiology and Virology Unit, University Hospital Città della Salute e della Scienza di Torino, Turin, Italy

Background: Among critically ill patients with pneumonia, the growing treat of antimicrobial resistance hampers the empirical treatment choice and relies heavily on rapid microbiological results. The detection of carbapenemase and extended-spectrum β-lactamase (ESBL) producers Enterobacterales (EB) has become a major issue among ICU patients, due to their clinical impact. Our aim was to determine whether molecular assays would expedite the detection of genes encoding carbapenemases and ESBL directly from bronchoalveolar lavage (BAL) and antibiotic therapy management in critically ill patients with pneumonia.

Materials/methods: The CRE and ESBL ELITe MGB® kits are two real-time PCR assays for the detection in less than 3h of the most prevalent carbapenemase and ESBL encoding genes in EB, respectively. From December 2018 to June 2019 all BALs of critically ill patients submitted for standard of care bacterial culture were prospectively collected. The CRE and ESBL ELITe MGB® assays were performed directly on 197 BALs sampled from 120 critically ill patients. Molecular results were compared to routine culture-based microbiological diagnostics results. A retrospective analysis of the therapeutic antimicrobial management was performed to evaluate the potential contribution of molecular assays to early optimization of empirical antibiotic therapy.

Results: Carbapenemase and ESBL encoding genes were detected in 20 (10.2%) and 12 (6.1%) BALs sampled from 15 and 11 patients, respectively. Positive (PPV) and negative (NPV) predictive values of the CRE ELITe MGB® kit were 85% [IC 95%: 64.9-94.6] and 100%, respectively. PPV and NPV of the ESBL ELITe MGB® kit were 75% [IC 95%: 49.4-90.2] and 100%, respectively. Retrospective analysis of medical records revealed that more than 50% of critically ill patients with pneumonia caused by carbapenemase- and/or ESBL-producing EB were initially treated with inadequate therapy. Overall, approximately 50% of patients could have been treated with appropriate therapy at least 24 h earlier if molecular data had been used.

Conclusions: Validity assessment of molecular assays detecting the main antibiotic resistance genes directly from BAL showed a high accuracy when compared to culture-based results. Molecular assays detecting the main carbapenemase and ESBL encoding genes provide an interesting tool for expediting appropriate antibiotic therapy in critically ill patients with pneumonia.

Significance of candidaemia causing neonatal sepsis and efficacy of caspofungin therapy
Soumyadeep Seal* 1

1Woodlands Multispeciality Hospital Limited, Kolkata, India

Background: Invasive candidiasis in extremely premature infants is the second most common cause of infectious disease-related death. The incidence of hematogenous infections due to Candida specially non-albicans species among immunocompromised neonates has increased significantly in recent decade. The emerging fungal pathogens comprising the Candida haemulonii complex are notable for their antifungal resistance with higher mortality and morbidity. Caspofungin is effective, safe and well-tolerated as an alternative therapy for persistent and progressive candidiasis in those neonates who are resistant, unresponsive to or intolerant of conventional antifungals.

Materials/methods: We here report our experience of caspofungin therapy in four cases of neonatal fungemia caused by C haemulonii. All these neonates were pre term, low birth weight with multiple invasive devices and had history of bacterial sepsis for which were on broad spectrum antibiotics. All the isolates were recovered in BACTEC Peds plus/F culture vials. Species identification was done in VITEK 2 yeast ID system. Confirmation of the species was done by PCR based molecular methods and MALDI-ToF mass spectrometry-based assay. Caspofungin therapy started with serial blood culture. Caspofungin therapy was continued two weeks after last negative culture.

Results: In all the 4 cases clinical and microbiological cure were possible. The dosage of caspofungin was 2 mg/kg/day, and the mean treatment duration was 14 days and the mean duration of antifungal therapy was 21 days. 2 out of the 4 patients had multifocal multidrug resistant (MDR) colonization and had history of azole exposure. 2 of the patients had adverse events are fever and rash. Increase of hepatic transaminases and hypokalemia was found in 1 patient.

Conclusions: The resistance of C. haemulonii represents a therapeutic challenge in the treatment of invasive candidiasis in immunocompromised neonatal patients. Caspofungin therapy is well tolerated, safe and effective in these resistant fungal infections. Caspofungin is FDA-approved for adults and children >3 months of age. These promising results suggest a potential role for caspofungin as an additional first-line treatment of systemic resistant candidiasis in immunocompromised neonates. This drug should be further investigated in this special patient population group.

Abstract 358

**Pneumococcal vaccination introduced between the chemotherapy cycles decreases the incidence of pneumonias in patients with multiple myeloma**

Igor Stoma*1,2, Igor Karpov1, Igor Iskrov2, Irina Lendina2, Anatoly Uss2

1Belarusian state medical university, Minsk, Belarus, 2Minsk scientific-practical center for surgery, transplantation and hematology, Minsk, Belarus

**Background:** Invasive pneumococcal infections (IPI) are life-threatening, but vaccine preventable complications in a range of immunosuppressed patients. Among the high-risk groups susceptible to IPI are patients with hematological malignancies receiving target treatment, novel agents and monoclonal antibodies. Novel agents to treat multiple myeloma (bortezomib, lenalidomide, ixazomib) are reported to be associated with high risk of pneumonias. The aim of the study was to assess the clinical efficacy of a 3-dose regimen of vaccination by 13-valent conjugate pneumococcal vaccine introduced in between the chemotherapy cycles with novel agents.

**Materials/methods:** Adult patients with multiple myeloma were included in this study, based at tertiary hematology and transplantation center in 2017-2019. Vaccination of adult multiple myeloma patients by 13-valent pneumococcal conjugate vaccine (PCV13) was performed during the intervals between the chemotherapy cycles with novel agents [bortezomib, lenalidomide, ixazomib]. A vaccination regimen was based on 3 doses of pneumococcal vaccine with a minimum of 1 month interval. There were totally 18 adult patients who were vaccinated by PCV13 along with 18 patients of a control group matched by age, sex, main diagnosis and treatment regimens. Incidence of clinically and radiologically confirmed pneumonias during one-year observation period was taken as a primary outcome. The study has been registered with ClinicalTrials.gov Identifier: NCT03619252. Logistic regression was performed to assess the independent effect of PCV13 vaccination on the risk of pneumonias.

**Results:** No adverse effects of vaccination were registered, while a statistically significant independent effect of 3-dose regimen of PCV13 vaccination on the incidence of clinically-radiologically confirmed pneumonias was observed (OR 0.14; 95% CI 0.02-0.93; p=0.041). Number needed to treat (NNT) for PCV13 vaccination in multiple myeloma patients receiving novel agents was 3.0 (95% CI 1.61-22.10; p = 0.0571).

**Conclusions:** Despite the expected decrease in response to vaccination during the chemotherapy with novel agents, we have shown the clinical effectiveness of PCV13 vaccination schedule based on 3 doses given with a minimum 1 month interval between the chemotherapy cycles. Further implication of pneumococcal conjugate vaccines in adult immunocompromised patients may serve as a basis for decrease in frequency of pneumonias.

Resolving within-host, full length, dengue virus variants without haplotype reconstruction using Oxford Nanopore Technology

Chathuraka Rodrigo1*, Preston Leung1, Thiruni Adikari1, Chathurani Sigera2, Nasir Riaz1, Kirston Barton1, Martin Smith1, Rowena Bull1, Praveen Weeratunga1, Senaka Rajapakse1, Andrew Lloyd1, S Deepika Fernando1

1University of New South Wales, Randwick Campus, UNSW Sydney, Australia, 2Faculty of Medicine, University of Colombo, Colombo, Sri Lanka, 3Kinghorn Centre for Clinical Genomics, Garvan Institute of Medical Research, Sydney, Australia

Background: Despite the advances in sequencing technologies and the small size of RNA viral genomes, identifying full-length within-host viral variants has been a challenge. Previously we developed a protocol for full-length dengue virus sequencing (single molecule) using Oxford nanopore technology (ONT). Now, we introduce a new bioinformatic pipeline to resolve full-length within host dengue variants from ONT sequences.

Materials/methods: This pipeline takes an alignment of ONT reads as the input, selects reads with a user-defined length and a starting codon, cleans them of indels and mismatches using a reference sequence and the quality scores at each base position. A hierarchical clustering algorithm is used to identify phylogenetically close read clusters to create a consensus per cluster (a within host variant). The final output of the pipeline is a list of within host variants and their relative abundance as a percentage. The accuracy of the pipeline was tested using in silico clonal mixtures of the hepatitis C virus.

Results: Forty clinical dengue samples were sequenced with ONT after multiplexing with either PCR based barcodes or ligated barcodes. Of these, only 19 samples had more than 100 reads (range 105 – 17,672) greater than 10kb after the initial cleaning steps of the algorithm (arbitrary lower limit to proceed to full pipeline). The number of within host variants detected ranged from 2-27 per sample with 2-3 dominant variants and the rest being minor variants. The number of minor variants identified depends on the total read count used (figure 1). More variants can be detected with increasing the input DNA, avoiding multiplexing or multiplexing with ligation barcoding.

Conclusions: This pipeline, combined with our method for pan-serotypic dengue full length genome amplification, offers the capacity to resolve within host viral variants without haplotype reconstruction for the first time for dengue virus (and for any RNA virus with a single open reading frame). This creates a new front in understanding within host viral evolution, closely related human to human transmission events and virological determinants of virulence in dengue.

Figure 1. Detected minor variants (<5% abundance) increases linearly with the input number of reads.

Molecular characterisation of Staphylococcus aureus clinical strains from endotracheal tubes of patients with intensive care unit-acquired pneumonia

Roberto Cabrera*1, Laia Fernandez Barat2, Anna Motos1, Ruben López2, Nil Vázquez Burgos1, Mauro Panigada3, Francisco Alvarez-Lerma4, Yuly Lopez5, Laura Muñoz2, Pedro Castro2, Jordi Vila Estape1, Antoni Torres1

1Hospital Clínic de Barcelona, Barcelona, Spain, 2Hospital Clínic de Barcelona, Barcelona, Spain, 3Policlinico of Milan, Milano, Italy, 4Hospital del mar, Barcelona, Spain, 5Barcelona Institute for Global Health, Barcelona, Spain

Abstract

Background: Staphylococcus aureus is among the most frequently isolated microorganism responsible for intensive care unit (ICU)-acquired pneumonia of which 29% are resistant to methicillin (MRSA). Our aim was to determine the antimicrobial susceptibility, the associated molecular mechanisms of resistance and the epidemiology relatedness of S. aureus strains from the endotracheal tubes (ETT) of intubated critically ill patients with S.aureus ICU-acquired pneumonia.

Materials/methods: Clinical S. aureus (17 MRSA and 3 methicillin susceptible S. aureus) were collected from ETTs after extubation during a prospective observational study carried out in four European tertiary hospitals. Antimicrobial susceptibility test, using the Kirby-Bauer method was performed to vancomycin, linezolid, ciprofloxacin, clindamycin, erythromycin, chloramphenicol, fusidic acid, gentamicin, quinupristin-dalfopristin, rifampicin, Sulfamethoxazole/trimethoprim, and tetracycline. Interpretation of results was carried out according to the European Committee on Antimicrobial Susceptibility Testing (EUCAST). Molecular characterization of each resistance mechanism was screened by PCR, electrophoresis and sequencing. Molecular epidemiology was analyzed by Multi locus sequence typing. Phylogenetic analysis was carried out using comparative eBURST V3 software [http://www.phyloviz.net/goeburst]

Results: S. aureus isolates were resistant to ciprofloxacin (85%), erythromycin (65%), gentamicin (35%), tetracycline (30%), clindamycin (20%), and fusidic acid (5%). Three strains showed hetero-resistant subpopulations to linezolid. The most frequent mutations in ciprofloxacin resistant S. aureus strains were S84L in the gyrA gene, V511A in the gyrB gene, S144P in the grlA gene, and K401R/E in the grlB gene. Strains resistant to erythromycin carried the ermC, ermA, and msrA genes; the same ermC and ermA genes were detected in strains resistant to clindamycin. The aac(6')-aph(2") gene was related to gentamicin resistance, whereas resistance to tetracycline was related to tetK (efflux pump). The fusB gene was detected in the strain resistant to fusidic acid. The most frequent sequence types were ST22, ST8, and ST23. These were distributed in four clonal complexes (CC5, CC22, CC45, and CC59).

Conclusions: High levels of resistance to second-line antimicrobials threatens the treatment of ICU-acquired pneumonia due to methicillin-resistant S. aureus, with decreased susceptibility to linezolid and vancomycin. The wide genotypic diversity found, even within the same ICU, reinforces the crucial role of ICU prevention bundles in cross-transmission.

Impact of biocide residues on *Escherichia coli* antimicrobial susceptibility
Rebecca Wesgate*, Jean-Yves Maillard¹, Séamus Fanning², Yujie Hu²

¹Cardiff University, Cardiff, United Kingdom, ²University College Dublin, Dublin, Ireland

**Background:** There is no standardised approach to predict the residues of biocides remaining on surfaces as a result of the use of disinfectants, nor is there a standardised way to predict the potential risk that these levels might pose to antimicrobial resistance. Although of practical relevance, bacterial selection and adaption to biocide surface residues has not been fully investigated to date. This study explores links between exposure effects of chlorhexidine at concentrations found on surfaces post-application and changes in phenotypes and the metabolome in *E. coli*.

**Materials/methods:** Chlorhexidine (CHX) surface concentration post-treatment was determined by High-Performance Liquid Chromatography. A modified standard efficacy carrier test was used against five genotypically distinct *E. coli* exposed to in-situ concentrations of CHX. Minimal inhibitory concentrations (MIC), antibiotic susceptibility profiles, efflux activity, and conjugal plasmid transfer were assessed and compared before and after exposure to CHX. Changes in susceptibility after CHX exposure were investigated for stability. The effect of CHX exposure on the broader phenotype was assessed using the OmniLog microarray (BioLog, US).

**Results:** CHX surface concentration post-application was on average 0.006 mg/mL after 0-7 days. CHX susceptible bacteria survived exposure to this residual concentration and were shown to adapt through metabolic alterations, such as those responsible for cell wall biosynthesis, along with transient insusceptibility to CHX, imipenem and cefoxitin, and stable resistance to amoxicillin/clavulanic acid, ampicillin, cefpodoxime and cefotaxime. Results show that a transiently adapted population may be selected amongst less tolerant sub-populations. CHX however did not increase transfer of ampicillin resistance at a residual concentration and prevented conjugal transfer at a concentration of 0.002 mg/mL.

**Conclusions:** CHX has the potential to promote the emergence of resistance and cross-resistance at concentrations found on surfaces after disinfection. Findings in this study warrant further investigation into residual concentrations of biocides found in the environment, their effects on common pathogens and potential markers for the risk of resistance development as a result of exposure.

Abstract 379

**Staphylococcus aureus bloodstream infection: can the practice of the VIRSTA score replace the infectious disease consultation in case management?**

Cécile Saint-Pastou Terrier¹, Nael Zemali¹, Antoine Bertolotti¹, Rodolphe Manaquin¹, Aurélie Foucher¹, Patrice Poubeau¹, Patrick Gerardin¹, Yatrika Koumar*¹

¹Saint Pierre, CHU Sud Réunion, Saint Pierre, Reunion

**Background:** *Staphylococcus aureus* bacteremia (SAB) causes life-threatening complications such as infective endocarditis (IE). Although de SAB management is well codified, its mortality remains high. The VIRSTA score was developed to guide physicians in the management of SAB, improve outcomes and risk stratification of IE. In this framework, the role of the infectious disease specialist has yet to be specified. Our primary objective was to assess whether an early infectious disease specialist consultation (IDC) could improve the management and outcomes of SAB. Our secondary objectives were to evaluate the adequacy of clinical practices to the VIRSTA score by ID and non-ID management.

**Materials/methods:** We performed a retrospective cohort study, in a 800-bed teaching hospital, in Reunion Island, over a one-year period in adult patients with SAB (≥1 positive blood culture with SA). Clinical practice was deemed adequate to VIRSTA score when no transesophageal echography (TEE) but only one transthoracic echography (TTE) was performed for scores ≤2 and when either one TEE or two TTE were performed for scores ≥3.

**Results:** Fifty-two SAB were included of which 73.1% were of nosocomial origin, and 90.4% were methicillin sensitive. ID specialists were solicited for 28 (53.9%) patients, in an average time of 3.3±6.6 days. ID specialists tended to be more often solicited when blood cultures remained positive beyond 48 hours (**P**=0.054). A TTE (OR 91.00, 95%CI: 1.389-595.97) and a control TTE (**P**=0.005) were more likely when an ID specialist managed the infection.

Antibiotic treatment was more appropriate when the patients benefited from an IDC (OR 25.00, 95%CI: 5.50-113.46). Clearance of bacteremia was more likely achieved after ID management (OR 4.28, 95%CI: 1.13-16.27).

Patients who benefited an IDC had a decision more likely conform to VIRSTA score (OR 4.60, 95%CI: 1.31-16.14). An IDC was associated with protection against the risk of death within three months (OR 0.26, 95%CI: 0.06-0.98).

**Conclusions:** Our study supports a central role of the ID specialist in the management of patients with SAB, this being associated with better outcomes and respectful of up-to-date guidelines. The VIRSTA score, when applied early could help the diagnostic strategy of SAB before the IDC.

Neural networks for prediction of minimum inhibitory concentration
Emil Carlsson¹, Fredrik Dyrkell²*, Torbjörn Lundh³

¹Chalmers University of Technology, 1928 Diagnostics, Gothenburg, Sweden, ²1928Diagnostics, Gothenburg, Sweden, ³Chalmers University of Technology, Gothenburg, Sweden

Background: Antibiotic resistance is listed by the World Health Organization as one of the biggest threats to global health and causes about 33 000 deaths, in the EU/ESS region only, each year. Lately, several machine learning methods have been purposed for autonomous resistant profiling of bacteria and this work aims to use neural networks for prediction of minimum inhibitory concentration (MIC).

Materials/methods: We have developed a neural network based machine learning model for prediction of minimum inhibitory concentration (MIC) from k-mers extracted from whole-genome sequencing. To handle the curse of dimensionality associated with k-mers we perform dimensionality reduction through principal component analysis. The dataset used consists of 4964 Salmonella samples with MICs measured, for up to 15 antibiotics, for each sample. All MICs were measured on a 2-fold dilution. The evaluation of the model was done using a 5-fold cross validation.

Results: For prediction of exact MIC the accuracy of our model varied from 0.61 for streptomycin to 0.93 for tetracycline with an average for all antibiotics of 0.78. When translating the MICs to labels, S/I/R, our model had an average accuracy of 0.97. Further, the model was compared to already existing machine learning model trained on the same dataset. Our model outperformed the already existing machine learning model when it comes to predicting exact MIC for 13 of the 15 antibiotics considered. Greatest improvement were for the antibiotics ampicillin, amoxicillin-clavulanic acid and tetracycline.

Conclusions: We conclude that our neural network outperforms the other machine learning model and yields a great improvement when it comes to accuracy. This is somewhat expected since neural networks tends to be the superior model in other areas such as image processing and natural language processing. The results also illustrates the complexity of predicting exact MIC. Comparing the exact accuracy to the accuracy for S/I/R of the model, which on average was 0. 97, we observe a vast improvement which shows that prediction of S/I/R is a more feasible and simpler problem compared to prediction of exact MICs.

Abstract 387

A k-mer-based approach for MLST and cgMLST analysis of nanopore sequenced Staphylococcus aureus
Oscar Aspelin*, Fredrik Dyrkell1, Dimitrios Arnellos1

1928Diagnostics, Gothenburg, Sweden

Abstract third-party references: 1928 Diagnostics

Background: Genotypic typing, such as MLST or cgMLST, is an important tool for infection control and is typically used today in combination with NGS data. However, one disadvantage of using NGS is the slow sample-to-result turnaround time, which can amount to several days. With the advent of Nanopore sequencing, it is possible to rapidly generate sequencing data at the expense of higher error rates, which could speed up the analysis and potentially revolutionize the field of clinical infection control.

Materials/methods: Eight double-sequenced bacterial samples (Illumina + Nanopore, Staphylococcus aureus, EMBL-EBI project PRJDB8599) were analyzed with MLST and cgMLST. The goal was to evaluate the ability to predict sequence types [STs] and cluster samples based on cgMLST profiles using only Nanopore data. Here, the Illumina data was used as a reference to verify the results. The raw Nanopore reads were analyzed in a custom, kmer-based bioinformatic pipeline and the Illumina reads were analyzed in the 1928D platform (https://1928diagnostics.com/). One of the samples was discarded due to a contamination and the remaining seven samples were included in the full analysis.

Results: The results from the MLST analysis showed that five samples had the same ST prediction between the two platforms. The remaining two samples were classified as novel STs by the 1928D platform, which was consistent with the Nanopore analysis, as these samples did not have any ST hit with full kmer-coverage. As for the cgMLST analysis, different kmer-sizes were used and the similarity to the Illumina result was calculated. A smaller kmer size decreased the allele prediction accuracy and the opposite was true for larger kmer sizes. The distances between samples were, however, different when comparing Illumina to Nanopore regardless of the kmer-size. This was mainly due to novel cgMLST alleles, which could be accurately detected in Illumina data only.

Conclusions: These results show a proof of concept that a kmer-based approach for MLST and cgMLST analysis of Nanopore sequenced Staphylococcus aureus is possible. However, a lot of effort needs to be directed towards improving the data quality in order to generate results accurate enough for the clinical setting.

Abstract 395

The economic burden of *Clostridioides difficile* infection in patients with haematological malignancies: a case-control study

Lola Duhalde¹², Lise Lurienne*¹¹, Sebastian Wingen-Heimann³⁴, Lucien Guillou¹⁵, Renaud Buffet¹, Pierre-Alain Bandinelli²

¹Da Volterra, Paris, France, ²École Polytechnique, Palaiseau, France, ³Hospital of the University of Cologne, Köln, Germany, ⁴Technical University of Cologne, Köln, Germany, ⁵Faculté de Pharmacie de l’Université Paris-Sud, Châténay-Malabry, France

Abstract third-party references: Da Volterra

**Background:** The burden of *Clostridioides (Clostridium) difficile* infection (CDI) is profound and patients with haematological malignancies are at high risk for developing the infection. Very few studies have assessed the economic burden of CDI in this specific population, whereby primarily hospital costs were analyzed. This study aims at describing all direct healthcare costs attributable to CDI (in-hospital and out-of-hospital) in patients suffering from haematological malignancies.

**Materials/methods:** A retrospective analysis was conducted based on databases of Truven Health Analytics®, part of the IBM Watson HealthTM business. Comprehensive data of hospital stays and services, out-of-hospital services and drug prescriptions of patients newly diagnosed with haematological cancer (acute myeloid leukemia [AML], acute lymphoblastic leukemia, Hodgkin’s lymphoma and non-Hodgkin lymphoma [NHL]) between 01/2014 – 12/2017 were analyzed. Patients with CDI after cancer diagnosis (CDI+ or cases) were matched to patients without CDI (CDI- or controls). Matched cases and controls were compared to identify the CDI-attributable costs and changes in care in the 90 days following the CDI onset (study period).

**Results:** 622 CDI+ patients were matched with 11,111 controls. NHL and AML were the predominant underlying diseases in the CDI+ group accounting for 41.7% and 30.9% of cases, respectively. Overall, CDI increased costs of care by an average of US$57,159 per patient, an increase of 41.9%, mainly driven by in-hospital costs. Costs data are presented in Table 1.

**Conclusions:** Findings confirm that CDI treatment results in substantial costs in patients with haematological malignancies, highlighting the need for better treatment and prevention options for this specific patient population.

Abstract 411

The first report of concurrent infections by two dengue serotypes among tribal population in central India
Supriya Malvi1*, Devjyoti Majumdar1

1Lt BRKM Government Medical College, Jagdalpur, India

Background: Dengue is spreading to newer areas in the world, including India. Concurrent infection by multiple serotypes are documented in certain areas in India, but not in tribal areas. We investigated an outbreak occurred in a tribal area in central India, during months of August to September 2015. We report markedly high percentage of concurrent infections by 2 dengue serotypes first time among tribal population in India.

Materials/methods: Acute phase sera samples were collected from 746 patients and tested for NS1 ELISA and MAC-ELISA. NS1 positive samples were subjected to serotyping by real time RT-PCR.

Results: of 746 samples tested, 167 (49.4%) were positive for NS1 ELISA while 171 (50.6%) were for MAC-ELISA. Positive NS1 samples were tested for serotyping, all 4 serotypes were found to be circulating in the outbreak, with predomination of DEN-3 serotype. Moreover, concurrent infections by 2 serotypes were observed in 26.2% of cases.

Conclusions: Dengue outbreak in tribal villages of Sukma district in central India experienced all 4 serotypes and concurrent infections, where health authorities never perceived dengue as a major health concern. Thus this outbreak emphasizes on continuous active surveillance to monitor spread of dengue virus, especially in hard to reach areas, so that effective vector control programme could be implemented at the earliest to prevent outbreaks.

Abstract 414

A descriptive study of tuberculosis hospital admissions in Ireland
James O’Connell*1, Eoghan De Barra1, Sam Mcconkey1

1Royal College of Surgeons in Ireland, Dublin, Ireland

Abstract third-party references: Royal College of Surgeons in Ireland, National Quality Assurance and Improvement System, Healthatlas Ireland

Background: Ireland is a low incidence tuberculosis country with 6.6 cases per 100,000 population in 2018. The last reform of TB services in Ireland was in 2003. It was recommended that most TB management should be delivered on an outpatient basis in general hospitals with a small number of beds allocated in 3 hospitals for inpatient management. This resulted in 3 hospitals (Cork University Hospital, University College Hospital Galway, St. James’s Hospital, Dublin) being designated as TB centres. Evaluating resource utilisation by patients admitted to hospital with TB may provide insight into how TB service organization could be improved.

Materials/methods: The Hospital In-Patient Enquiry (HIPE) system is a computerized health information system designed to capture hospital activity data. It is the principal source of demographic and clinical data on inpatient discharges from public hospitals in Ireland. The National Quality Assurance and Improvement System (NQAIS) Clinical is an online interactive application that analyses hospitals’ own HIPE data. The NQAIS Clinical was searched for all TB discharges between 01/01/2015-31/12/18. An estimate of the projected cost of respiratory TB admissions was calculated using the Healthcare Pricing Office Admitted Patient Price List 2019.

Results: 1185 discharges with TB as the principal diagnosis were identified. 802/1185 (68%) of admissions were emergencies and 383/1185 (32%) were elective. Most emergency admissions, 735/802 (92%), were discharged after an overnight stay of at least one night while the remainder 67/802 (8%) were same day discharges. In total, 16,005 bed-days were used by patients with a principal diagnosis of TB, an average of 4,001 bed-days per annum. This equates to an average of 12.8 bed-days per notified case of TB. The ten longest emergency admissions made up only 10/802 (1.2%) of admissions but 1,935/14,072.5 (13.8%) of emergency bed-days used. We estimate that between 67% (834/1248) and 74% (928/1248) of TB cases notified were admitted to hospital. We estimate that between 78% (653/839) and 87% (729/839) of respiratory TB cases notified were admitted to hospital. The projected cost of respiratory TB admissions for 2019 is €1,813,346-2,413,137.

Conclusions: There is a significant burden on the acute hospital inpatient service due to TB.

Abstract 418

The INHALE trial: designing a prescribing algorithm to aid antibiotic choices for the FilmArray Pneumonia Panel Plus

Zaneeta Dhesi1, Virve Irene Enne*1, Vanya Gant2, David Livermore3

1University College London, London, United Kingdom, 2University College Hospital, London, United Kingdom, 3University of East Anglia, Norwich, United Kingdom

Background: The NIHR-funded INHALE Programme aims to improve antimicrobial stewardship through molecular diagnostics for HAP/VAP in ICUs. Its first phase selected the BioFire FilmArray Pneumonia Panel as the best-performing relevant test, and this is now deployed at point of care (POC) in 12 UK ICUs, with patients randomized to FilmArray-guided or Standard antimicrobials. The test seeks 34 organism and gene targets, providing results in 1.5h. The results’ complexity, combined with rapid round-the-clock availability, prompted us to design an antimicrobial prescribing algorithm to support clinicians at the point of decision. To our knowledge, this is the first instance of prescribing advice being directly linked to a rapid PCR test.

Materials/methods: We designed the algorithm based on (i) organism and resistance gene targets detected alone or in combination, (ii) national resistance surveillance data and (iii) patient’s allergy status. Narrow spectrum agents were preferred, and good antimicrobial stewardship encouraged. Site microbiologists, ICU pharmacists, and ICU clinicians were consulted and local adaptation allowed.

Results: Where single organisms are found the algorithm favours, e.g. temocillin vs. Enterobacterales, flucloxacillin vs. MSSA and co-amoxiclav vs. Haemophilus influenzae; discontinuation is advised if no organism is found and the patient lacks convincing evidence of infection; broader spectrum agents are favoured for combinations of organisms. Among 10 adult sites, 4 adopted the algorithm essentially unaltered and 2 with minor variation only. Common concerns were: unwillingness to adopt: (i) temocillin for Enterobacterales; (ii) ceftazidime vs. Pseudomonas; or (iii) cephalosporins for patients with mild β-lactam allergy. There was considerable debate apropos infection control implications of ICU-based (rather than laboratory-based) detection of carbapenemase producers. Substantial variation was needed at 2 paediatric ICUs, principally because temocillin lacks a paediatric licence.

Conclusions: Prescribing algorithms such as this will ensure that potential benefits of rapid syndromic tests are realised at POC. Whilst it was not possible to impose a single algorithm at all hospitals, core elements and principles were retained. An early audit of RCT results indicates that most test-arm treatments are being guided by the algorithm, as sought. The sites’ willingness to adopt this approach illustrates the potential for a major shift to molecular-guided chemotherapy.

Abstract 419

Is it cost effective to use a 2% chlorhexidine gluconate wipes bath to reduce primary bloodstream infection? A quasi-experimental study experience

Cely Abboud1, Diego Feriani1, Larissa Gordilho Mutti Carvalho1, Aline Santos Ibanes1, Eliana Vasconcelos1, Vera Lucia Barros Barbosa1, Ercilia Evangelista De Souza1

1Instituto Dante Pazzanese de Cardiologia, Instituto Dante Pazzanese de Cardiologia, São Paulo, Brazil

Background: Bathing with 2% chlorhexidine (CHG) wipes is an important measure regarding infection prevention in critically ill patients. At our ICU, central line-associated bloodstream infections rates (CLABSI) was higher than expected (9.05/1,000 central line-days) and as an additional measure were introduced a daily bathing with 2% CHG wipes. The aim of the study were to evaluate the impact of introducing the CHG wipes bath in CLABSI prevention and determine if such measure is cost-effective.

Materials/methods: Quasi-experimental study with pre-intervention period from July 2017 to May 2018, and intervention, June 2018 to April 2019. Were evaluated the CLABSI rate, the costs with guided antimicrobials for proven CLABSI, and CHG wipes. Antimicrobials (ATM) given empirically at the suspicion of the CLABSI were not evaluated.

Results: Were observed a reduction in CLABSI rates in the intervention period (9.05 to 1.35/1,000 central line-days; P= 0.01), mainly due to Kp-KPC BSI (P= 0.05) decrease and a substantial cost reduction with guided antimicrobials (US$ 45,278.93 to US$ 1,799.82 in intervention period). The average monthly consumption of CHG wipes in the ICU were 190 towels/month, with unit value of US$ 14.20, generating a monthly cost of US$ 2,698.00. The total costs (guided ATM plus CHG wipes) are shown on TABLE 1.

Conclusions: The introduction of daily bath with 2% CHG wipes at our ICU was effective in CLABSI reduction, being a good cost-effective measure, saving 30% of total costs.

TABLE 1 - Pre-intervention & Intervention period, Costs (US$) x CLABSI rates

*total costs = CHG wipes plus guided ATM

Abstract 425

**Persistence of high-risk clones of carbapenem-resistant Klebsiella pneumoniae in a tertiary hospital in Valencia, Spain**

Begoña Fuster Escriva*, Nuria Tormo1, Carme Salvador Garcia1, Manuel Belda1, Concepción Gimeno Cardona1

1Consorcio Hospital General Universitario de Valencia, Valencia, Spain

**Background:** High-risk clones of Klebsiella pneumoniae have contributed to the spread of mobile genetic elements among Enterobacteriaceae. The aim of this study is to characterize carbapenem-resistant K.pneumoniae strains and to determine clonal relationship among them.

**Materials/methods:** Bacterial identification was performed by mass spectrometry, whereas antimicrobial susceptibility testing was obtained using the MicroScan Walkaway system [Beckman Coulter]. Carbapenem-resistant strains were selected. Phenotypic methods for the detection of carbapenemase production included beta-carbatest [Biorad] and disk-synergy test [Rosco Diagnostica]. Isothermal amplification with Eazyplex Superbug system [Amplex] was performed to genotypically determine carbapenemase genes. Clonal studies with pulse-field gel electrophoresis included all the strains that shared similar features. Strains belonging to predominant clones were sequenced using next-generation sequencing (NGS). Data from NGS provided information regarding sequence-type, plasmid-typing and resistance genes.

**Results:** 130 strains were submitted to NGS. Data regarding clones, resistance genes, STs and plasmid replicons is shown in the table below:

<table>
<thead>
<tr>
<th>Nº of Strains</th>
<th>Years</th>
<th>CLones</th>
<th>MLST</th>
<th>Carbapenemase</th>
<th>CTX-M</th>
<th>DHA-1</th>
<th>SHV</th>
<th>Others</th>
<th>Replicons</th>
</tr>
</thead>
</table>

**Conclusions:** During four years, five different clones of K.pneumoniae, belonging to three different sequence-types have been circulating in the same hospital. Interestingly, there are differences between the carbapenemase genes detected in 2015 and those detected in 2018, even in the same sequence-type, suggesting that the same clone acts as a recipient and as a donor for resistance determinants, depending on the environmental situation they are found in each time. Non beta-lactam antibiotics are also enormously affected by resistance to carbapenems, as resistance genes to different antimicrobials are usually found in the same plasmid.

**Presenter email address:** begona.fuster@gmail.com
Abstracts 2020

Abstract 428

**Doramapimod treatment inhibits granuloma formation and improves antibiotic activity in *Mycobacterium tuberculosis*-infected mice**

Christoph Hölscher¹, Jessica Gräb*², Jan Rybniker³

¹Research Center Borstel, Borstel, Germany, ²University Hospital Cologne, Cologne, Germany, ³University Hospital Cologne, Division of Infectious Diseases, Cologne, Germany

**Background:** *Mycobacterium tuberculosis* (*Mtb*), the causative agent of tuberculosis (TB), is the major killer among infectious agents which led to 1.5 million deaths in 2018. Treatment of TB requires combinations of antibiotics for several months, a strategy which becomes increasingly complicated in times of rising numbers of multi-drug resistant *Mtb*-isolates. Adjunctive host directed therapy (HDT) might improve and accelerate treatment by modifying host pathways targeted by *Mtb*. We have recently shown that genetic or chemical inhibition of p38 mitogen-activated protein kinase (MAPK) results in abrogation of *Mtb*-induced host cell death and decreased release of inflammatory alarmins such as High-Mobility-Group-Protein B1 (HMGB1) ex vivo.

**Materials/methods:** To evaluate the potential of p38 MAPK inhibition as an adjuvant treatment for TB and to determine the risk for exacerbation of the disease during monotherapy, we analyzed the outcome of experimental TB under p38 MAPK inhibition and antibiotic treatment during acute and chronic infection of C57BL/6 mice.

**Results:** We show that treatment of *Mtb*-infected C57BL/6 mice with doramapimod, a p38 MAP-kinase inhibitor, results in reduced inflammation, granuloma formation and lung pathology. Moreover, doramapimod, together with a standard antibiotic treatment significantly reduced lung and spleen mycobacterial loads compared to antibiotic treatment alone.

**Conclusions:** Our data suggest the opportunity to repurpose p38 MAPK inhibitors for adjunct host directed therapies. We also provide first data on safety of p38 MAPK inhibition which is of relevance for future application of these substances in inflammatory diseases and concomitant TB.

Abstract 429

**Late-onset *Pneumocystis jirovecii* pneumonia in renal transplant recipients**

Angela Beatriz Cruz*1, Claudia Jarrin Tejada1

1DMC Harper University Hospital, Detroit Medical Center, Detroit, United States

**Background:** The risk of *Pneumocystis jirovecii* pneumonia (PJP) in solid organ transplant patients is 5-15%, with highest risk at 6-12 months post-transplantation. There has been an increase in the number of cases seen much later post-transplant. We describe 7 patients presenting with PJP over 6 months post renal transplant during the period March 2018 thru April 2019. All these patients had their renal transplant and follow-up care at our institution.

**Materials/methods:** Renal transplant recipients (RTR) presenting with PJP in 2018 and 2019 were retrospectively studied. Definitive diagnosis of PJP was defined as positive PJP stain from BAL. Patients with positive PJP PCR, elevated serum \(1 \rightarrow 3\) \(\beta\)-D-glucan (BDG), elevated serum LDH were also included as possible diagnosis of PJP. Period from renal transplant to development of PJP, clinical presentation and severity of disease, immunosuppression and level of immunosuppressant, presence of rejection, treatment and clinical outcomes were included.

**Results:** All but 1 patient developed PJP at least two years after their kidney transplant. None of the patients was receiving PJP prophylaxis at the time of diagnosis. Mean period between transplant and infection was 4024 days. Five patients presented with atypical pneumonia and 2 had hypoxic respiratory failure. Four patients had definitive diagnosis of PJP and 3 had possible diagnosis of PJP. Five patients were cured and 2 patients died despite treatment and modification of immunosuppression; these patients also had the highest levels of LDH.

**Conclusions:** *P. jirovecii* should be considered as a cause of atypical pneumonia and/or hypoxic respiratory failure, in RTR receiving immunosuppression who are no longer on PJP prophylaxis. Nosocomial outbreaks of PJP infection should be considered in RTR who present with PJP late into their transplant.

Multidrug resistant Gram-negative infections among critically ill patients: analysis of baseline characteristics and factors associated with mortality

Esraa Altawil*, Fadi Aljamman1, Ahmad Almeman2

1Medical City, Riyadh, Saudi Arabia, 2Qassim University, Buraydah, Saudi Arabia

Background: Bacterial infections are a frequent cause of hospitalization and a leading cause of death particularly with the emergence of antibiotics resistance. The emergence of Carbapenem resistance among gram negative bacteria (GNB) is one of the evolving alerts as its use is considered the last resort of treatment. Therefore, this urged studying the risk factors for development of multi-drug resistant (MDR) GNB, identify the clinical outcomes and factors associated with mortality especially among critically ill patients who are expected to have the worst outcomes.

Materials/methods: This is a retrospective observational study of critically ill patients who had an infection with Carbapenem-resistant Enterobacteriaceae (CRE), or MDR Pseudomonas aeruginosa, or MDR Acinetobacter spp. between May 2016-Nov 2018. Baseline demographics, co-morbidities and clinical outcomes were collected, and were evaluated for association with 28 days mortality. Approval of the research was obtained from the Institutional Review Board (IRB) before commencement of the study.

Results: A total of 255 patients with MDR Gram-negative cultures were screened, 77 patients met the inclusion criteria. Pseudomonas aeruginosa was the most common index organism (53% of patients), followed by Acinetobacter spp. and CRE, respectively. 28 days mortality was (59.7%). Non survivors were significantly older (mean age 64 vs 44 years, P= 0.0001), had significantly worse disease severity scores on ICU admission, higher incidence of chronic kidney disease (CKD) (43% vs 16%, P= 0.010), and required more continuous renal replacement therapy (CRRT) (54% vs 13% P= 0.0001), longer hospital length of stay prior to infection (median 34 vs 13 days, P= 0.018), required longer inotropic and vasopressors support (median 19 vs 8 days, P = 0.0001). In multivariate logistic regression the following factors were significantly associated with mortality; requirement of inotropic support post infection [OR 10.01 (95% CI 1.55-64.77); P= 0.015], age [OR 1.05 (95% CI 1.0- 1.1); P=0.01], and APACHE IV score on ICU admission [OR 1.03 (95% CI 1.0- 1.06); P = 0.04].

Conclusions: MDR Gram-negative infection is associated with significant in-hospital mortality among critically ill patients. Old age, high APACHE IV score, and higher hemodynamic support are associated with higher mortality.

Presenter email address: etaweel@live.com
**Background:** Substantial scientific evidence has accumulated that contamination of environmental surfaces in hospitals plays an important role in the transmission of Multi-Drug-Resistant-Organisms (MDRO). In this work, we propose to assess the overall risk of environmental dissemination of different MDRO, by evaluating the contamination of the environment, taking into consideration the individual risk factors together with the microbiological aspect of resistance.

**Materials/methods:** We conducted a prospective cohort study from May 2018 to May 2019. We included 91 patients admitted to Avicenne Hospital, older than 18, carriers of MDRO (BLSE-PE, CPE, VRE); known at admission or detected in the first 48 hours. Rectal and environmental sampling were realized. For each patient, we did a quantification of MDRO in stool, a qualitative evaluation of presence of MDRO in 4 different environmental sites and collected data including demographic characteristics, ward and duration of hospitalization, antibiotic administration, Charlson’s score of comorbidities, Katz’s score of dependence, nursing procedures, urinary/fecal incontinency, MDRO species and mechanisms of resistance.

**Results:** Fifty-three (58%) patients were admitted in a medical ward, 11 (12%) in surgery and 27 (30%) in ICU. MDRO were *Escherichia coli* (52%), *Klebsiella pneumoniae* (36%), *Enterobacter cloacae* (4%) and *Enterococcus faecium* (8%). Resistance mechanisms of detected MDRO were ESBL (41%), OXA48 (51%) and VanA (8%). Contamination of at least one environmental site was observed for only 14 (15%) patients: 36% (n=5) ESBL-PE, 36% (n=5) CPE and 28% (n=4) VRE. We didn’t find any statistically significant difference in age, sex, wards of admission, duration of hospitalization, Charlson’s score, Katz’s score, antibiotic consumption, recent stay abroad and interestingly relative abundance of MDRO in stool, between the group of patients having contaminated their environment (15%) and those who have not (85%). However, only VRE, among the other MDRO, appeared to colonize significantly more the patients who contaminated their environment (15%) and those who have not (85%). However, only VRE, among the other MDRO, appeared to colonize significantly more the patients who contaminated their environment (p=0.009).

**Conclusions:** Our preliminary study shows that only VRE colonized/infected patients seemed to be associated with a higher risk of spreading in the environment. Although this result needs to be confirmed on a larger scale, it raises questions about our national policies for contact isolation.

Abstract 437

Dynamic monitoring of sTREM-1 and other biomarkers in biliary tract infection
Jiahui Jiang*1, Daojun Yu2

1Zhejiang Chinese Medical University, Hangzhou, China, 2Zhejiang University, Hangzhou, China

Background: Sepsis is a common complication of biliary tract infection (BTI), which is associated with high mortality. We explored the significance of white blood cell (WBC), C-reactive protein (CRP), procalcitonin (PCT), soluble triggering receptor expressed on myeloid cells 1 (sTREM-1) and temperature (T) alone or combined together in early identification of BTI with or without sepsis and the monitor of treatment effect.

Materials/methods: 65 cases with BTI and 76 control cases were divided into three groups: Group A (BTI patients with sepsis), Group B (BTI patients without sepsis) and Group C (individuals without BTI or other infection). We dynamically measured the levels of WBC, CRP, PCT, sTREM-1 and temperature of all study subjects. Comparisons between groups were made using Non-parametric test. Receiver operating characteristic (ROC) curves were established to evaluate the diagnostic value for discriminating among three groups above. The cutoff values, area under curves (AUC) with corresponding 95% confidence intervals (CI), and sensitivity/specificity at optimal cut-off were calculated. Spearman rank correlation analysis was used to explore correlations between sTREM-1 and WBC in three groups.

Results: CRP had the highest AUC to identify BTI and sepsis from healthy controls (AUC = 1; sensitivity 100%; specificity 100%). Among various single indexes, PCT performed best (AUC = 0.785; sensitivity 75.8%; specificity 72.2%) to distinguish sepsis in patients with BTI. While combined multi-biomarkers didn’t perform better. From day 1 to day 5 of hospitalization, the levels of sTREM-1 in Group A were highest (P<0.05); on day 8, sTREM-1 levels in Group A and B declined back to normal. Both in Group A and B, sTREM-1 levels declined fast between day 1 and day 2 (P<0.05). The results of dynamic monitoring of WBC, CRP, PCR, T and sTREM-1 in three groups were shown in Figure 1.

Conclusions: CRP is the best biomarker to suggest infection. PCT alone is well used for diagnosing BTI with sepsis, meanwhile sTREM-1 and temperature should be taken into account. sTREM-1 has great value to monitor patients’ response to antimicrobial therapy and biliary drainage. The correlation between WBC and sTREM-1 was not very strong when diagnosing sepsis and observing curative effect.

**Abstract 442**

**Antimicrobial resistance and pathogenicity of Corynebacterium striatum clinical isolates collected from three tertiary hospitals in China**

Junrui Wang¹, Yanqiu Han*²

¹Affiliated hospital of Inner mongolian medical university, Hohhot, China, ²Affiliated hospital of Inner Mongolian medical university, Hohhot, China

**Background:** In recent years, more and more reports regarding multi-drug resistance and potential pathogenicity of Corynebacterium striatum were published, which may pose a knotty issue for clinicians. The pathogenicity potential of C. striatum strains isolated from different origins need to be further investigated.

**Materials/methods:** C. striatum clinical strains were isolated and identified with VITEK-2 ANC card, MALDI-TOF microTyper and 16S rRNA sequencing technique. Broth microdilution method was used to detect the antibiotic susceptibility profiles of 420 C. striatum clinical isolates, and PFGE method was used to discriminate different clones. Furthermore, in vitro adherence assay and mouse toxicity assay were performed to assess the pathogenicity of the strains with different genotypes.

**Results:** 420 C. striatum isolates were all sensitive to vancomycin, linezolid and daptomycin. Based on antibiotic resistance results, 420 strains were classified into 19 resistance patterns, when R1, R2 and R3 patterns accounted for 45.2% (190/420), 20.2% (85/420) and 22.4% (94/420), which were all multi-drug resistant patterns. PFGE typing results showed that 107 C. striatum strains were classified into 52 types (T01-T52), when 4 epidemic clones (T36, T28, T32, T14) accounted for 14.02% (15/107), 11.21% (12/107), 5.61% (6/107) and 3.73% (4/107), respectively. All of these 4 clones belonged to resistance patterns R1, R2 and R3. Among 27 C. striatum strains, 92.6% (25/27) strains showed moderate to strong in vitro adherence abilities, while only 7.4% (2/27) strains showed weak adherence ability on polystyrene surfaces. Furthermore, mouse lethality of different strains differed greatly, when non-dominant clone (Strain NMGYC339, T24) showed the strongest mouse lethality (90.0%).

**Conclusions:** The majority of the C. striatum clinical isolates tested in this study were multi-drug resistant, except vancomycin, linezolid and daptomycin. Most of the C. striatum strains showed moderate to strong adherence abilities and varied greatly among different hospitals. The C. striatum strains belonging to specific genotypes showed significant lethality in vivo, and the potential pathogenicity of C. striatum should be paid more attention to.

Abstract 443

Prevalence and antimicrobial susceptibility of Ureaplasma species and Mycoplasma hominis in female patients in Korea: increasing trend of pristinamycin-resistant isolates

Jiyong Lee*1

1H plus Yangji hospital, Seoul, South Korea

Background: Ureaplasma species and Mycoplasma hominis, commonly found in the lower urogenital tract, have been associated with various urogenital infections. Tetracycline and macrolide antibiotics are available for the treatment of urogenital tract infections caused by genital mycoplasmas. However, an increase in the prevalence of antibiotic-resistant mycoplasmas has been reported worldwide. Therefore, this study aimed to estimate the prevalence and antimicrobial susceptibility trend of genital mycoplasmas in female patients and to evaluate risk factors for acquisition of pristinamycin-resistant mycoplasma.

Materials/methods: Endocervical swabs from 4,035 specimens obtained from March 2016 to December 2018 were analyzed using Mycoplasma IST2 Kits. Since pristinamycin and josamycin are not available in Korea, we performed an age- and date-matched case-control study to evaluate the risk factors for acquisition of pristinamycin-resistant isolates.

Results: A total of 1,589 (37.4%) cases of genital mycoplasmas were identified, which included 1,243 (78.2%), 49 (3.1%), and 279 (18.7%) cases of Ureaplasma species, Mycoplasma hominis, and both respectively. The antibiotics susceptibility rate decreased over the years for pristinamycin (99.8%, 99.3% and 96.7% for 2016, 2017, and 2018, respectively, p<0.001), josamycin (97.4%, 97.6% and 94.8%, p=0.001), tetracycline (89.5%, 85.8%, and 82.7%, p=0.008) and doxycycline (96.0%, 93.1%, and 92.3%, p=0.061). In the multivariate analysis, coinfection with Candida species was an independent risk factor for the acquisition of pristinamycin-resistant isolates (odds ratio 6.35, 95% confidence interval, 1.36 to 29.76, p=0.019).

Conclusions: The antibiotic-resistant genital mycoplasmas have been gradually increasing every year. Nationwide surveillance, proper antibiotics stewardship, and culture-based treatment strategy are needed to control this upcoming threat.

Abstract 445

Immunisation and multiple sclerosis: recommendations from the French Multiple Sclerosis Society

Christine Lebrun-Frenay1, Sandra Vukusic2

1Pasteur 2 Hospital, Nice, France, 2University of Lyon, Lyon, France

Abstract third-party references: on behalf SFSEP and France4MS

Background: Vaccines have been suspected in the past to trigger Multiple Sclerosis (MS) or MS exacerbations. Other concerns arose more recently, with the extension of the immunomodulatory treatment arsenal, about an increased risk of infections or a decreased effectiveness of immunization in immunosuppressed patients. The objective of this work is to establish recommendations on immunization and multiple sclerosis.

Materials/methods: The French Group for Recommendations in Multiple Sclerosis (France4MS) did a systematic review of articles from PubMed and universities databases (January 1975 through June 2018). The RAND/UCLA appropriateness method, which has been developed to synthesize the scientific literature and expert opinions on health care topics, was used for reaching a formal agreement. Twenty-four MS experts worked on the full-text review and a group of 110 multidisciplinary health care specialists validated the final evaluation of summarized evidences.

Results: Neurologists should double check vaccination status as soon as possible after MS diagnosis and before the disease-modifying treatment (DMT) introduction. The French vaccines calendar should be applied to MS patients and they should be advised to receive seasonal influenza vaccine. If possible, serological status, including A, B, C hepatitis, measles, mumps, pertussis, rubella, small pox, varicella-zoster should be checked before starting a DMT. In case of treatment-induced immunosuppression, MS patients should be informed about infections risks and vaccine standards from the French High council of Health should be applied. Live attenuated vaccines are contra-indicated in MS patients currently or recently treated with immunosuppressive drugs, including corticosteroids; other vaccines can be proposed whatever the treatment, but their effectiveness may be partly reduced with some drugs.

Conclusions: Physicians and patients should be aware of the updated recommendations for immunizations and MS. Practice guidelines will be delivered by the French MS Society (SFSEP) for the medical and patients communities.

On behalf the SFSEP and the FRANCE4MS group

**Haemophagocytic lymphohistiocytosis in human immunodeficiency virus: a systematic review of literature**

Farhan Fazal1, Ankit Mittal2, Animesh Ray2, Nitin Gupta*3

1KMC Hospital, Mangalore, India, 2All India Institute Of Medical Sciences, New Delhi, New Delhi, India, 3Kasturba Medical College, Manipal, Manipal, India

**Background:** Hemophagocytic lymphohistiocytosis (HLH) is a hyper-immune condition secondary to malignancy, infection or auto-immune conditions. HLH in patients with human immunodeficiency virus infection (HIV) can be either be due to a co-existent malignancy/infection or due to uncontrolled replication of HIV itself. The aim of this systematic review (SR) was to delineate the number of reported cases of HLH in HIV, their possible triggering factors, treatment and outcome.

**Materials/methods:** Search strategy: We conducted a comprehensive search of English medical literature via the Medline / PubMed database using different synonyms of „HIV” AND „HLH”. The review was registered under PROSPERO CRD42018099987. Study selection: The titles and abstracts of 185 articles between January 1986 and April 2018 were screened for inclusion. The reasons for exclusion were- articles not in English [19], absence of either HIV or HLH [48], non-case studies [17], non-availability of full articles [10] and unfulfillment of HLH 2004 diagnostic criteria [50]. A total of 41 articles with 52 patients were included in the analysis.

**Results:** Of the 52 patients, 42 (80.8%) were male. The mean age was 38.2 +/- 14.2 years. The median CD4 count at the time of diagnosis of HIV with HLH was 41/ml (IQR: 8-94/ml). HLH was associated with malignancy in 17 patients [Lymphoma [n=11], Kaposi sarcoma [n=6]] while associated infection was found in 25 patients [Fungal [Histoplasmosis-15, penicilliosis-1, invasive candidiasis-1, invasive aspergillosis-1], Parasitic [leishmaniasis-1, toxoplasmosis-2], Bacterial [bartonellosis-1], Viral [cytomegalovirus-2, Epstein-barr virus-1] and tuberculosis [n=1]]. Presence of either malignancy (p=0.051) or opportunistic infection (p=0.69) was not associated with increased chances of death by uni-variate analysis. A total of 26 patients were treated with steroids while etoposide was used in only four patients. Death was reported in 21 patients. Intake of steroids as a treatment of HLH was associated with more chances of death (p=0.048).

**Conclusions:** Malignancy and opportunistic infections are important triggers for HLH in HIV. Acute HIV and IRIS by itself can act as a trigger for HLH. Evidence on the use of steroids as a treatment of HLH is not convincing.

Abstract 453

**Value of the CXCL13 ELISA and a CXCL13 lateral flow immunoassay in the diagnosis of Lyme neuroborreliosis**

Katharina Ziegler*, Anca Rath1, Christoph Schoerner2, Renate Meyer2, Thomas Bertsch1, Frank Erbguth4, Jörg Steinmann1, Jürgen Held2

1Klinikum Nürnberg, Institute of Clinical Hygiene, Medical Microbiology and Infectiology, Nürnberg, Germany, 2Universitätsklinikum Erlangen und Friedrich-Alexander-Universität Erlangen-Nürnberg, Mikrobiologisches Institut - Klinische Mikrobiologie, Immunologie und Hygiene, Erlangen, Germany, 3Klinikum Nürnberg, Institute of Clinical Chemistry, Laboratory Medicine and Transfusion Medicine, Nürnberg, Germany, 4Klinikum Nürnberg, Clinic of Neurology, Nürnberg, Germany

**Background:** Diagnosis of Lyme neuroborreliosis (LNB) can be challenging in an early disease stage especially if *Borrelia*-specific intrathecal antibodies are still negative. This study aimed to assess the performance of CXCL13 ELISA and the ReaScan® CXCL13 lateral flow immunoassay (LFA) in the diagnosis of Lyme neuroborreliosis.

**Materials/methods:** In this dual-center case-control study 90 CSF samples were retrospectively analysed by the Euroimmun CXCL13 ELISA and the ReaScan® CXCL13 LFA. Overall, 34 CSF samples from patients with definite LNB, 10 samples from patients with possible LNB and 46 samples from patients with other predominantly inflammatory CNS diseases (non-LNB control group) were included. Patients with definite or possible LNB were classified according to the EFNS guidelines.

**Results:** CXCL13 ELISA was significantly elevated in all 34 patients with definite LNB (median 1409 pg/mL) compared to 46 control patients (median 20.7 pg/mL, \( p < 0.0001 \)). In the control group patients with possible LNB were not included. For a cut-off of 78.6 pg/mL a sensitivity of 100% and a specificity of 84.8% (AUC 0.93) was calculated. The ReaScan® CXCL13 LFA was significantly elevated in 31 patients with definite LNB (median 223.5 arbitrary values) compared to 46 control patients (median 0 arbitrary units, \( p < 0.0001 \)). A cut-off of 22.5 arbitrary values (AV) had a sensitivity of 91.2% and a specificity of 93.5% (AUC 0.94). Overall, the agreement of the LFA with the ELISA was 90%; 98% for ELISA values < 250 pg/mL; 22% for ELISA values from 250-500 pg/mL and 96% for ELISA values > 500 pg/mL, respectively. The correlation between the CXCL13 ELISA and the LFA was \( r = 0.89 \) and \( p < 0.0001 \).

**Conclusions:** CXCL13 ELISA and the ReaScan® CXCL13 LFA in CSF are reliable diagnostic tools for the identification of patients with definite LNB.

Abstract 454

Combined effects of low incubation temperature, minimal growth medium and low hydrodynamics optimise Acinetobacter baumannii biofilm formation

Emmanuel Chima Eze*1

1 University of KwaZulu-Natal, South Africa, School of Health Sciences, College of Health Sciences, Durban, South Africa

Background: Biofilm formation is an important virulence factor expressed by microorganisms. It shields and protects microbial cells from host immune responses, antibiotics and other anti-infectives. It is hypothesized that microbial cells demonstrate enhanced biofilm formation in nutrient limiting environment. The aim of this study was to investigate if limiting environmental conditions act synergistically to promote biofilm formation in multidrug resistance Acinetobacter baumannii.

Materials/methods: Biofilm was cultivated using quantitative microtiter plate method. The combined effects of temperature, medium and shear force were determined by measuring adherence (OD570 nm) following incubation at 26°C, 30°C and 37°C for 24 hr. when biofilm was cultured with minimal nutrient medium (EAOB) and nutrient-rich medium (TSB) without or with agitation at 50 rpm. Antibiotic susceptibility test of selected antimicrobials were tested with Kirby-Bauer disc method. P < 0.05 was considered statistically significant for all the tests.

Results: A noticeable variation in adherence was observed among the isolates cultured with both media. Biofilm forming capacity of the isolates range from 0.09 to 0.33. Majority of the isolates had their relative biofilm-forming capacity significantly higher than the positive control, Acinetobacter baumannii ATCC 19606. The biofilm biomass during growth in nutrient-rich medium (TSB) without shaking was significantly different (p < 0.05) among the three temperatures tested compared with when cultured in EAOB without shaking. A positive correlation was observed between biofilm formation and resistance to imipenem (r = 0.2889; p = 0.05). There is a statistically significant difference among the median of the three source groups (p < 0.05) compared with the median between the source groups.

Conclusions: This observation extended further the view that A. baumannii biofilm formation is enhanced when nutrient-poor medium was used at room temperature (26°C) with or without agitation compared to growth at 37°C.

Insights of colistin resistance and flexible transmission of mcr-1
Yang Yu1, Xingping Li1, Xiao-Ping Liao*, Jian Sun1, Ya-Hong Liu2

1South China Agricultural University, Guangzhou, China

Background: Colistin, a cationic antimicrobial peptide, is regarded as one of the last-resorts to treat clinical infections caused by MDR Gram-negatives bacteria. However, colistin resistance has been increasingly emerged recently, primarily mediated by plasmid-mediated colistin resistance gene mcr-1, which has drawn attention to mcr-like genes and the needs to systemically and accurately monitor colistin resistance.

Materials/methods: Feces were collected from swine, chicken and waterfowl and detected for the mcr-positive bacteria. Antimicrobial susceptibility testing and PCR screen were performed to investigate the phenotype and genotype of tigecycline resistance. Conjugation, S1-PFGE, and WGS were used to determine the transferability, location of mcr gene, and the further study the bacterial genomic profiles.

Results: We collected 2747, 1217 and 1104 fecal samples from swine, chicken and waterfowl during 2016 to 2018. The results show that 40%, 57.1% and 41.8% of the samples are mcr-1 positive. A four-year monitoring of colistin resistance in a specific pig farm in Jiangxi, the resistance rate and mcr-1 positive detection rate displays a downward trend, but the prevalence of mcr-1 is still high in 2017 (33.78%) and 2018 (23.08%). The mcr-1-positive E. coli isolates show distinct genetic relatedness, and the mcr-1 gene can be located on the chromosome and the IncX4, IncI2, IncHI2, IncFII and IncFIB type plasmids. In addition, we observed substantial within-host diversity of mcr-1-positive Enterobacteriaceae isolates from different aspects [e.g. species, clone relatedness, plasmid types and genetic context of mcr-1]. To further clarify the transmission mechanism[s] of rapid and wide spread of mcr-1 gene, we engineered E. coli strains that carry an intact Tn6330 transposon or its deletion derivatives, providing direct evidence that mcr-1 transposition relies on the presence of an intact Tn6330.

Conclusions: Extensive heterogeneity and flexibility of mcr-1 transmission exist in both intra-host and with-in host level. mcr-1 transposition mediated relies on the presence of an intact Tn6330. Considering that gut is a melting pot for active horizontal gene transfer, it will take long for regulations to control colistin resistance, and continuous supervision of colistin usage and colistin resistance genes is necessary.

Presenter email address: xpliao@scau.edu.cn
Dissemination of tet(X4)-positive Escherichia coli on duck farms in south-east China
Yang Yu*, Chaoyue Cui1, Xu Kuang1, Chong Chen1, Xiao-Ping Liao1, Jian Sun1, Ya-Hong Liu1

1South China Agricultural University, Guangzhou, China

Background: Carbapenems, colistin and tigecycline are critically important antibiotics in clinics and tigecycline is considered the last-resort drug against severe human infections caused by multi-drug resistant bacteria. This is especially true after the global appearance of blaNDM and mcr mediating the resistance to carbapenems and colistin respectively. Recently, a mobile tigecycline resistance gene tet(X4) has been identified in Escherichia coli, Klebsiella pneumoniae and Acinetobacter baumannii that causes high resistance to tigecycline and other tetracyclines. In this study, the prevalence of tet(X4) in E. coli isolates from duck farms in Southeast China was identified and characterized.

Materials/methods: Feces, soil, sewage and dust samples were collected from duck and goose farms along with the southeast coast provinces of China. Antimicrobial susceptibility testing and PCR screen were performed to investigate the phenotype and genotype of tigecycline resistance. Conjugation, S1-PFGE, and WGS were used to determine the transferability, location of tet(X4) gene, and further study the bacterial genomic profiles.

Results: We collected 1716 samples and 16 isolates (0.9%) were identified carrying the tet(X4) gene with tigecycline MICs ≥ 8 mg/L. Sequencing analysis demonstrated these isolates belonged to diverse sequence types, mostly ST3997 from Jiangsu province. Conjugation assay to E. coli C600 was succeeded for 11 isolates, and correspondingly IncHI1- and IncX1-plasmids bearing tet(X4) were detected by sequence analysis. tet(X4) was found adjacent to an insertion sequence ISCR2 downstream and a catD gene upstream for all isolates. In addition, multiple-drug resistance to meropenem, ceftazidime, ampicillin, ciprofloxacin, trimethoprim/sulfamethoxazole and fosfomycin was profiled in all the tet(X4)-positive isolates.

Conclusions: The identification of tet(X4) harboring E. coli strains in duck farms and their surroundings enlarges our knowledge of the variety and prevalence of tigecycline resistance. Additionally, the prevalence of tet(X4) raises concern for the use of tetracyclines in animal farming and the tet(X4) gene should be listed as primary gene for resistance surveillance.

Clinical and molecular perspectives of colistin-resistant Klebsiella from an oncology centre in a lower-middle income country

Kulakkattil Abdul Ghafur*, Chaitra Shankar2, Surendran Rajendran2, Thirunarayan MA2, Veeraraghavan Balaji3

1Apollo Cancer Institutes, Chennai, India, 2Christian Medical College and Hospital, Vellore, India, 3Christian Medical College, Vellore, India

Background: There is limited available data on the clinical and molecular perspectives of colistin resistant Klebsiella from Lower Middle Income countries.

Materials/methods: We did a retrospective observational study of a cluster of 20 patients with CoRKp infections in our tertiary care oncology centre, from June to November 2017. Clinical details were collected from the case records. Broth micro dilution was performed to derive colistin MIC. The bacteremic isolates (14) were subjected to Whole Genome Sequencing (WGS) to determine mechanism of colistin resistance.

Results: The study included 20 patients with a median age of 60 years, majority were females (70%) and with a median APACHE score of 18. Most patients (19/20) were immunocompromised, receiving treatment for malignancy. Prior exposure to a polymyxin (B/E) was 50%(10/20), an additional 15% (3/20) patients developing bacteremia while on the drug. Fourteen patients had CoRKp bacteremic and 6 non bacteremic infections (4 pneumonia, one UTI and one intrabdominal). All patients received a polymyxin (B/E) in combination with one or more of the following drugs - tigecycline, fosfomycin, chloramphenicol, minocycline or a carbapenem based on the susceptibility and MIC. The time taken for the development of CoRKp infection was a median of 22 days since hospitalisation. Mortality was 75% (15/20), with a median time of death 7 days since the onset of sepsis. Colistin MIC for the isolates ranged from 32-64µg/ml. Of the 14 bacteremic isolates, 12 belonged to ST231, the other two being ST395 and ST147. The carbapenemases identified were OXA-232 in 11, NDM-1 in one isolate and two isolates did not carry any carbapenemase. Mutations in chromosomal genes such as eptA (n=12), arnB (n=1) and arnT (n=1) contributed to colistin resistance. mgrB was disrupted in one of the isolates by insertion of IS903B. Plasmid mediated colistin resistance due to mcr and its variants were absent.

Conclusions: Patients with CoRKp infections have a high mortality rate, despite receiving combination therapy. The commonest carbapenem resistance gene identified was OXA 232. ST231 is the predominant clone among colistin resistant K. pneumoniae. mcr and its variants were absent in all isolates. Mutations in chromosomal genes contributed to colistin resistance.

Abstract 460

Prevalence of device use and transmission-based precautions in nineteen large Australian acute care public hospitals: secondary outcomes from a national healthcare associated infection point prevalence survey

Philip Russo1,2,3, Andrew Stewardson1, Allen C Cheng4,5,6, Tracey Bucknall3,5,7, Brett Mitchell8,9

1 Monash University Peninsula Campus, Department of Nursing and Midwifery, Frankston, Australia, 2 Cabrini Health - Malvern, Department of Nursing Research, Malvern, Australia, 3 Alfred Health Partnership, Centre for Quality and Patient Safety Research, Melbourne, Australia, 4 Monash University, Department of Infectious Diseases, Prahran, Australia, 5 Monash University, School of Public Health and Preventive Medicine, Prahran, Australia, 6 Alfred Health, Infection Prevention and Healthcare Epidemiology Unit, Prahran, Australia, 7 Deakin University Melbourne Burwood Campus, School of Nursing and Midwifery, Burwood, Australia, 8 University of Newcastle, School of Nursing and Midwifery, Callaghan, Australia, 9 Avondale College of Higher Education, Faculty of Arts, Nursing and Theology, Cooranbong, Australia

Background: The use of invasive devices increases the risk of healthcare associated infections (HAI). The recent national Australian HAI point prevalence survey secondary objectives aimed to estimate the prevalence of patients with an indwelling urinary catheter device and vascular access devices; and also identify prevalence of those managed under transmission based precautions (TBP); and those colonised or infected with a multi drug resistant organism (MDRO). Data was also collected on the ratio of infection control professional (ICP) per 100 beds and the proportion of single rooms at each hospital.

Materials/methods: A point prevalence study (PPS) was conducted in large acute care Australian public hospitals. All data were collected by two trained Research Assistants. Surveillance methodology was based on the European Centre for Disease Prevention and Control (ECDC) PPS Protocol. Data was also collected on prevalence of TBPs and MDROs.

Results: A total of 2767 acute adult inpatients were sampled across 19 hospitals. The prevalence of peripheral vascular, central vascular and urinary catheters devices was 55.2% (95%CI: 53.3%-57.1%), 14.8% (95% CI: 13.5%-16.1%) and 20.7% (95%CI: 19.2%-22.3%) respectively. Of the 2767 patients sampled 285 (10.3%, 95%CI: 9.2%-11.5%) were documented as either being infected or colonised with a MDRO, and 781 (11.8%) patients were being managed under the hospital TBP policy. Overall proportion of single rooms was 46% (range 16%-100%) and the mean ICP ratio per 100 beds was 0.9 (range 0.3-1.7).

Conclusions: This is the first national study to describe the prevalence of devices, TBPs and MDROs in Australian healthcare settings. Furthermore, it has identified broad variation in ICP resources (staff and single rooms) across a homogenous sample of 19 Australian hospitals. In an era where device use should be constantly reviewed to minimise risk of HAI, combined with the increasing challenges of managing patients with MDROs, it would appear that some hospitals are clearly better able meet these challenges. This data will serve as a benchmark for future studies.

Prevalence of ESBL Klebsiella pneumoniae infections in Nigeria: a systematic review
Usman Abubakar*1,2

1International Islamic University Malaysia, Kulliyah of Pharmacy, Kuantan, Malaysia, 2Ibrahim Badamasi Babangida Specialist Hospital, Minna, Nigeria

Background: Surveillance is an important strategy used in the control of antimicrobial resistance. It guides selection of empirical antimicrobial therapy and identifies priority areas for infection prevention and control as well as antimicrobial stewardship interventions. Nigeria has no antimicrobial resistance surveillance system at the moment. This review evaluates the prevalence of Extended Spectrum Beta-Lactamase (ESBL) among clinical K. pneumoniae isolates in Nigeria (2007 – 2017).

Materials/methods: This systematic review was conducted in accordance with the Preferred Reporting Items for Systematic Reviews and Meta-Analysis (PRISMA) statements. PubMed, Scopus and Google scholar electronic databases were searched to identify eligible studies. Search terms used include: Extended Spectrum Beta-Lactamse, ESBL, Klebsiella pneumoniae, enterobacteriaceae, and Nigeria. Studies that reported prevalence of ESBL K. pneumoniae in at least 30 non-duplicate clinical specimens were selected. Studies involving animals and healthy human population were excluded. Study characteristics and prevalence of ESBL K. pneumoniae isolates were extracted using a data collection form.

Results: Of the 283 articles screened, only seven met the inclusion criteria including three and four studies conducted in Southern and Northern Nigeria, respectively. All the selected studies used prospective study design. Overall, the selected studies involved a total of 244 K. pneumoniae isolates and 237 ESBL phenotypes. Available data indicated that there was an increase in the prevalence of ESBL K. pneumoniae in both regions: from 12.7% (2005 – 2007) to 37.5% (2011) in the South-West zone and from 14.8% (2010 – 2011) to 62.9% (2012 – 2014) in the North-West. The prevalence of ESBL K. pneumoniae in the South-South, North-East and North-Central was 43.8%, 33.1% and 26.7% respectively. ESBL K. pneumoniae was more common in urine and surgical wound specimens.

Conclusions: Prevalence of ESBL K. pneumoniae infection in Nigeria was high and has increased during the period under review. Active surveillance of ESBL K. pneumoniae infections is recommended. In addition, Infection control and antimicrobial stewardship interventions should be strengthened to reduce the burden of antibiotic resistance.

Abstract 467

Investigation of positive blood culture bottles with the hemoFISH test: a beacon-based fluorescence in situ hybridisation technique

Devrim Dündar1, Doğanhan Kadir Er*1, Birsen Mutlu2

1Kocaeli University, Faculty of Medicine, Medical Microbiology Department, Kocaeli, Turkey; 2Kocaeli University, Faculty of Medicine, Clinical Microbiology and Infectious Diseases Department, Kocaeli, Turkey

Background: Pathogenic isolates that responsible for bacteraemia are need to identified rapidly and accurately. Blood culture is the gold-standard method for detection pathogens in blood, but culture-based methods are time-consuming. Beacon-based fluorescence in situ hybridization (bb-FISH) technique is thought to be one of the methods that may fill this gap. Therefore, a bb-FISH test (HemoFISH, Miacom diagnostics, Germany) was evaluated.

Materials/methods: A total of 72 BACTEC Plus Aerobic/F blood culture bottles which were gave positive signal were collected. The isolates growth on subcultures were identified by conventional/automated (Vitek-2, BioMérieux, France) reference methods. Also, appropriate hemoFISH assay (Gram-positive or Gram-negative) was performed from signal-positive blood culture bottles after Gram staining.

Results: From the 72 signal-positive blood culture bottle, 75 different isolate were isolated. A total of 69 (95.8%) specimen had monomicrobial, 3 (4.2%) specimen had polymicrobial growth with two species. Twenty-four (32%) Gram-negative and 51 (68%) Gram-positive strain identified with the reference methods. All of the positive control wells were positive for 72 signal-positive blood culture bottles with the hemoFISH assay. From the 75 of the isolates, 67 (89.3%) were classified within the level of species, genus or family by the specific probes of the assay. From the 8 undetected isolates, 2 (Alcaligenes faecalis and Achromobacter xylosoxidans) were not identified by the assay due to absence of specific probes to these pathogens. Also, 6 of these isolates (2 Acinetobacter spp., 1 Klebsiella pneumoniae, 1 Pseudomonas aeruginosa, 1 Enterococcus spp. and 1 Staphylococcus hominis subspecies hominis) could not classified within the levels despite the presence of probes. Total processing time for one signal-positive blood culture bottle was approximately 45 minutes with the hemoFISH assay. When the classical subculture is applied, minimum time for identification is about 36 hours.

Conclusions: Rapid technologies for the determination of the bacteraemia is important to start appropriate empirical treatment. The hemoFISH assay has shortened the evaluation time of bacteraemia but the ability to identify at species level is limited to some pathogens. Thus, it is recommended to use bb-FISH assays in parallel with reference-methods to ensure appropriate empirical therapy.

Abstract 470

Molecular differentiation of dengue serotypes in the public health system in Santo André, Brazil

Katharyna Gois*1,2; Sheila Das Chagas Mendes2,3; Beatriz Alves1; Fernando Luis Affonso Fonseca1; Flavia Gehrke1,2,3

1Faculdade de Medicina do ABC | FMABC, Santo André, Brazil, 2Instituto de Assistência Médica ao Servidor Público Estadual de S. Paulo - IAMSPE, São Paulo, Brazil, 3Universidade Paulista, São Paulo, Brazil

Abstract third-party references: Supported by Fapesp 2016/14457-0

Background: Dengue virus has four serotypes (DENV1-4). It is an arbovirus belong to the family Flaviviridae, whose main vector is the mosquito Aedes aegypti. Dengue infection has nonspecific symptoms (high fever, retro-orbital pain, myalgia and rash) and similar to other arbovirus infections, laboratory diagnosis becomes essential. In 2018, 163,236 dengue cases were confirmed in Brazil, and of these 301 cases of severe dengue and 3,386 dengue cases with alarm signals. Until April 2019, 15,953 cases of Dengue were confirmed. Early diagnosis can positively influence the clinical management of these patients and consequently reduce mortality.

Materials/methods: From June 2018 to June 2019, 645 patients were admitted to the public health service of the municipality of Santo André in the state of São Paulo with clinical suspicion of Arboviroses. From each patient 5 mL of peripheral blood were collected. The immunochromatographic test was performed for research of protein NS1, IgG and IgM. Viral RNA was isolated from the patient’s serum using the QIAamp Viral RNA kit. Complementary DNA synthesis was performed from 1 μg of viral RNA using the QuantiNova Reverse Transcription kit. RT-qPCR was performed with the aid of specific oligonucleotides for the 4 Dengue serotypes and the endogenous gene RPL13a. Amplification reactions were performed on an ABI 7500 thermocycler.

Results: Of the samples evaluated, 48.9% were female and 51.1% male. In immunochromatographic test 601 (93,1%) were negative, 9 (1,4%) NS1 positive, 3 (0,5%) positive IgM and 32 (5%) positive IgG. In RT-qPCR 22/645 (3,41%) dengue 2 was detected and in 1 2/645 (1,86%) genetic material from the dengue 1 has been detected.

Conclusions: The serological method was able to detect 12 (1,86%) patients in the acute phase while molecular biology testing was able to detect viral RNA in 34 (5,27%) of the samples and even differentiate into dengue 1 and dengue. 2. Therefore, the implementation of molecular diagnosis of the virus in the acute phase of infection in the public health service has shown to be a promising tool in the clinical management of these patients.

Antimicrobial activity of ceftazidime-avibactam, ceftolozane-tazobactam and comparators tested against *Pseudomonas aeruginosa* and *Klebsiella pneumoniae* isolates collected from US medical centres in 2016-2018

Helio S. Sader*1, Cecilia Carvalhaes1, Jennifer Streit1, Timothy Doyle1, Mariana Castanheira1

1JMI Laboratories, North Liberty, United States

**Abstract third-party references:** This study was performed by JMI Laboratories and supported by Allergan, which included funding for services related to preparing this abstract.

**Background:** Very few agents remain active against *Pseudomonas aeruginosa* (PSA) and *Klebsiella pneumoniae* (KPN) in some geographic regions. We evaluated the *in vitro* activity of ceftazidime-avibactam (CAZ-AVI), ceftolozane-tazobactam (C-T) and many comparator agents against a large collection of contemporary PSA and KPN isolates from United States (US) medical centers.

**Materials/methods:** A total of 6,210 PSA and 6,041 KPN isolates were consecutively collected from 85 US medical centers (37 states) in 2016-2018. MICs were determined by reference broth microdilution method and susceptibility rates were calculated using EUCAST breakpoints. KPN with elevated MIC for broad-spectrum cephalosporins were submitted to whole genome sequencing analysis to detect resistance genes.

**Results:** CAZ-AVI (97.1% susceptible [S]) and C-T (97.0%) were the most active compounds against PSA [Table], and retained activity against meropenem-nonsusceptible [MEM-NS; 88.5-89.0%] and piperacillin-tazobactam-NS [PIP-TAZ-NS; 86.6-87.0%] isolates; 40.7% of C-T-NS PSA were CAZ-AVI-S and 44.2% of CAZ-AVI-NS PSA were C-T-S. PSA S rates for MEM, PIP-TAZ and tobramycin were 78.2%, 79.1%, and 93.3%, respectively. The most active agents against KPN were CAZ-AVI (>99.9%), colistin (98.3%), amikacin (97.6%), and MEM (97.5%). C-T was active against 92.3% of KPN and showed limited activity against ESBL- and carbapenemase (CPE)-producers (67.2% and 0.0%, respectively). Among KPN, 10.2% were ESBL-producers (excluding CPE co-producers) and 2.7% were CPE-producers. The most common ESBLs were CTX-M-15 (75.9%) and OXA-1/OXA-30 (52.4%), 54.4% produced >1 ESBL, mainly CTX-M-15+OXA-1/OXA-30 (50.2% of ESBL-producers). The most common CPE among KPN were KPC-3 (57.8% of CPE-producers) and KPC-2 (39.8%), and only 1 metallo-beta-lactamase-producing isolate was observed (NDM-1). The most active agents against ESBL-producing KPN were CAZ-AVI (100.0%), MEM (98.7%), and colistin (96.2%), and only CAZ-AVI (99.4%) and colistin (82.4%) were active against >45% of CPE-producers.

**Conclusions:** CAZ-AVI and C-T showed similar coverage (%) against PSA (97.0-97.1%), including against isolates resistant to other antipseudomonal agents. In contrast, C-T was less active than CAZ-AVI against KPN in general and exhibited limited activity against ESBL and/or CPE producers.

Abstract 481

Reducing paediatric blood culture contamination rates: a benefit to arterial catheter-drawn cultures
Michal Meir*1,2,3, Osama Naserldeen4,5, Halima Dabaja-Younis6,7, Yuval Geffen4,7, Imad Kassis4,7

1The Ruth Rappaport Children’s Hospital (Meyer), Pediatrics Department, Haifa, Israel, 2The Ruth Rappaport Children’s Hospital (Meyer), Pediatric Infectious Diseases Unit, Haifa, Israel, 3Rambam Health Care Campus, Microbiology Laboratory, Haifa, Israel
4Rambam Healthcare Campus, Haifa, Israel, 5Rambam Healthcare Campus, Haifa, Israel, 6Rambam Healthcare Campus, Haifa, Israel, 7Rambam Healthcare Campus, Haifa, Israel

Background: Contamination of blood cultures occurs universally, often impeding medical care. Catheter-drawn cultures are considered less reliable compared to cultures obtained by venipuncture in adults. We aimed to reduce pediatric blood culture contamination rates using educational and technical interventions. We also assessed the positive predictive value (PPV) of catheter-drawn cultures in pediatric patients.

Materials/methods: The study was conducted at the Ruth Rappaport Pediatric Hospital, a tertiary medical center in Israel. All blood cultures drawn from patients aged 0-18 years were included. Cultures were drawn by nurses and physicians. For 6 months, we performed specialized training, personal feedbacks, and departmental reports of contamination rates. Blood culture contamination rates during the 6 month intervention period were compared to rates in the preceding year. We analyzed contamination rates according to age, department and drawing method.

Results: Pediatric blood culture contamination rates were reduced from 2.18% in the year prior to intervention to 1.93% during the intervention period (1.93% and 2.18% respectively OR 0.89 [95% CI 0.67 – 1.16]). Across all pediatric departments, neonates aged 0-30 days had significantly lower blood culture contamination rates compared to patients aged 1-2 months or older. Cultures drawn from arterial catheters had lower contamination rates than those drawn from a central venous catheter (2.2% versus 3.7% respectively OR 1.72 95% CI 1.14-2.6, see table).

Conclusions: Reducing pediatric blood culture contamination rates below 2% is challenging. Technical difficulties likely play an important role in contamination, therefore arguing for use of a dedicated phlebotomy team, especially in patients aged >1 month. While drawing from vascular catheters, arterial blood cultures are less likely to be contaminated, suggesting a benefit to blood draw from arterial catheters for cultures obtained in intensive care settings.

Abstract 490

Rough-type and loss of the LPS due to lpx genes deletions are associated with colistin resistance among multidrug-resistant *Escherichia coli* clinical isolates not harbouring mcr genes

Mohammad Savari*1,2; Nasrin Emam3; Mojtaba Moosavian1

1Ahvaz Jondishapur University of Medical Sciences, Ahvaz, Iran, 2Ahvaz Jundishapur university of medical sciences, Ahvaz, Iran, 3Ahvaz Jondishapur University of Medical Sciences, Ahvaz, Iran

**Background:** The emergence of multi drug resistant *Escherichia coli* (*E. coli*), is a great challenge in treating nosocomial infections. Colistin is the last line of therapy for such strains, but resistance to colistin is increasingly emerge in the public health systems.

**Materials/methods:** In this study, we examined 38 clinical isolates of *E. coli*, with decreased susceptibility to colistin. After confirmation of the isolates, antimicrobial susceptibility tests were done to characterized the resistance pattern of these isolates to the different classes of antibiotics, using the disk diffusion test, and then, MIC of colistin was determined by broth microdilution methods according to CLSI recommendations. The isolates were examined for the presence of mobile colistin resistance (*mcr-1* and *mcr-2*) genes, using the PCR methods. Cloning of *mcr-1* gene was done to prove its role in colistin resistance. LPS was extracted from the isolates to determine the presence or the absence of this bacterial target for colistin. *lpx* genes were analyzed by PCR and sequencing for detecting any mutation.

**Results:** Among 38 clinical isolates of *E. coli*, with decreased susceptibility to colistin, 52.6% (n=20) were resistant to colistin. The MICs of colistin ranged between 0.5 µg/ml and >256 µg/ml. among the colistin resistant isolates, 6 isolates were harboring the *mcr-1* gene but not the *mcr-2*. The transformed *E. coli* DHα, showed a 8-fold increase in colistin MIC. The other 14 isolates, were negative for *mcr* genes. Among these, 6 isolates were negative for LPS production in SDS-PAGE analysis and five showed the rough type LPS phenotype, and all were significantly associate with resistance to colistin.

**Conclusions:** this study, presented evidences that loss of LPS or lipid A-deficiency can lead to colistin resistance among clinical isolates of *E. coli*, according to the loss of the drug target or a less affinity of LPS for colistin.

Abstract 492

**Treatment of influenza and influenza-like illnesses with antiviral having anti-inflammatory efficacy**

Natalia Pshenichnaya*, Vilja Bulgakova**, Elena Volchkova†, Elena Kareva§, Vladimir Gorodin||, Antonina Grekova¶

1National Medical Research Center of Phthisiopulmonology and Infectious Diseases, Moscow, Russian Federation, 2Children’s Health Research Centre, Moscow, Russian Federation, 3Sechenov First Moscow State Medical University, Moscow, Russian Federation, 4PIrogov Russian National Research Medical University, Moscow, Russian Federation, 5National Medical Research Center of Phthisiopulmonology and Infectious Diseases, Kuban State Medical University, Moscow, Russian Federation, 6Smolensk State Medical University, Smolensk, Russian Federation

**Background:** Enisamium iodide (EI) (Nobazit) is a Russian drug whose molecule was developed in the Institute of Pharmacology and Toxicology of Ukraine as an anti-inflammatory and antipyretic agent. Later, other properties of EI were found: inhibition of the influenza virus hemagglutinin, increasing the production of interferon-γ, level of Th1, blood antioxidant activity, inhibition TNF-α and other pro-inflammatory cytokines, activation of macrophages and lysozyme activity.

The aim of study was to evaluate the efficacy of antiviral therapy with EI in out-patient patients with influenza and influenza-like illnesses (ILI) without risk factors for severe course of disease.

**Materials/methods:** 124 patients aged 18-55 years with influenza and ILI within 6-48 hours of symptoms onset were randomized into 2 groups. 1th group (n=66) was treated with EI 500 mg tid 5 days, 2nd group (n=63) received placebo according to the same scheme. In the 1th group the proportion between influenza and other respiratory viruses was 32.2%-67.8%, in the 2th group 31.7%-68.3%, accordingly. Duration of disease and main clinical symptoms, frequency of complications and speed of the virus elimination from the nasopharynx were estimated.

**Results:** The number of cases with complete recovery within 96 hours was 56 (84.8±4.2%) in 1st group and 44 (69.8±5.8%) in 2nd group (p=0.047). The duration of fever was 68.0±2.8 hours in 1th group and 77.1±2.9 hours in 2nd group (p=0.044), muscle pain - 52.3±2.3 and 60.6±2.6 hours (p=0.041), headache-52.1±2.6 and 65.1±2.5 hours (p=0.032), weakness – 75.5±2.3 and 90.4±2.5 hours (p=0.001), accordingly. On the 4th day of treatment the viruses were isolated in 37.8±5.9% of cases in the 1st group and 57.1±6.2% in 2nd group; p=0.048. Bacterial complications were observed in 3.0±2.1% and 12.6±4.2% accordingly, p=0.048.

**Conclusions:** The study is demonstrated the effectiveness of EI in the treatment of influenza and ILI in adult outpatient patients. The antiviral and anti-inflammatory effects of the drug, which was administered within 48 hours of the symptoms onset were demonstrated by a more rapid reduction of clinical symptoms, frequency of bacterial complications and reduction in the time of virus elimination. Continuation of EI clinical trials are necessary for more full evaluation of its effectiveness.

**Abstract 494**

**Tuberculous lymphadenitis: are Asians at greater risk?**

Typhaine Billard-Pomares¹, Frédéric Méchaï*¹, Fatma El Alaoui¹, Julie Figoni¹, Violaine Walewski¹, Olivier Bouchaud¹, Etienne Carbonnelle¹, Hugues Cordel¹

¹Avicenne Hospital [AP-HP], Bobigny, France

**Background:** Lymphadenitis are the main localization of extra-pulmonary tuberculosis. Despite the existence of treatment recommendations, clinicians are sometimes faced with diagnostic and treatment difficulties. The objective of this study was to describe characteristics and follow-up of patients with Tuberculous Lymphadenitis (TL).

**Materials/methods:** Analysis of TL cases diagnosed by PCR (Cepheid MTB/RIF test) and/or by culture in Avicenne Hospital from January 1, 2015 to January 31, 2019. Clinical presentation and evolution were compared by continent of birth.

**Results:** Seventy-two patients [19%] of the 382 tuberculosis cases diagnosed during the period, were TL. Majority were male [n=58, 81%], median age was 32 years [IQR 26-44]. Fifteen percent [n=11] of patients were born in India, 11% [n=8] in Pakistan, 10% [n=7] in Bangladesh and 8% [n=6] in Sri-Lanka. Asians peoples accounted for 44% of TL compared to 22% (68/310) of pulmonary tuberculosis cases (p<0.01). Sub-Saharan African people accounted for 38% of patients. Localization was mainly cervical (54%, n=39), and supra-clavicular (36%, n=26). Lung damage was associated in 31% (n=22) of patients, 7% (n=5) of patients were HIV-infected and none were diabetic. Smears were positive in only 14% (n=10) of cases, while PCR, when performed, was positive in 89% (n=25/28) of cases. Only 8% (n=6) of patients had an isoniazid-resistant strain, all were rifampicin-sensitive. Median duration of treatment was 6 months and 22% (n=16) were treated for 9 months or more. Corticosteroid treatment was associated in 18% of cases (n=13) for a duration of 1 to 3 months. Adenopathy was noted to be persistent on clinical examination at 12 months in 13% [n=6] of the 47 patients reported. Due to poor progress, surgical excision was performed in 3 patients. Clinical presentation and evolution were similar between the different birth continents, except for people born in Asia who had more exclusive lymphadenitis (82% versus 58%, p=0.03).

**Conclusions:** In our study, TL accounts for nearly 1/5th of tuberculosis cases and affects patients born in Asia in particular. Risk factors or genetic factors that may explain the greater susceptibility of this population have to been studied. The use of corticosteroids and surgery should be better specified.

Investigation of hetero-VISA among MRSA isolates in Gaziantep, Turkey

Deniz Gazel1, Mehmet Erinmez*1, Ayşe Büyüktaş Manay1, Yasemin Zer1

1Gaziantep University, School of Medicine, Department of medical microbiology, Gaziantep, Turkey

Abstract

Background: Heteroresistant vancomycin intermediate Staphylococcus aureus (hVISA) is defined as isolates which are susceptible to vancomycin, but with minority populations having MIC>2 µg/ml for vancomycin. hVISA testing is recommended when therapeutic failure is suspected. Since population analysis profile is difficult to perform, Satola et al. proposed a practical method for screening of hVISA using brain heart infusion (BHI) agar containing vancomycin and casein and stated that this test had 90% sensitivity and 95% specificity. This test was also cited by EUCAST guidelines for detection of resistance mechanisms V2.01. Here, we aimed to investigate the prevalence of hVISA among MRSA isolates and compared Satola’s test with two other agar screening methods for detection of hVISA.

Materials/methods: One hundred MRSA isolates were collected in our university hospital laboratory between 01.04.2018 and 30.09.2019. For screening of hVISA, we prepared two screening agar plates and one commercial media; BHI agar plates containing 4 µg/ml vancomycin and 16 g/liter casein (Satola’s test), BHI agar plates containing 4 µg/ml vancomycin (BHIAV), and commercially obtained vancomycin resistant enterococci (VRE) agar. A standard of 0.5 McFarland from an overnight culture in tripticase soy broth was prepared for each isolate. All three screening plates were inoculated with these bacterial suspensions. Colonies which could grow on plates were counted manually at 24th and 48th hours. MICs of the growing colonies in Satola’s test were determined using gradient test for vancomycin to see whether the MICs of VISA colonies would decrease or not.

Results: Among 100 MRSA isolates, 43 (43%) were found as hVISA using Satola’s test. BHIAV and VRE agar screening test results were found 70% and 4%, respectively. Finally, at the step of gradient test, MIC values of 20 (47%) hVISA isolates reduced to 2 µg/ml after subculturing for the test.

Conclusions: At the step of gradient test, nearly half of the clones of hVISA isolates remained as VISA (MIC>2) after subculturing. When we compared VRE agar and BHIAV screening test with Satola’s method, we concluded that both two tests failed to detect hVISA properly. Finally, we found higher rates of hVISA comparing other studies in Turkey.

Dried blood spots tested with the Abbott m2000 sp/rt system perform well to identify patients with active HCV infection in Vietnam

Tram Hong Tran1, Binh Thanh Nguyen1, Tuan Anh Nguyen1, Tram Thi Phuong Pham2, Thi Thu Trang Nguyen1, Thi Bich Hong Mai2, Ba Hien Pham1, Thai Minh Nguyen1, Huong Phan1, Nhan Do3, Mohand Ait Ahmed5, Fabien Taieb5, Madec Yoann*5

1National Institute of Hygiene and Epidemiology, Hanoi, Vietnam, 2Nam Tu Liem district medical centre, Hanoi, Vietnam, 3Dong Da general hospital, Hanoi, Vietnam, 4Vietnam Authority of HIV/AIDS control, Ministry of Health, Hanoi, Vietnam, 5Institut Pasteur, Paris, France

Background: In recent years, the treatment advances of direct acting antivirals (DAA) have radically changed the management of HCV patients. However, in resource-limited countries, identification of patients with active HCV infection continues to present a challenge in remote settings due to the limited access to laboratories able to measure HCV viral load. Dried blood spots (DBS) transferred to a central laboratory may be able to overcome this challenge.

Materials/methods: A total of 315 HCV-infected patients, who never received anti-HCV treatment, provided each three type of samples: plasma, DBS with calibrated quantities of venous blood and DBS with uncalibrated quantities of capillary blood. Qualitative comparison was conducted in terms if detection of HCV viral load on DBS as opposed to plasma to estimate sensitivity and specificity. Quantitative comparisons were conducted by means of correlation estimation and Bland-Altman analysis.

Results: Of the 250 patients with detected plasma HCV viral load, 245 also had detectable DBS HCV viral load (capillary or venous) leading to a sensitivity of 98.0% (95% confidence interval [CI]: 95.4%-99.3%); importantly, all measurements with an HCV viral load >118 IU/mL on plasma were also detected on DBS. When HCV was not detected with plasma, it was also not detected with DBS resulting in 100% specificity (95% CI: 94.5%-100%). Quantitative HCV viral load results were very similar when utilizing plasma or DBS sample types as illustrated by correlations >0.99 and by the Bland-Altman analyses.

Conclusions: DBS sample types performed well to distinguish patients with active HCV infection, and who therefore need treatment, from the other patients. DBS with either uncalibrated capillary blood or calibrated venous blood provided similar results.

Abstract 505

Potential value of qPCR for the early detection of Mucorales in high-risk patients

Dirk Schmidt*1, Ulrike Scharmann1, Jan Buer1, Peter-Michael Rath1

1University Hospital Essen, Institute of Medical Microbiology, Essen, Germany

**Background:** Mucormycosis is a rare but often fatal infection in immunocompromised patients. Early and appropriate treatment is paramount for the outcome of the patients. Diagnosis based on clinical symptoms, histopathology, computerized tomography (ct) can be unreliable. Additionally, culture is often negative despite an infection. In order to evaluate the benefit of qPCR as an early and specific diagnostic marker for Mucorales infections we have tested respiratory samples from hematotoxicological and oncological patients of the University Hospital Essen.

**Materials/methods:** Overall we have analyzed 120 respiratory samples from 92 patients (64 % male, age 11-78 years, median = 61 years) for the presence of Mucorales using an inhouse qPCR (Bialek 2005, Löffler 2016) and culture. The qPCR assay simultaneously detected a 175bp fragment of the 18s rRNA gene and a 107bp fragment of the 28s rRNA gene. Limit of detection (LOD) was established by serial dilutions of Mucorales DNA and by serial dilutions of fungal material in a respiratory sample. Aliquots of diluted fungal material were inoculated onto an agar plate for fungal count (fungus forming unit, ffu).

**Results:** LOD of the qPCR assay was 0.1pg/ µl (18s) and 1pg/ µl (28s) when using diluted DNA, and 2ffu/ ml for both targets when using diluted fungal material. A clinical sample was defined as positive only when both targets were amplified (cycle threshold value below 40). Nine samples (7.5%) of six patients were tested positive for the presence of Mucorales DNA by qPCR. Culture was only positive in two samples from two patients (1.7%). Ct scans revealed characteristic signs for mold infections in all six patients. The outcome of all patients was fatal.

**Conclusions:** Culture based microbiology is of limited value for the early detection of Mucorales. Our results generally indicate a good agreement between the qPCR assay and the results of ct scans. The qPCR assay we performed was sensitive and specific enough to detect infected patients. We therefore consider qPCR a potential tool for the early detection for Mucorales. Additionally, we recommend regular screening of high-risk patients by qPCR.

**Presenter email address:** dirk.schmidt@uk-essen.de
**Evaluation of efficacy of antibacterial prophylaxis in case of paraproctitis**

Sergey Zyryanov¹, Grigory Rodoman¹, Marina Ivzhits*¹, Oleg Romashov¹, Mikhail Chenkurov², Gleb Putsman²

¹State Clinical Hospital №24, Moscow, Russian Federation, ²Peoples’ Friendship University of Russia, Moscow, Russian Federation

**Background:** The treatment of acute paraproctitis is a topical problem in coloproctology. There is little reliable data on the effectiveness of Ceftriaxone / Sulbactam in preventing postoperative complications. The purpose of this study is to evaluate the effectiveness of Ceftriaxone / Sulbactam in the prevention of postoperative complications, using various schemes of pre- and perioperative prevention.

**Materials/methods:** In a prospective study conducted in the period from December 2018 to March 2019 were analyzed cases of acute paraproctitis in patients of different age groups. Patients were stratified into 2 groups: patients of the 1st group - with a mild course of paraproctitis, requiring only antibiotic prophylaxis, and the 2nd group - patients with moderate and severe course, who received additional therapy with Ceftriaxone / Sulbactam.

**Results:** The study involved 95 people. In 25 patients (26.3%) of 95, prolongation of perioperative antibiotic therapy was required. In 88 cases out of 95 (92.6%) bacterial cultures were taken. In 43 bacterial inoculations out of 82 (52.4%) was found monoculture and in 39 cases - association of microorganisms (47.6%). In bacterial inoculations was determined sensitivity to Ceftriaxone. In most cases, seeded pathogens were sensitive to this drug. The causative agents of acute paraproctitis were, as elsewhere in world practice, in most cases typical pathogens:

Were received monocultures of microorganisms:

- *Escherichia coli* 24 out of 43 (55.8%)
- *Staphylococcus spp.* 9 out of 43 (20.9%)
- *Streptococcus spp.* 4 out of 43 (9.3%)

And association of microorganisms. *Escherichia coli* with:

- *Bacteroides spp.* 6 out of 39 (15.4%)
- *Klebsiella spp.* 6 out of 39 (15.4%)
- *Staphylococcus spp.* 3 out of 39 (7.7%)
- *Streptococcus spp.* 3 out of 39 (7.7%)
- *Enterococcus spp.* 3 out of 39 (7.7%)

**Conclusions:** Ceftriaxone/sulbactam shows high clinical efficacy when used as a preparation for pre- and perioperative prophylaxis in patients with acute paraproctitis. The effectiveness of the drug in monotherapy [40% of patients] in the absence of postoperative complications is more than satisfactory with mild to moderate paraproctitis. It is possible to recommend the use of the pre- and perioperative prophylaxis with Ceftriaxone / Sulbactam.

Abstract 508

Investigation of an Enterobacter cloacae OXA-436 carbapenemase outbreak: when everything goes down the drain
Anette Holm*1, Annette Toft1, Mette Marie Nordestgaard2, Anette M. Hammerum3, Henrik Hasman3, Michael Kemp1, Ulrik S. Justesen1

1Odense University Hospital, Department of Clinical Microbiology, Odense, Denmark, 2Odense University Hospital, Department of Cardiology, Odense, Denmark, 3Statens Serum Institut, Department of Microbiology and Infection Control, Copenhagen, Denmark

Background: In August 2017, a patient (index) at the Department of Cardiology, Odense University Hospital, Denmark, was diagnosed with Enterobacter cloacae ST90 from a wound swab harbouring an OXA-436 (OXA-48 like) carbapenemase gene, located on a conjugative plasmid. This specific combination of sequence type and gene had not been observed in Denmark before (OXA-436 was initially observed in Denmark in September 2013 in E. asburiae at a hospital in the Copenhagen area). There was no history of recent travel outside of Denmark. In the following 1½ year, six patients from the same department as the index patient were also diagnosed with the same E. cloacae OXA-436 (Figure 1). However, there was no direct epidemiological link between several of the patients apart from the department. Screening (rectal swab) of all patients at the department was performed several times during the outbreak. Staff and procedures were audited by the infection control team, but no source or route of transmission was revealed. Finally, an investigation focusing on the department facilities, including sinks and drains, was performed.

Materials/methods: In February 2019, all drains, sinks and bedpan boilers/instrument washers from the affected department were sampled with eSwab (Copan, Italy) and cultured on selective agars for carbapenemase detection (Chrom ID Carba Smart, bioMerieux, France). Cultured isolates of Enterobacterales were submitted for whole genome sequencing and compared to the index patient E. cloacae isolate.

Results: Seven drains, 25 sinks and three bedpan boilers/instrument washers were sampled. E. cloacae ST90 with the OXA-436 gene were detected from two shower drains in the patient bathrooms.

Conclusions: The shower drains were the most likely source of this outbreak. Staff reported that the shower drains had been partly clogged resulting in regular overflow of water returning from the drains. Drains were unclogged and cleaned, and extra cleaning of the bathrooms was initiated. No further cases have been seen for eight months. Patients and staff should be aware of the potential of transmission of resistant bacteria from shower drains.

Trophic cooperation promotes *Pseudomonas aeruginosa* and *Staphylococcus aureus* survival in cystic fibrosis patients

Laura Camus*, Briaud Paul†, Sylvère Bastien†, Anne Doleans1,2, Sylvie Elsen3, François Vandenesch1,2, Karen Moreau1

1Centre International de Recherche en Infectiologie, U1111-INSERM/CNRS/ENS/UCBL, Lyon, France, 2Hospices Civils de Lyon, Institut des Agents Infectieux, Lyon, France, 3Institut de Biosciences et Biotechnologies de Grenoble, U1036-INSERM/CEA/UJF, Grenoble, France

**Background:** Lungs of cystic fibrosis (CF) patients are colonized by numerous microorganisms including *Pseudomonas aeruginosa* (PA) and *Staphylococcus aureus* (SA). These bacteria are can co-infect up to 40% of patients according to the age class. Different interaction patterns between PA and SA can be observed throughout infection: PA strains can either inhibit SA growth through well-described mechanisms or coexist with SA. We aim to better understand the coexistence interaction state with SA by characterizing its impacts on PA physiology.

**Materials/methods:** Twenty-two PA/SA strain pairs in coexistence were isolated from CF patient sputa and cultivated in monocultures or co-culture. PA genomic expression was assessed in these conditions by RNAseq (2 strains pairs) and confirmed by RT-qPCR (22 pairs). Deletion mutants of the aco system were produced in a clinical PA isolate and cultivated in regular or long-term co-culture with SA, during which acetoin concentration and bacterial survival were monitored. Acetoin dosages were also performed on CF patient sputa.

**Results:** Transcriptomic analyses show that co-culture with SA significantly affects the expression of numerous genes involved in nutrient metabolism in PA. In presence of SA, 70% of PA strains presented an important overexpression of the aco system, involved in acetoin catabolism. Acetoin, produced by clinical SA strains and detected in CF patient sputa, was shown to be responsible for aco system induction in PA. Clinical PA strains actually catabolized acetoin produced by SA, especially during coexistence interaction. This catabolism promoted the survival of both pathogens in nutrient-depleted conditions, as acetoin constituted a carbon source for PA and presented a dose-dependence toxicity towards SA.

**Conclusions:** Our results indicate that coexistence with SA induces the up-regulation of the aco system and acetoin catabolism in PA. Due to its beneficial effects on both bacteria, acetoin catabolism could testify to the establishment of trophic cooperation between SA and PA in the CF lung environment, promoting their persistence.

Evaluation of prevalence and risk factors of *Helicobacter pylori* infection in an urban population

Adaeze Chidinma Oreh*1,2, Adamu Onu2, Akin Moses3

1Department of Hospital Services, Federal Ministry of Health, Abuja, Nigeria, 2Department of Family Medicine, Garki Hospital Abuja, Abuja, Nigeria, 3Department of Family Medicine, National Hospital Abuja, Abuja, Nigeria

Abstract third-party references: Garki Hospital Abuja, Department of Hospital Services, Federal Ministry of Health Abuja

Background: High prevalence rates of *Helicobacter pylori* infection have been reported in developing countries like Nigeria. This infection is known to significantly contribute to the development of gastric cancer and other non-communicable diseases. It is imperative that risk factors associated with this infection are explored to develop evidence-based prevention strategies and improve the health of developing communities.

Materials/methods: A hospital-based cross-sectional study was conducted between May and July 2017 among dyspeptic adults in the GOPD of Garki Hospital Abuja. Two hundred and eighty participants were tested for *Helicobacter pylori* using serum *H. pylori* Immunoglobulin G antibody test kits. Data was collected using pre-tested interviewer-administered questionnaires to assess the risk factors, presenting symptoms and signs and prevalence of *H. pylori*. Epi-info 7.2 was used for data entry and SPSS version 25 for analysis. Logistic regression and odds ratios with 95% confidence intervals were computed to identify risk factors and clinical features associated with *H. pylori* infection.

Results: Out of 280 study participants, 150 (53.6%) tested positive for *H. pylori* infection. Age group 26 – 35 years (OR = 8.40: 95% CI = 1.777 to 39.722), age group 56 – 65 years (OR = 6.78: 95% CI = 1.133 to 40.524), monthly income group $150 to $200 (OR = 11.81: 95% CI = 1.868 to 74.731) and monthly income group of $300 and above (OR = 7.53; 95% CI = 1.565 to 36.195) were positively associated with *H. pylori* infection. Family history of dyspepsia or peptic ulcer disease (OR = 0.32: 95% CI = 0.128 to 0.784), regular consumption of fruits and vegetables (OR = 0.11: 95% CI = 0.046 – 0.281) and regular hand-washing with soap and water (OR = 0.02: 95% CI = 0.006 – 0.040) were negatively associated with *H. pylori* infection.

Conclusions: The prevalence of *H. pylori* amongst dyspepsia patients in Garki Hospital Abuja was found to be high. Interventions to increase awareness of *H. pylori* infection and prevent infection and transmission of *H. pylori* through good dietary and hygiene practices are vital.

Abstract 514

Seroprevalence of anti-CCHF IgG in population in different districts of endemic region and Crimean-Congo haemorrhagic fever morbidity

Natalia Pshenichnaya*, Natal’ja Golovchenko2, Larisa Ermakova3, Elena Volchkova4, Andrey Zhuravlev4, Antonina Grekova5

1National Medical Research Center of Phthisiopulmonology and Infectious Diseases, Rostov State Medical University, Moscow, Russian Federation, 2Rostov Scientific Research Institute of Microbiology and Parasitology, Rostov-on-Don, Russian Federation, 3Rostov Scientific Research Institute of Microbiology and Parasitology, Rostov State Medical University, Rostov-on-Don, Russian Federation, 4I.M. Sechenov First State Medical University, Moscow, Russian Federation, 5Smolensk State Medical University, Moscow, Russian Federation

Background: 710 cases of Crimean-Congo hemorrhagic fever (CCHF) were recorded in the Rostov region of Russia from 2000 to 2019. This region is endemic for CCHF since the sixties of the last century.

Aim of study: to detect the level of seroprevalence in the 12 endemic for CCHF districts of the Rostov region and compare it with CCHF morbidity in the same areas.

Materials/methods: 522 serum samples of conditionally healthy individuals from 12 districts of Rostov region were checked on anti-CCHF-IgG by ELISA. Analysis of CCHF morbidity from 2015 to 2019 in the same districts was implemented

Results: Within 4 years (2015-2018) the decrease of CCHF morbidity was observed. 77 CCHF cases were recoded in this area in 2015, 51 in 2016, 37 in 2017, 24 in 2018. In 2019 CCHF morbidity raised up to 48 cases. The largest number of cases (72%) were registered in 8 endemic districts. anti-CCHF-IgG were found in individuals from 6 districts. On average, the proportion of seropositive individuals for CCHF was 1.2%. 10 years ago, this level was 0.4%. This indicator ranged from 0% (in Dubovsky, Martynovskiy, Kamensky, Peschanokopsky and Tselinsky, Proletarsky districts) to 1.4-1.7% (in Zavetinsky, Remontensky Orlovsky, Bagavevsky districts) and 2.2% - 2.3% in Salsky and Zimovnikovsky districts. In areas with a high incidence of CCHF we have observed positive correlation with a level of seroprevalence (r = 0.8, p=0.04). But in districts with the high prevalence of anti-CCHF-IgG, the level of morbidity (5-9 cases of CCHF annually) was more than 10 years ago (13-14 cases). From other side, In the 1/3 of districts with 0% seroprevalence (Dubovsky and Martynovsky districts) the incidence of CCHF was higher than 10 years ago (4-5 versus 0-1). Increasing the level of seropositive individuals in the region as a whole is inversely related to the incidence rate (r = -0.8, p=0.04).

Conclusions: These data allow to predict a further increase the incidence of CCHF in the districts with low level of seroprevalence and annual registration of cases of CCHF and should be used in the CCHF epidemiological forecast.

**Abstract 517**

**Prevalence and serotype distribution of *Streptococcus agalactiae* colonisation among pregnant women in Taiwan**

Chang Yu-Fen*, Fang Yu-Ping¹, Chun Yi Lee¹

¹Chang Bing Show Chwan Memorial Hospital, Changhua, Taiwan

**Background:** Group B streptococcus (GBS), also known as *Streptococcus agalactiae*, is a prevailing pathogen that leads to neonatal bacteremia, sepsis, meningitis, and even mortality. The study was aimed to investigate the antennal GBS colonization in pregnant women at the gestational age of 35-37 weeks in Taiwan, including prevalence, serotype distribution, antimicrobial resistance profiles, and molecular characters.

**Materials/methods:** A total of 977 vaginal swabs were collected throughout the 2016 calendar year at single hospital in Taiwan. All GBS isolates were tested for capsule serotypes by using multiplex polymerase chain reaction (PCR) assay. Multilocus sequence typing (MLST) was carried out on selective representative isolates. Antimicrobial susceptibility profile to penicillin, ampicillin, erythromycin, clindamycin, levofloxacin, and ceftriaxone was determined in accordance with CLSI guideline. PCR targeting the major virulence gene, *HvgA*, was performed in isolates of clonal complex (CC) 17.

**Results:** Of the 977 swab cultures, 219 were positive for GBS (22%). In total, seven serotypes were identified, and serotype III was the leading capsular type (25.1%) followed by VI (22.4%), V (14.6%), Ia (13.7%), II (11.9%). Serotype IV was not detected in the present study. MLST analysis was carried out in 105 isolates and depicted 14 sequence types (ST). The leading three sequence types in order were ST1 (50, 47.6%), ST12 (10, 9.5%), ST17 (8, 7.6%). Of 105 MLST tested isolates, 21 were serotype VI and fully were ST1 (100%). For ST12, serotype II was the dominant type (9/10, 90%). In addition, a total of 8 isolates were identified as CC17 strain and all were serotype III. All these 8 ST17-III isolates harbored *HvgA* gene. Four clonal complexes were found in this study and the predominant clonal complexes were CC1 (51, 48.6%), followed by CC23 (19, 18.1%). Regarding of antimicrobial resistance, all the isolates were susceptible to penicillin (100%). Resistance rates of erythromycin and clindamycin were 41.1% and 39.3%, respectively.

**Conclusions:** In this present study, GBS colonization rate of pregnant women in Taiwan is 22%. Serotype III and VI are the two leading capsule types and the CC1 is the predominant clonal complex. Penicillin was still the first choice for treating GBS infection.

Interim pharmacokinetic analysis of a multi-centre randomised open label phase IIb study in neonates to validate the meta-analysis population pharmacokinetic model used to simulate an optimised dosing regimen in neonates and infants aged < 90 days: the NeoVanc trial

Louise Frances Hill*, Evelyne Jacqz-Aigrain, Valery Elie, Wei Zhao, Michelle Clements, Mark Turner, Irja Lutsar, Paul Heath, Emmanuel Roilides, Sarah Walker, Mike Sharland

1St George’s, University of London, Institute for Infection and Immunity, London, United Kingdom, 2UCL Great Ormond Street Institute of Child Health, London, United Kingdom, 3Hôpital Robert Debré, Department of Pediatric Pharmacology and Pharmacogenetics, Paris, France, 4Shandong Provincial Qianfoshan Hospital, Department of Pharmacy, Jinan, China, 5Shandong University, Department of Clinical Pharmacy, School of Pharmaceutical Sciences, Jinan, China, 6MRC Clinical Trials Unit at UCL, London, United Kingdom, 7University of Liverpool, Institute of Translational Medicine, Liverpool, United Kingdom, 8University of Tartu, Tartu, Estonia, 9Aristotle University of Thessaloniki, 3rd Department of Pediatrics, Thessaloniki, Greece

Background: Vancomycin remains one of the most widely prescribed antibiotics for Gram-positive neonatal late onset sepsis (LOS), however, a consensus on optimal vancomycin dosing and duration is lacking. Robust neonatal clinical pharmacokinetic (PK) data comparing different vancomycin dosing regimens remain sparse. NeoVanc (NCT02790996) is a European, randomised controlled, non-inferiority trial comparing an optimised and standard vancomycin regimen in infants aged ≤ 90 days with suspected/proven Gram-positive LOS. The optimised regimen was determined through pre-clinical studies including a population PK meta-analysis of individual data from >1600 babies.

Materials/methods: Babies with clinical sepsis (≥3 clinical/laboratory criteria) or confirmed sepsis (Gram-positive blood culture and ≥1 clinical/laboratory criterion) were recruited. Participants were randomised 1:1 to the optimised regimen [vancomycin loading dose (25 mg/kg) followed by 5±1 day course] or a standard regimen [no loading dose; 10±2 day vancomycin course]. An interim PK analysis was performed; the validation dataset was collected from 8 centres in 5 European countries. Data collected included demographic variables (gestational and postnatal age, birth and current weight), vancomycin administration (dose, time of start and end of infusion, exact sampling time), creatinine concentrations (Jaffe, enzymatic), vancomycin concentrations (ultraperformance liquid chromatography-tandem mass spectrometry).

Results: 68 babies recruited between March 2017 and April 2018 were included in the interim analysis. Gestational age was <29 (n=16), 29–36 (n=22), >35 (n=30) weeks. Median (IQR) birthweight was 1258 (455–4040) g with median weight at randomisation being 1525 (590–4156) g. Median post-menstrual age at randomisation was 33.8 (25.1–47) weeks. Median serum creatinine was 41.5 (8.84–96.36) µmol/L. 240/255 PK and scavenged PK samples were evaluable. Vancomycin concentrations were used to confirm the reliability of the meta-analysis model where clearance (CL) was dependent on current weight, method used to quantify creatininaemia, renal maturation (RM) and renal function (RF) according to CL = 86 × [CW/1350]^0.68 × RM × RF × F_{Jaffé-Enzymatic} × F_{race}

Conclusions: External validation with NeoVanc trial PK data confirmed the predictive performance of the model developed from the PK meta-analysis.

Abstract 523

Unravelling the mechanism of virulence of M1 protein of Streptococcus pyogenes

Eva Torres Sangiao1, Lotta Happonen2, Frida Palm2, Paul Pyl3, Oonagh Shannon2, Carlos García-Riestra1, Johann Malmström2

1Hospital University Complex of Santiago Compostela-Biomedical Research Institute, (F)IDIS-CHUS, Santiago de Compostela, Spain, 2BMC - Biomedical Center, Faculty of Med., Dept. of Clinical Sci. Lund, Div. of Infection Med., Lund, Sweden, 3Lund University, Faculty of Med., Dept. of Clinical Sci. Lund, Division of Oncology and Pathology., Lund, Sweden

Background: Most pathogenic bacteria form complex extracellular protein-protein interaction networks (PPINs) with host proteins on the bacterial surface. The dynamic PPIN and the way they are formed and regulated, can deepen our understanding of bacterial infection and host immune response. However, it still remains a challenge to quantitatively determine the dynamics, structure and function of such host-pathogen interactions in a systems-wide manner.

Materials/methods: To enable quantitative analysis of PPINs we have established a generic affinity-purification mass spectrometry-based proteomics strategy (AP-MS)1 to investigate bacterial pathogen-host PPINs at a grand scale. We have applied the AP-MS strategy to determine how human host and mouse (BALB/c) plasma proteins competitively interact with main virulence factor - the M1-protein – of the human pathogen Streptococcus pyogenes.

The experimental workflow includes isolation of interacting proteins using affinity-enrichment followed by highly quantitative MS techniques including sequential window acquisition of all theoretical fragment ion spectra analysis MS (SWATH-MS)2.

Results: The dynamic regulation of the PPINs was assessed using a mixture of human and BALB/c mouse (50/50 vol/vol dilution) plasma to measure any inherent competition between both mammalians’ protein interactions. Eleven different clusters of proteins with different binding patterns were identified, being human and mouse albumin, fibrinogen, C3 protein of complement system or mouse IgM and human IgGs, enrichment proteins [clusters V, VI and VI, Figure 1A]. A full peptide-level analysis unraveled several common peptides among human and mouse proteins [Figure 1B], of which fibrinogen was the most conserved protein among mammalians, showing a high homology human to mouse. (Figure 1C).

Conclusions: These results demonstrate how M1 protein assembles a complex PPIN in plasma which could modulate the host immune response. Excitingly, the M1-protein is shown to be a ligand for human and mouse fibrinogen, but also for human IgGs or heavy chain variable domains of mouse Igs.
Characterisation of internalin genes in Listeria monocytogenes food strains, and their association with invasiveness in vitro

Katarzyna Roeske* 1, Iwo Korycinski1, Aleksandra Zasun1, Radoslaw Stachowiak1, Dorota Korsak1, Jacek Bielecki1

1University of Warsaw, Department of Applied Microbiology, Warsaw, Poland

Background: Listeria monocytogenes (Lm) is a facultative intracellular pathogen and the causative agent of a food-borne disease listeriosis. The bacterium colonizes niches in food processing environments due to ability to survive in a variety of stress conditions. Internalization enables Lm to invade non-phagocytic cells like intestinal epithelium. The process is mediated mainly through a group of proteins called internalins (Inl), of which InlA and InlB have been shown to play a critical role. In this study, 16 strains of L. monocytogenes collected from food samples in Poland were tested for the hemolytic activity and invasiveness in cultured cells. Data from phenotypic analysis were integrated with genomic approach to assess the biodiversity of the pathogen and reveal genetic variants of internalin genes.

Materials/methods: Invasiveness was tested in gentamycin protection assays using epithelial (HeLa), placental (JEG-3), and neuronal (Neuro-2a) cell lines. Simultaneously, the isolates were subjected to Illumina MiSeq whole genome sequencing (WGS). In silico multi-locus sequence typing (MLST) and core genome MLST were performed using Institute Pasteur Lm MLST database. Sequence search for the presence of virulence genes, manual annotation etc. were performed with UGENE program. Sequences of LIPI-1 pathogenicity island and internalin clusters were aligned using MAUVE software.

Results: The isolates were differentiated into 2 phylogenetic lines (I, n=9; II, n=7), and 8 sequence types (ST), with ST580 (5/16) being the most common. Five internalin profiles were distinguished: I (CC9), II (ST1 41 3), III (CC2, CC3, CC5), IV (ST51 7) and V (CC1). Premature stop codon mutation (AA 685) in inlA were identified in all line II isolates, of which only one exhibited unimpaired invasion to placental epithelial cells.

Conclusions: Comparative analysis revealed the presence of globally distributed sequence types along with differences among the isolates at a genomic level. Two strains exhibit unique features. LM-UW02, classified as the second known representative of ST1413, uniquely does not encode Vip protein and carries the A112T mutation in LRR region of inlB gene. LM-UW11 from phylogenetic line I, encodes InlG previously attributed to line II strains only and harbors LIPI-4 pathogenicity island characteristic mainly for clinical strains with increased CNS and placenta invasion capacity.

**Regulation of intestinal bacterial translocation by intestinal lamina propria dendritic cells expressing TLR5 after trauma/haemorrhagic shock**

Zhang Yun*, Jian Zhang¹, Cheng Zhang²

¹The First Affiliated Hospital, Zhejiang University School of Medicine, Department of Hepatobiliary and Pancreatic Surgery, Hangzhou, China, ²Zhejiang University, Department of Hepatobiliary and Pancreatic Surgery, the First Affiliated Hospital, Zhejiang University School of Medicine, Hangzhou, China

**Background:** Enterogenous infection is a major cause of death induced by traumatic/hemorrhagic shock (T/HS). Specific toll-like receptors (TLR5⁺) lamina propria dendritic cells (LPDCs) are critical antigen presenting cells (APCs) for modulating the intestinal mucosa-related immunological state to defend against bacterial translocation. We aimed to investigate LPDCs’ responses after T/HS, which would deeply affect the subsequent local immunity of the intestinal mucosa as well as bacterial translocation.

**Materials/methods:** Wild-type (WT) and Tlr5⁻/⁻ mice were divided into T/HS and sham groups. After T/HS, TLR5⁺ LPDCs were sorted. Hemodynamic parameters and intestinal mechanical barriers were determined. Th1 differentiation was analyzed in mouse intestinal lamina propria (LP) or in a co-culture system of LPDCs and naïve T cells. Moreover, intestinal bacterial translocation and mouse survival were also monitored.

**Results:** CD11c⁺ MHCII⁺ LPDCs specifically expressed TLR5. No differences were observed between WT and Tlr5⁻/⁻ mice regarding hemodynamic parameters and intestinal mechanical barriers after T/HS. LPDCs sourced from T/HS WT mice induced decreased Th1 polarization and more bacterial translocation, however, Tlr5 knockout conferred LPDCs with abilities to induce increased Th1 polarization and remain stable under T/HS hit. Moreover, retinoic acid (RA) released by TLR5⁺ LPDCs might play a key role in modulating Th1 polarization. Finally, RA treatment clearly increased the quantity of Th1 cells in LP and attenuated bacterial translocation after T/HS in WT mice but not Tlr5⁻/⁻ mice (Figure 1), though mouse survival after T/HS was not prolonged by RA enteral supplementation.

**Conclusions:** Disordered LPDC TLR5-RA downregulation-induced Th1 differentiation might be an immunological mechanism of intestinal bacterial translocation and enterogenous infection after T/HS, and a TLR5-RA-independent mechanism that is relatively stable and rarely affected by T/HS may exist for LPDCs to polarize Th1 cells. In summary, both TLR5-RA-dependent and TLR5-RA-independent pathways within LPDCs may be therapeutic targets for interfering with Th1 differentiation and intestinal bacterial translocation.

Lyngby, Denmark

Abstract 532

Background: One of the biggest health problems is antimicrobial resistance (AMR) complicating the treatment of infections and community health. In 2016, DARWIN project (Dynamics of Antimicrobial Resistance Project in the Urban Water Cycle in Europe) emerges with the objective of developing a dynamic predictive model to assist in wastewater management, analyzing and quantifying resistant microorganisms and their genetic determinants, from their excretion in hospital and urban sources, to the water receiving surface (http://www.amr-darwin.eu/)

Materials/methods: Sampling has been carried out in 3 cities simultaneously, Copenhagen, New Castle and Santiago de Compostela, by 8 different points of the wastewater treatment system: hospital and urban effluent, wastewater treatment plant, relevant plant compartments, and in the Sar River up- and down-stream of the WWTP (purification plant), in Santiago de Compostela (ES). CHROMID®ESBL and CHROMID®CARBA (BioMerieux) were the chromogenic medias used for detection of ESBLs and carbapenemases respectively, plus a non-commercial MBO medium supplemented with antibiotics. Isolates were identified by MALDI Biotyper Bruker and sequencing of the 16S rRNA gene.

Results: A total of 504 resistant strains were isolated from the different sampling points in Santiago de Compostela city. MALDI Biotyper showed a correlation index with respect to 16S sequencing up 0.9 at genus level, because of the identification of environmental isolates non-associated with infection. The isolates with greater clinical relevance and resistance were isolated in the hospital effluent, highlighting the isolate of Klebsiella pneumoniae producing BLEEs and carbapenemases, and being Escherichia spp the most ubiquitous Enterobacteria. The greatest confluence of Aeromonas spp came from the residential effluent, although they were isolated at all points. After the treatments carried out in the wastewater, the resistant bacteria decreased by 80%. Downstream of the Sar River the largest isolates producing BLEEs were Aeromonas caviae complex, and resistant to carbapenemases were Pseudomonas spp

Conclusions: The isolates with greater clinical relevance and resistance, especially to carbapenemases, were isolated at hospital effluent. WWTPs could act as a vehicle for transmission of resistance mechanisms to environmental strains. Therefore, current wastewater treatments could be insufficient to eliminate resistant strains, especially those resistant to carbapenemases.

Abstract 538

Hepatosplenic bartonellosis in immunocompetent adults: a case series and literature review

Florian Berteau*1, Rafael Mahieu2, Paul Le Turnier3, Nausbaum Jean Baptiste4, Luc Quaesael1, Didier Tandé5, Bénédicte Rouvière6, David Boutille3, Severine Ansart1, Pierre TATévin7

1Brest, Service des Maladies Infectieuses et Tropicales, Hôpital de la Cavale Blanche, Brest, France, 2Angers, Service des Maladies Infectieuses et Tropicales, Angers, France, 3Nantes, Service des Maladies Infectieuses et Tropicales, Hôtel Dieu, Nantes, France, 4Brest, Service d’Hépato-Gastroentérologie, Hôpital de la Cavale Blanche, Brest, France, 5Brest, Laboratoire de Microbiologie, Hôpital de la Cavale Blanche, Brest, France, 6Brest, Service de Médecine Interne, Hôpital de la Cavale Blanche, Brest, France, 7Rennes, Service des Maladies Infectieuses et Réanimation Médicale, Hôpital Pontchaillou, Rennes, France

Background: Bartonella henselae, agent of cat-scratch disease (CSD) is rarely responsible from visceral granulomatosis, reported by few case series with low numbers. The objective was to better characterize hepatosplenic bartonellosis (HSB) in immunocompetent adults, a rare complication of B. henselae infection.

Materials/methods: Retrospective study of all HSB diagnosed in 4 French tertiary care university hospitals in 2001-2018. Inclusion criteria were i) radiological lesions in liver and/or spleen; ii) B. henselae infection documented by PCR, or serology. We excluded patients <15-year-old or immunocompromised. A literature review was performed using Medline, Embase, and Scopus database, with no language or time restriction.

Results: Of 414 cases of bartonellosis documented during the study period in the 4 centres, 24 (5.8%) were HSB in immunocompetent adults [estimated incidence, 0.19/million inhabitants-year]. Literature review identified 72 additional cases. Overall, there were 53 men and 43 women, median age was 41 years [IQR 27-52], 79 (82.3%) reported contact with cats. Main symptoms were fever [n=80, 83.3%], weight loss [n=56, 58.3%], abdominal pain [n=45, 46.9%], and peripheral lymphadenopathy [n=45, 46.9%]. Median duration of symptoms before diagnosis was 30 days [15-60]. Abdominal imaging found round-shaped lesion[s] in liver [n=16, 16.7%], spleen [n=28, 29.2%], or both [n=52, 54.2%], multiple in 82 patients [85.4%]. B. henselae infection was documented by serology [n=80], and/or PCR [n=38]. Antibacterial treatment was prescribed for 81 patients [84.4%], mostly macrolides [n=38], cyclines [n=36], and quinolones [n=21], for a median duration of 30 days [14-60]. Surgery was performed in 12 patients [12.5%]. Of the 89 patients with follow-up data, 85 were cured [95.5%].

Conclusions: HSB is a rare disease in immunocompetent adults, with favourable outcome in most cases, whatever the management.

Prophages, plasmid integration and lack of CRISPR-Cas elements underlie genome adaptation in European human-associated Staphylococcus aureus ST398

1 University of Antwerp, Laboratory of Medical Microbiology, Vaccine & Infectious Disease Institute, Antwerp, Belgium, 2 AstraZeneca, BioPharmaceuticals R&D, South San Francisco, United States, 3 Amphia Hospital, Department of Microbiology and Infection Control, Breda, Netherlands, 4 UMC Utrecht, Julius Center for Health Sciences and Primary Care, Utrecht, Netherlands, 5 Erasmus University Medical Center, Department of Medical Microbiology and Infectious Diseases, Rotterdam, Netherlands, 6 UMC Utrecht, Department of Medical Microbiology, Utrecht, Netherlands, 7 AstraZeneca, BioPharmaceuticals R&D, Gaithersburg, United States, 8 University of Limoges, Medical-Surgical Intensive Care Unit, Limoges, France

Abstract third-party references: on behalf of COMBACTE-NET 6A & 6B working groups

Background: Staphylococcus aureus (SA) sequence type (ST) 398 causes both moderate livestock-associated and severe-to-fatal human-associated (HA) infections. HA-ST398 infections are common in Asia (AS) and are also gaining epidemiological importance in European (EU) hospitals. Due to geographic separation, we hypothesized divergent evolutionary trajectories among AS-HA-ST398 and EU-HA-ST398 and investigated these in ST398 isolated from hospitalized patients in both continents.

Materials/methods: EU-SA (n=868) obtained from mechanically-ventilated ICU or from surgical ward patients enrolled in ongoing clinical trials in COMBACTE-NET [NCT02413242, NCT02935244, NCT02296320] during 2014-2018 in 9 countries were whole-genome sequenced (short-read, Illumina-MiSeq; and long-read, n=2, Pacbio Sequel). Raw read processing and assembly, MLST-typing, resistance/virulence gene identification and genome annotation were performed with BacPipe (v1.2.6; https://github.com/wholeGenomeSequencingAnalysisPipeline/BacPipe) and SMRTLink v7.0.1. EU-HA-ST398 (n=44) were identified and genomic relatedness of 1 isolate/patient (n=26), together with AS-HA-ST398 sequences (n=8, hospitalized patients in China, 2010) obtained from NCBI, was studied using allelic-loci-comparison (cg/wgMLST) with a study-specific ST398-scheme (chewBBACA), comparative genome analysis (Mauve v2.4.0) and SNP calling (CLC v9.5.1).

Results: Analysed strains (n=34) formed three clades based on core-genome and whole-genome MLST (Figure A & B). EU-HA-ST398 segregated in 2 clades (average 341 allelic-loci-differences) differentiated by the presence and absence of the highly-conserved φST398_5 prophage that inserts in smpB which encodes a SsrA-binding protein. In both core and accessory genome analysis, EU-HA-ST398 Clade 2, containing primarily ST398 isolated from South-Eastern Europe, clustered closer to AS-HA-ST398 (n=6, Clade 1) than to Clade 3 that consisted of strains from Western Europe. All ST398 lacked CRISPR-Cas elements and EU-HA-ST398 genomes harbour integated plasmids and resistance-gene clusters (Figure C). On average, the accessory genome ratio determined for the 5 long-read-sequenced HA-ST398 (2 EU & 3 AS) was 6.5% which is higher than USA300-FPR3757 (ST8; 4.807%) but lower than TW20 (ST239; 11.088%).

Conclusions: Our data shows that HA-ST398 genomes are labile, easily acquire and integrate mobile elements that might underlie the emergence and success of the clone. The remarkable genome relatedness of the Chinese and the South-Eastern European clade indicates that an intercontinental spread of this clade might have been a recent occurrence.
Allelic loci comparison of HA-ST398 isolates

Three clades formed in the cgMLST (A) and wgMLST (B) trees. AS-HA-ST398 mainly clustered separately from EU-HA-ST398 (Clade 1) (left). Two clades formed in EU-HA-ST398 based on the presence of ampi-disrupting φST398_5 (right). EU-HA-ST398 Clade 2, containing East European strains, linked closer to Clade 1 than Clade 3. C) Schematic view of EU-HA-ST398, AS-HA-ST398 and their similarity to existing plasmids. pUR3912 was completely integrated in the EU-HA-ST398 chromosome of Clade 2 (100%) and almost completely in EU-HA-ST398 Clade 3 (93%) but was missing in the AS-HA-ST398 chromosome. Green lines indicate shared genes. (blue: insertion elements – orange: resistance genes – yellow: replication genes).

Abstract 567

Can Rapid Antimicrobial Susceptibility Testing (RAST) improve the time to the optimal therapy for bloodstream infections?

Flaminia Olearo*1,2, Benjamin Berinson1, Martin Christner1, Holger Rohde1

1University Medical Center Hamburg-Eppendorf, Institute for Medical Microbiology, Virology and Hygiene, Hamburg, Germany, 2University Medical Center Hamburg-Eppendorf, Antimicrobial Stewardship Team, Hamburg, Germany

Background: Gram-negative bloodstream infections (BSI) remain an important cause of morbidity and mortality. Fast and reliable antimicrobial susceptibility assays ensure early adequate therapy and may reduce the prolonged use of empiric broad-spectrum antibiotics. EUCAST has validated new breakpoints for short incubation disk diffusion testing directly from positive blood culture bottles, interpretable after 4, 6 and 8 hours (RAST). We aimed to evaluate the effect of RAST on BSI management in our hospital.

Materials/methods: RAST was implemented at the University Medical Center Hamburg-Eppendorf (Germany) in addition to standard of care [SOC; Vitek2], i.e. availability of AST results a day after blood culture positivity. For all interpretable results (zone diameter outside the area of technical uncertainty, ATU) categorical agreement (CA, concordant interpretation by SOC and RAST), very major error (VME, resistant by SOC, susceptible by RAST), major error (ME, susceptible by SOC, resistant by RAST) and minor error (mE, susceptible, increased exposure by SOC, resistant or susceptible by RAST) rates were calculated. The proportion of patients receiving optimal antimicrobial therapy after communication of RAST results was determined.

Results: For 97 blood cultures growing species for which RAST breakpoints are available, overall categorical agreement between RAST and SOC was 97.1%; mE rate was 1.5%, ME rate was 1.4% and no VME were observed (Table 1). A significant number of results within the ATU [15B/879] was found. Clinical impact of RAST was evaluated for 51 patients from 1st May to 31th July 2019. In 90.2% [46/51] of the cases RAST was available after 4h, in 7.8% [4/51] after 6h and in 2% [1/51] after 8h. Optimal treatment was achieved in 21/51 (41.2%) patients according to the RAST results and among these, RAST allowed for early escalation to a broad-spectrum antibiotic in 6 cases related to multi-resistant isolates. An unnecessary escalation based on RAST occurred in 9/51 (17.6%) patients.

Conclusions: Our findings suggest that the implementation of RAST may be especially helpful for early treatment escalation in BSI caused by multi-resistant bacteria. RAST result communication should be integrated into structured antimicrobial stewardship programs to prevent inadequate or premature treatment adjustments.

Table 1. RAST categorical agreement vs. Vitek2 per species and incubation time from 1st May to 30 September 2019.

Proton pump inhibitors increase the digestive carrying of OXA-48-producing Enterobacteriaceae in a mouse model

François Javaudin*, Quentin Le Bastard¹, Michel Dion¹, Yhiienew Bezabih¹, Emmanuel Montassier¹, Eric Batard¹

¹University of Nantes, MiHAR, Nantes, France

Abstract: Proton pump inhibitors (PPI) are responsible for altering the composition of the gut microbiota but little is known about their impact on the gut resistome. It would appear that PPI consumption is associated with extended-spectrum β-lactamase–producing Enterobacteriaceae rectal carriage at hospital admission. Our objective was to evaluate the effect of PPI on the digestive carriage of OXA-48-producing Enterobacteriaceae in a mouse model.

Materials/methods: C57BL/6J mice were initially treated orally with amoxicillin (0.5 g.l⁻¹ in drinking water) for 7 days before the bacterial challenge (10⁷ CFU of OXA-48-producing Escherichia coli) by gastric gavage. PPI were added to drinking water (0.1 g.l⁻¹ of pantoprazole) for a group of mice (PPI group) throughout the experiment while the control group did not receive them. The stool was collected for 15 days after the bacterial challenge. The bacterial count was performed on selective chromogenic medium for the screening of OXA-48 type Carbapenemase-Producing Enterobacteriaceae. The mice were housed in individual cages to avoid inter-individual contamination.

Results: Height mice were analyzed in the PPI group and 12 in the control group. One day after the bacterial challenge the PPI group had a higher average concentration of E. Coli OXA-48 in the feces (2.1x10⁹ CFU.g⁻¹ versus 2.8x10⁷; P < 0.001). Except for the 3rd day after the bacterial challenge, this concentration was higher in the PPI group than in the control group (P < 0.001 on days 6, 10 and 15). Indeed, there was a clear decrease in E. Coli OXA-48 colonization in the control group from the 6th day post-bacterial challenge [approximately 4 log CFU.g⁻¹], while the PPI group kept a high level of carriage [approximately 8 log CFU.g⁻¹] (Figure).

Conclusions: The use of PPI could be a factor promoting digestive colonization with resistant bacteria. These widely prescribed treatments should be evaluated in humans in order not to ignore a possible factor promoting the spread of this type of bacterium.

Abstract 572

**Time to positivity of blood cultures and its role in the diagnosis of bacteraemia**

Amaia Aguirre Quinonero, Maitane Marroyo-Salazar, Ester Saez De Adana Arroniz, Andrés Canut

1University Hospital of Álava, Biosanitary Research Institute (Instituto de Investigación Biosanitaria), BioAraba, Vitoria-Gasteiz, Spain

**Background:** This study aimed to evaluate the time-to-positivity (TTP) of all bacteraemia episodes (true and contaminations) isolated in a tertiary hospital in order to study to what extent the TTP can provide information on the type of microorganism isolated and its involvement in infection.

**Materials/methods:** From January to October 2019 a total of 1121 bacteraemia episodes were recorded. Of them, 742 were considered true (698 monomicrobial, 44 polymicrobial) and 379 contaminations. TTPs of the first positive bottle of all monomicrobial episodes (n=698) and of the ones considered contaminants (n=379) were evaluated. Blood culture samples are routinely incubated at 35ºC until they yield a positive signal or for up to five days in a BD-BactecFX (BD®) automated instrument. Each new episode is daily discussed by the antimicrobial stewardship program team.

**Results:** Table 1. The average TTP for true cases was 17.3h (16.8h excluding yeasts) and 32.5h for contaminations. Bottles of true episodes flagged positive considerably faster (p<0.001) than the ones considered contaminations. Regarding true episodes, 44.3% (309/698) grew in ≤12h, 85.4% (596/698) in ≤24h and 95.7% (668/698) in ≤48h. 98.7% (309/313) of the microorganisms with a TTP<12h were involved in a true episode. Regarding Enterobacterales, in 61.5% (122/343) the TTP<12h. Considering coagulase negative staphylococci (CoNS), the isolates considered contaminants yielded a TTP significantly higher (p<0.001) than the ones involved in infection. No significant differences in TTPs were observed among *Staphylococcus aureus* and significant CoNS, or among Enterobacterales and non-fermenting Gram-negative bacteria.

**Conclusions:** In hospitals with a high contamination rate, TTP can be especially useful in guiding towards the type of microorganism involved and its role in infection.

Abstract 583

Treatment of latent tuberculosis infection based on the interferon-gamma releasing assay in allogeneic stem cell transplant recipients

Joung Ha Park*1, Moonsuk Bae1, Seongman Bae1, Eun-Ji Choi1, Han-Seung Park1, Sang-Ho Choi1, Sang-Oh Lee1, Yang Soo Kim2, Jun Hee Woo1, Jung-Hee Lee1, Je-Hwan Lee1, Kyoo-Hyung Lee1, Tae Sun Shim1, Sung-Han Kim1

1Asan Medical Center, Seoul, South Korea

Background: The tuberculin skin test is being replaced by the interferon-gamma releasing assay (IGRA) for diagnosing latent tuberculosis infection (LTBI) in transplant recipients. However, there is limited evidence that IGRA-based LTBI treatment is effective in preventing TB in hematopoietic stem cell transplant (HCT) recipients. Therefore, we have evaluated its effectiveness.

Materials/methods: We retrospectively enrolled patients who underwent allogeneic HCT from January 2010 to December 2018 in a tertiary hospital in an intermediate TB-burden country, and observed TB development for at least 6 months of follow-up until 24 months after HCT. All patients underwent IGRA using QuantiFERON-TB Gold In-Tube (QFT-TB) to screen for LTBI before HCT. LTBI treatment was defined as taking isoniazid (INH) for at least 6 months. We classified the study population into three groups: the negative or indeterminate QFT-TB group, the positive QFT-TB with full LTBI treatment, and the positive QFT-TB without LTBI treatment [no treatment or early discontinued treatment].

Results: A total of 1,162 patients were followed-up for 1,550.4 person-years. 181 (15.6%) patients gave positive QFT-TB results. There were 981 (84.4%) in the negative (n=911) or indeterminate (n=70) QFT-TB group, 51 (4.4%) in the positive QFT-TB with LTBI treatment, and 130 (11.2%) in the positive QFT-TB without LTBI treatment, of whom 75 had no INH treatment and 55 stopped treatment prematurely. 21 (1.8%) patients developed active TB comprising 15 (1.5%) in the negative group, none in both the indeterminate group and in the positive QFT-TB patients with LTBI treatment, and 6 (4.6%) in the positive QFT-TB without LTBI treatment group. The median time from allogeneic HCT to TB diagnosis was 7.4 months (IQR 3.9-10.8). The incidence of TB in the positive QFT-TB without LTBI treatment group (3.58/100 person-years) was significantly higher than in the negative or indeterminate QFT-TB group (1.15/100 person-years) (p=0.01), and there was a trend towards it being higher than in the positive QFT-TB with LTBI treatment group (0/100 person-years) (p=0.09). The number needed to treat (NNT) was 22 (95% CI 12-99) with positive QFT-TB results.

Conclusions: IGRA-based INH treatment appears to lower the rate of post-transplant TB after HCT, with a reasonable NNT.

Next-generation infection prevention: integrated whole genome sequencing and clinical epidemiology analysis to detect actionable carbapenem-resistant *Acinetobacter baumannii* transmission hotspots

Sean Wei Xiang Ong* 1,2, Pooja Rao1, Zhang Wei1, Bee Fong Poh1, Sai Rama Sridatta Prakki1, Liang De Wang1, Victor Yi Fa Ong1, Brenda Ang1,3,4, Partha Pratim De1, Don Tek Ng2,3, Kalisvar Marimuthu1,2,4

1National Centre for Infectious Diseases (NCID), Singapore, Singapore, 2Tan Tock Seng Hospital, Singapore, Singapore, 3Lee Kong Chian School of Medicine, Singapore, Singapore, 4Yong Loo Lin School of Medicine, Singapore, Singapore

**Background:** CRAB is a significant hospital-acquired pathogen. In our centre, previous infection prevention and control (IPC) resources were concentrated on other multidrug-resistant organisms other than CRAB as the rate of CRAB was stable with no evidence of outbreaks. We used WGS to uncover horizontal transmission of CRAB and established plausible routes of transmission for targeted IPC actions in an endemic setting.

**Materials/methods:** We prospectively collected epidemiological characteristics of patients with CRAB infection or colonisation, and identified genetic relatedness of CRAB isolates using a pairwise single nucleotide polymorphisms (SNP) threshold of ≤ 11. We investigated patients with genomically-linked CRAB isolates for either spatio-temporal overlap (sharing the same ward at the same time) or spatial only overlap (sharing the same ward at different times). Findings were regularly presented to IPC and intensive care unit (ICU) committees, and follow-up actions were documented.

**Results:** Of 141 CRAB isolates identified between May and November 2016, 70 (48.2%) from 61 patients were available for WGS. Including 22 clinical (from 12 patients) and 11 environmental CRAB isolates from a previous 2015 study, a total of 92 samples (73 patients) were analysed. WGS identified seven distinct CRAB clusters involving a total of 47 patients (cluster size 1 to 28 patients). Genomic transmissions were explained by spatio-temporal overlap in 14 patients (29.8%) and spatial overlap only in 13 patients (27.7%). The focus of transmission was deduced to be the ICUs (Figure 1). Dissemination of CRAB from the ICUs to general wards and onward horizontal transmission were demonstrated in 2 instances. Clusters were also found to be related to the environmental isolates from 2015 suggesting the environment as a possible site or source of the horizontal transmission. Discussion of the above findings at IPC and ICU meetings led to implementation of enhanced control measures, including terminal environmental cleaning supplemented by hydrogen peroxide vapour disinfectant for rooms occupied by CRAB patients.

**Conclusions:** This study showed that WGS could be utilised as a "tool-of-persuasion" for action in IPC by demonstrating presence of ongoing transmission of CRAB in an endemic setting and identifying actionable routes of transmission for directed IPC interventions.

Correlation between antibiotic resistance of main Gram-negative pathogens and antibiotic consumption in a general hospital of China

Yun Cai* 1,2

1PLA General Hospital, Center of Medicine Clinical Research, Department of Pharmacy, Beijing, China; 2Hainan Branch of PLA General Hospital, Department of Pharmacy, Sanya, China

Background: Our hospital is a newly established hospital in China, which is located in the tropics. Better depicting antibiotic consumption and antibiotic resistance may help better develop and implement an antibiotic stewardship with regional characteristics.

Materials/methods: Total antibiotic prescriptions, patient days and microbiological data from January 2014 to December 2017 were collected. Antibiotic use density (AUD) was expressed as daily defined dose (DDD) and normalized per 100 patient-days. The resistance rates of Gram-negative pathogens against commonly used antibiotics were calculated. The relationship between antibiotic consumption and bacterial resistance rate was described by Pearson's correlation coefficient.

Results: Different from mainland China, Acinetobacter baumannii was the leading Gram-negative pathogen, followed by Klebsiella pneumoniae, Escherichia coli and Pseudomonas aeruginosa. The AUD was gradually increased from 2014 to 2016, while it was slowly decreased in 2017. Ceftazidime/tazobactam, levofloxacin and meropenem were the top three consumed antibiotics. The proportion of multidrug resistant (MDR) Gram-negative bacteria was increased (>40%) before 2016, and it was decreased in 2017. The prevalence of MDR A. baumannii and MDR P. aeruginosa was correlated with the AUD of β-lactam/lactamase inhibitors, fluoroquinolones and carbapenems. The increased AUD of meropenem had positive effects on the incidence of carbapenem-resistant A. baumannii and P. aeruginosa.

Conclusions: Our study showed that there was an association between the resistance density of Gram-negative pathogens and the consumption of β-lactam/lactamase inhibitors, carbapenems and fluoroquinolones. Collectively, a multifaceted antimicrobial stewardship is necessary to decrease resistance density of available antibiotics.

Figure 1. Changing pattern in prevalence of pathogens and AUD of antibiotics from 2014 to 2017. a) MDR Gram-negative bacteria, b) AUD of various antimicrobial agents, c) AUD of mainly used antibiotics. MDR-AB: Multidrug-resistant A. baumannii; MDR-PA: Multidrug-resistant P. aeruginosa; MDR-KP: Multidrug-resistant K. pneumonia. AUD: antibiotic use density; DDD: defined daily dose. pd: patient-day.

Identification of individual risk factors for acquisition of vancomycin-resistant Enterococcus faecium (VRE) during an outbreak in an university hospital and implication in prevention strategies

Tom Abrassart*1,2, Huguette Strale2, Delphine Martiny3, Baudouin Byl3,4

1Centre Hospitalier Universitaire Ambroise Paré, Mons, Belgium, 2Université Libre de Bruxelles, Erasme Hospital, Brussels, Belgium, 3Université Libre de Bruxelles, LHUB-ULB, Bruxelles, Belgium, 4Université Libre de Bruxelles, School of Public Health, Brussels, Belgium

Background: Erasme hospital is the 864 bed academic hospital of the Université Libre de Bruxelles (Brussels, Belgium). A sustained increase in vancomycin resistant Enterococcus faecium (VRE) acquisition occurred in 2017 and involved several departments {mainly intensive care, haematology, and gastroenterology departments}. We performed a case control study to identify individual risk factors for acquisition of VRE.

Materials/methods: The study involved the 10 concerned hospitalisation wards, where we had implemented a systematic screening for VRE carriage at admission and during hospitalisation, from 1/1/2017 until 30/9/2018. Isolated VRE were genotyped during a limited period to explore the clonality of the outbreak. For each case, a spatio-temporally matched control was selected among screened patients. Case and control files were reviewed retrospectively to collect 36 selected variables (previous hospitalisation, intensive care stay, prior antibiotic therapy, major co-morbidities and procedures). Variables associated with a p-value < 0.1 were integrated into a multivariate model (multiple logistic regression).

Results: 73 patients colonised with vanA (n=72) or vanB (n=1) VRE fulfilled inclusion criteria and were matched with 73 controls. Genotyping demonstrated a high proportion of monoclonality (71% VRE) among the isolated VRE. A recent previous hospitalisation, intensive care stay, solid organ transplantation, and previous exposure to any antibiotics, or to 8 specific antimicrobial agents were associated with acquisition of VRE in univariate analysis. Among 15 variables with univariate p value <0.10, 4 were identified as independent risk factors for VRE colonization using the multivariate model: prior antibiotic therapy (OR 5.5 [1.1-26.5]; p = 0.04), vancomycin (OR 10.2 [1.1-95.8]; p = 0.04) or metronidazole exposure (OR 24 [2.2-267]; p = 0.01) and recent solid organ transplantation (OR 5,8 [1.1-29.3]; p = 0.03).

Conclusions: Our results confirm the role of antibiotic exposure, especially vancomycin but also metronidazole, in the acquisition of VRE. More originally, solid organ transplantation appeared also independently associated with this risk. This last risk factor could have important consequences if confirmed by others, as, in addition to prudent use of antibiotics and infection control measures, it could be recommended to avoid hospitalisation of VRE colonised patients in the same ward than transplanted patients.

**Evaluation of a new commercial assay for detection and characterisation of carbapenemase genes**
Gary Eltringham*, Monika Suwara1, Mohammed Bakheit2, Seamus Stack1, Elizabeth Gillies2, John Perry3

1 Newcastle Freeman Hospital, Newcastle upon Tyne, United Kingdom, 2 Mast Group Ltd., Bootle, United Kingdom, 3 Mast Diagnostica GmbH, Reinfeld, Germany

**Background:** The MAST ISOPLEX® CRE-ART is a loop-mediated isothermal amplification (LAMP) assay for detection of genes encoding carbapenemases in Enterobacterales, *Pseudomonas aeruginosa* and *Acinetobacter* species. We describe here the first evaluation of this assay with bacterial strains.

**Materials/methods:** The assay was evaluated with a diverse collection of 248 Gram-negative bacteria including Enterobacterales (*n* = 203), *Acinetobacter* species (*n* = 37) and *P. aeruginosa* (*n* = 8). A diverse range of carbapenemases were represented as well as a range of controls with other ß-lactamases. Isolates were sampled from Mueller-Hinton agar and DNA was extracted using an extremely simple protocol that involved heating at 95°C for 5 minutes in buffer. An internal process control was added at the point of extraction. The tests were performed on an ABI 7500 real time PCR instrument and the entire procedure (including sample preparation) required approximately 1 hour to generate results.

**Results:** 154 out of 155 (99.4%) carbapenemase-producing Enterobacterales (CPE) with VIM, NDM, IMP, KPC or OXA-48-like carbapenemases were successfully detected as well as 4/4 carbapenemase-producing *P. aeruginosa* (with VIM or NDM carbapenemases). One CPE isolate with NMC-A remained undetected. For *Acinetobacter*, the assay was able to successfully detect all isolates with OXA-23 (*n* = 23), OXA-24 / OXA-40 (*n* = 2) or NDM (*n* = 3). Eighteen other *Acinetobacter* isolates with carbapenemases (with OXA-51, OXA-58 or OXA-69) remained undetected as these genes are not targeted by the assay. The Ct values for isolates with carbapenemases ranged from 5.01 - 10.37 and provided clear distinction from 2/53 isolates without carbapenemases that generated a signal (Ct values > 20). Both of these isolates were negative on repeat testing. Applying a Ct cut-off value of 15 allowed successful detection of all genes that are targeted by the assay with 100% sensitivity and specificity.

**Conclusions:** The MAST ISOPLEX® CRE-ART is a simple and rapid assay that allows highly effective detection and differentiation of the most common carbapenemase genes including the 5 major carbapenemase genes found in Enterobacterales and OXA-23 in *Acinetobacter* species.

Abstract

Background: A specific and distinct lung microbiota is present in healthy subjects; changes in commensal composition has been associated with various chronic respiratory diseases. Aim of this study was to explore and quantify the potential modification of lung microbiota during mechanical ventilation (MV), paying particular attention to patients developing within 15 days ventilator associated pneumonia (VAP).

Materials/methods: Pilot observational multicenter prospective study involving two neurological and one general Intensive Care Units. All adult patients admitted from 10/2017 to 03/2019 and intubated for extra-pulmonary reasons with expected duration of MV longer than 48 hours were enrolled. All patient were followed until day 15 or at extubation, when earlier. Tracheal aspirate was collected at intubation (T0), day 3 (T3), 5 (T5) and 7 (T7). Pulmonary microbiota analysis through 16S-rRNA gene sequencing was performed in all VAP patients and in a subgroup of non-VAP ones, comparable within center for reason and period of intubation, and antibiotic administration pre-intubation (48h). Microbiota results are presented according to selected indices of α-diversity and β-diversity, as operational taxonomic units (OTUs) number and Principal Coordinates Analysis (PCoA), respectively.

Results: Sixty-nine patients were enrolled and microbiota of 18 VAP and 27 non-VAP was analysed. Groups were comparable for sex, Glasgow Coma Score (mean≈8), intubation days (mean=10) and diagnoses at intubation; although VAP patients were slightly younger (mean=46.8) than non-VAP (mean=57.6 years). When number of OTUs was analyzed over time, despite a wide variability between patients, a significant U-shape was observed, with median values of 139.2, 83.9, 87.2 and 129.8 at T0, T3, T5 and T7, respectively (p-value=0.03 after that age, days of intubation and VAP occurrence were considered into the repeated measures model). When the similarity between patients in terms of microbiota composition (β-diversity) was analyzed at each time point, no major differences emerged between VAP and non-VAP patients, as showed by PCoA figures.

Conclusions: This pilot analysis showed a U-shape time-pattern in the number of OTUs identified in pulmonary microbiota during MV. Considering its wide variability between-patients, larger samples are needed to analyze determinants of this time-pattern and to identify potential differences in microbiota species-composition.

Occurrence of NDM-1-producing Morganella morganii and Proteus mirabilis in a single patient, Portugal: probable in vivo transfer by conjugation

Marta Aires De Sousa1,2,3; Jose Manuel Ortiz De La Rosa4; Maria Luisa Goncalves5; Augusto Costa5; Patrice Nordmann4; Laurent Poirel*4

1Escola Superior de Saúde da Cruz Vermelha Portuguesa, Lisboa, Portugal, 2Universidade Nova de Lisboa (UNL), Instituto de Tecnologia Química e Biológica António Xavier (ITQB), Oeiras, Portugal, 3Université de Fribourg, Fribourg, Switzerland, 4Université de Fribourg, Fribourg, Switzerland, 5Hospital SAMS, Lisbon, Portugal

Background: Recent studies showed that KPC is the most common acquired carbapenemase identified among enterobacterial isolates in Portugal, where OXA-181 producers are also identified at low rate. Our study was initiated by the isolation of two carbapenem-resistant, carbapenemase-producing but KPC- and OXA-181 negative enterobacterial isolates from a single patient in Portugal.

Materials/methods: Carbapenemase genes were searched by PCR assays and mating-out assays were performed to further characterize the plasmid support of the carbapenemase genes. Genetic characterization of the plasmid supports was performed by whole plasmid sequencing using the Illumina technology.

Results: The two carbapenemase-producing isolates, namely a Morganella morganii and a Proteus mirabilis, were found to produce the NDM-1 carbapenemase. Surprisingly, both isolates shared the same \( \text{bla}_{\text{NDM-1}} \)-positive plasmid. This 154-kb in-size plasmid belonged to the IncA/C type and co-harbor two AmpC \( \beta \)-lactamase genes, namely \( \text{bla}_{\text{CMY-4}} \) and \( \text{bla}_{\text{DHA-1}} \), in addition to the 16S rRNA methylase gene \( \text{armA} \) encoding high-level resistance to aminoglycosides. Moreover, the \( M. morganii \) isolate produced the CTX-M-33 extended-spectrum \( \beta \)-lactamase possessing weak carbapenemase activity, encoded by another plasmid.

Conclusions: We showed here that, apart from KPC-type and OXA-181 carbapenemases that have been identified as common, another concern is the emergence of NDM-1-producing enterobacterial isolate in Portugal. We demonstrated here the in-vivo plasmid transfer of \( \text{bla}_{\text{NDM-1}} \)-Positive plasmid leading to dissemination of that carbapenemase gene within different enterobacterial species in a given patient.

Abstract 600

Impact of a catch-up strategy of Tdap vaccination during hospitalisation on vaccination coverage among people over 65 years of age in Sarthe: the HOSPIVAC study

Sophie Blanchi*, Nicolas Crochette1, Ludovic Hery1, Servane Laforest1, Jean Marc Toque1, Justine Vaux1

1Le Mans, France

Background: The Tetanus-Diphtheria-Polio (Tdap) vaccination coverage of the elderly in France is insufficient and decreases with age. The main objective of this study was to evaluate the impact of a catch up strategy of Tdap vaccination during hospitalization among people over 65 years of age in Sarthe. The secondary objectives were to assess the Tdap vaccination coverage of this population and the factors independently associated with the vaccination status being up to date.

Materials/methods: This was a prospective, monocentric, randomized, clustered study. From 28/05/2018 to 27/05/2019, eligible patients over 65 years of age hospitalized in the general medicine ward at Le Mans General Hospital were included. The Tdap vaccination status of patients was collected at inclusion in both groups. In the intervention group, the vaccination update was performed during hospitalization. In case of temporary contraindication or refusal, a prescription was given to the patient upon discharge. The final vaccination status was collected during a call to the patient’s general practitioner two months after discharge from hospital.

Results: 157 patients were included, 73 in the intervention group 84 in the control group. In the intervention and control groups, vaccination coverage increased by 24.6% and 2.4% respectively (p<0.001). The vaccine coverage at inclusion was 46.5%. The factor independently associated with the vaccination being up to date was having been sufficiently informed about vaccination by the general practitioner OR = 5.07 [2.45-10.51]. In terms of knowledge of immunization status, 27.4% of patients who thought they were up to date were not.

Conclusions: The Tdap vaccination coverage of patients over 65 years of age in Sarthe is low. A catch up strategy for Tdap vaccination during hospitalization is effective. The availability of vaccines in hospital should improve immunization coverage. The systematic collection of the vaccination status of patients at entry should be facilitated by new data collection tools. The general practitioner is a source of information on vaccination for the population over 65 years of age.

**Faecal microbiota transplantation in the treatment of *Clostridioides difficile* infection**

Roman Stebel*1,2, Lenka Vojtilova1,2, Radek Svačinka1,2, Petr Husa1,2

1Masaryk University, Faculty of Medicine, Brno, Czech Republic, 2University Hospital Brno, Department of Infectious Diseases, Brno-Bohunice, Czech Republic

**Abstract third-party references:** Supported by Ministry of Health, Czech Republic – conceptual development of research organization [FNBr, 65269705]

**Background:** Fecal microbiota transplantation represents a unique therapeutic procedure targeted to restore the natural diversity of intestinal microbiota and to prevent recurrence of one of the most significant nosocomial infections – *Clostridioides difficile* colitis. The aim of this prospective study was to assess the success rate and safety of fecal bacteriotherapy in the treatment of *Clostridium* colitis at a clinic that had been the first in the Czech Republic to perform this procedure as early as 2010, and still is the national leader in the number of realized transplantations to-date.

**Materials/methods:** Within the monitored four-year interval [2015–2018], 172 patients were treated by means of intestinal microbiota transplantation. The patients were followed up by means of personal visits or by phone after treatment. If colitis did not recur within eight weeks, the treatment was evaluated as successful.

**Results:** The overall success rate of FMT in the study period was 76%. Advanced patient age was the only separate risk factor for treatment successful identified through subgroup analysis. No statistically significant difference in success rate was demonstrated based on patient sex, the way of fecal transplant application, initial antibiotic therapy or on the application of fresh or frozen donor stool. Two serious adverse events were observed in the study period; both cases were of rectal wall perforation, and occurred during stool suspension application via rectal enema. There was no lethality.

**Conclusions:** Fecal microbiota transplantation is a successful and safe therapeutic alternative for recurrent colitis caused by *Clostridioides difficile*.

**Diagram 1:** Dependence of FMT success rate on the number of previous CDI episodes

**Nasopharyngeal viral load determinants among influenza-infected patients receiving primary care in France: 2010-2018**

Romain Gueneau*1, Sylvie Behillil2, Enouf Vincent2, Madec Yoann1, Sylvie Van Der Werf2

1Institut Pasteur, unité d’épidémiologie des maladies émergentes, Paris, France, 2Institut Pasteur, Centre National de Référence des virus des infections respiratoires (dont la grippe), UMR 3569 CNRS, Université de Paris, Paris, France

**Background:** Influenza, a continuing major public health problem due to recurrent seasonal epidemics justifying epidemiological and virologic surveillance. Virus detection by RT-qPCR, widely used for surveillance, is mostly a qualitative diagnosis tool but also allows to estimate the viral load (VL). We analyzed factors associated with VL in nasopharyngeal specimens from patients attending primary care with confirmed influenza virus infection.

**Materials/methods:** Patients recruited by the French primary care surveillance networks in the Northern half of France during the 2010-2011 to 2017-2018 seasons for which a nasopharyngeal swab was found positive for influenza virus type A or B by RT-qPCR were included. For each patient, epidemiological and clinical data were collected. Analyses by RT-qPCR performed at the National Influenza Center also provided influenza A virus subtype and an estimated VL. Determinants of VL were identified using multivariate linear regression and severity (presence of dyspnea or hospitalization) determinants were identified using logistic regression.

**Results:** Overall, specimens from 6297 patients were included, ranging from 365 in 2013-2014 to 1179 in 2015-2016. Of these, 50.7% were men. Median [inter quartile range] age at diagnosis was 20 [6-43] years. Influenza virus was A(H1N1)pdm09 in 1722 [27.4%] patients, A[H3N2] in 2184 [34.7%] patients and B in 2345 [37.2%] patients. Mean [standard deviation] VL was 4.78 [1.43] log copies/µL. In multivariate analysis, patients infected with A[H3N2] and B viruses presented significantly higher VL then those infected with A(H1N1)pdm09 (p<0.001). The 2012-2013 and 2014-2015 seasons were characterized, in multivariate analysis by lower VL than all other seasons (p<0.001). The other factors associated with increased VL were younger and older ages (<2, 2-4, 4-15 and ≥65 years; p<0.001), male gender (p=0.01), presence of rhinitis (p<0.001), and being vaccinated in patients older than 65 years or immunocompromised (p=0.04). In multivariate analysis, higher VL was associated with increased severity, but the type of influenza virus was not associated with severity.

**Conclusions:** After adjusting for confounding factors among which the influenza virus, VL fluctuations remained between seasons, with no appropriate explanations today. However, we noted that the seasons exhibiting the lowest VL levels were always those when the three viruses co-circulated.

Abstract 607

Flu isolation wards: does medical specialty matter? Comparison of three specialties on outcome and antibiotic usage in hospitalised influenza A infected patients in Vienna during the season 2018/19

Mario Karolyi*, Erich Pawelka1, Hasan Kelani*, Georg Christian Funk1, Boris Lindner1, Christoph Porpaczy*, Sabine Publig*, Tamara Seitz1, Marianna Traugott1, Alexander Zoufaly1, Christoph Wenisch1

1Department for Infectious Diseases, Kaiser-Franz-Josef-Hospital (KFJ), Vienna, Austria, 2Medical University Vienna , Vienna, Austria, 3Medical Department II and Karl-Landsteiner Institute für Lungenforschung und Pneumologische Onkologie, Wilhelmsenspital, Vienna, Austria, 4Medical Department II - Center for diagnosis and treatment of rheumatic diseases, Hospital Hietzing, Vienna, Austria

Background: Diagnosis and care of influenza are often provided across several medical specialties. We compared patient outcomes at the infectious diseases (ID), rheumatology (Rheu) and the pulmonology (Pulm) department.

Materials/methods: In this exploratory-prospective-observational multi-centre-study we included all influenza positive patients ≥18 years who were hospitalized for critical medical reasons and treated at flu-isolation-wards in three hospitals in Vienna during the season 2018/19. Diagnosis was made via Cobas® Liat®-POCT.

Results: 490 patients with a median age of 73 years (IQR 61-82) were included. 48.8% were female. No difference regarding age, sex and underlying diseases were present at admission.

The complications were different: pneumonia (ID 27.8%, Rheu 40%, Pulm 39.8%, p=0.031), acute kidney failure (ID 12.7%, Rheu 21.2%, Pulm 37.1%, p<0.001), acute heart failure (ID 4.3%, Rheu 17.1%, Pulm 14.4%, p<0.001), respiratory insufficiency (ID 45.1%, Rheu 41.5%, Pulm 56.3%, p=0.030).

Oseltamivir prescription was lower at the pulmonology flu ward (ID 79.6%, Rheu 90.5%, Pulm 61.7%, p<0.001).

176 patients (35.9%) had pneumonia. Antibiotic treatment differed between specialties (see table 1).

The median length-of-stay was ID 6 days [IQR 5-8], Rheu 6 days [IQR 5-7] and at Pulm 7 days [IQR 5-9.5], p=0.034. In-hospital-mortality was 4.3%, increased to 9.5% during the 90-day follow-up-period and did not differ between specialties.

Conclusions: We detected differences in oseltamivir usage, length-of-stay and antibiotic choices for pneumonia. Influenza-associated-mortality was not affected by specialty.

Ursolic acid and its amide derivatives disrupt clinical Acinetobacter baumannii isolates and biofilm formation

Ayaz Ahmed1*, Yamina Usmani1, Shabana Simjee2, Shaheen Faizi2

1University Of Karachi, Dr. Panjwani Center for Molecular Medicine and Drug Research, International Center for Chemical and Biological Sciences, Karachi, Pakistan, 2University Of Karachi, H.E.J. Research Institute of Chemistry, International Center for Chemical and Biological Sciences, Karachi, Pakistan

Background: Hospital acquired infections due to antimicrobial resistant ESKAPE pathogens have emerged globally with increased morbidity and mortality. Acinetobacter baumannii is a members of ESKAPE pathogens which acquired multiple drug resistance (MDR) even with the last resort drug colistin at rapid phase which hinder its treatment or management. World Health Organization (WHO) categorized A. baumannii among the list of pathogens for which new pharmacophore required on urgent basis. So, in this study Ursolic acid (UA) and its synthetic amide derivatives were screened against standard (ATCC: 19606) and clinical isolates of A. baumannii strains.

Materials/methods: In the first phase of this study clinical isolates were collected and identified as A. baumannii strains phenotypically as well as genotypically. Then the ursolic acid and its derivatives were screened for antimicrobial, biofilm inhibiting and eradicating potential.

Results: Out of tested compounds amide derivative of UA (KSUA-2,4) was found to possess better antimicrobial concentration at 77.87 μg/ml against colistin resistant A. baumannii strains (Colistin MIC > 100 μg/ml). Compound KSUA-2,4 significantly inhibited or eradicated >60% biofilm formation of tested standard and clinical isolates at MIC. Microscopic analysis further confirms the biofilm inhibition and eradication potential of this compounds. Atomic Force Microscope analysis (AFM) further confirms the antimicrobial properties KSUA-2,4 and suggesting that the antimicrobial action might be due the the membrane leakage. Considering this evidence, microbial membrane potential was determine by using FACS analysis which confirm the loss of membrane potential after compound treatment. Gene expression analysis further explained that this compound inhibit biofilm formation by reducing the gene expression of bap (biofilm gene) and aboR (quorum sensing).

Conclusions: Ursolic acid amide derivative KSUA-2,4 significantly inhibit growth and biofilm formation of colistin resistant A. baumannii strains, so, might be used to tackle Acinetobacter baumannii related nosocomial infections and further evaluated as a drug candidate.

Survival outcome in allogeneic haematopoietic stem cell transplant recipients with multiple, sequential cytomegalovirus, Epstein-Barr virus, BK virus and respiratory viral infections

Shio Yen Tio*, Monica Slavin, David Ritchie, Lynette Chee, Ashish Bajel, Joe Sasadeusz, Charles Malpas, Michelle Yong

1The Royal Melbourne Hospital, Parkville, Australia, 2Peter MacCallum Cancer Centre, Melbourne, Australia, 3University of Melbourne, Parkville, Australia

Background: Reactivation of latent double-stranded DNA (dsDNA) viruses [Cytomegalovirus (CMV), Epstein-Barr virus (EBV) and BK polyomavirus (BKV)] as well as community-acquired respiratory viruses can lead to significant morbidity after allogeneic haematopoietic stem cell transplantation [allo-HSCT]. The clinical burden of multiple, sequential viral infections in this population has not been well characterized. We aimed to assess the impact of cumulative viral infections on clinical outcome in recipients of allo-HSCT.

Materials/methods: All patients undergoing allo-HSCT between January 2015 to December 2017 at Royal Melbourne Hospital were included in a retrospective analysis. Episodes of viral infection with time to event were recorded for a minimum follow up period of 12 months or until death. Weekly quantitative CMV and EBV PCR to day 100 was performed and as clinically indicated thereafter. BKV PCR and respiratory virus PCR were tested as clinically indicated. An episode of infection was defined as first detectable CMV, EBV, BKV and/or respiratory virus. Statistical analysis evaluating time to multiple viral events was performed using Andersen-Gill and Cox proportional hazard models.

Results: Two hundred and fifty-five patients [median age=51, male (61%)] were included. Indication for HSCT was AML (41%), ALL (11%), MDS (11%), others (37%). Anti-thymoglobulin (ATG) conditioning regimens were used in n=117 (46%). 401 episodes of viral infection were identified in 206 patients. CMV reactivation = 139 (55%), EBV =131 (51%), BK = 53 (21%) and respiratory viral infections were identified in 78 (31%) patients. 19 patients (7.5%) had reactivation of all 3 dsDNA viruses; 9 patients (3.5%) had all 4 viral events. The 12-month all-cause mortality was 26.7%.

ATG use was associated with increased risk of viral infections overall [HR 1.5, 95% CI 1.2-1.8, p<0.001], and a longer median duration of both CMV viremia (79 vs 72 days, p=0.008) and EBV viremia (36 vs 28 days p=0.03). The risk of twelve-month all cause mortality was increased in patients with multiple, sequential viral infections (HR 1.36 95% CI 1.15-1.62, p<0.001).

Conclusions: Multiple episodes of latent dsDNA or respiratory viral infections occurring within the first 12 months of allogeneic HSCT was associated with an increase in overall mortality.

Abstract 616

Immunogenicity and safety of a quadrivalent influenza vaccine (GC GLU) versus quadrivalent seasonal influenza vaccine (Fluarix Tetra) in Asian adults aged 20 to 50: a phase III prospective, open labeled, multi-centre study

Sung-Ching Pan1, Hai-Hua Chuang2,4,5, Wen-Sen Lee6, Ning-Chi Wang7, Szu-Min Hsieh8

1National Taiwan University Hospital, Taipei, Taiwan, 2Chang Gung Memorial Hospital, Linkou, Taiwan, 3Chang Gung University, Taoyuan, Taiwan, 4National Taipei University of Technology, Taipei, Taiwan, 5Geisinger Healthcare, Danville, United States, 6Taipei municipal wangang hospital, Taipei, Taiwan, 7Tri-service general hospital, Taipei, Taiwan, 8National Taiwan University Hospital, Taipei, Taiwan

Background: The egg based quadrivalent vaccines (IV4) was suggested by WHO for use in the 2019-2020. Due to the high demand of IV4 globally, we conducted a non-inferior phase III clinical trial to evaluate the Immunogenicity and safety of an IV4 (GC GLU), compared with active controlled (AC) (Fluarix Tetra, GSK).

Materials/methods: The randomized, open labelled, active controlled study was conducted in four sites in Taiwan (NCT03718468). Vaccinee aged 20-50 were enrolled. GC flu is an IV4 contained 60ug purified inactivated influenza virus antigen (15ug each), including A [H1N1], A [H3N2], B [Maryland], and B [Phuket]. The primary end point was the non-inferior immunogenicity of GC flu to AC as HAI titers against each virus strain on Day 22 (GMc/GMTgflu<=1.5).

Results: 842 vaccinee were randomized and received one dose of vaccination, and the baseline characteristic was similar in the 2 groups. 840 vaccinee fulfilled PP criteria, with 421 received GC Flu and 419 received AC. For both type A strains, there was no significant difference between GC FLU and the AC. The 95% CI upper bounds of GMTac/GMTgcflu are both 1.00. For both type B strain, the 95% CI upper bounds of GMTac/GMTgcflu are 1.41 (Table 1). Further analyzing GMT using ANCOVA incorporating baseline, study site, and/or age as factors if significant, the upper bounds of the 95% CI of GMTac/GMTgcflu of all 4 strains ≤ 1.5 in PP population. Safety analyses were performed on the 842 ITT population. The local solicited AEs was 80.3% [339/422] in GC flu group and 81.9% [344/420] in AC group. The systemic solicited AEs were 53.6% [238/422] and 45.2% [190/420] and unsolicited AE were 19.2% [81/422] and 16.7% [70/420], respectively.

Conclusions: GC flu exhibit comparable safety profile and immunogenicity non-inferior to Fluarix Tetra.

Abstract 624

Clinical experience with isavuconazole in Chinese healthy volunteers and Chinese patients with invasive aspergillosis

Jing Zhang*, Yingyuan Zhang, Depei Wu, Guoying Cao, Kamal Hamed, Amit Desai, Jalal A. Aram, Xuan Guo, Rana Fayyad, Oliver A. Cornely

1Institute of Antibiotics, Huashan Hospital, Fudan University, Shanghai, China, 2Department of Hematology, The First Affiliated Hospital of Soochow University, Suzhou, China, 3Basilea Pharmaceutica International Ltd., Basel, Switzerland, 4Astellas Pharma Inc, Northbrook, IL, United States, 5Pfizer Inc, New York, NY, USA, New York, NY, United States, 6Pfizer Inc, Beijing, China, 7Department of Internal Medicine, Centre for Clinical Trials Cologne, Cologne, Germany, 8ZKS Köln, Centre for Integrated Oncology CIO Köln Bonn, Cologne, Germany, 9Excellence Cluster on Cellular Stress Responses in Aging-Associated Diseases (CECAD), German Centre for Infection Research, University of Cologne, Cologne, Germany

Abstract third-party references: Funded by Pfizer Inc. Submitted by Karen Miller from CMC Connect, a division of McCann Health Medical Communications Ltd on behalf of the authors

Background: Invasive aspergillosis (IA) has an increasing incidence in China. We present experience with the antifungal isavuconazole in Chinese subjects from two clinical studies: a Phase I study in healthy volunteers [Study 9766-CL-0038 [NCT01555918]] and the global Phase 3 SECURE study [NCT00412893] in patients with IA.

Materials/methods: Healthy volunteers received an oral or intravenous dose of isavuconazole 200 mg on Day 1 of each 15-day period, followed by a 2-week washout [Part 1], and 200 mg three-times-daily for 2 days followed by once-daily for 10 days [Part 2]. In SECURE, patients were randomised to isavuconazole 200 mg intravenously three-times-daily on Days 1 and 2, then either intravenously or orally once-daily, or voriconazole 6 mg/kg intravenously twice-daily on Day 1, 4 mg/kg intravenously twice-daily on Day 2, then intravenously 4 mg/kg twice-daily or orally 200 mg twice-daily from Day 3 to end of treatment [EOT] (up to 84 days). One patient was randomised to isavuconazole but received voriconazole intravenously for the first 7 days, then switched to oral isavuconazole until EOT and was included in the voriconazole safety population and the isavuconazole intent-to-treat population. Efficacy (SECURE), safety and pharmacokinetic measures were assessed.

Results: Sixty-two Chinese healthy volunteers/patients were included (46 received isavuconazole). Plasma exposure to oral isavuconazole was higher in Chinese than Western healthy volunteers [Studies 9766-CL-0041 [NCT01657890] and 9766-CL-0017 [NCT01565720]] [Table]. In SECURE, trough steady-state isavuconazole concentrations for three Chinese patients were higher [3844–8646 ng/mL] than for the global population [452–8646 ng/mL]. The primary endpoint of all-cause mortality through Day 42 was 10% [1/10] in the isavuconazole group and 25% [4/16] in the voriconazole group. Overall, 88.9% [8/9] of Chinese isavuconazole-treated patients experienced ≥1 treatment-emergent adverse event, as did 94.1% [16/17] of those receiving voriconazole. Efficacy and safety trends were similar to the global population.

Global isavuconazole exposure-response modelling results revealed no statistically significant relationships of exposure with efficacy endpoints. Furthermore, the differences in exposure were not associated with differences in safety outcomes.

Conclusions: Safety/efficacy in Chinese patients was consistent with the global population. Higher exposure did not alter safety/efficacy outcomes in the global analysis.

Table. Comparison of isavuconazole exposure in Chinese healthy volunteers from Study 9766-CL-0038 and Western healthy volunteers after oral administration

The potential benefit of a second C-reactive protein measurement in patients with Gram-negative bacteraemia presenting to the emergency medicine department

Tal Levinson*1,2, Natalie Tamir1,2, Shani Shenhar-Tsarfaty1,2, Yael Paran1,2, David Zeltzer1,2, Itzhak Shapira1,2, Daniel Trotzky1,2, Pinchas Halpern1,2, Ahuva Weiss-Meilik1,2, Eli Raykhshat1,2, Ilana Goldiner1,2, Amos Adler1,2, Shlomo Berliner1,2, Ori Rogowski1,2, Asaf Wasserman1,2

1Ichilov, Tel Aviv-Yafo, Israel, 2Tel Aviv University, Tel Aviv-Yafo, Israel

Background: Low concentrations of C-reactive protein (CRP) in patients presenting with acute bacterial infections to an emergency medicine department could convey the erroneous impression of a relatively mild infection. We focused on a group of patients with gram negative bacteremia, a phenomenon frequently seen in the emergency medicine department.

Materials/methods: Of the 2200 patients with gram negative bacteremia, we reviewed the medical records of 460 patients who presented with CRP <30mg/L and 460 patients with CRP>187mg/L. Following a series of exclusions, we finally investigated 229 and 289 patients with low and high CRP concentrations, respectively. The cut-off values of relatively low and high CRP were obtained by using a large [n=17,206] database of apparently healthy individuals.

Results: We divided our total cohort into low and high CRP groups. Patients were examined following a mean of 1 and 2.7 days (standard deviation of 2.6 and 3.7 days), respectively from symptom onset. Median first CRP was 13.6 and 219.9 mg/L (interquartile range 6.4-21.6 and 195-270.1) for low and high CRP groups, respectively. Compared to patients with first high CRP, patients with first low CRP concentrations had a significant 5-fold higher CRP level with their second test representing a higher CRP velocity.

Conclusions: Patients with gram negative bacteremia can present with CRP concentrations that are within the range of those detected in apparently healthy individuals. A second CRP test obtained in those presenting with low CRP concentrations might prompt the physician to reevaluate the ongoing inflammatory response, thereby avoiding an eventual erroneous decision regarding the severity and prognosis of the infectious condition.

Figure: Frequency of CRP velocity in low and high baseline CRP groups.

Abstract 638

Daptomycin decreased mortality in methicillin-resistant Staphylococcus aureus bacteraemia compared to vancomycin: a monocentric retrospective study of 96 cases

Antoine Froment1, Raphael Guiheneuf1, Camille Mabille1, Jean-Philippe Lanoix*1

1Chu D’amiens-Picardie Site Sud, Amiens, France

Background: MRSA bacteraemia is a severe and frequent infection currently treated with Vancomycin as gold standard. However Vancomycin, has a slow bactericidal effect, a slow diffusion in tissue, and severe adverse effects that may alter prognosis. Daptomycin, a lipoglycopeptide, has less adverse effects and is more bactericidal. Currently data are missing to support the non-inferiority of Daptomycin against Vancomycin in MRSA bacteraemia on clinical outcomes. We aimed to demonstrate the non-inferiority of Daptomycin on mortality in this context.

Materials/methods: In a monocentric retrospective study, we included 96 patients with MRSA bacteraemia treated with Daptomycin or Vancomycin in a university hospital in Amiens, North of France between 2010 and 2019. We excluded patients with pneumonia or with polymicrobial bacteraemia. The primary outcome was survival after 30 days of antibiotic. The secondary outcomes were tolerance (acute renal failure or end of treatment for adverse events), blood culture (BC) negativation, time to BC negativation, time to apyrexia, length of stay and complications (secondary abscess, endocarditis, septic arthritis or spondylodiscitis).

Results: Both groups were similar in terms of age (mean ± SD in vancomycin group vs daptomycine group) [70.5 ± 13 vs 70.2 ± 11.6] and severity (evaluated by SOFA score, median [interquartile range]) [3 [2-4.5] vs 4 [2-5.5]). There was more men treated with Daptomycine (sex ratio H/F=32/7) than with vancomycine (35/22). Mortality was 40% [23/57] and 13% [5/39] in Vancomycin and Daptomycin group respectively (odd ratio (OR) = 0.22, Confidence Interval (CI) 95% = [0.06; 0.69], p<0.005). There were 11 and 4 cases of acute renal failure in Vancomycin and Daptomycin group, respectively (OR = 0.48, IC95% [0.14; 1.65]), 2 and 1 premature end of treatment due to adverse events in Vancomycin and Daptomycin group, respectively. No difference was found regarding length of stay, BC negativation at day 3, time to BC negativation, time to apyrexia or complications.

Conclusions: Daptomycin drastically decreased mortality in MRSA bacteraemia compared to Vancomycin in our cohort but larger study are warranted to confirm these results.

Abstract 643

A systematic analysis of the direct antiglobulin test in post-artesunate delayed haemolysis during severe imported Plasmodium falciparum malaria: a multi-centre retrospective study

Olivier Paccoud1, Xavier Chamillard2, Ken Ndiaye1, Isabelle Vinatier1, Mohammed Khalloufi1, Claire Boulat1, Laure Surgers1, Benjamin Wyplosz2, Olivier Bouchaud1, Sophie Matheron6, Eric Caumes7, Stéphane Jauréguiberry4,8,9

Background: Post-artesunate delayed haemolysis (PADH) is a frequent adverse effect of artesunate treatment for severe Plasmodium falciparum malaria. Cases of PADH with positive direct antiglobulin tests (DATs) have been reported, but systematic analyses of the DAT and its responsibility in the late haemolytic event during severe imported malaria are lacking.

Materials/methods: In this multicentre retrospective study, we reviewed medical data from all patients with severe imported Plasmodium falciparum malaria in 5 infectious diseases departments over an 8-year period, and included all patients for whom at least one DAT had been performed (DC-Screening I or II, Biorad©). We further analysed parameters of anaemia and haemolysis from day 0 to day +28 of treatment initiation in patients for whom sufficient follow-up data was available. We defined PADH as a 10% drop in haemoglobin levels and a 10% rise in lactate dehydrogenase levels occurring after day 7 of treatment initiation.

Results: Out of 355 patients with severe imported malaria, 46 patients with at least one DAT evaluation were included [including 7 with 2 separate DAT evaluations]. The median age of patients was 44.5 years, and median parasitaemia was 6.4%. Overall, 53 DATs were performed at a median [min-max] of 10 [1-35] days after treatment initiation, which coincided within 7 days of a patient’s haemoglobin nadir in 74% of cases. The DAT was positive in 50.9% [27/53] of cases. Most were positive for IgG [22/27, 81%], among which 63% [17/27] were weakly positive. Among 40 patients with sufficient follow-up data, 17/40 (42.5%) experienced PADH. Compared to patients without PADH, those who experienced PADH had significantly higher median haemoglobin levels [12.4g/dL vs 10.6g/dL, p = 0.021] and parasitaemia [11.4% vs 6%, p = 0.046] at admission. DAT positivity was not significantly associated with the occurrence of PADH [p = 0.36]. No patient received systemic corticosteroids, 41% required one or more erythrocyte transfusions, and outcomes were favourable in all cases.

Conclusions: DAT positivity is frequent during severe imported malaria. Auto-immune haemolysis does not appear to be a significant pathophysiological mechanism in most cases of PADH, although it may be involved in some rare cases.

Interplay between inflammation and infection in a single-centre cohort of patients with X-linked agammaglobulinemia

Olivier Paccoud1*, Nizar Mahlaoui2,3, Fanny Lanternier1, Capucine Picard3,4, Stéphane Blanche2, Olivier Hermine5, Olivier Lortholary1

Abstract 645

Background: X-linked agammaglobulinemia (XLA) is a rare primary antibody deficiency associated with increased susceptibility to early-life infections. Various inflammatory manifestations have been reported during XLA but they are less well-characterised than in other primary immune deficiencies (PID), and are sometimes difficult to distinguish from cases of atypical infections.

Materials/methods: We carried out a retrospective cross-sectional analysis of the medical records of all patients with XLA referred to our hospital between 2009 and 2019. We reviewed data on all inflammatory manifestations, including clinical, biological, histological features, and link to a pathogen. In addition, we reviewed data on all infections before XLA diagnosis, at ages 16 to 18, and at last follow-up. Only infections that led to hospitalisation or that were documented were considered. We also retrieved data regarding use of antibiotic prophylaxis, immunosuppressive treatment, and last residual immunoglobulin level.

Results: Sixty patients with definite XLA were included. Median age (range) at last follow-up was 22.5 (4-59) years. Forty-seven inflammatory flares were reported in 14 patients (23.3%). The most frequently affected organ was the gastro-intestinal tract, presenting as inflammatory bowel disease or coeliac-like enteropathy in 8 patients (13%). Eight/14 (57%) patients received systemic corticosteroids and 4 received tumour necrosis factor inhibitors. A total of 188 infections were recorded, including 95 after initiation of immunoglobulin replacement therapy (IgRT). The most common sites of infection were the lungs and the gastro-intestinal tract. Of note, we recorded 13 cases of Giardia intestinalis infections and 12 cases of Campylobacter spp. infections. Overall, 53% of patients experienced either inflammatory or infectious manifestations despite IgRT during a total follow-up of 1470 patient-years. These occurred more frequently during adulthood than before the age of 16. Having a history of at least one inflammatory manifestation was significantly associated with experiencing more infections (0.14 vs 0.04 infections per person-year, p = <0.001) and more hospital admissions (6.29 vs 1.09 admissions, p = <0.001), as well as receiving higher mean monthly IgRT doses (0.74 vs 0.54 g/kg/month, p = 0.014) in adulthood.

Conclusions: Inflammatory manifestations are of increasing importance in XLA patients reaching adulthood and are associated with increased susceptibility to infection

Abstract 646

**Investigating the sexual protective behaviour among HIV-positive women in Tehran, Iran**

Zeinab Talebi Tamajani¹, Razieh Lotfi¹, Kourosh Kabiri¹, Zahra Bayat Jozani², Minoo Mohraz²

¹Alborz University of Medical Sciences, Karaj, Iran, ²Iranian research center for HIV/AIDS (IRCHA), Tehran, Iran

**Abstract third-party references:** Iranian research center of HIV/AIDS/For validation of data not for fund

**Background:** The third wave of human immunodeficiency virus (HIV) is rising due to high-risk sexual behaviours in Iran. In spite of launching programs to combat HIV in Iran, condom use frequency has not yet reached the optimal level, especially in high-risk groups. The aim of this study was to assess the sexual protection behaviours and awareness among HIV-positive women.

**Materials/methods:** This descriptive study was performed on 100 HIV-positive women who referred to the Voluntary and Counselling Centre (VCT) in Tehran and were recruited using a purposive sampling method. Data collection was carried out using HIV/acquired immunodeficiency syndrome (AIDS) awareness and sexual protection behaviour questionnaires.

**Results:** Condom use was practiced only by 22.2% in all their vaginal and anal sexual intercourse during the three months, and 77.8% of the women never used condoms or failed to use them continuously. Their sexual partners were HIV-positive in 71% of cases. The mean ± SD of awareness score about HIV/AIDS was 7.60 ± 3.31, indicating average awareness of the subjects in the study. A total of 49.1% of the participants stated that their sexual partners’ reluctance was the most important reason for non-use of condoms, while women were not willing to use condoms in 18.2% of cases.

**Conclusions:** The results of the present study indicated poor sexual protection behaviours in HIV-positive women. As a result, gender-based harm reduction programs to promote safe sexual behaviour, awareness level, and negotiation power for condom use in HIV-positive women is more important than ever.

Abstract 652

Correlation between serum C-reactive protein levels and CURB-65 in elderly patients with community-acquired pneumonia

William Nseir⁎, Amir Amara1, Raymond Farah2, Tamer Saidahmad1

1The Azrieli Faculty of Medicine, Safed, Bar-Ilan University, Israel, The Baruch Padeh Medical Center, Poriya, Israel, 2The Azrieli Faculty of Medicine, Safed, Bar-Ilan University, Israel, Ziv Medical Center, Safed, Israel

Background: CURB-65 is an important clinical score for severity in community-acquired pneumonia (CAP). C-reactive protein (CRP) an acute phase protein marker for bacterial infection or tissue inflammation. Serum CRP levels are well correlated with the severity of CAP. We aimed to investigate whether serum levels of CRP correlates with CURB-65 ranking in hospitalized patients with CAP.

Materials/methods: 858 patients aged 18 - 90 years who were hospitalized with CAP during a period of two years in the departments of Internal Medicine at Ziv Medical Center in Safed, Israel, were collected. Five hundred patients who met the inclusion and exclusion criteria were included. CURB-65 and serum levels of CRP within 24 hours of admission were collected for each participant. The correlation between serum CRP levels and CURB-65 were analyzed by Spearman’s rank correlation test.

Results: The mean age of all study group was 64±19 years, and the means CRP levels and CURB-65 score were 114 ± 100 mg/dl, 1.4±1.1points, respectively. No significant correlation was found between CRP and CURB-65 for all study group (R=-0.014, P=0.768). Nevertheless, we found a significant correlation between CRP and CURB-65 in 320 patients aged ≥ 65 years (R=-0.126, P=0.024).

Conclusions: In this study we found a significant correlation between CRP and CURB-65 among elderly patients aged ≥65 years but not among patients below the age 65 years. We believe that CRP measurements could be used as adjuvant marker to CURB-65 for assessment CAP severity in elderly patients.

**Genome-based epidemiology and antimicrobial susceptibility of a nation-representative collection of clinical isolates of *Acinetobacter baumannii* obtained from Saudi Arabia**

Reema Bawazeer*1,2; Turki Abujamel1, Majed Alghoribi1,2; Liliane Okdah1; Maha Alzayer1, Abdulrahman Alswaji1, Eisa Alrashidi1, Reem Alarfaj1, Sarah Alhassinah1, Hanan Balkhy4, Sameera Al-Johani1,3, Michel Doumith1,3

1King Abdullah International Medical Research Center, Riyadh, Saudi Arabia, 2King Abdulaziz University, college of Medical Applied Science, Jeddah, Saudi Arabia, 3King Saud bin Abdulaziz University for Health Sciences, Riyadh, Saudi Arabia, 4World Health Organization, Geneva, Switzerland

**Abstract third-party references:** King Abdullah International Medical Research Center, King Abdulaziz University

**Background:** Multidrug-resistant *Acinetobacter baumannii* has emerged as one of the most troublesome pathogens for health care institutions worldwide. However, limited information is collected on the antimicrobial resistance rates among clinical isolates in Saudi Arabia. Here we characterized a nationally representative collection of isolates.

**Materials/methods:** Isolates (*n*=200) were collected between March-2018 and March-2019 from five National Guard-Health Affairs hospitals covering the east, west and centre of Saudi Arabia. Identification was confirmed by species-specific PCR. Susceptibility testing were obtained with the VITEK II system and broth microdilution. β-Lactamase genes were sought by PCR. Selected (*n*=114) isolates were further characterized by multi-locus sequence typing (*ST*) (*n*=71) using the Oxford scheme or by whole genome sequencing (*n*=43) on the MiSeq instrument. Phylogeny was defined by single nucleotide polymorphism (SNP) analysis.

**Results:** Majority (*122/200, 61%*) of the isolates were resistant to carbapenems among which *118/122 (96.8%)* encoded Oxa-23-like; the remaining *4/122, 3.2%* produced Oxa-24-like. Isolates were variably resistant to gentamicin (*36.5%*) and tobramycin (*42.4%*) but remained mostly susceptible to colistin (*93.7%*) and tigecycline (*78.8%*). MLST and genome sequences identified 26 and 21 different STs among carbapenem-resistant (*n*=90) and -sensitive (*n*=24) isolates, respectively. STs of carbapenem-sensitive isolates were highly diverse whereas most (*88.9%, 80/90*) of those identified in resistant isolates were single or double locus variants of each other and comprised ST557 (*n*=25), ST218 (*n*=23), ST195 (*n*=13), ST1286 (*n*=8), ST451 (*n*=4), ST208 (*n*=2), ST444 (*n*=2), ST214 (*n*=1) and ST1050 (*n*=1), all of which belonged to ST2 (Pasteur scheme). Overall, phylogenetic analysis clustered carbapenem-resistant ST2 isolates according to their Oxford STs, but these were hundreds of SNPs apart. Among most common STs, SNP analysis identified close relatedness between isolates collected from the same or different hospitals suggesting inter- and intra-hospital transmission.

**Conclusions:** Our results showed a high prevalence rate of carbapenem resistance among *A. baumannii* in Saudi Arabia that was mainly associated with the acquisition of Oxa-23-like carbapenemase. Majority of carbapenem-resistant isolates belonged to ST2 (Pasteur scheme) but these were highly diverse at the whole-genome level. Spread of resistance was partially explained by clonal dissemination.

Abstract 657

Feasibility, reproducibility and first results of a multimodal prevention approach for KPC-Kp in a high prevalence hospital setting

Valeria Belvisi*1, Cosmo Del Borgo1, Raffaella Marocco1, Serena Vita2, Pasquale Dolce1, Marianna Meschiari1, Sergio Parrocchia1, Loredana De Marchis1, Lusana Aibardi2, Marco Clores3, Antonio Carraturo2, Giovanni Blanco2, Carmine Cosentino2, Antonella Melucci2, Elia Di Vincenzo2, Alessandra De Meo2, Alessandra Me佐zzi2, Massimo Aiuti2, Angelo Pompucci2, Giuseppe Visconti2, Alessandra Ianiari2, Claudio M. Mastroianni1, Cristina Mussini4, Miriam Lichtner7

1Department of Public Health and Infectious Diseases, “Sapienza” University, Polo Pontino, Latina, Italy, 2S.M. Goretti Hospital, Latina, Italy, 3Department of Public Health, University of Naples Federico II, Naples, Italy, 4University of Modena and Reggio Emilia, Modena, Italy, 5“Sapienza” University, Polo Pontino, Latina, Italy, 6Department of Public Health and Infectious Diseases, “Sapienza” University, Latina, Italy

Background: Targeted actions of infection control on hospital institutions’ local epidemiology and resources are required to contain carbapenemase-producing Klebsiella pneumoniae [KPC-Kp].

Materials/methods: An interchange protocol with the Infectious Diseases Unit of Modena Polyclinic was started to verify the feasibility of “Anti-KPC-Kp bundle” in the setting of S.M. Goretti Hospital of Latina (a tertiary university care centre with a high endemicity of KPC-Kp). A dedicated multidisciplinary working group was set up. Standardized indexes were defined to evaluate setting modifications and proposed targets in 3 high-risk wards (Intensive Care Unit (ICU), Emergency Medicine, Neurosurgery):

- active surveillance of rectal colonization;
- handwashing adherence assessments;
- alcohol solution consumptions, L/1000 patient-days (PD);
- meropenem Defined Daily Dose (DDD)/100 PD;

Statistical analysis: Indexes modifications are shown in percentages or changes in level (average ± SD). A Poisson regression model was applied to analyse the trend of KPC-Kp prevalence in ICU, Emergency Medicine and Neurosurgery. Only for ICU, a Poisson regression model was applied also to analyse the trend of the incidence density rates, considering the total hospitalization days as an offset in the model. Active control by participative focus groups among healthcare workers ensured the continuous implementation of the bundle.

Results: At baseline carbapenem resistance in all Kp hospital’s blood cultures was 71.4% (in ICU 87.5%). KPC-Kp prevalence reported monthly on the first day showed a dramatic reduction (Figure 1).

Figure 1: KPC-Kp colonization prevalence

Results from the Poisson regression models showed a statistically significant negative trend of prevalence in ICU (p<0.001) and Emergency Medicine (p=0.021), but not in Neurosurgery (p=0.259). A statistically significant negative trend was also found for incidence density rates in ICU (p=0.002). At basal, handwashing adherence in ICU was 59.3%. Further assessments are scheduled after starting a structured training program. An increase of alcoholic hand rub consumption was ob-
served from 14,2 (SD±7,56) to 33,59 (SD±13,11). A slight decrease of meropenem DDD was observed from 19,53 (SD±16,98) to 14,09 (SD±9,72).

Conclusions: After 8 months, an improvement of the indexes was observed. The exported model based on a multimodal approach exerted a rapid effect on Kp-KPC diffusion in the intensive area of the hospital, also in a different situation of high basal prevalence. A longer follow-up is necessary to confirm these data together with a more detailed carbapenem resistance rates’ analysis.

Abstract 663

Matched-paired analysis of patients treated for invasive mucormycosis with isavuconazole versus standard treatment

Danila Seidel*, Oliver A. Cornely, Maria J.G.T. Vehreschild, Philipp Köhler, Hartmut Bertz, Nikolai Klimko, Martin Hoenigl, Raoul Herbrecht, Hilmar Wisplinghoff, Farima Barmaki-Rad, Mikael Saulay, Marc Engelhardt, Kamal Hamed

1University of Cologne, Faculty of Medicine and University Hospital of Cologne, Department I of Internal Medicine, Center for Integrated Oncology Aachen Bonn Cologne Duesseldorf (CIO ABCD), European Diamond Excellence Center for Medical Mycology (ECMM), Cologne, Germany, 2University of Frankfurt, Department II of Internal Medicine, Section of Infectious Diseases, University Hospital Frankfurt, Frankfurt, Germany, 3University Hospital of Freiburg, Department of Hematology and Oncology, Freiburg, Germany, 4North-Western State Medical University, Department of Clinical Mycology, Allergy and Immunology, Saint Petersburg, Russian Federation, 5University of California San Diego School of Medicine, Division of Infectious Diseases, San Diego, California, United States, 6University of Strasbourg and Hôpital de Hautepierre, Department of Oncology and Hematology, Strasbourg, France, 7Wisplinghoff Laboratories, Cologne, Germany, 8Basilea Pharmaceutica International Ltd., Basel, Switzerland

Background: Isavuconazole (ISAV) is a novel, broad-spectrum triazole antifungal, available as both an intravenous and oral water-soluble prodrug, for the treatment of adult patients with invasive aspergillosis and mucormycosis. It was first approved for mucormycosis in 2015 based on data from 37 patients enrolled in a single-arm open-label trial (VITAL study) and 33 matched controls from the FungiScope® registry. Additional real-world data documenting the effectiveness of isavuconazole are obtained from an ongoing retrospective study within FungiScope®.

Materials/methods: FungiScope® proven and probable invasive mucormycosis cases treated with ISAV between 2016 and 2018 were matched with amphotericin B-based treatment controls from 1997 to 2018. Case-matching criteria included disease severity (i.e. central nervous system or disseminated disease), hematological malignancy and surgery. Baseline patient characteristics, key outcomes of clinical response according to the European Organization for Research and Treatment of Cancer/Mycoses Study Group (EORTC/MSG) criteria and all-cause mortality (ACM) were compared descriptively.

Results: 17 ISAV cases (16 proven, 1 probable) and 44 controls (41 proven, 3 probable) were identified. In the majority of cases (n=14, 82%), ISAV was administered as treatment for invasive mucormycosis in patients who had received prior lipid formulations of amphotericin B. In the remaining cases, ISAV was administered after prior posaconazole (n=2) or as primary therapy (n=1). In the control group, all patients received an amphotericin B-based therapy at some point, with 70% (n=31) as their initial or primary documented therapy.

Baseline patient characteristics and causative pathogens were similar between ISAV cases and controls. The overall response (complete or partial response) rates at the final assessment were 47% (8/17) for ISAV cases and 45% (20/44) for controls. ACM was 47% (8/17) in ISAV cases as compared to 59% (26/44) in controls.

Conclusions: In this analysis from FungiScope®, ISAV showed similar overall treatment response and improved mortality as compared to amphotericin B-based treatment in patients with invasive mucormycosis.

Abstract 664

**Anal human papilloma virus infection and disease in HIV-positive and -negative men and women**

Giuseppina Capra*, Paola Di Carlo¹, Nicola Serra¹, Luca Pipito¹, Daniela Cabibi¹, Chiara Mascarella¹, Daniela Pistoia³, Maria Carmela Micciulla¹, Teresa Maria Assunta Fasciana¹, Anna Giammanco¹

¹University of Palermo, PROMISE, Department, Palermo, Italy; ²Statistic Unit, Department of Public Health, Naples, Italy; ³Policlinico Paolo Giaccone Universital Hospital, Palermo, Italy

**Background:** Determining the forms of sexual behavior risk factors for various types of HPV infection is the basis for both understanding the natural courses of different HPV types and designing comprehensive strategies. The aim of this study was to evaluate the prevalence of HPV infections in patients with clinical anal lesions and in patients with risky factors of sexual intercourse.

**Materials/methods:** The analysis involved samples from patients who consecutively came to the Virology laboratory of the Department of Sciences for Health Promotion and Mother and Child Care (Policlinico University of Palermo, Italy), between February 2017 and May 2019 with clinicians’ requests for HPV tests. Routine laboratory diagnosis of HPV infection was performed on all samples using routine laboratory procedures as previously reported. HPV genotypes were identified using the INNO-LiPA HPV Genotyping Extra II kit (Fujirebio). All cytology, HPV testing, and histological examination was assessed in enrolled population.

**Results:** We enrolled 113 pts (74 of men and 39 of women), 64 reported anal lesions suggestive of HPV etiology and 49/113 patients showed sexual intercourse as sexual behavior risk factors. 43/113 enrolled pts showed HIV infections (37/74 males and 6/39 females). Among 113 anal sampling investigations we found HPV infection in 74/113 patients. HPV infection was confirmed in 44/64 patients with anal lesion suggestive of HPV etiology. HPV infection was confirmed in 30/49 pts with sexual intercourse. Oncogenic types were found in 48/74 positive samples: 31 were males and 17 were females. Among 74 HPV positive infections we founded multiple HPV genotype positive analysis in 38/74 cases. 36/38 multiple HPV genotype infection showed high risk genotypes. Overall of these were male with sexual intercourse as risk factors. Please copy and paste the corresponding text here.

**Conclusions:** Our study shows that the presence of HPV and multiple HPV infections in the anal district is high especially in subjects with sexual intercourse risk factors and male gender. Anal HPV lesion should be involved in the clinicians to HPV analysis to found multiple and HR HPV infection to prevent cancer evolution and stressed preventive strategies.

Cost-benefit analysis of rapid influenza testing in German emergency rooms

Roland Diel¹, Albert Nienhaus², Juergen Becker*³

¹University Medical Hospital Schleswig-Holstein, Institute for Epidemiology, Kiel, Germany, ²University Medical Center Hamburg-Eppendorf, Institute for Health Service Research in Dermatology and Nursing, Hamburg, Germany, ³Quidel Germany GmbH, Medical Scientific Division, Kornwestheim, Germany

Background: Seasonal influenza causes significant morbidity worldwide and has a substantial economic impact on the healthcare system. The objective of this study was to assess the cost-benefit by implementing two influenza tests that provides rapid testing results in emergency rooms (ER) of German hospitals.

Materials/methods: A deterministic decision-analytic model was developed simulating the incremental costs of using the Solana Influenza A+B real time molecular assay or the Sofia Influenza point-of-care A+B antigen assays, as compared to those of using conventional clinical judgement alone to confirm or exclude influenza in adult ILI (influenza-like illness) patients, in German ER, prior to hospitalization. Direct costs were evaluated from the hospital perspective, considering resource use directly related to influenza testing and treatment, as well as indirect costs incurred by nosocomial influenza transmission. Univariate sensitivity analysis was performed to examine the extent to which our calculations were effected by varying the parameters considered in our model between plausible extremes. To capture the interactions between multiple inputs, we also provided a probabilistic sensitivity analysis (PSA) by drawing values at random out of the distributions of the respective parameters in a second order Monte Carlo simulation with 10,000 repetitions.

Results: Through base-case analysis and assuming an influenza prevalence of 42.6%, influenza testing with the Solana and the Sofia assays reduced average costs of hospitalized ILI patients by €132.61 and €52.16 per tested patient, respectively. Moreover, utilizing the Solana assay, but not the Sofia assay saved €6.9 per tested patient in favor of the hospital. In PSA, under all reasonable assumptions, implementing the Solana assay reduced hospital costs on average by €144.13 as compared to the clinical-judgement-only strategy, thus, it was found to be constantly less expensive. In PSA, the Sofia assay also resulted in constantly lower expenditures, but of €119.89 per tested patient compared to the symptom-based approach.

Conclusions: Using highly specific influenza tests that provides a fast testing result in ILI patients at German ER may significantly reduce hospital expenditures.

Abstract 667

The clinical and molecular epidemiology of non-carbapenemase-producing carbapenem-resistant Enterobacteriaceae: a case-case-control matched analysis

Ruth Bouganim*, Liana Dykman1, Omar Fakeh1, Yair Motro1, Rivka Oren2, Tzilia Lazarovitch4, Ronit Zaidenstein2,5, Jacob Moran-Gilad3, Dror Marchaim2

1Tel Aviv University, Tel Aviv-Yafo, Israel, 2Assaf Harofeh Hospital, Unit of Infection Control, Be‘er Ya‘akov, Israel, 3Ben Gurion University of the Negev, Faculty of Health Sciences, Be‘er Sheva, Israel, 4Assaf Harofeh Hospital, Clinical Microbiology Laboratory, Be‘er Ya‘akov, Israel, 5Assaf Harofeh Hospital, Department of Medicine A, Be‘er Ya‘akov, Israel

Background: Risk factors and outcomes associated with CRE acquisitions, are derived primarily of cohorts consisting of carbapenemase-producing (CP) strains, but CRE-non-CP are understudied. Study aims were to analyze the clinical and genomic epidemiology of CRE-non-CP.

Materials/methods: A case-case-control matched analysis was conducted at Shamir (Assaf Harofeh) Medical Center, Israel, 11/2014 to 12/2016. Isolates were Klebsiella spp., Escherichia coli or Enterobacter spp. showing meropenem MIC≥ 2 µg/dL and negative for CP detection by multiplex PCR. CRE-non-CP patients (infected and asymptomatic carriers) were matched to patients with non-CRE Enterobacteriaceae carriage, and to un-infected controls (1:1:1 ratio). Matching criteria (in order of importance) included the 1) bacterial species 2) colonization vs. infection status, 3) age group, 4) calendar year, and 5) time at risk [days from admission to culture]. Matched multivariable regression models were constructed to analyze risk factors for CRE non-CP acquisition, and its independent impact on multiple outcomes. Thirteen representative isolates were whole genome sequenced using Illumina and analyzed for resistome and phylogeny (MLST and cgMLST).

Results: The study included 327 patients: 109 CRE-non-CP carriers (94% asymptomatic) who were perfectly matched to susceptible cases and uninfected controls. Despite multiple associations per univariable analyses, matched logistic regression revealed that the independent predictors of CRE-non-CP acquisition remained: 1) recent [≤ 3 months] exposure to antibiotics [to any class, of at least 2 days’ duration]; 2) ICU admission; and 3) chronic skin ulcers. CRE-non-CP isolation was not independently associated with worse outcomes. Genomic analyses revealed multiple clones (figure), and confirmed the lack of carbapenemases and co-existence of multiple genes contributing to carbapenem-resistance phenotype [multiple beta-lactamases and efflux pumps].

Conclusions: CRE-non-CP acquisitions were almost exclusively associated with asymptomatic carriage. Both the independent predictors [i.e., exposure to antibiotics], and what could be deduced from the genomic analyses [i.e., polyclonality and presence of various resistance mechanisms], imply that the major mode of acquisition is “emergence of resistance”, not “patient-to-patient transmission”, although this needs to be further explored in designated trials. CRE-non-CP remains an epidemiological threat due to the therapeutic challenge it imposes, and directed efforts [i.e., stewardship] should be invested in order to curb its continued spread.

Abstract 668

Analysis of the vaccination coverage in a dispensary in Mayotte, an oversea department and region of France

Clélia Pascal*, Olivier Lesens

1CHU Clermont-Ferrand, Service Maladies Infectieuses et Tropicales, Clermont-Ferrand, France

Background: Mayotte has been the 101st French County since April 2011. It has a high-density population explained by a high birth rate and a high immigration population coming from the Comoro islands. The aim of this study was to compare the mandatory vaccine coverage rate in dispensaries for native versus migrants.

Materials/methods: The vaccine status was collected during general practice consultations in the dispensaries of the north of the island of Mayotte from the 12th to the 28th of June 2019. Patients were interrogated by a general practitioner and a translator about their vaccine status written in their health care notebook (carnetiss). We noted the number of injections received of each mandatory vaccine, place of birth, age and gender. We considered that the vaccine status was complete if all the mandatory vaccination for their age was written on their health care notebook.

Results: We included 162 patients [54% (87) children <18-year-old and 57% (93) women. Migrants represented 22% (36/162) of patients and 78% (126/162) were native [French mahorais]. In this population, 23% (37/162) were up to date on their mandatory vaccinations, 45% (73/162) were not and 32% (52/162) of vaccine status were unknown. The health care vaccine notebook of children was better filled in than those of the adults with only 4,60% (4/87) of unknown vaccine status (2 of those were migrant children) against 64% (48/75) of unknown vaccine status for adults. Among children 25.3% (22/87) were up to date on their mandatory vaccinations compared to 20% (15/75) of adults. In total 21% (27/126) of natives versus 21.6% (35/162) of migrants were up to date on their vaccinations (p=0,14).

Conclusions: In this study the vaccination coverage was not affected by the origin of patients whether they are native or migrants. The causes of limitation to health care access for the overall population are multiple: lack of transportation, cost and high waiting time of consultation, lack of social welfare and health insurance, cost of vaccine if they are not realized in a Mother and Children Health care center and for migrants, the fear of being arrested on their way to consultation.

Abstract 669

**Incidence rate of health care associated infection in tertiary care children’s hospital in Ukraine**

Arkadii Vodianyk*, Kateryna Soiak1, Andrii Aleksandrin1

1National Children’s Specialized Hospital “OHMATDYT”, Kyiv, Ukraine

**Background:** Health care associated infections (HAI) are the most frequent adverse event in health care delivery worldwide. At any given time, the prevalence of HAI in developed countries varies between 3.5% and 12%. In low- and middle-income countries the frequency of HAI in intensive care units (ICU) is at least 2-3 fold higher than in high-income countries and for device-associated infections the frequency is up to 13 times higher.

Previously, health care facilities were not encouraged to use standardized approach for registration and notification of HAI which resulted in lack of data and understanding of the burden of HAI and affect planning on HAI response in Ukraine.

The aim of the study was to calculate the baseline incidence rate (IR) of HAI in ICU and surgical wards of tertiary care children hospital in Ukraine.

**Materials/methods:** Data on HAI was obtained using standardized notification forms that were filled by the doctors from March 1st till October 1st 2019. The case definitions of HAI outlined in EU Commission implementing decision 2018/945 were used.

Data verification and calculations of HAI incidence rates were conducted by department of infection control and risk assessment.

**Results:** The incidence rate of central line-associated bloodstream infections (CLABSIs) was 10.3 per 1000 device-days, the most common causative pathogens were Gram-negatives (60%). The IR of ventilator-associated pneumonia (VAP) was 49.7 per 1000 device-days, the most common causative pathogens were *A. baumannii* (38.8%), *K. pneumoniae* (22.2%). The IR of catheter-associated urinary tract infections (CAUTIs) was 18.3 per 1000 device days. The average length of catheterization was – 6 days for urinary catheters, 18 days for central line catheters and the average length of ventilation was 16 days.

**Conclusions:** The incidence rates of device-associated infections that were obtained are comparable to the HAI rates in low- and middle-income countries. Further surveillance on HAI, reducing the length of device use and implementation of core components for infection control are essential for reducing the burden of HAI.

Abstract 671

**Trachoma between schoolchildren: epidemiological situation in an endemic region of north-east Brazil**

Roberto Da Justa Pires Neto*1,2, Adjoane Maurício Silva Maciel1, Vivian Da Silva Gomes3, Flávio Brandão De Farias4, João Paulo De Sousa5

1Federal University of Ceará - Campus Porangabuçu, Department of Community Health, Fortaleza, Brazil, 2Federal University of Ceará - Campus Porangabuçu, Pós-Graduação em Saúde Pública, Fortaleza, Brazil, 3Health Secretary of the State of Ceará, Fortaleza, Brazil, 4Núcleo Estadual do Ministério da Saúde no Ceará, Fortaleza, Brazil, 5Municipal Health Secretary of Russas, Russas, Brazil

**Background:** Trachoma is a chronic relapsing keratoconjunctivitis caused by Chlamydia trachomatis that remains a public health problem and a major cause of morbidity, visual impairment and preventable blindness in Brazil. This study aimed to characterize the epidemiological situation of trachoma in the state of Ceará, northeastern Brazil.

**Materials/methods:** A cross-sectional study was conducted with data from school surveys conducted from 2013 to 2017 in 78 of 184 municipalities in the state of Ceará. The population comprised schoolchildren aged 5 to 14 years old. External ocular examination with 2.5X magnifying binocular loupe and flashlight was performed by reference examiners trained by the Brazilian Ministry of Health for clinical diagnosis of trachoma according to World Health Organization simplified trachoma classification system. Secondary data were obtained from the official Epidemiological Surveillance System of the Health Secretary of the State of Ceará.

**Results:** 936,916 schoolchildren were examined and 32,948 cases of trachoma detected. The proportion of cases decreased in the period with a reduction from 4.49% in 2013 to 2.04% in 2017. Most (72.6%) of the municipalities had a percentage below 5%. However, 42 (13.7%) municipalities still had a case rate above 10%.

**Conclusions:** The epidemiological profile of trachoma in Ceará shows a reduction in the proportion of cases of the disease among schoolchildren. The extension and distribution of trachoma in the state of Ceará is still of great magnitude and demonstrates the need for more effective actions to control the disease among schoolchildren.

Clinical manifestations of hospitalised chikungunya fever cases during epidemic in the state of Ceará, Brazil, from 2017 to 2019

Roberto Da Justa Pires Neto*1,2,3, Francisca Lillyan Christyan Nunes Beserra1, Joana D’arc Rocha Damasceno1, David Mendes De Melo1, Evelyne Girão2,4

1Federal University of Ceará - Campus Porangabuçu, Department of Community Health, Faculty of Medicine, Fortaleza, Brazil, 2Hospital São José de Doenças Infecciosas (HSJ), Fortaleza, Brazil, 3Federal University of Ceará - Campus Porangabuçu, Pós-Graduação em Saúde Pública, Fortaleza, Brazil, 4Hospital Universitário Walter Cantídio, Universidade Federal do Ceará, Fortaleza, Brazil

Background: Chikungunya fever is a viral illness transmitted by hematophagous arthropods and occurs mainly in tropical and subtropical areas. Chikungunya virus spread to America in late 2013. Autochtonous transmission was confirmed in Brazil in 2014. Chikungunya fever presents typically with fever and joint pain and may also develop severe and atypical manifestations.

Materials/methods: This was a retrospective study which analysed data from patients’ charts in a reference hospital in infectious diseases in Brazil. The study period was from January 2017 to April 2019. São José Hospital of Infectious Disease is located in state of Ceará, in the northeastern region of Brazil. Medical records of patients admitted to this hospital with Chikungunya fever confirmed by serological test were reviewed.

Results: Medical records from 71 patients with confirmed Chikungunya fever were analyzed. The average age was 22 years (±26). Comorbidities were found in 26 patients (36.6%). The most frequent clinical manifestations on admission were fever (68; 95.7%), nausea and vomiting (57; 80.3%), rash (49; 69%), arthralgia (35; 49.3%), and headache (27; 38%). Dermatological manifestations with bullous rash were observed in 13 cases (18.3%), of which 12 (92.3%) were children, and 9 (69.2%) younger than 1-year old. During hospitalization, 25 patients (35.2%) presented complications, especially neurological manifestations (15; 21.1%), of which 7 were meningitis, 5 encephalitis, 1 Guillain-Barré syndrome, 1 myelitis and 1 meningoencephalitis. Other frequent complications were acute kidney injury, hydrolelectrolytic disorders, myocarditis, and sepsis. 64 patients (90.1%) were discharged, 2 (2.8%) died and 5 (7.1%) were transferred to another hospital.

Conclusions: Great variability in the clinical manifestations of patients with Chikungunya fever admitted to a reference hospital in northeastern Brazil was observed. A significant percentage of complications, atypical manifestations, and unfavorable outcomes underscore the importance of early clinical recognition of Chikungunya fever to ensure adequate clinical support and reduce the risk of complications.

**Abstract 677**

Pan-genome analysis supports the differentiation of Bacteroides fragilis in division I and the potentially carbapenem-resistant cfiA+ division II into two species

Thomas Vognbjerg Sydenham*1, Ulrik S. Justesen2

1Department of Clinical Microbiology, Vejle Hospital - Part of Lillebaelt Hospital, Vejle, Denmark, 2Department of Clinical Microbiology, Odense University Hospital, Odense C, Denmark

**Background:** The commensal, opportunistic pathogen *B. fragilis* comprises at least two DNA homology groups. Division I carry the chromosomal cepA cephalosporinase gene and division II carry the cfiA carbapenemase gene. 5-30% of clinical isolates are cfiA+ and of these 30-50% display phenotypical resistance to carbapenems. The cepA and cfiA carrying isolates can be distinguished using routine MALDI-TOF-MS, but not by 16S rRNA gene sequencing. To investigate the differentiation of core genes between the two divisions we performed preliminary pangenome analysis.

**Materials/methods:** *B. fragilis* genomes were identified and downloaded from NCBI RefSeq using ncbi-genome-download [https://github.com/kblin/ncbi-genome-download](https://github.com/kblin/ncbi-genome-download) and re-annotated using Prokka. Roary with MAFFT was used for pangenome alignment phylogeny analysis. ABRicate [https://github.com/tseemann/abricate](https://github.com/tseemann/abricate) was used for identification of antimicrobial resistance genes.

**Results:** Genome assemblies of 161 *B. fragilis* isolates were available on October 15, 2019. For the 161 isolates a total of 38,247 genes were annotated of which 892 were core genes present in 99-100% of strains (Figure 1). 19 isolates were cfiA+ (division II) isolates. CfiA+ and cepA+ strains respectively, contained a large set of genes not present in the other. Division II isolates shared a core genome of 2602 genes of a total of 14216 genes. For cepA+ (division I) isolates a total of 31415 genes were annotated of which 1627 were core genes.

**Conclusions:** Of the 161 *B. fragilis* genome assemblies 19 are division II strains. The core-genome of the 161 isolates is only 892 genes which is much lower than the core-genome of *E. coli*, which has a comparable genome size to *B. fragilis*. 97% of *E. coli* strains share a core-genome of 2,613 genes (Ambram et al bioRxiv 2019). The core-genome of the 19 division II isolates is 2,602 genes. The current results support further work towards describing *B. fragilis* division II as a separate species.

**Figure 1.** Visualisation of the pan-genome of 161 *B. fragilis* strains from NCBI RefSeq using phandango [https://jameshadfield.github.io/phandango/](https://jameshadfield.github.io/phandango/). The 19 *B. fragilis* division II (cfiA+) are clearly differentiated from the remaining strains. A large set of genes are present in one division but not the other.

**Presenter email address:** thomas.sydenham@dadlnet.dk
Background: the 13-valent pneumococcal conjugate vaccine (pcv13) was introduced in Navarra in 2010. In 2020 two new pcvs are expected to be manufactured. pcv15 includes pcv13 serotypes plus 22f and 33f. pcv20 includes pcv13 serotypes plus 8, 10a, 11a, 12f, 15b, 22f and 33f. Monitoring of serotype distribution is necessary for surveillance and evaluation of vaccines. We aimed to monitor the circulating serotypes before the possible introduction of pcv15 and/or pcv20 in Navarra.

Materials/methods: we included the cases of invasive pneumococcal disease (ipd) diagnosed in Navarra between 2010-2019. An ipd case was defined as isolation of S. pneumoniae or detection by pcr from a normally sterile body site.

Results: 608 ipd were included: 67 (11%) patients were <5 years old, 239 (39.3%) patients were 5-64 years old and 302 (49.7%) patients were >=65 years old. 55 ipd could not be serotyped. Among the 553 serotyped ipd, the 3 most frequent serotypes were: serotype 3 (17.5%), serotype 8 (9.2%) and serotype 19a (7.4%). Other detected serotypes (between 4-5%) were: 9n, 7f and 22f. The detected serotypes according to the group of age were: in children <5 years old serotypes 19a (14.1%), 24f (14.1%) and 3 (10.7%); in patients between 5-64 years old serotypes 8 (16.4%), 3 (12.6%) and 9n (7.9%); in patients >=65 years old serotypes 3 (22.9%), 19a (6.9%) and 8 and 6b (5.5% each).

The rate of antibiotic resistance and the related serotypes was: 3.5% of penicillin resistance related to serotypes 11a, 14 and 19a; 0.7% of cefotaxime resistance related to serotypes 14 and 19a; 21.2% of erythromycin resistance related to serotypes 24f, 33f and 19a; 0.8% of quinolones resistance related to diverse serotypes.

Conclusions: the most prevalent serotypes causing ipd in Navarra were 3, 8 and 19a. In the last 9 years, in all ages 48.3% and 67.1% of ipd in Navarra were caused by serotypes included in pcv15 and pcv20 respectively. It would be critical to assess the effectiveness of the new vaccines against serotype 3. Serotype 24f caused 3.8% of ipd and is not covered by any of these 2 new products.

Abstract 681

**Generation of protective antibodies against heterologous Acinetobacter baumannii isolates**

Gathoni Kamuyu*1, Sam Willcocks2, Chidchamai Kewcharoenwong3, Richard Stabler2, Brendan Wren2, Ganjana Lertmemongkolchai2, Jeremy Brown1

1University College London, Rayne Institute, London, United Kingdom, 2London School of Hygiene & Tropical Medicine, London, United Kingdom, 3Khon Kaen University, Cellular and Molecular Immunology Unit, Research 4, Khon Kaen, Thailand

**Abstract third-party references:** Medical Research Council (MRC), Global Challenges Research Fund (GCRF), Respiratory Department, CITR, University College London

**Background:** Opportunistic nosocomial infections by multi-drug resistant Acinetobacter baumannii (A. baumannii) are associated with high morbidity and mortality rates. The increase in the incidence of infections caused by pan-drug resistant isolates further highlights the urgent need for novel therapeutics. We report on the generation of cross-reactive antibodies that are protective against homologous and heterologous strains in vivo and in vitro.

**Materials/methods:** We immunized CD1 mice with sub-lethal doses of Ab3879 (st215/kl10) and Abapsp-515 (st164/kl47) clinical A. baumannii isolates. We measured in vitro IgG binding to the bacterial surface and lysate by flow cytometry and Western blot analysis. Growth inhibitory/bactericidal activity of antibodies were measured by comparing bacterial growth in the presence anti-sera. Neutrophil phagocytosis of A. baumannii was measured following bacterial opsonisation with either homologous or heterologous sera, followed by incubation with neutrophils isolated from healthy human blood donors. The efficacy of antibodies in vivo was evaluated using a bacteremia mouse model of A. baumannii infection by either passive or active immunization prior to challenge.

**Results:** Flow cytometry and growth impairment assays demonstrated that antibodies in sera recovered from mice previously infected with A. baumannii recognized homologous and heterologous isolates but to different degrees. Anti-Ab3879 antibodies recognized the surface of the homologous isolate to a greater extent when compared to heterologous isolate (Ab3879, 93% versus Abapsp-515, 67%). Similarly, anti-Abapsp-515 bound its homologous isolates to a greater extent than Ab3879. Western blot analysis showed the recognition of both isolate-specific high molecular weight capsule, and multiple proteins. Survival following intraperitoneal challenge with lethal doses of Ab3879 was 100% in both homologous (Ab3879) and heterologous (Abapsp-515) immunized mice compared to 50% in controls, and the bacterial burdens in the lungs, spleen and liver of immunized mice were significantly lower compared to control mice (p-value < 0.05).

**Conclusions:** We demonstrate the generation of cross-reactive antibodies that recognize heterologous isolates both through recognition of structurally-related capsular polysaccharide and/ or conserved proteins. Protective antibodies to specific conserved protein targets could potentially be used for future monoclonal antibody passive immunization therapies.

Background: Cystic fibrosis patients are prone to bacterial pulmonary infections, mainly with *Burkholderia cepacia* complex. These bacteria are associated with severe complications.

Ceftazidime is currently combined with avibactam (CZA) as a first-line antibiotic. No studies have evaluated the CZA infusion time in patients with cystic fibrosis to date, although this population is known to have its own pharmacokinetic (PK) characteristics. The aim of this study was to evaluate different dosage regimens and to identify those that guarantee microbiological efficacy.

Materials/methods: From the population pharmacokinetic models published by Bulitta *et al.* and Bensman *et al.*, 10,000 PK profiles were simulated. The MIC distribution of *Burkholderia cepacia* complex bacteria was determined at the Burkholderia Observatory (Toulouse University Hospital) from strains isolated from 46 different hospitals. Based on the simulated kinetic profiles and the MIC distribution, the Probability of Target Attainment (PTA) and the Cumulative Fraction Response (CFR) were calculated. The critical values of the pharmacokinetic/pharmacodynamic (PK/PD) criterion were 65% fT>MIC and 50% fT>1mg/L for ceftazidime and avibactam, respectively.

Results: The CFR have shown that a minimum infusion time of 6 h is required to reach the critical value of the PK/PD criterion in more than 99% of patients. The infusion time can then be adapted after determining the MIC of the offending germ. For example, for a germ with a MIC equal to 8 mg/L, an infusion time of 4 h is necessary to guarantee microbiological efficacy in more than 99% of patients.

Conclusions: This work shows that the infusion time of CZA depends on the type of treatment (probabilistic antibiotic therapy or adapted secondarily to the antibiogram) and the sensitivity (MIC) of the causative pathogen.

This simulation-based work must be validated for use in hospital practice. Nevertheless, this approach was adopted for one patient (Toulouse University Hospital). As a result, the critical value of the PK/PD criterion was reached on the one hand and, on the other hand, clinical improvement was quickly obtained.

Abstract 687

Role of deoxyribonucleic acid content in the composition of microbial biofilm in the pathogenesis of severe respiratory infections

Viktoryia Ziamko*, Vitaly Okulich1, Alexander Dzyadzko Dzyadzko2

1Vitebsk State Medical University, Vitebsk, Belarus, 2Minsk Scientific and Practical Center of Surgery, Transplantation and Hematology, Vitebsk, Belarus

Background: It has been known about possibility of microorganisms to create specific multi-layered structures called biofilms. Non-cellular deoxyribonucleic acid actively participates in regulation of properties of biofilms. Thus, in biofilms transfer of genetic information including genes responsible for sensitivity to antibacterial drugs occurs much more often than in single-living bacterial cells. However, despite the involvement of extracellular deoxyribonucleic acid in adhesive processes and intercellular interactions, its role has not been fully understood.

Materials/methods: 238 isolates isolated from sputum and pharynx of 175 patients during 2016-2019 were studied. Patients were divided into two groups: the 1st group of 139 people (79.4%) had severe respiratory infections, the 2nd of 36 people (20.6%) - respiratory infections of moderate severity.

Results: A method was developed for determining percentage of deoxyribonucleic acid in microbial community using 4’6-diamidino-2-phenylindole dihydrochloride. Average age of the 1st group was higher than the second (p<0.05). Pseudomonas aeruginosa had the largest mass of biofilm and percentage of deoxyribonucleic acid in group 1, 48.25 [30.5-70.1] mcg/ml and 5.2 [2.1-7.67] %, p = 0.04. A strong relationship was found between percentage of deoxyribonucleic acid in Pseudomonas aeruginosa and severity of disease, r = 0.73, p<0.05. The incidence of adverse outcomes in isolating antibiotic resistant isolates was higher than in antibiotic sensitive (p<0.05). Analysis of results made it possible to propose fatal outcome when mass of microbial biofilm is > 47.5 mcg/well and percentage of deoxyribonucleic acid is >2.33% (p<0.01).

Conclusions: Method for determining percentage of deoxyribonucleic acid in biofilm has been proposed. With age there is a decrease in immune system which contributes to adherence of more pathogenic, antibiotic resistant microflora which has high biofilm weight and deoxyribonucleic acid percentage leading to disease progression and death.

Abstract 689

**Enterovirus D68 subclade B3 in children with acute flaccid paralysis in west Africa: evidence of spread of outbreaks reported in US and Europe, 2016**

1Institut Pasteur Dakar, Dakar, Senegal

**Background:** Since 2014, several outbreaks due to Enterovirus D-68 (EV-D68) have been reported, and it was confirmed that the virus can cause upper and lower respiratory tract diseases and be associated with the neurologic syndrome of acute flaccid myelitis (AFM). However, in African countries, the circulation and the molecular epidemiology of EV-D68 is poorly documented particularly on children with AFM. Our study aims to understand the extent of EV-D68 AFP in West Africa but also to know its genetic diversity and molecular epidemiology.

**Materials/methods:** To investigate the circulation of EV-68 in West Africa in AFP during the 2016 outbreak, we retrospectively screened 567 stools sample collected through routine poliomyelitis surveillance activities in seven countries of West Africa including Cape Verde, Gambia, Guinea-Bissau, Guinea Conakry, Mauritania, Niger, and Senegal between June to September 2016. After EV-D68 detection, molecular characterization was performed by amplification of the VP1 regions, followed by nucleotide sequencing.

**Results:** Among the 567 stool specimens tested, EV-D68 was detected in sixteen samples (2.8%) from three countries whose Guinea Conakry (11/391), Niger (1/85) and Senegal (4/59). The majority (62.5%) of the EV-D68 cases were detected in July. Children under 5 years were more vulnerable to EV-D68 infection with a frequency of 87.5%. Phylogenetic analysis of sequences of the VP1 region revealed that all West Africa strains sequenced belongs to the Subclade B3 variant of clade B. Additionally, the Subclade B3 strains of West Africa clustered with several other strains circulating during the same period in Spain and Sweden.

**Conclusions:** This study allowed to understand the extent of EV-D68 AFP in West Africa but also evidence of spread of outbreaks reported in US and Europe in 2016. These findings warrant implementation of enhanced surveillance of EV-D68 in confirmed case of AFM in African countries for a better understanding the disease and it burden.

**Abstract 690**

**Dissemination of a blaNDM-1-carrying IncA/C2 plasmid in a broiler flock: a possible real-life scenario**

Sead Hadziabdic*, Jennie Fischer1, Burkhard Malorny1, Istvan Szabo2

1German Federal Institute for Risk Assessment, Berlin, Germany

**Background:** Emergence of carbapenemase-producing Enterobacteriaceae (CPE) in livestock animals poses a worrying concern for public health safety. The sporadic detection of CPE in livestock suggests their low prevalence and a knowledge gap on the spread potential of plasmids carrying carbapenemase-encoding genes. In the frame of an international research project EFFORT, *in vivo* broiler chicken infection experiments were performed, aiming to understand spread and adaptation potential of a *S. Corvallis* native blaNDM-1-carrying broad-host range IncA/C2 plasmid in the absence of antibiotic pressure.

**Materials/methods:** Broiler chicken infection model was selected as an *in vivo* model for the investigation of spread and adaptation of a public health relevant broad MDR-encoding blaNDM-1-carrying IncA/C2 plasmid. Following oral inoculation of NDM-1-producing *S. Corvallis* strain, selection of *S. Corvallis* re-isolates and entero bacterial transconjugants were in-depth analysed by S1-PFGE and by Illumina and Nanopore whole-genome sequencing for a deeper insight into variants of the blaNDM-1-carrying IncA/C2 plasmid at genome level.

**Results:** The conducted *in vivo* study revealed rapid and broad host range dissemination of the blaNDM-1-carrying IncA/C2 plasmid to commensal *E. coli* strains (ST-117, ST-156, ST-2040, ST-2485) and a *K. pneumoniae* strain (ST-1106). Beside plasmid transfer, a transposition event of the blaNDM-1 gene onto another ~30 kb plasmid of an *E. coli* transconjugant strain was detected. Three types of structural deletions of the blaNDM-1-carrying IncA/C2 plasmid were detected (~10 kb deletions, ~70 kb deletions as a co-integrate formation). Despite structural deletions, loss of the blaNDM-1 gene was not observed.

**Conclusions:** Conducted *in vivo* study revealed broad dissemination of the blaNDM-1-carrying IncA/C2 plasmid. This occurrence is worrying as such entrance scenario might lead to broader dissemination of this plasmid in environments with mixed bacterial population. Another concerning observation is the transposition event of blaNDM-1 gene onto another plasmid which might facilitate further dissemination of this gene. Few structural alterations of blaNDM-1-carrying IncA/C2 plasmid indicate adaptation and persistence potential of this plasmid in the absence of antibiotic pressure. With the aim of preventing this scenario, entrance of a NDM-1-producing *S. Corvallis* strain into a broiler flock should be prevented, as broad dissemination of its MDR-encoding blaNDM-1-carrying IncA/C2 plasmid is inevitable.

**Presenter email address:** sead.hadziabdic@bfr.bund.de
Comparing clinical outcomes in Gram-negative bloodstream infections with desirability of outcomes ranking: focus on non-fermenting organisms

Kimberly Claeys*,1, Emily Heil1, J. Kristie Johnson1, Surbhi Leekha1

1University of MD at Baltimore, Baltimore, United States

Background: Rapid diagnostic testing (RDT) for the management of bloodstream infections (BSIs) has the potential to decrease time to organism identification and effective antibiotic therapy. These findings are primarily driven by data in gram-positive organisms, with less known regarding the benefits among gram-negatives, especially non-lactose fermenting organisms, where antibiotic resistance is complex and rarely detected by current RDTs.

Materials/methods: Subgroup analysis of retrospective quasi-experimental study of adult patients with gram-negative BSI from 9/2014 to 08/2018, with Verigene intervention in 9/2015. Inverse probability of treatment weighting (IPTW) controlling for Charlson Comorbidity Index and critical illness was used to balance patients. To further analyze risk/benefit IPTW-adjusted desirably of outcomes ranking (DOOR) was derived combining patient disposition and optimal antibiotic therapy. The DOOR designation was as follows; 1 = home, optimal antibiotics; 2 = home, suboptimal antibiotics; 3 = not home, optimal antibiotics, 4 = not home, suboptimal antibiotics, 5 = death.

Results: The original cohort consisted of 832 patients; 700 with Enterobacteriaceae, 99 with P. aeruginosa and 33 Acinetobacter spp. BSI. Among Enterobacteriaceae, median time to optimal therapy significantly decreased with RDT (54.7 vs 25.9 hours, \( P = 0.02 \)); however there was no change among non-lactose fermenters (24.5 vs 25.2 hours, \( P = 0.34 \)). For subgroup analysis, 132 met inclusion; 40 pre-RDT, 92 post-RDT. Among the IPTW subgroup there were no significant differences in time to optimal antibiotics (24.6 vs 25.4 hours, \( P = 0.3 \)) or in-patient all-cause mortality (10.9% vs 16.7%, \( P = 0.54 \)) with the introduction of RDT. Additionally controlling for source of infection there was no difference in in-patient all-cause mortality [adjusted OR = 0.77, 95% CI 0.14, 4.2]. DOOR was similar between groups; the probably of a lower DOOR among the pre-RDT group (Figure 1) was marginally higher (10%, 95% CI 9.6%, 10.5%).

Conclusions: Compared to patients with gram-negative BSI caused by Enterobacteriaceae, among BSI caused by non-lactose fermenting organisms the addition of RDT did not confer significant benefits. This is likely due to the complex, multifactorial mechanisms of resistance rarely detected by available RDT platforms.

Presenter email address: kcclaey@gmail.com
Detection of echinocandin resistance in *Candida glabrata* in the microbiology laboratory using commercial methods: interpret with caution!

Pilar Escribano*1, Laura Alguacil1,2, Judith Diaz-Garcia1,2, Carlos Sanchez Carrillo1, Patricia Muñoz2, Jesus Guinea Ortega1,2

1Hospital Gregorio Marañon, Instituto de Investigación Sanitaria del Hospital Gregorio Marañon, Madrid, Spain, 2Hospital Gregorio Marañon, Madrid, Spain

**Background:** Echinocandin resistance in *C. glabrata* can be detected in the clinical microbiology laboratory by using EUCAST and CLSI reference broth microdilution methods. Reference methods are time-consuming and most of microbiology laboratories lie on commercial methods such as Sensititre Yeast One® [SYO] or ETest to perform antifungal susceptibility testing. We assessed the ability of the ETest and SYO to accurately detect echinocandin resistance in *C. glabrata* clinical isolates.

**Materials/methods:** We studied micafungin- or anidulafungin-resistant *C. glabrata* isolates (n=29) according to EUCAST EDef. 7.3.1 methodology and harbouring the following FKS2 gene mutations: Δ658 (n=14), S663P (n=7), W715L (n=3), S663Y (n=1), E655A (n=1), and none (n=3). Echinocandin susceptibility using CLSI M27-ED4, ETest, and SYO (the latter using CLSI breakpoints) was further performed. Agreement between methods and very major errors (false susceptibility) were assessed.

**Results:** Essential agreement (± two-fold dilutions) between EUCAST and CLSI for anidulafungin and micafungin was 86% and 79%, respectively, and all mutants were correctly classified as resistant using both procedures (Figure). SYO yielded 6 isolates with very major errors to only micafungin (n=2, Δ658 and W715L), only anidulafungin (n=2, Δ658), or both (n=2, FKS wild type); the EUCAST MIC ranges against the isolates were 0.06-0.5 mg/L [micafungin] and 0.25-2 mg/L [anidulafungin]. All isolates showed an MIC of micafungin and anidulafungin ≥0.06 mg/L and ≥0.03 mg/L, respectively.

**Conclusions:** Micafungin and anidulafungin MICs against *C. glabrata* obtained by SYO should be interpreted with caution because up to 20% of very major errors (false susceptibility) may come out. In the absence of clinical breakpoints for MICs obtained by ETest, values ≥0.06 mg/L and 0.03 mg/L for micafungin and anidulafungin, respectively, could be used to detect echinocandin resistance. Isolates with suspicion of phenotypic echinocandin resistance using SYO or ETest should be confirmed by CLSI or EUCAST and by further FKS gene sequencing.

Abstract 710

Five-day versus ten-day oseltamivir chemoprophylaxis to prevent hospital influenza transmission: a non-inferiority randomised open-label study

Lidija Lepen¹, Maša Velušček¹, Rok Blagus², Amra Hodžić¹, Matej Mavrič¹, Rajko Saletinger¹, Dasa Stupica*³

¹Department of Infectious Diseases, University Medical Centre Ljubljana, Ljubljana, Slovenia, ²Faculty of Medicine Ljubljana, University Ljubljana, Institute for Biostatistics and Medical Informatics, Ljubljana, Slovenia, ³Department of Infectious Diseases, University Medical Centre Ljubljana, Faculty of Medicine Ljubljana, Ljubljana, Slovenia

Background: Based on the evidence of a protective effect of antivirals against influenza as well as their generally benign safety profile, some hospital infection control authorities recommend oseltamivir prophylaxis for vulnerable patients who were in close contact with influenza. Given the short incubation period of influenza, the recommended oseltamivir post-exposure prophylaxis for 7 to 10 days after the last known exposure may be too long.

Materials/methods: In an open-label randomized clinical trial, performed in a single-centre university hospital, the effectiveness of a 5-day versus 10-day post-exposure oseltamivir prophylaxis was compared in an intention to treat (ITT) and per protocol (PP) analyses and on a noninferiority premise in adult patients who were exposed as close contacts to influenza. Breakthrough influenza rate was assessed up to 10 days after discontinuation of oseltamivir prophylaxis.

Results: Among 222 randomized contact patients (median age 75 years; male 119 [53.6%]; median Charlson comorbidity index 5), 110 patients [49.6%] were assigned to receive oseltamivir post-exposure prophylaxis for 5 days, and 112 patients for 10 days. Patients in the two prophylaxis groups did not differ regarding basic demographic and clinical characteristics. Because single-patient rooms and cohorting capacities were in short supply, the median duration of exposition to influenza was two days [IQR 1–3 days]. All of 137 identified influenza patients, who served as index cases for 202/222 (91.0%) exposed contact patients, were prescribed oseltamivir treatment for 5 days. Rates of breakthrough influenza were 2/110 [1.8%] with 5-day regimen and 0/112 [0%] with 10-day regimen in the ITT study population (difference, 1.8 percentage points [1-sided 95% CI, –1 to 4.9 percentage points]; P=0.765) and 2/102 [2.0%] and 0/95 [0%), respectively, in the PP study population (difference, 2.0 percentage points [1-sided 95% CI, –1 to 5.3 percentage points]; P=0.745).

Conclusions: In patients, exposed to influenza as close contacts within hospital environment, 5-day post-exposure oseltamivir prophylaxis was noninferior to 10-day regimen with respect to preventing influenza transmission, assuming the predetermined noninferiority margin of 7 percentage points. Both prophylactic regimens were effective even if the exposed contact patients could not have been separated from index patients with influenza.

Abstract 711

**Association of statin use and microbiological and clinical characteristics of early Lyme borreliosis**

Maša Velušček¹, Rok Blagus², Tjasa Cerar Kišek³, Eva Ruzic-Sabljic¹, Franc Strle⁴, Dasa Stupica*⁵

¹Department of Infectious Diseases, University Medical Centre Ljubljana, Ljubljana, Slovenia, ²Institute for Biostatistics and Medical Informatics, Faculty of Medicine Ljubljana, Ljubljana, Slovenia, ³Institute of Microbiology and Immunology, Faculty of Medicine Ljubljana, Ljubljana, Slovenia, ⁴University Medical Centre Ljubljana, Ljubljana, Slovenia, ⁵Department of Infectious Diseases, University Medical Centre Ljubljana, Faculty of Medicine Ljubljana, Ljubljana, Slovenia

**Background:** *Borrelia burgdorferi* sensu stricto, the causative agent of Lyme borreliosis (LB) possesses a functional 3-hydroxy-3-methyl-glutaryl-coenzyme A reductase (HMGR), which is a rate limiting enzyme of the mevalonate pathway that contributes to cell wall synthesis. Statins are HMGR inhibitors and have been shown to reduce bacterial burden and alter the immune response to favour clearance of spirochetes in a mouse model of LB.

**Materials/methods:** The association between background statin use and prospectively collected clinical and microbiologic characteristics was investigated in 1220 adult patients with early LB manifesting as erythema migrans (EM) at a single-centre university hospital in Ljubljana, Slovenia. Patients were assessed at enrolment and followed-up for 12 months.

**Results:** Statin treatment was associated with age and prevalence of other comorbidities besides hyperlipidemia, but not with borrelial skin culture positivity rate, serological response to infection, or presence of LB-associated symptoms at enrolment. The proportion of patients taking statins was lower among patients with disseminated disease manifested as multiple EM than among those with solitary EM, but the difference was not significant (10/195, 5.1% vs 84/1025, 8.2%; *P*=0.19). The time to resolution of EM after starting antibiotic treatment was comparable in patients on statins and in those without statins (median 7 days, IQR 4–14). At 12 months, 59/989 (6.0%) patients showed incomplete response. The odds for incomplete response decreased with time from enrolment (odds ratio [OR] 0.49, 0.50, and 0.48 for 2-month vs. 14-days, 6-month vs. 2-month, and 12-month vs. 6-month follow-up visits, respectively), were higher in patients who reported LB-associated constitutional symptoms at enrolment (OR 8.10, 95% CI 5.69–11.55; *P*<0.001), but were not affected by statin use (OR 1.09, 95% CI 0.61–1.98, *P*=0.76).

**Conclusions:** In our study of European patients with EM, most of whom were infected with *B. afzelii*, statin use was not associated with selected clinical and microbiological parameters of infection.

**Presenter email address:** dasa.stupica@kclj.si
Abstract 715

Excluded versus included patients in a randomised controlled trial of infections caused by carbapenem-resistant Gram-negative bacteria: relevance to external validity

Vered Daitch1,2*, Mical Paul3,4, George L. Vanvitelli’, Napoli, Italy, 9Tel Aviv Sourasky Medical Centre, Tel Aviv, Israel, 10University of Haifa, Spencer Department of Nursing, Haifa, Israel, 11Attikon University General Hospital, Athens, Greece, 12Uppsala University, Department of Pharmaceutical Biosciences, Uppsala, Sweden, 13Center for Anti-Infective Agents, Vienna, Australia

**Background:** Population external validity is the extent to which an experimental study results can be generalized from a specific sample to a defined population. In order to apply the results of a study, we should be able to assess its population external validity. We performed an investigator-initiated randomized controlled trial (RCT) (AIDA study), which compared colistin-meropenem combination therapy to colistin monotherapy in the treatment of patients infected with carbapenem-resistant Gram-negative bacteria. In order to examine the study’s population external validity and to substantiate the use of AIDA study results in clinical practice, we performed a concomitant observational trial.

**Materials/methods:** The study was conducted between October 1st, 2013 and January 31st, 2017 [during the RCTs recruitment period] in Greece, Israel and Italy. Patients included in the observational arm of the study have fulfilled clinical and microbiological inclusion criteria but were excluded from the RCT due to receipt of colistin for >96 hours, refusal to participate, or prior inclusion in the RCT. Non-randomized cases were compared to randomized patients. The primary outcome was clinical failure at 14 days of infection onset.

**Results:** Analysis included 701 patients. Patients were infected mainly with Acinetobacter baumannii [78.2% (548/701)]. The most common reason for exclusion was refusal to participate [62% (183/295)]. Non-randomized and randomized patients were similar in most of the demographic and background parameters, though randomized patients showed minor differences towards a more severe infection. Combination therapy was less common in non-randomized patients [31.9% [53/166] vs. 51.2% [208/406], p=0.000]. Randomized patients received longer treatment of colistin [13 days [IQR 10-16] vs. 8.5 days [IQR 0-15], p=0.000]. Univariate analysis showed that non-randomized patients were more inclined to clinical failure on day 14 from infection onset [82% [242/295] vs. 75.5% [307/406], p=0.042]. After adjusting for other variables, non-inclusion was not an independent risk factor for clinical failure at day 14.

**Conclusions:** The similarity between the observational arm and RCT patients has strengthened our confidence in the population external validity of the AIDA trial. Adding an observational arm to intervention studies can help increase the population external validity and improve implementation of study results in clinical practice.

Investigation of the prevalence of Verocytotoxigenic Escherichia coli (VTEC) contamination of private groundwater wells in Ireland

Ellen Brosnan¹, Lateefat Olaore¹, Louise O’connor¹,², Brigid Hooban¹,², Kelly Fitzhenry¹,², Niamh Cahill¹,², Carlos Chique³, Michael P Ryan¹, Dearbhaile Morris¹,², Paul Hynds⁵, Jean O’dwyer³, Liam Burke*¹,²

¹National University of Ireland Galway, Antimicrobial Resistance and Microbial Ecology Group, School of Medicine, Galway, Ireland, ²National University of Ireland Galway, Ryan Institute Centre for One Health, Galway, Ireland, ³University College Cork, School of Biological, Earth and Environmental Sciences, Cork, Ireland, ⁴University of Limerick, Department of Chemical Sciences, School of Natural Sciences, Castletroy, Ireland, ⁵Technological University Dublin, Environmental Sustainability and Health Institute, Dublin, Ireland

Background: Approximately 750,000 people in Ireland obtain their drinking water from a private well. Wells are unregulated and quality testing by users is infrequent. Waterborne transmission of Verocytotoxigenic Escherichia coli (VTEC) through private wells has emerged as an important transmission route. Cattle manure and septic tanks are possible contamination sources, with persistent heavy rainfall contributing to microbial ingress. Ireland has the highest incidence of human VTEC infection, at almost ten times the EU average in 2017. The aim of this study was to investigate the prevalence of VTEC contamination in domestic private wells in Ireland.

Materials/methods: Groundwater wells (n=21) were sampled during October 2019 (Figure 1). Raw and/or treated well water samples (30 L) were collected and analysed using the “CapE” method (Morris, 2016). Filters were enriched overnight in buffered peptone water, DNA was extracted from enrichment broths and tested by multiplex real-time PCR for eae, vtx1 and vtx2 genes. Positive samples were tested for genes associated with serogroups O157, O26, O153, O145, O111 and O104. All samples were assessed for total coliforms and total E. coli using the Colilert-18 system (IDEXX). Data relating to groundwater vulnerability were geospatially linked to each well and assessed for univariate association with VTEC presence/absence.

Results: Verocytotoxin genes were detected in 9/21 wells (43%), 7 of which were also positive for eae. One or more of six serogroup gene targets were identified in all positive samples. Multiple serogroups were detected in 4/9, with O145 (n=6), O157 (n=5) and O103 (n=4) the most prevalent. Presence of live E. coli in well water samples (Colilert-18) was associated with detection of verocytotoxin genes (P=0.0075, Fisher’s Exact test). No significant associations were noted between the groundwater vulnerability variables analysed and presence of VTEC (significance level P<.05).

Conclusions: Private wells in Ireland are at risk of contamination with pathogenic strains of E. coli capable of causing human disease. This research represents preliminary data from the DESIGN (Detection of Environmental Sources of Infectious diseases in Groundwater Networks) study. Data generated from more widespread sampling may lead to policy development to protect private well users in Ireland from waterborne infectious diseases.

Abstract 721

Genomic analysis of carbapenemase-encoding plasmids from *Klebsiella pneumoniae* across Europe highlights three major patterns of dissemination

Sophia David¹, Victoria Cohen¹, Sandra Reuter², Tommaso Giani¹, Gian M. Rossolini³, Edward Feil⁴, Hajo Grundmann², David Aanensen¹⁵

¹Centre for Genomic Pathogen Surveillance, Cambridge, United Kingdom, ²Institute for Infection Prevention and Hospital Epidemiology, Medical Centre - University of Freiburg, Freiburg, Germany, ³University of Florence, Florence, Italy, ⁴University of Bath, Bath, United Kingdom, ⁵Big Data Institute, Oxford, United Kingdom

**Background:** The incidence of *Klebsiella pneumoniae* infections that are resistant to carbapenems, a last-line class of antibiotics, has been rapidly increasing. The primary mechanism of carbapenem resistance is production of carbapenemase enzymes, which are most frequently encoded on plasmids by *bla*<sub>OXA-48-like</sub>, *bla*<sub>VIM-like</sub>, *bla*<sub>NDM-like</sub> and *bla*<sub>KPC-like</sub> genes. Using short-read sequence data, we previously analysed genomes of >1700 isolates from the *K. pneumoniae* species complex submitted during the European survey of carbapenemase-producing Enterobacteriaceae (EuSCAPE). Here, we investigated the diversity, prevalence and transmission dynamics of carbapenemase-encoding plasmids in this sample collection.

**Materials/methods:** All carbapenemase-carrying contigs from short-read assemblies (*n*=696) were clustered into gene context (GC) groups, based on the order and nucleotide similarity of coding sequences flanking each carbapenemase gene. We performed long-read sequencing on 79 isolates including one isolate per GC group. These encoded a total of 14 *bla*<sub>OXA-48-like</sub>, 11 *bla*<sub>VIM-like</sub>, 15 *bla*<sub>NDM-like</sub> and 44 *bla*<sub>KPC-like</sub> genes. Long- and short-read sequence data were assembled together using Unicycler. Short-read mapping to the newly-obtained reference plasmids indicated how much of the reference sequence was present amongst all remaining isolates from the collection.

**Results:** We identified three major patterns by which carbapenemase genes have disseminated via plasmids. First, *bla*<sub>OXA-48-like</sub> genes have spread across diverse lineages primarily via the highly conserved, epidemic pOXA-48-like plasmid. Phylogenetic analysis of pOXA-48-like plasmid sequences demonstrated substantial horizontal transmission amongst co-localised chromosomal lineages but also indicated prolonged vertical transmission upon acquisition by high-risk lineages (ST11, ST15, ST101). Second, *bla*<sub>VIM-like</sub> and *bla*<sub>NDM-like</sub> genes have spread via transient associations of diverse plasmids with numerous lineages, albeit with high-risk lineages also playing a primary role in geographic spread. Third, *bla*<sub>KPC-like</sub> genes have transmitted predominantly by stable association with one successful clonal lineage (ST258/512), despite frequent mobilisation between pre-existing yet diverse plasmids within the lineage. These include pKpQIL-like plasmids which have co-evolved with the ST258/512 chromosome.

**Conclusions:** Here, we highlight three predominant modes of plasmid spread that have enabled widespread dissemination of carbapenemase genes. They can be summarised as using one plasmid/multiple lineages, multiple plasmids/multiple lineages, and multiple plasmids/one lineage. Despite these contrasts, all are underpinned by significant propagation along high-risk clonal lineages.

**Presenter email address:** sophia.david@sanger.ac.uk
Abstract 722

**A prospective cohort study of Malawian children presenting with fever**

*Angus De Wilton*¹, Fergal Howley²

¹University College Hospital, London, United Kingdom, ²Midland Regional Hospital Tullamore, County Offaly, Ireland

**Background:** Of an estimated 4.3 million cases of malaria in Malawi in 2017, the majority of malaria-related deaths occurred in children. Differentiating causes of childhood fever in rural clinics is challenging. Greater understanding of clinical features that differentiate malaria from other causes of fever may improve triage of febrile children in these settings. This study aimed to analyse clinical features associated with malaria and parental perceptions on causation of fever in a rural clinic in Malawi.

**Materials/methods:** This prospective cohort study included 313 children presenting with fever to a charity-funded clinic in rural Malawi between the months of March and June 2019. Children underwent tympanic temperature measurement and malaria rapid diagnostic testing (MRDT). Blood films were not routinely performed. Clinical assessment was performed, and brief interviews conducted with the child’s parent or guardian.

**Results:** 47.3% of children had positive MRDTs and were treated for malaria as per WHO guidelines. Children with a history of vomiting were more likely to have a positive MRDT (Odds ratio 3.4773, Confidence Interval 1.98-6.10, p-value <0.0001). This association increased when combined with a history of headache (OR 11.44, CI 2.6-50.2, p-value 0.0012). Negative MRDTs were predicted by rash (OR 6.6776, CI 1.49-29.90, p-value 0.013) and upper respiratory tract symptoms (OR 9.9716, CI 5.13-19.38, p-value <0.0001). There was no significant difference in time to presentation between MRDT positive and negative children. The likelihood of a positive MRDT was not significantly different where parents predicted a diagnosis of malaria as the cause of symptoms. There was a strong correlation between recorded temperature up to 40°C and likelihood of positive MRDT (r = 0.976, p-value 0.004). Temperature >40°C did not predict positive MRDT.

**Conclusions:** A diagnosis of malaria was predicted by symptoms of vomiting and headache, and by objectively elevated temperatures up to 40°C. Parents did not reliably differentiate the cause of symptoms at time of presentation, and children with malaria did not present earlier. This data should inform triage and malaria testing of febrile children and guide community education regarding malaria symptomatology.

Abstract 723

Typing of MRSA isolates from bloodstream infections in the Dutch-German border region and Berlin

Natacha Couto*, Erwin G. Raangs1, John Rossen2, Josef Hellkamp3, Johannes Elias4, Robin Köck4, Alexander W. Friedrich1

1University Medical Center Groningen, Groningen, Netherlands, 2University of Groningen / University Medical Center Groningen, Department of Medical Microbiology and Infection Prevention, Groningen, Netherlands, 3University of Oldenburg, Oldenburg, Germany, 4DRK Kliniken Berlin, Berlin, Germany

Background: Recent surveillance data indicated that in hospitals located in the Northern Dutch part of the Dutch-German border area, the incidence of MRSA bloodstream infections (BSIs) was [although lower than in Germany] higher than expected and exceeded national levels (Jurke et al., 2019). It was speculated that this could be a result of an additive burden of BSIs due to livestock-associated (LA)-MRSA in the border area characterized by a high density of livestock production. In order to evaluate this, we investigated the MRSA isolates from BSIs by using molecular surveillance techniques.

Materials/methods: We retrospectively characterized all available MRSA bacteremia isolates from university hospitals in the Dutch and the German part of the Dutch-German border region, as well as (for comparison) a hospital in Berlin. Typing of the isolates collected between 2016-2018 was performed by using WGS and a gene-by-gene approach (cgMLST, Ridom SeqSphere+ v6.0.2). Antimicrobial resistance genes were detected using CLC Genomics Workbench v12.0.3 and the ResFinder database.

Results: A total of 31 MRSA isolates were characterized (n=6 from Groningen, n=10 from Berlin, n=15 from Oldenburg). Most of the isolates belonged to clonal complex (CC) 22 (n=16), which was the most frequent CC in Groningen and Berlin but not in Oldenburg (Figure 1). Two isolates had new sequence types (STs 5702 and 5703, single locus variants of ST22). Several resistance genes were identified. None of the isolates was PVL-positive. MRSA ST398, indicative for LA-MRSA was not detected. Two possible direct transmission events could have occurred between two patients in Oldenburg and Berlin.

Conclusions: CC22 was the most commonly found clonal complex and none of the isolates belonged to the typical LA-MRSA STs, ruling out the additive burden that could have arisen from a high density of livestock production in this "Euregio".

Figure 1. Most common STs found in the 3 different studied sites.

Ignatzschineria bacteraemia following maggot wound infestation

Kristina Nadrah*1, Urška Glinšek Biškup1, Barbara Soba2, Vesna Cvitković Špik2, Manica Mueller-Premru2

1Department of Infectious Diseases, University Medical Centre Ljubljana, Ljubljana, Slovenia, 2Inštitut za mikrobiologijo in imunologijo, Medicinska fakulteta, Univerza v Ljubljani, Ljubljana, Slovenia

**Background:** Myiasis is an infestation of live humans and other vertebrates by larvae of various flies of the order Diptera which feed on host's dead or living tissue. In humans, it is often associated with precarious living conditions. We describe a case of myiasis with subsequent *Ignatzschineria* bloodstream infection as a complication of maggot wound infestation in a young male migrant.

**Materials/methods:** 18-year-old male patient was admitted to our hospital after being found in the river on the Slovenian border. On admission, he was febrile (39.6°C), normotensive with tachycardia (130/min). Since he was traveling by foot in the rural areas and woodlands of Balkans he had multiple superficial wounds on both legs with surrounding cellulitis and numerous small moving larvae on the skin and in the skin folds. His laboratory results revealed CRP 499, PCT 8.9 and leucocytosis of 25,9 \( \times 10^9 \) with a left shift (8% bands). Debridement of the wounds was performed and the patient was started on flucloxacillin and ciprofloxacin. The wounds were redressed two days later with numerous larvae observed and debrided.

**Results:** According to the shape and pattern of the posterior spiracles the larvae were identified as *Lucilia* sp. Rectal swab yielded *Enterobacter cloacae* ESBL and the skin swabs MRSA, therefore we changed antibiotics to imipenem and vancomycin. Blood cultures yielded *Ignatzschineria* sp., identified from subculture on blood agar only by 16S rRNA gene sequencing and sensitive to piperacillin/tazobactam, ceftazidim, imipenem and ciprofloxacin. After 10 days of antibiotic therapy the CRP levels decreased and clinical condition improved, he was afebrile and discharged. After second debridement there were no more larvae observed and the wounds were healing well.

**Conclusions:** This is the first human case of *Ignatzschineria* bacteraemia in Slovenia. *Ignatzschineria* spp. are emerging bacteria that have known association to myiasis in humans. Bacteraemia caused by these bacteria is rare. Given the increasing number of illegal border-crossers it could become an important migrant health issue. Therefore, it should be suspected by healthcare providers when experiencing maggot wound infestation.

**Presenter email address:** kristina.nadrah@guest.arnes.si
Abstract 758

**Increasing trend of leptospirosis in an area of northern Spain (1986-2019)**

Maria Julia Echeverria Irigoyen, Milagrosa Montes, Maria Yolanda Salicio, Luis Pineiro, Tania Martín Peñaranda, Gustavo Cilla

1Microbiology Department, Donostia University Hospital-Biodonostia Health Research Institute, San Sebastian, Spain

**Background:** Leptospirosis is a zoonotic disease more frequent in wet tropical and subtropical regions. Human infection results from indirect exposure to urine of carrier mammals, especially rodents. This work studies the incidence and epidemiological characteristics of leptospirosis in Gipuzkoa (Basque Country, Spain), 712,119 inhabitants.

**Materials/methods:** Retrospective leptospirosis review of clinical and laboratory data, 1986-Sept2019. Laboratory tests: Leptospira agglutination (Diagnostics Pasteur) until 1991, IgM ELISA (Panbio or Novatek) since that year and Leptospira DNA detection using an “in house” PCR (JCM 2014;52:2011) in 2015-2016 and a commercial PCR (Tropical fever, Fast-Track Diagnosis) since 2017. Microscopic Agglutination Test (MAT) (reference laboratories) was used to confirm agglutination or IgM-positive cases. Cases were classified following CDC Leptospirosis 2013 Case Definition.

**Results:** Eighty-two cases were detected in the period of study, being 55 (67.1%) confirmed and 27 (32.9%) probable cases, 72 (88%) in males. PCR only contributed with one more case than serology but allowed to confirm 13 cases that otherwise would have been classified as probable cases. Thirty-one cases (38%) were detected in 1986-2002 and 51 (62%) in 2003-2019 (22 of them in the last three years). Fifty-six cases (73% of the 77 with known age) were 30-69 years-old [group range 13-77 years]. In 2017-2019, the incidence was 1.03 cases/100,000 inhabitants, being in males 30-69 years-old 2/100,000. An epidemiological linkage was known in 60 (73%) cases: job-related [sewer maintenance, agricultural activities, livestock farming] in 67% and recreational activities [immersion in water, hunting, trekking] in 33%. Most cases were autochthonous [93%] and occurred in summer and fall [81%]. Ninety-eight percent of patients needed hospitalization and 50% were admitted in the Intensive Care Unit. There were no deaths. L. icterohaemorrhagiae (71%) and L. canicola (18%) were the most common serogroups.

The increase of cases observed in the last period (2017-2019), could not be attributed to an increase in requests or a common epidemiologically source.

**Conclusions:** In Gipuzkoa, the incidence of leptospirosis increased in recent years without a known cause. The highest rate was detected in 30-69 year-old males. A plausible epidemiological exposure was detected in most cases and PCR allowed confirm many of them.

**Presenter email address:** mariajulia.echeverriairigoyen@osakidetza.net
Linezolid-resistant strains of Enterococcus faecium in the Czech Republic from 2009 to 2018
Lucia Malisova*, Vladislav Jakubu12, Martin Musilek1, Helena Zemlickova123

1The National Institute of Public Health, Centre for Epidemiology and Microbiology, Prague, Czech Republic, 2Faculty of Medicine and University Hospital, Charles University, Department of Clinical Microbiology, Hradec Kralove, Czech Republic, 3Third Faculty of Medicine, Charles University, Department of Laboratory Medicine, Prague, Czech Republic

Background: Enterococci has become one of the most important opportunistic pathogens leading to nosocomial infections. Enterococcus faecium is the most clinical relevant. The treatment of infections caused by enterococci is limited since they exhibit intrinsic resistance to a broad spectrum of antibiotics [cephalosporins, sulphonamides, aminoglycosides, macrolides]. However, linezolid was approved and is still used for treatment of vancomycin-resistant enterococci infections, the incidence of linezolid resistant enterococci is worldwide on the rise. Therefore, the aims of this study was to determine mechanism of resistance and to map epidemiology of this pathogen within the Czech Republic since 2009 to 2018.

Materials/methods: The minimum inhibitory concentration (MIC) of 57 strains of E. faecium was examined according to the EUCAST recommendations. Molecular tools, PCR [plasmid carrying genes cfr, optrA], sequencing [23S rRNA, L3, L4 proteins] as well as multilocus sequence typing (MLST) were used to elucidate the mechanisms of resistance of linezolid resistant strains and to determine epidemiological relationship between linezolid resistant enterococci widespread in the Czech Republic within 9 years. Software Bionumerics 7.6.3 was used for sequence and consequently BURP analysis.

Results: All linezolid resistant isolates (n=75, 13%) had MIC for linezolid above 4mg/L. Altogether, 83 % (n=62) of strains were resistant also to vancomycin and/or to aminoglycosides (77%, n=58). Totally, 71 strains were linezolid resistant due to the mutation G2576T in 23S rRNA of 50S ribosomal subunit. The presence of gene cfr was confirmed just once. MLST analysis revealed the presence of only one clonal complex, CC17 [ST18, 78, 80, 117] of linezolid resistant E. faecium in the Czech Republic.

Conclusions: The high risk hospital associated clone CC17 confirmed all around Europe was also observed in the Czech Republic. The main mechanism (95%) of resistance to linezolid among E. faecium was the mutation in 23S rRNA (G2576T).

RESTORE-IMI 2: randomised, double-blind, phase III trial comparing efficacy and safety of imipenem/cilastatin (IMI)/relbebacam (REL) versus piperacillin/tazobactam (PIP/TAZ) in adult patients with hospital-acquired or ventilator-associated bacterial pneumonia (HABP/VABP)

1Ivano-Frankivsk Regional Clinical Hospital, Ivano-Frankivsk, Ukraine, 2Northwestern University Feinberg School of Medicine, Chicago, IL, United States, 3CHU de Nantes, Nantes, France, 4Hospital Civil de Guadalajara, Guadalajara, Mexico, 5University of the Philippines, Manila, Philippines, 6Tufts Medical Center, Boston, MA, United States, 7University of Michigan, Ann Arbor, MI, United States, 8Merck & Co., Inc., Kenilworth, NJ, United States

Abstract third-party references: Funding for this research was provided by Merck Sharp & Dohme Corp., a subsidiary of Merck & Co., Inc., Kenilworth, NJ, USA.

Background: Due to rising carbapenem resistance, new HABP/VABP treatment options are needed. IMI/REL, a combination of IMI and the class A and class C β-lactamase inhibitor REL, is active against many carbapenem-resistant gram-negative pathogens. We conducted a phase 3 clinical trial evaluating efficacy and safety of IMI/REL in HABP/VABP.

Materials/methods: RESTORE-IMI 2 was a randomized, controlled, double-blind, multinational, phase 3, non-inferiority trial in adult patients with HABP/VABP. Lower respiratory tract specimens were obtained ≤48 hours prior to screening. Patients were randomized 1:1 to IMI/REL 500mg/250mg or PIP/TAZ 4g/500mg, given intravenously every 6h for 7-14d. Patients also received empiric linezolid until baseline cultures confirmed absence of MRSA. The primary endpoint was Day 28 all-cause mortality and the key secondary endpoint was clinical response at early follow-up (7-14d after completing therapy) in the modified intent-to-treat (MITT) population (randomized patients with ≥1 dose of study drug, excluding patients with only gram-positive cocci present on baseline Gram stain). Non-inferiority margins for these endpoints were 10% and -12.5%, respectively. The safety population comprised all patients who received study drug.

Results: The MITT population comprised 531 of 537 randomized patients [264 IMI/REL, 267 PIP/TAZ]; 48.6% had ventilated HABP or VABP, 42.9% were ≥ 65 years old, 66.1% were in the ICU, 47.5% had APACHE-II scores ≥15, and 24.7% had moderate/severe renal impairment. The most common causative pathogens in the microbiologic MITT population (MITT patients with confirmed, eligible causative pathogens) were K. pneumoniae (25.6%), P. aeruginosa (18.9%), A. calcoaceticus-baumannii complex (15.7%), and E. coli (15.5%). IMI/REL was non-inferior [p <0.001] to PIP/TAZ in both primary and key secondary efficacy endpoints [Table]. Rates of adverse events (AEs) in the safety population [IMI/REL 226/266 [85.0%] vs PIP/TAZ 233/269 [86.6%]], and therapy discontinuations due to both overall AEs [IMI/REL 15/266 [5.6%] vs PIP/TAZ 22/269 [8.2%]) or specifically due to drug-related AEs [IMI/REL 6/266 [2.3%] vs PIP/TAZ 4/269 [1.5%]) were similar in both groups. The most frequently reported (>5 patients) drug-related AEs in the IMI/REL arm were diarrhea, increased alanine aminotransferase, and increased aspartate aminotransferase [6/266 [2.3%] each].

Conclusions: IMI/REL is an efficacious and well-tolerated treatment option for HABP/VABP.

Abstract 772

*Mycobacterium tuberculosis* drives expansion of low-density neutrophils equipped with regulatory activities

Marco La Manna1,2, Bartolo Tamburini1,3, Paola Di Carlo4,5, Antonio Cascio1,4, Valentina Orlando1,3, Sofia Lo Sauro1, Federica Amatuzzo1, Rosanna Assetta1, Elvezia Maria Paraboschi1, Benedetta Romanin1,4, Francesco Dieli1,3, Nadia Caccamo3

1University of Palermo, Palermo, Italy, 2University of Palermo, Centre of Biomedical Applications, BIND, Palermo, Italy, 3University of Palermo, Centre of Biomedical Applications, Palermo, Italy, 4University of Palermo, PROMISE department, Palermo, Italy, 5Humanitas University, Milan, Milan, Italy

**Background:** In human tuberculosis (TB) neutrophils represent the most commonly infected phagocytes, however their role in TB protection and pathology remained contradictory, with some data implicating neutrophils in the TB control and others associating them with TB pathology and progression. Moreover, a subset of low-density neutrophils (LDNs) has been identified in TB, but until now, despite several studies have described the diversity of neutrophil subpopulations, their plasticity in playing different functions is still not fully elucidated.

**Materials/methods:** We have compared the ratio between neutrophils and lymphocytes (N/L) in Active TB patients Cured TB patients and Healthy donors (H.D.). Moreover, in active TB patients, we have analyzed total neutrophils and their low-density (LDNs) and normal-density (NDNs) subsets, in terms of frequency, phenotype, functional features and gene expression signature. Data collection, emocytometer, flowcytometry and confocal microscopy were used in order to evaluate the absolute count of neutrophils and lymphocytes cells, the phenotypical and functional properties of the subsets of neutrophils and their transcriptomic profile for cytokines, chemokines and transcription factors of the innate immunity compartment.

**Results:** Biological properties of the two isolated neutrophil populations suggest their dual role during TB: NDNs provide a mechanism for bacteria killing, through oxidative burst and NETosis, by upregulating transcription factors involved in the release of cytokines and activation of innate and acquired immune cells, LDNs instead exert suppressive activities on T cell response.

**Conclusions:** The balance between these two subsets of neutrophils might influence either the initial steps of innate immune responses or the subsequent development of the adaptive immune response to *M. tuberculosis*, ultimately influencing the outcome of infection.

Susceptibility of β-lactam-resistant Pseudomonas aeruginosa to last-line antibiotics stratified by carbapenemase production

Nicholas Jun Wei Ho1, Yong Lin Ng1, Bernadette Cheng2, Jeanette Teo1, Ka Lip Chew*2

1Ngee Ann Polytechnic, Singapore, Singapore, 2National University Hospital, Singapore, Singapore

Background: Carbapenem-resistant Pseudomonas aeruginosa is a global critical threat. There are various mechanisms of resistance to carbapenems including carbapenemase production. Clonal spread of NDM-producing Pseudomonas aeruginosa has previously been demonstrated in our local population. An investigation was conducted to determine the distribution of carbapenemase production and antimicrobial susceptibility among β-lactam resistant Pseudomonas aeruginosa.

Materials/methods: Polymerase-chain-reaction (PCR) for gene-encoding NDM, KPC, OXA-48, GES, VIM, IMP, and OXA-23 was performed on β-lactam-resistant Pseudomonas aeruginosa isolates from a tertiary hospital in Singapore between 1/1/2019 and 30/6/2019. Only isolates that were non-susceptible to ceftazidime, cefepime, piperacillin-tazobactam, imipenem, and meropenem from routine susceptibility testing (Vitek 2) were included. Extended antimicrobial susceptibility testing to aztreonam, ceftazidime-avibactam, ceftolozane-tazobactam, and colistin was also performed using Sensititre broth-microdilution (ThermoFisher) and interpreted according to EUCAST breakpoints.

Results: Twenty-nine (54.7%) of the 53 Pseudomonas aeruginosa isolates were found to carry carbapenemase genes. Of these, fifteen (28.3%) were NDM-positive, eleven (20.8%) were IMP-positive, and three (5.7%) were GES-positive. The overall susceptibility results are present in Table 1. Metallo-β-lactamase-positive-isolates (NDM and IMP) were all resistant to ceftazidime-avibactam and ceftolozane-tazobactam, while GES-positive-isolates (class A carbapenemase) were susceptible to ceftazidime-avibactam but resistant to ceftolozane-tazobactam. Susceptibility to colistin was variable. All colistin-resistant isolates had a minimum-inhibitory-concentration (MIC) of 4 mg/L.

Conclusions: High rates of carbapenemase production was demonstrated among our β-lactam-resistant Pseudomonas aeruginosa isolates. High rates of resistance to various last-line antimicrobials were also demonstrated. The antibiogram varied based on carbapenemase-genes. Overall susceptibility was highest for colistin at 66.0%, and less than 50% for other drugs. All colistin resistant isolates had MICs within the area-of-technical-uncertainty (ATU) for colistin, the impact of which is unclear. Further work is needed to control spread of these multi-drug-resistant-organisms and to develop better treatment options.

Abstract 780

Effectiveness of implementing a locally developed antibiotic use guideline for community-acquired cellulitis at a large tertiary care university hospital in Thailand

Rujipas Sirijatuphat*, Pornboonya Nookeu, Visanu Thamlikitkul

1Department of Medicine, Faculty of Medicine Siriraj Hospital, Mahidol University, Bangkok, Thailand

Background: Cellulitis is a common infection among both ambulatory and hospitalized patients. A study conducted in 970 adult patients with cellulitis at Siriraj Hospital revealed that broad-spectrum antibiotic or antibiotic combination was inappropriately prescribed in most of these patients even though only a narrow-spectrum agent and a single agent was needed in most patients. The objective of this study was to determine the effectiveness of implementing a locally-developed clinical practice guideline (CPG) for antibiotic use in adults with community-acquired cellulitis who receive medical care at Siriraj Hospital in Bangkok, Thailand.

Materials/methods: The CPG for antibiotic treatment of community-acquired cellulitis was developed based on data from 970 adult patients treated for cellulitis at Siriraj Hospital during June to December 2016. The CPG is a one-page Thai language document. The CPG was introduced via multiple methods, including posters, brochures, circular letters, social media, conference, classroom training, and interactive education during January to September 2018. Medical records of adult patients with cellulitis were collected and analyzed for demographic and clinical characteristics, antibiotic regimens, clinical outcomes, cost of treatment, and CPG compliance.

Results: Among 360 adult patients with community-acquired cellulitis, 84.4% were ambulatory, and 15.6% were hospitalized. The median age of patients was 62 years, and 59.4% were female. Antibiotic prescription according to CPG (CPG-compliant group) was observed in 251 patients (69.7%), and CPG non-compliance was found in 109 patients (30.3%) (CPG-noncompliant group). The demographics and characteristics of patients were comparable between groups. Patients in the CPG-compliant group had a significantly lower rate of intravenous antibiotics (18.7% vs. 33.9%, p=0.007), lower prescription rate of broad-spectrum antibiotics (14.7% vs. 78.9%, p<0.001) and antibiotic combinations (6.4% vs. 13.8%, p=0.022), shorter median duration of antibiotic treatment (7 vs. 10 days, p<0.001), lower median cost of antibiotic treatment (3 vs. 7 USD, p<0.001), and lower median hospitalization cost (601 vs. 1,587 USD, p=0.008) than those in the CPG-noncompliant group. Treatment outcomes were not significantly different between groups.

Conclusions: Adherence to the CPG could reduce inappropriate prescription of broad-spectrum antibiotics or antibiotic combinations and lower treatment costs in adults with community-acquired cellulitis without differences in favorable outcomes or adverse events.

Abstract 784

Launch of a new faecal molecular external quality assessment scheme by UK NEQAS Parasitology

Jaya Shrivastava*, Agatha Saez1, Peter Chiodini2

1Public Health England, London, United Kingdom, 2University College Hospital, London, United Kingdom

Background: Protozoan infections still cause significant morbidity and are responsible for a large portion of infectious gastroenteritis. They are even believed to be twice as common as bacterial infections. These commonly recognized pathogenic protozoa include Giardia lamblia, Cryptosporidium species and Entamoeba histolytica.

Because of the clinical importance of these protozoa, rapid plus sensitive detection and standardised diagnostic procedures are needed in order to allow for specific and rational treatment. As a result, recent times have seen increased use of molecular methods for detection.

Various molecular methodologies exist each with their own specific and general pitfalls and limitations.

Thus, the need for a fit-for-purpose qualitative External Quality Assessment (EQA) or Proficiency testing scheme for these parasites is very timely.

Materials/methods: We sent out a questionnaire to all participants within our microscopy-based Faecal Parasitology EQA scheme in order to determine level of interest for a molecular EQA scheme.

Freeze dried specimens were prepared using clinical and/or cultured specimens spiked in negative faeces.

The homogeneity and stability of these specimens at various temperatures and time points were analysed.

A pre-pilot survey was performed with 10 labs (UK plus non-UK) and results analysed.

Results: 100% of participants were able to identify faecal parasites in our EQA challenge. No false positive or false negatives were observed in the mini-pilot.

Freeze dried faeces is a suitable matrix due to the following:

- Intended matched participant results.
- Samples travelled well.
- Samples worked well under all DNA extraction and amplification methods used by participants.
- Samples were homogeneous and stable under the tested conditions.

Conclusions: We have produced a fit for purpose EQA scheme for molecular detection of faecal parasites.

Presenter email address: jaya.shrivastava@phe.gov.uk
Background: During providing medical care to seriously ill patients with Crimean-Congo hemorrhagic fever (CCHF), the risk of Health care-associated infections (HCAIs) increases in first and second level hospitals. A unified assessment of the severity of the patient’s condition which allow to identify the patients at high risk of death and indications for transfer to a third-level hospital is required.

Aim: to develop a methodology for assessment the risk of death in patients with CCHF based on the clinical and laboratory parameters at the day of hospitalization, which are available in the hospitals of first / second level.

Materials/methods: Based on the analysis of 4 methods of assessment the severity of patients with CCHF [Swanepoel R. et al., 1989; Bakir M. et al., 2012; Dokuzoguz B., 2013; Bakir M. et al., 2015] a mortality risk prediction scale was developed. It based on 12 clinical and laboratory parameters (age, alanine transaminase, aspartate transaminase, leukocyte count, liver size, organ disorders, bleeding, thrombocyte count, prothrombin time, international normalized ratio, fibrinogen) and 2-4 gradations of each parameter, which were reflected in 32 criteria of the scale. The scale was tested on the retrospective analysis of case records of 52 patients with CCHF who were treated in hospitals of the Turkestan region in Kazakhstan in 2000-2018.

Results: Clinical and laboratory parameters of the patients were evaluated in accordance with the developed point scale for assessing the risk of death in patients with CCHF. Each evaluated parameter was assigned a certain number of points and their total amount was determined. With a patient score of ≥11, a high probability of an adverse outcome was predicted. With a score of <11, the probability of an fatal outcome of CCHF was estimated as low. The sensitivity of the proposed method is 100%, specificity - 98%, predicted value - 90%.

Conclusions: The proposed methodology with a high probability allows to predict the development of an unfavorable outcome of CCHF and is suitable for use in hospitals of the first and second levels to optimize the medical care of patients with this pathology and the prevent of HAI's.

Abstract 787

**A pathogen and a non-pathogen spotted fever group Rickettsia trigger differential proteome signatures in macrophages**

Pedro Tiago Cardoso Curto*1,2,3, Cátia Santa1,3, Paige Allen2, Bruno Manadas1,3, Isaura Simoes1,2, Juan Jose Martinez2

1Coimbra, Center for Neuroscience and Cell Biology, Coimbra, Portugal, 2Louisiana State University, School of Veterinary Medicine, Baton Rouge, United States, 3University of Coimbra, Institute for Interdisciplinary Research, Coimbra, Portugal

**Abstract third-party references:** This work was supported in part by Fundos FEDER através do Programa Operacional Factores de Competitividade—COMPETE 2020 and por Fundos Nacionais através da FCT—Fundação para a Ciência e a Tecnologia no âmbito do projeto Estratégico com referência atribuída pelo COMPETE: POCI-01-0145-FEDER-007440; and by POCI-01-0145-FEDER-029592, financiado pelo Programa Operacional Competitividade e Internacionalização na sua componente FEDER e pelo orçamento da Fundação para a Ciência e a Tecnologia na sua componente OE.

**Background:** Spotted fever group Rickettsia are recognized as important agents of human tick-borne diseases worldwide such as Mediterranean spotted fever (*R. conorii*) and Rocky Mountain spotted fever (*R. rickettsii*). Reductive genome evolution in obligate intracellular Rickettsia has resulted in the loss of many metabolic pathways, which culminates with Rickettsia species being strictly dependent on host cells to survive and proliferate. Several efforts have been made to identify host and bacterial determinants that allow bacteria to proliferate inside host cells. We have reported a differential tropism of pathogenic and non-pathogenic Rickettsia species in macrophages, further strengthening the complexity of host–rickettsiae interactions and raising questions on how pathogenic Rickettsia manipulate host pathways to their advantage.

**Materials/methods:** We have herein employed a quantitative high-throughput proteomics approach (SWATH-MS) to profile alterations in THP-1 macrophages upon infection with the highly pathogenic *R. conorii* and the non-pathogenic *R. montanensis*.

**Results:** Our results revealed that *R. conorii* is able to substantially reprogram several host signaling pathways, modulating host cells to a niche apparently more adapted to its needs. Specifically, *R. conorii* induced the accumulation of several enzymes of the tricarboxylic acid cycle, oxidative phosphorylation, fatty acid β-oxidation, and glutaminolysis, as well as of several inner and outer membrane mitochondrial transporters. These results suggest a profound metabolic rewriting of macrophages by *R. conorii* toward a metabolic signature of an M2-like, anti-inflammatory activation program. Moreover, several subunits forming the proteasome and immunoproteasome are found in lower abundance upon infection with both rickettsial species, which may help bacteria to escape immune surveillance. *R. conorii*-infection specifically induced the accumulation of several host proteins implicated in protein processing and quality control in ER, suggesting that this pathogenic Rickettsia may be able to increase the ER protein folding capacity.

**Conclusions:** Our results unfold the intricate pattern of modulation triggered by a pathogenic Rickettsia to control macrophage homeostasis and to maintain a viable intracellular niche. By illuminating the still very poorly studied aspects of macrophage–Rickettsia interactions, our work provides an essential framework for a deeper understanding of the link between rickettsial pathogenicity and host manipulation.

**Feasible alternatives to dried blood spot in the retrospective diagnosis of congenital cytomegalovirus infection**

Carmen Alhena Reyes Ruiz*1, Irene Taravillo2, Noelia Moral1, Cinta Moraleda3,4, Daniel Blázquez-Gamero3,4,5, Lola Folgueira1,4,5

1Hospital Universitario 12 de Octubre, Virology laboratory, Madrid, Spain, 2Hospital Universitario 12 de Octubre, Biomedical Research Institute imas12, Madrid, Spain, 3University Hospital 12 de Octubre, Paediatric Infectious Unit, Paediatric Department, Madrid, Spain, 4Hospital Universitario 12 de Octubre, Biomedical Research Institute imas12, Madrid, Spain, 5Universidad Complutense de Madrid, Medicine Department, School of Medicine, Madrid, Spain

**Background:** Retrospective diagnosis of CMV infection (cCMV) cases plays a crucial role in the management of late-onset symptomatic infants and it is usually achieved by CMV DNA detection in dried blood spot (DBS) cards. However, there is a lack of consensus about the most reliable extraction and PCR protocols to be used. In this study, we describe viral load (VL) results in various clinical samples from confirmed cCMV cases. The objectives were: (1) To compare CMV-VL values in samples obtained at birth from infants with cCMV. (2) To evaluate dried umbilical cord (DUC) samples as an alternative to dried blood samples (DBS).

**Materials/methods:** Saliva and/or urine, peripheral blood, and DBS from 15 infants with confirmed cCMV infection were collected at birth. CMV-VL was determined by real-time polymerase chain reaction (rt-PCR). In two cases, VL was determined from available DUC samples. The Mann–Whitney U test was used to compare VL values.

**Results:** Five (33.3%) of the 15 infants were symptomatic, and 10 (66.6%) were asymptomatic. The CMV-VL found in saliva and in urine were both higher than those found in peripheral blood (p-value: 0.0001). Symptomatic infants presented 100% of detectable VL in peripheral blood and 40% in DBS. Asymptomatic infants showed 75% of detectable VL in peripheral blood and 40% in DBS.

**Conclusions:** When VL was detectable in peripheral blood, the values were lower than in saliva or urine, in both symptomatic and asymptomatic cases of cCMV. The low sensitivity in DBS samples could be due to low blood volume content, making CMV-VL undetectable even when using optimised extraction and PCR protocols. Based on our experience and on published data, DUC could be a reliable alternative to DBS.

**Kingella endocarditis in children: a distinct entity or not?**

Alexander Lowenthal1,2, Hila Weisblum-Neuman1, Einat Birk1,2, Itzhak Levy1,2, Haim Ben Zvi1, Gabriel Amir1,2, George Frenkel1,2, Elchanan Bruckheimer1,2, Gilat Livni1,2, Dafna Marom1,2, Liat Ashkenazi-Hoffnung1,2, Ofer Schiller1,2, Elhanan Nahum1,2, Oded Scheuerman*1,2

1Schneider Children’s Medical Center in Israel, Petah Tikva, Israel, 2Tel Aviv University, Tel Aviv-Yafo, Israel, 3Beilinson, Petah Tikva, Israel

**Background:** Kingella, a gram-negative coccobacillus, causes various invasive pediatric diseases, including life threatening infective endocarditis (IE). Data on pediatric Kingella endocarditis are scarce. Our aim is to describe the clinical features of pediatric Kingella IE patients and compare them to other causative agents of IE, determining whether they have unique clinical characteristics.

**Materials/methods:** We retrospectively analyzed patients, aged 0-18 years, admitted with IE between the years 1994-2019, in a tertiary pediatric center in Israel.

Inclusion criteria was fulfillment of Duke’s criteria for diagnosis of IE. We compared the epidemiologic, clinical, laboratory, imaging and cardiac features of the patients with Kingella to Streptococcus species and Staphylococcus Aureus IE.

**Results:** 60 patients were included in the study. In 19 the causative pathogen was kingella, 25 had Streptococcus and 16 had Staphylococcus aureus IE. Nine (47%) patients with Kingella endocarditis had no known previous heart defect. The mean age of the patients with Kingella was younger than the Streptococci and Staphylococci groups (16±10 months, 106±70, 68±76 respectively, P< 0.001). A male predominance was noted (69.4% compared with 40.0%, 37.5% respectively). The Kingella IE patients had higher temperature on admission, history of oral aphthae prior to the diagnosis of IE (29.4% compared with 0%, 0% respectively, P<0.002) and higher lymphocye count (4.27K±3.04, compared with 2.09K±1.36, 2.40K±2.38 respectively, P<0.002).

**Conclusions:** Kingella IE pediatric patients have some unique features compared to those with S. aureus and Streptococci IE; Young healthy children (<36 months), especially males, with or without congenital heart defect, with recent history of oral aphthae, that present with prolonged fever should raise the suspicion for Kingella IE.

**Presenter email address:** odedshv@clalit.org.il
Stenotrophomonas maltophilia bloodstream infections in umbilical cord blood transplant recipients

Muneyoshi Kimura*1, Hideki Araoka1, Sho Ogura1, Mitsuhiro Yuasa1, Daisuke Kaji1, Kosei Kageyama1, Yuki Taya1, Shinsuke Takagi2, Hisashi Yamamoto2, Go Yamamoto2, Yuki Asano-Mori2, Naoyuki Uchida2, Shuichi Taniguchi2, Akiko Yoneyama1

1Department of Infectious Diseases, Toranomon Hospital, Tokyo, Japan, 2Department of Hematology, Toranomon Hospital, Tokyo, Japan

Background: Limited data are available on Stenotrophomonas maltophilia bloodstream infection (SM-BSI) in umbilical cord blood transplant (uCBT) recipients who exhibit a higher risk of delayed neutrophil engraftment relative to other types of allogeneic hematopoietic stem cell transplant recipients. Additionally, the therapeutic efficacy against SM-BSI and hemato-toxicity of trimethoprim-sulfamethoxazole (SXT) are still unknown in uCBT settings.

Materials/methods: The medical and microbiological records of patients who received uCBTs between December 2008 and December 2015 were reviewed. Identification and drug susceptibility testing were performed using the WalkAway 96 SI system. The current CLSI breakpoints for S. maltophilia were used. Evaluation of SXT was performed only for recipients who received ≥ 7 days of intravenous SXT as treatment for SM-BSI (the evaluation cohort).

Results: Of 561 uCBT recipients, 34 developed SM-BSI. Diabetes mellitus, severe neutropenia for ≥ 21 days, and age ≥ 60 years were significant independent risk factors for SM-BSI. The hazard ratio for all-cause mortality up to 100 days after transplantation was 10.5 (95% CI, 6.79 – 16.1) for patients with SM-BSI, compared to patients without SM-BSI. Of the 34 recipients with SM-BSI, 25 developed SM-BSI during the pre-engraftment phase (neutrophil count < 500/µL) and 24 were treated with an intravenous SXT-based regimen (iSXT-BR). The 7-day- and 30-day-crude-mortality-rates of the recipients with SM-BSI were 64.7% and 73.5%, respectively. Additionally, 7-day-crude-mortality-rate of the recipients with SM-BSI with pneumonia (11/12) was significantly higher than that for recipients without pneumonia (11/22) (P=0.04). The susceptibility rates of the 34 causative strains for SXT and levofloxacin were 97% and 79%, respectively. Nine recipients were included in the evaluation cohort. The doses of iSXT ranged from 2.4 to 6.9 mg/kg/day of the trimethoprim component. Five of the nine recipients developed SM-BSI during the pre-engraftment phase. The 30-day-crude-mortality-rate and the clinical cure rate of the cohort were 22% and 77%, respectively. In addition, only one of the nine recipients experienced significant neutrophil toxicity.

Conclusions: The epidemiology of SM-BSI in uCBT recipients was determined and its negative impact on survival was demonstrated. The iSXT-BR was a tolerable and important therapeutic option for SM-BSI in the uCBT setting, including during the pre-engraftment phase.

Impact of a routine molecular Point-of-Care test-and-treat strategy for influenza in adults hospitalised with acute respiratory illness: a pragmatic, multi-centre, randomised controlled trial (FluPOC)

Tristan Clark*, Kate Rhian Beard1, Nathan Brendish1, Ahalya Malachira2, Samuel Mills2, Cathleen Chan1, Stephen Poole2, Sean Ewings1, Nick Cortes3

1University Hospital Southampton, University of Southampton, Southampton, United Kingdom, 2University Hospital Southampton NHS Foundation Trust, Department of Infection, Southampton, United Kingdom, 3Hampshire Hospitals Foundation NHS Trust, Basingstoke, United Kingdom

Background: Influenza infections often remain undiagnosed in patients admitted to hospital due to lack of routine testing. When tested for, the diagnosis of influenza is often delayed due to the long turnaround times of laboratory PCR, leading to inappropriate and late antiviral and isolation facility use. Molecular point-of-care tests (mPOCT) for influenza can deliver results in under 1 hour but high quality evidence for impact on clinical management and outcomes is lacking.

Materials/methods: In this pragmatic, multicentre, randomised controlled trial we enrolled adults admitted to hospital with acute respiratory illness (ARI) during influenza season. Patients were randomised (1:1) to receive mPOCT for influenza or routine clinical care. The primary outcome was the proportion of influenza infected patients who received antivirals. Secondary outcomes included; the detection rate of influenza, turnaround time of results, time to antivirals, isolation facility use, antibiotic use, length of stay, time on supplementary oxygen, critical care admission and mortality.

Results: 613 patients were recruited and randomised, 307 to POCT and 306 to routine care. All were analysed in the intention-to-treat (ITT) analysis. 100/307 (33%) patients in the POCT group and 102/306 (33%) patients in the control group were influenza infected. The median [IQR] turnaround time for results was 1.2 [1.1-1.4] hours in the POCT group and 23 [16-29] hours in the control group, p<0.0001. 100/100 (100%) influenza-infected patients were diagnosed in the POCT group but only 55/102 (54%) were diagnosed in the control group, p<0.0001. 99/100 (99%) influenza-infected patients received antiviral treatment in the POCT group versus 63/102 (62%) in the control group, relative risk 1.6 [95%CI 1.4 to 1.9]; p<0.0001. 70/100 (70%) of influenza infected patients in the POCT group were correctly nursed in single room accommodation versus 39/102 (38%) in the control group, p<0.0001. Admission to critical care units or death occurred in 1/100 (1%) patients in the POCT group versus 8/102 (7.8%) in the control group, p=0.035.

Conclusions: A routine mPOCT strategy for influenza in adults hospitalised with ARI improved the detection of influenza and the appropriate and timely use of antivirals and isolation facilities. It was also associated with improvements in clinical outcome.

Figure 1. Kaplan-Meier curve showing time to the administration of antivirals in the point-of-care testing group (red) and the control group (green) in influenza-infected patients. Log rank test, p=0.0001

Abstract 802

In vitro activity of ceftazidime-avibactam (CAZ-AVI) and comparators against Gram-negative pathogens isolated from patients in Canadian hospitals in 2009-2018: CANWARD surveillance study

Philippe Lagacé-Wiens*1,2, Heather Adam2,3, Melanie Baxter2, James Karlowsky1,2, Andrew Walkty2,3, George Zhanel2

1 Saint-Boniface Hospital, Shared Health, Winnipeg, Canada, 2 University Of Manitoba, Winnipeg, Canada, 3 Health Sciences Centre, Shared Health, Winnipeg, Canada

Background: Ceftazidime-avibactam is used for the treatment of infections caused by multi-drug-resistant organisms. We determined the in vitro activity of ceftazidime [CAZ] with and without avibactam and comparators versus Gram-negative pathogens recovered from January 2009 to December 2018 from patients in medical and surgical wards, intensive care units, clinics, and emergency rooms in 15 Canadian hospitals.

Materials/methods: Antimicrobial susceptibility testing was performed using broth microdilution panels following CLSI recommendations (M07, 11th edition). Susceptibility was determined using EUCAST breakpoints [where available] or CLSI breakpoints (M100, 29th edition). Cephalosporin-resistant Escherichia coli and Klebsiella spp. isolates were genetically characterized for ESBL production using PCR and DNA sequencing.

Conclusions: CAZ-AVI demonstrated in vitro activity against clinical Enterobacterales isolates, including those with resistance to oximinocephalosporins by a variety of mechanisms. 93.3% of P. aeruginosa were susceptible to CAZ-AVI while CAZ, MER and TZP-resistant P. aeruginosa were moderately susceptible to CAZ-AVI. Activity against A. baumannii was not improved compared to CAZ alone.

Abstract 805

Evaluation of the FebriDx host response Point-of-Care test to differentiate viral from bacterial aetiology in adults hospitalised with acute respiratory illness during influenza season

Kate Rhian Beard*, Nathan Brendish1,2, Stephen Poole1, Cathleen Chan1, Samuel Mills2, Tristan Clark1,2,3

1Academic Unit of Clinical and Experimental Sciences, University of Southampton, Southampton, United Kingdom, 2Department of Infection, University Hospital Southampton NHS Foundation Trust, Southampton, United Kingdom, 3NIHR Southampton Biomedical Research Centre, University Hospital Southampton NHS Foundation Trust, Southampton, United Kingdom

Background: Diagnostic uncertainly regarding microbial aetiology in patients hospitalised with acute respiratory illness (ARI) contributes to antibiotic overuse. A host response test distinguishing between viral or bacterial infection may reduce unnecessary antibiotic use. The FebriDx is a low cost, rapid, host response point-of-care test that uses fingerpick blood samples to distinguish between viral or bacterial infection by detection of MxA and/or CRP.

Materials/methods: We took fingerpick blood samples from adults with ARI, hospitalised during influenza season, and tested them using the FebriDx. Respiratory samples were tested for viruses on the Biofire FilmArray Respiratory Panel 2 plus. The FebriDx was evaluated for failure rate and accuracy of results (Viral, Bacterial, Negative). FebriDx results were not given to treating clinicians. All patients gave written consent.

Results: We took fingerpick blood samples from adults with ARI, hospitalised during influenza season, and tested them using the FebriDx. Respiratory samples were tested for viruses on the Biofire FilmArray Respiratory Panel 2 plus. The FebriDx was evaluated for failure rate and accuracy of results (Viral, Bacterial, Negative). FebriDx results were not given to treating clinicians. All patients gave written consent.

Conclusions: In this real-world evaluation FebriDx use in adults hospitalised with ARI was associated with a relatively high test failure rate and problems reading test lines. FebriDx had a high specificity (94%) and positive predictive value (94%) for the detection of viruses, especially influenza. Bacterial and negative FebriDx results were often associated with non-influenza virus detection which may represent colonisation, secondary bacterial infection or viral infection confined to the airways.

Impact of pharmacist-driven antimicrobial stewardship interventions on multicomponent patient outcomes

Emily Beasley¹, Claudiu Georgescu², Geehan Suleyman³, Kelli Cole*⁴

¹University of Toledo Medical Center, Toledo, United States, ²Henry Ford Hospital, Detroit, United States

Background: Prospective audit and feedback (PAAF) is a core antimicrobial stewardship (AS) strategy recommended to improve antimicrobial use. While studies have demonstrated the benefit of PAAF on clinical outcomes in specific disease states or high-risk groups, few have reviewed the broader impact of this AS initiative. The purpose of this study was to determine the impact of pharmacist-driven AS interventions on multicomponent patient outcomes.

Materials/methods: Retrospective cohort included adult inpatients treated with antimicrobials for ≥ 72 hours from July 2015-December 2015. Patients with an ID consultation, on long-term antibiotics, or made hospice or comfort care during their admission were excluded. Patients were grouped according to the presence or absence of AS intervention performed by a pharmacist. Primary endpoint was a composite of 30-day all-cause mortality, 30-day readmission, 28-day emergence of antimicrobial resistance, and 90-day *Clostridioides difficile* infection (CDI). Secondary endpoints included hospital and intensive care unit (ICU) length of stay (LOS).

Results: 338 patients screened, 200 included: 100 with AS intervention, 100 without. Baseline characteristics were similar between groups except less chronic obstructive pulmonary disease (p=0.01), peptic ulcer disease (p=0.017) and diabetes with organ damage (p = 0.02) in the AS intervention group. Infection types were similar between groups, however more patients were ICU status in the AS intervention group (p = 0.003). Primary and secondary endpoints are listed in Table 1.

Table 1. Study Endpoints

</tr>
</tbody>
</table>

Data presented as n (%) or median (IQR)

*n = 25 and 45, respectively

Conclusions: Patients with AS intervention performed by a pharmacist were found to have lower rates of 30-day readmission compared to those without. Overall, these results demonstrate a positive impact of pharmacist-driven AS intervention on long-term patient outcomes; however differences in LOS warrant further investigation.

Abstract 810

**A new perspective: microbiota, the role of Streptococcus gallolyticus in childhood colorectal cancer**

Ayşe Büyükcam*1, Canan Akyüz2, Nafia Canan Gursoy1, Diclehan Orhan3, Baris Dtlü4, Banu Sancak5, Ateş Kara2

1Hacettepe University Faculty of Medicine, Department of Pediatric Infectious Diseases, Ankara, Turkey, 2Hacettepe University Faculty of Medicine, Department of Pediatric Oncology, Ankara, Turkey, 3İnönü University Faculty of Medicine, Medical Microbiology, Malatya, Turkey, 4Hacettepe University Faculty of Medicine, Department of Pediatric Pathology, Ankara, Turkey, 5İnönü University Faculty of Medicine, Medical Microbiology, Malatya, Turkey, 6Hacettepe University Faculty of Medicine, Medical Microbiology, Ankara, Turkey

**Background:** Colorectal cancer in childhood is rare but usually associated with a higher incidence of unfavorable histotypes (high-grade, poorly differentiated subtypes) and more aggressive tumor behavior. The prognosis is poor due to delayed diagnosis and advanced stage at diagnosis. The tumorigenesis of childhood colorectal cancer, which necessarily occurs over a shorter period, is still unclear and most likely evolves through different steps. There has been limited knowledge about colorectal cancer in childhood. The aim of this study was to investigate the relationship between childhood colorectal cancer and *S. gallolyticus*.

**Materials/methods:** The clinical and pathologic characteristics, and outcomes of colorectal cancer in 21 children and adolescents referred to our Pediatric Oncology Department between 1974 and 2017 were reviewed. The control group (healthy colorectal tissue) consisted of 40 pediatric patients who underwent colon surgery for other reasons. Demographic and clinical findings of the patients were evaluated. *S. gallolyticus* analysis was performed from cancerous and healthy colorectal tissues. DNA was isolated from paraffin tissue for *S. gallolyticus* analysis. The presence of *S. gallolyticus* was screened by the Real-Time PCR method using specific predetermined primers and probes. Positive isolates were confirmed by Sanger sequence analysis.

**Results:** The median age of patients with colorectal cancer was 14 years (range: 10 to 17 years). The male-to-female ratio was 2.5:1. Tumor localization was mostly in the rectum and/or sigmoid region (n=14, 66.7%). The most common stage was stage D (61.9%, n=13). There wasn’t any patient in stage A. The most common histologic subtype was mucinous adenocarcinoma (61.9%, n=13). None of the pediatric patients with colorectal cancer had documented *S. gallolyticus* in blood culture. *S. gallolyticus* was detected in 8 (38.1%) colorectal cancer patients and 2 (5%) children in the control group (p=0.002).

**Conclusions:** Childhood colorectal cancer has distinct features with poor prognosis despite multidisciplinary approaches and new therapies. In our study, *S. gallolyticus* was found to be significantly higher in colorectal cancer tissues in our patients. This is the first study in the literature. Our study provides a new perspective for early diagnosis and understand risk groups for childhood colorectal cancer that may have a different pathophysiology than adults.

Abstract 812

**Determination of pentraxin 3 levels in cerebrospinal fluid during central nervous system infections**

Marta Zatta*, Stefano Di Bella¹, Barbara Bottazzi¹, Francesca Rossi¹, Ludovica Segat¹, Pierlanfranco D’agaro¹, Massimiliano Fabbiani³, Alberto Mantovani², Roberto Luzzati¹

¹Trieste Hospital, Trieste, Italy, ²IRCCS Humanitas Clinical and Research Center, Milano, Italy, ³IRCCS Polyclinico San Matteo, Pavia, Italy

**Background:** Pentraxin 3 (PTX3) is an acute phase protein; its plasmatic levels significantly raise during severe infections. Data on PTX3 levels in cerebrospinal fluid (CSF) of patients with central nervous system (CNS) infections are lacking. We aimed: a) to assess the diagnostic potential of measuring CSF PTX3 levels in patients with CNS infections; b) to establish CSF PTX3 cut-offs to distinguish between bacterial and aseptic meningoencephalitis (ROC curve).

**Materials/methods:** In this retrospective observational study, PTX3 levels were measured in CSF from 19 patients admitted to Trieste Hospital, Italy, with CNS infection from January 2016 to September 2018. CSF was collected by lumbar puncture performed within two hours from hospital admission. For each patient four samples of CSF were collected for obtaining these data: 1) leukocyte count, glucose and total protein levels, 2) culture and molecular amplification, 3) real-time PCR for virus (HSV 1-2, CMV, EBV, VZV, WNV, enteroviruses, TBEV and Mumps virus) and 4) PTX3 levels. The latest samples were first stored at -80°C and then analysed in duplicate using a home-made sandwich ELISA. The assay has a lower limit of detection of 100 pg/ml, with 8–10% inter-assay variability.

**Results:** A diagnosis of bacterial infection and aseptic meningoencephalitis was made in 7 (37%) and 12 (63%) patients, respectively. Subjects with bacterial infections showed significantly higher PTX3 levels (13.5 vs 1.27 ng/mL in aseptic meningoencephalitis, p=0.010). We identified two different CSF PTX3 levels cut-offs. 1) The best cut-off to maximize Youden’s J was 9.6 ng/mL with a sensitivity, specificity, positive predictive value and negative predictive value (NPV) of 71.4%, 91.4%, 83.3%, 84.6%, respectively, 2) The cut-off with higher NPV (100%) was 3.6 ng/mL: a diagnosis of bacterial infections was obtained in 0% patients with CSF PTX3 levels < 3.6 ng/mL vs 58% of those with CSF PTX3 levels ≥ 3.6 ng/mL (p=0.017).

**Conclusions:** CSF PTX3 levels are higher in bacterial meningitis than aseptic meningoencephalitis. A cut-off of 3.6 ng/mL of CSF PTX3 has a high NPV and can be used to exclude bacterial CNS infections.

Physicochemical characterisation of aluminium hydroxide and aluminium phosphate and their potential adjuvant function in combination with squalene emulsion for EV71 vaccine development

Ming-Hsi Huang*1

1National Health Research Institutes, Zhunan, Taiwan

**Abstract**

**Background:** Aluminum phosphate and aluminum hydroxide (generally called Alum) are two conventional adjuvants acceptable for human vaccines. Yet, the physicochemical properties as well as the adjuvanticity associated with the structure of the two forms of gel suspensions are poorly defined.

**Materials/methods:** We designed vaccine formulations based on aluminum phosphate and aluminum hydroxide as adjuvants, and investigated respective mode of action linking the physicochemical properties and the adjuvanticity.

**Results:** The SEM microscopy indicated that aluminum phosphate gel solutions are amorphous, whereas aluminum hydroxide gel solutions have a crystalline structure consistent with boehmite. At very low concentrations, the adsorption of model protein (BSA) onto both aluminum-containing adjuvants followed Langmuir adsorption isotherm, i.e. the antigen adsorption percentage was functional to the antigen/adjuvant ratio. As the protein concentration increases, the adsorbed BSA reduced as less vacant sites were offered on the surface of adjuvants. Notably, 100% of adsorption could be achieved in aluminum hydroxide, whereas a maximal 30% of adsorption was observed in aluminum phosphate, probably due to the presence of the same charge on the adjuvant and antigen. For the investigation of biological interactions, the prepared aluminum salts were tested for their properties to drive the activation/maturation of murine bone marrow-derived dendritic cells (DCs). Flow-cytometry analysis showed that aluminum hydroxide may be an efficient regulator of DC activation, compared with aluminum phosphate. For immunogenicity study of an enterovirus (EV) 71 formalin-inactivated whole virus vaccine, we found that a single-dose intramuscular injection of 0.2 μg inactivated virus could not elicit a forceful EV71 virus neutralized antibody titer. When the same amount of antigen was co-administered with single adjuvant, aluminum phosphate or squalene emulsion, enhances protective EV71-specific serological immunity in mice; moreover, the adjuvant potency of their combination was more potent than individual to induce high levels of antigen-specific antibodies.

**Conclusions:** It was concluded that aluminum hydroxide, rather than aluminum phosphate, is suitable to be adjuvanted in vaccine candidate according to the results from morphology, antigen adsorption efficiency and DCs activation/maturation; in addition, it will be of great interest for co-administrating Alum together with an emulsified vaccine delivery system against the emerging infectious diseases.

Abstract 821

Introducing end-of-life considerations into a computerised decision support system for antibiotic treatment: effects on the system's recommendations and comparison to physicians' behaviour

Yael Dishon-Benattar1,2, Iris Pfeffer3, Mads Lause Mogensen4, Logan Ward4, Leonard Leibovici5,6, Efrat Dagan2, Mical Paul1,7

1Division of Infectious Diseases, Rambam Health Care Campus, Haifa, Israel, 2The Cheryl Spencer Department of Nursing, University of Haifa, Haifa, Israel, 3Division of Epidemiology and Preventive Medicine, Tel Aviv Sourasky Medical Center, Tel Aviv, Israel, 4Treat Systems, Aalborg, Aalborg, Denmark, 5Sackler Faculty of Medicine, Tel Aviv University, Tel Aviv, Israel, 6Department of Internal Medicine E, Rabin Medical Center, Petah Tikva, Israel, 7The Ruth and Bruce Rappaport Faculty of Medicine - Israel Institute of Technology, Haifa, Israel

Background: TREAT is a previously developed and validated computerized decision support system for antibiotic treatment, in clinical use. Currently, it does not address end of life (EOL) considerations, when antibiotic treatment does not offer a benefit but inflicts high collateral damage.

Materials/methods: Based on a causal probabilistic network, TREAT advises antibiotic treatment using a cost-benefit calculation. Costs, expressed as life years loss, comprise of drug, adverse events and ecological costs. The latter considering the clinical significance of resistance selection following specific antibiotics in the individual treated and among contacts. We developed an individualized ecological costs model, addressing the higher ecological impact of patients at EOL. The main individualized ecological cost components were patients’ risk for harboring resistant bacteria at baseline, their risk for experiencing a subsequent infection and their potential to transmit resistant bacteria. After implementation into TREAT’s cost-benefit calculation, we compared TREAT’s baseline advice to its individualized ecological costs advice and physicians’ prescribed treatment. Broad-spectrum treatment included piperacillin-tazobactam, carbapenems, vancomycin and colistin.

Results: In a previously collected cohort of 1232 patients with suspected or proven sepsis, a significant difference in ecological costs between 30-day survivors and fatalities was observed. Implementation of individualized ecological costs in TREAT resulted in change of advice for 44.7% [551/1232] patients. Among all patients, the individualized ecological cost TREAT advised significantly less 3rd generation cephalosporins, quinolones and broad-spectrum antibiotics compared to baseline TREAT and significantly more frequently ampicillin, ampicillin-clavulanate and chloramphenicol. Among 30-day fatalities [18.9%, 233/1232], no treatment was advised by individualized TREAT for 11.1% [26/233] patients vs 8.1% [19/233] by baseline TREAT and 16.3% [38/233] by physicians. When prescribing antibiotics, TREAT recommended ampicillin significantly more frequently and ceftriaxone significantly less frequently than physicians. Broad-spectrum treatment and ceftriaxone were advised for 21% [49/233], 44.2% [103/233] and 58.4% [136/233] by individualized TREAT, baseline TREAT and physicians.

Conclusions: Individualization of the ecological costs and EOL considerations are necessary in a decision support system for antibiotic treatment, to approximate physicians’ behavior and to avoid aggressive futile antibiotic treatment. Physicians limited treatment at EOL more frequently than individualized TREAT, but used more broad-spectrum therapy when prescribing antibiotics at EOL.

Pinpointing the genetic intra-host diversity of *Mycobacterium tuberculosis* and its determinants

Charlotte Genestet*1,2, Elisabeth Hodille1,2, Alexia Barby1,2, Jean-Luc Berland1,3, Laurent Jacob4, Gerard Lina1,2,5, Stéphane Dray4, Samuel Venner4, Oana Dumitrescu1,2

1Centre International de Recherche en Infectiologie, Lyon, France, 2Hospices Civils de Lyon, Institut des Agents Infectieux, Lyon, France, 3Fondation Mérieux, Lyon, France, 4Biometry and Evolutionary Biology laboratory, Villerbanne, France, 5Université Lyon 1, Facultés de Médecine et de Pharmacie, Villeurbanne, France

Abstract third-party references: on behalf of the Lyon TB study group

**Background:** Tuberculosis (TB) caused by *Mycobacterium tuberculosis* (Mtbc) complex results in a variety of disease manifestations and epidemiological success. Recently, studies based on Whole Genome Sequencing (WGS) have revealed micro-diversity in isolates composition. However this diversity and its dynamics have not yet been considered as a source of information to highlight the process leading to adapt and respond to a changing environment. Here we characterized the variability of the composition of pulmonary and extrapulmonary Mtbc isolates and its relations with various host factors.

**Materials/methods:** We explored by WGS Mtbc genomic micro-diversity within hosts, by comparing pairwise isolates obtained from both pulmonary and extra-pulmonary sampling in 37 TB patients. Firstly we determined the frequency of single nucleotide polymorphisms (SNP) called at heterozygous sites, then variants were defined as assemblies harboring SNP with similar frequencies. Diversity was assessed by alpha and beta diversity measures based on the variant assemblies. Clinical data resuming the immune and nutritional status of patients were also recorded.

**Results:** We observed differences between pulmonary and extra-pulmonary isolates from the same patient for 68% of cases, supporting Mtbc micro-diversity within the same host. Differences in variant distribution between the pulmonary and the extra-pulmonary isolates, with overall lower extra-pulmonary diversity, indicates Mtbc compartmentalization in different body sites. Moreover, we observed a variability involving gene functions specifically associated with either pulmonary or extra-pulmonary TB. Our analysis revealed a correlation between Mtbc micro-diversity within pulmonary compartment and low patient body mass indexes. Conversely, Mtbc micro-diversity within extra-pulmonary compartment inversely correlated with patient CD4 T cells count, supporting the selective pressure of the immune response on Mtbc infection spreading.

**Conclusions:** These results confirm that close-related but still different Mtbc variants coexist rather than a clonal population. This micro-diversity is shaped by the interactions between Mtbc and various host factors. Compartmentalization could rely on the higher ability of variants to disseminate and adapt to extra-pulmonary tissues, but more in-depth analysis is required to correlate with some clinical presentations. Taking into account this diversity of Mtbc variants, its intra-host dynamics should lead to a better understanding of the dynamics of this disease.

Abstract 823

Evaluating the predictive performance of ID-ODS software in critically ill patients for piperacillin: a comparison using IV bolus and continuous infusion data

Abdullah Alsultan*1, Steven Wallis2, Jeffrey Lipman2, Jason Roberts2

1King Saud University, Riyadh, Saudi Arabia, 2University of Queensland, Brisbane, Australia

Background: Piperacillin displays high interindividual variability in critically ill patients. PKPD Model based dosing software can optimize antibiotic exposure and improve treatment outcome. Our objective is to evaluate and compare the accuracy of the individualized dosing program ID-ODSTM (Individually Designed Optimum Dosing Strategies) in predicting piperacillin concentrations a priori in critically ill patients for both continuous infusion and bolus injections.

Materials/methods: The data used for the validation comes from a prior publication in critically ill patients. Samples were collected on days 1 and 2 in 16 patients, with 8 patients receiving bolus dosing and 8 patients receiving continuous infusion. All patients in the continuous infusion group received a loading dose of 4 g. Patient demographics and dosing information were input into the IDODS software and concentrations were predicted in 0.1 hour increments. To assess the predictability of the software, we compared the observed VS predicted concentrations and estimated the R², bias and precision. Statistical analysis was performed using the R software.

Results: In total we had 116 observations from the 8 patients on continuous infusion and 113 observations from the 8 patients on bolus dosing. For the continuous infusion group, the R² was 0.54, bias was -25 % and precision was 74 %. For the bolus dosing group, the R² was 0.67, bias was -38 % and precision was 72 %. For both groups, we noticed the software is biased and under predicts the early concentrations after dose administration, while bias approaches zero at later time points.

Conclusions: The IDODS software demonstrated reasonable accuracy in predicting piperacillin concentrations. Predictive performance was similar across the two dosing groups indicating it can be applied for either administration method. The software tended to under predict concentrations at early time points after drug administration, given piperacillin has time dependent activity and the focus is on achieving therapeutic trough concentrations, this is not likely to impact dose selection. Overall, IDODS software can be used to optimize initial dosing of piperacillin and decrease the likelihood of suboptimal concentrations compared to standard dosing. Further clinical trials are needed to assess its impact on clinical outcome.

Abstract 824

**International survey on diagnosis and management of human herpes virus-8 infection in solid organ transplant recipients**

Alessandra Mularoni*1, Lucia Adamoli1, Malgorzata Karolina Mikulska2, Maddalena Giannella3, Paolo Antonio Grossi4

1ISMETT-IRCCS, Palermo, Italy, 2Division of Infectious Diseases, University of Genoa (DISSAL) and Ospedale Policlinico San Martino, Genova, Italy, 3Infectious Diseases Unit, Policlinico Sant’Orsola Malpighi, University of Bologna, Bologna, Italy, 4Clinica delle Malattie Infettive e Tropicali, Università degli Studi dell’Insubria, Varese, Italy

Abstract third-party references: ESGICH Escmid Study Group of Infections in Immunocompromised Host

**Background:** HHV8/KSHV infection is associated with uncommon but potentially fatal neoplastic and non-neoplastic diseases in Solid Organ Transplant (SOT) recipients. Screening and follow-up protocols are not established.

We aimed to define the current approach of transplant centers worldwide to screening and management of HHV-8 in transplant recipients.

**Materials/methods:** We conducted a survey (June-October 2019) on behalf of Escmid Study Group of Infections in Immunocompromised Host (ESGICH). Study group members received an email containing an introduction and a link to our survey, 12 questions about screening and follow-up for HHV-8 (www.surveymonkey.com/r/ESGICH-HHV8).

**Results:** 51 transplant centers filled out the survey (23 Italy, 8 Spain, 8 other European countries, 4 USA, 1 Canada, 3 Latin America, 1 Israel, 3 anonymous.)

34 centers (67%) do not perform screening for HHV-8; routinely screening is performed in 14 centers (27%) mainly for recipients. Centers where serology is performed use IFA or ELISA in equal proportion. Transplant suitability is not influenced by HHV8 serology in any center.

29 centers (57%) do not monitor HHV8 after transplant, while 10 (20%) perform it only in symptomatic patients, 3 (6%) perform universal follow-up, 9 (17%) use different risk-based approaches. The most used test for monitoring is quantitative commercial PCR (52%). Frequency of monitoring differs widely. Only 2 centers perform HHV8 specific T-cell response.

The most common approach in case of elevated viremia is reducing immunosuppression [n=29, 57%] and/or switching from CNI to m-TOR inhibitor [n=23, 45%] with or without antivirals; [val]ganciclovir is the most used agent.

67% of the centers registered HHV-8-related diseases in SOT in the last five years: cutaneous [n=16] and visceral [n=16] Kapo-si Sarcoma, non-malignant disease [i.e. KICS like syndrome, n=14], MCD [n=8] and PEL [n=4].

**Conclusions:** There is no uniform approach for screening and management of HHV-8 in SOT recipients. 67% of centers do not screen for HHV-8 serology, but the same proportion registered HHV-8 associated diseases: these are probably underestimated in the transplant setting. Considering potentially fatal complications and the possibility to screen and perform prompt diagnosis, collaborative studies to establish the best screening and prevention strategies of HHV8-related diseases in SOT are needed.

**Abstract 828**

**Performance of a PCR-based syndromic panel compared to routine culture and microscopy in patients suspected of pneumonia**

Vigith Andrews*1, Mette Pinholt1, Uffe Vest Schneider1,2, Lillian Søes1, Kristian Schønning1, Gorm Lisby1

1Copenhagen University Hospital Hvidovre, Department of Clinical Microbiology, Hvidovre, Denmark, 2Department of Clinical Microbiology, Rigshospitalet, Denmark, Copenhagen, Denmark

**Abstract third-party references:** Department of Clinical Microbiology, Hvidovre and Amager Hospital, Denmark

**Background:** Syndromic testing for lower respiratory tract infections with Biofire® Filmarray® Pneumonia Panel (BF) consists of a multiplex PCR with 27 pathogens and a turn-around-time of two hours. Routine diagnostic of bacterial pneumonia in the Capital Region of Denmark consist of culture preceded by microscopy for quality assessment of sputum. Turn-around-time and sensitivity of culture can be a limiting factor for targeted antimicrobial treatment. Hence, we evaluated BF against culture for analytical and clinical performance.

**Materials/methods:** from January to May 2019 298 samples (sputum or endotracheal aspirates) were collected consecutively from hospitalized patients with suspected pneumonia. Samples were referred routinely to the Department of Clinical Microbiology (Copenhagen University Hospital Hvidovre) for culture and additional testing by BF.

Retrospectively, patients were categorized into ‘pneumonia’ according to IDSA definition, ‘probable pneumonia’ for patients without lung infiltrate but otherwise meeting the pneumonia criteria, and “not pneumonia”. Analytical performance was evaluated by bacterial pathogen concordance between the two methods. Clinical performance was determined regarding pneumonia/not pneumonia and detection of a positive/negative bacterial pathogen, and evaluated by sensitivity, positive predictive value (PPV), negative predictive value (NPV) and efficacy.

Patients with probable pneumonia were excluded in clinical performance calculations.

**Results:** 98 patients had pneumonia, 71 had probable pneumonia and 129 had not pneumonia.

Overall positive agreement between culture and BF was 42%. The rate increased to 67% when pathogens in lowest quantity \(10^4\) and \(10^5\) copies/mL) in BF were excluded.

Overall sensitivity of BF was improved from 73% to 89%, and for culture from 50% to 72%, when only high-quality samples as judged by microscopy were included in the analysis. For BF, PPV: 50%, NPV: 69% and efficacy: 57% were comparable to culture (PPV: 49%; NPV: 62%; efficacy: 55%); this increased slightly for both BF (PPV: 55%; NPV: 76%; efficacy: 61) and culture (PPV: 53%; NPV: 62%; efficacy: 56%), when only high-quality samples were included.

**Conclusions:** PPV and NPV of both BF and culture were low. Both tests are therefore best used in patients in whom the pneumonia diagnosis has been established clinically. Indiscriminate use may be diagnostically misleading and a cause of inappropriate use of antibiotics.

Abstract 831

Correlation of central line-associated bloodstream infections with employee turnover: continuity in nursing staff matters!

Stefan P. Kuster1, Mesida Dunic1, Christian Falk2, Hugo Sax1, Peter W. Schreiber*1

1University Hospital of Zürich, Division of Infectious Diseases and Hospital Epidemiology, Zürich, Switzerland, 2University Hospital of Zürich, Information and Communication Technology, Zürich, Switzerland

Background: Understaffing has been previously reported as a risk factor for central line-associated bloodstream infections (CLABSI). No previous study addressed the question whether fluctuations in staffing have an impact on CLABSI incidence. We analyzed prospectively collected CLABSI surveillance data and data on employee turnover of health care workers (HCW) to address this research question.

Materials/methods: In January 2016, a semi-automatic surveillance system for CLABSI was implemented at the University Hospital Zurich, a 950 bed tertiary care hospital. Source data including presence of a central venous catheter (CVC), length of hospital stay, and microbial results of blood cultures are prospectively extracted from our patient data management system into Caradigm Intelligence Platform®. In case of positive blood culture results in a patient with a CVC in place at time of sampling, an infection control nurse differentiates between bacteremia of other origin and CLABSI. Monthly incidence rates (IR, CLABSI/1000 catheter days) were calculated and correlated to human resources management-derived monthly data on employee turnover of HCWs (defined as number of HCWs who left the hospital divided by the number of employed HCWs in that month).

Results: Over a period of 24 months, we detected a positive correlation of CLABSI incidence and nursing personnel turnover (Spearman rank correlation, r=0.467, P=0.022) [Figure]. In more detailed analyses on the professional training of nursing personnel, a correlation of CLABSI incidence rates and turnover of nurses with advanced training was confirmed (Spearman rank correlation, r=0.471, P=0.021). Physician turnover did not correlate with CLABSI incidence (Spearman rank correlation, r=-0.058, P=0.787).

Conclusions: Prospectively determined CLABSI incidence correlated positively with the degree of turnover of nurses overall and nurses with advanced training, but not with the turnover of physicians. Efforts to maintain continuity in nursing staff might be helpful for sustained reduction in CLABSI rates.

Can gentamicin concentrations be used to estimate glomerular filtration rate in intensive care unit patients?

Anna-Karin Smekal*, Maria Swartling1, Mia Furebring1, Elisabet Nielsen2, Anders Larsson3, Miklós Lipcsey1

1Uppsala University, Department of Surgical Sciences, Uppsala, Sweden, 2Uppsala University, Department of Pharmaceutical Biosciences, Uppsala, Sweden, 3Uppsala University, Department of Medical Sciences, Uppsala, Sweden

Background: Acute kidney injury is common in critical ill intensive care unit (ICU) patients. Accurate assessment of kidney function is vital to correct dosing of important drugs such as antibiotics in sepsis patients. Kidney function can be assessed using plasma creatinine or cystatin C to calculate estimated glomerular filtration rate (eGFR). However, both of these markers are endogenous and require steady-state conditions. As gentamicin is freely filtered in the glomerulus, it is a potential exogenous marker for eGFR when used in ICU patients. The aim of the study was to investigate whether serum gentamicin concentrations correlates to standard estimates of eGFR in an ICU setting.

Materials/methods: All adult patients (>18 years) in the ICU of Uppsala University Hospital treated with gentamicin and with at least one serum gentamicin measurement between January 1, 2009 and December 31, 2013 were included in this retrospective study. Patients on renal replacement therapy, and those with missing gentamicin dose information were excluded. Data on age, sex, weight, gentamicin administration time and dose, serum gentamicin, plasma creatinine and cystatin C were collected. eGFR for creatinine and cystatin C were calculated from the LM-rev and CAPA equations, respectively. Gentamicin clearance was estimated with a population pharmacokinetic model (Hodiamont et al 2017). Correlation, bias and agreement for the two eGFRs compared to gentamicin clearance were calculated.

Results: 254 patients were included. The correlation coefficient for gentamicin clearance vs. eGFR creatinine was 0.69, with a mean difference between the methods 4.6 (1.9-7.3; bias [95% CI]) and limits of agreement -43.7 -52.9 mL/min. The correlation coefficient for gentamicin clearance vs. eGFR cystatin C was 0.67, with a mean difference of -1.9 (-5.1 - 1.3) and limits of agreement -58.3 to 54.5 mL/min.

Conclusions: In the comparison of the two eGFR methods and gentamicin clearance we found low agreement despite low bias. However, cystatin C and creatinine are suboptimal markers of kidney function in the ICU. Gentamicin clearance for estimating GFR in ICU patients cannot be dismissed and should be compared to other exogenous GFR markers.

Abstract 835

**Epidemiology of carbapenemase-producing *Klebsiella pneumoniae* in Northern Portugal: predominance of KPC-2 and OXA-48**

Elizeth Lopes¹, Maria Jose Saavedra¹, Eliana Costa³, H. De Lencastre¹, Laurent Poirel⁵, Marta Aires De Sousa*¹,⁶

¹Universidade Nova de Lisboa, Instituto de Tecnologia Química e Biológica António Xavier, Oeiras, Portugal, ²University of Trás-os-Montes and Alto Douro, Vila Real, Portugal, ³Centro Hospitalar de Trás-os-Montes e Alto Douro, Vila Real, Portugal, ⁴The Rockefeller University, New York, United States, ⁵University of Fribourg, Friburgo, Switzerland, ⁶Escola Superior de Saúde da Cruz Vermelha Portuguesa, Lisboa, Portugal

**Background:** Carbapenemase-producing *Klebsiella pneumoniae* are increasingly reported in Portugal, but data from the northern region of the country (Trás-os-Montes and Alto Douro) are missing. The aim of the present study was to provide information on the molecular epidemiology of carbapenemase-producing *K. pneumoniae* isolates currently circulating at the tertiary and university hospital of Vila Real, Portugal.

**Materials/methods:** A total of 106 carbapenemase-producing *K. pneumoniae* isolates recovered between January 2018 and March 2019 were included in this study. All isolates were characterized by antimicrobial susceptibility, identification of resistance determinants, pulsed-field gel electrophoresis (PFGE), multilocus sequence typing (MLST), and plasmid analysis.

**Results:** The most common carbapenemase identified was KPC-2 (91%), followed by OXA-48 (9%). The *bla*<sub>KPC-2</sub> gene was mainly carried onto IncN (53%) and IncF (29%) plasmid types, whereas the *bla*<sub>OXA-48</sub> gene was mainly located on the IncL (80%) incompatibility group. Molecular characterization distributed the 106 isolates into 29 PFGE types and 26 STs, but three clones included 50% of the isolates: PFGE A-ST147-KPC-2 (n=31; 29%), B-ST15-KPC-2 (n=16; 15%), and C-ST11-OXA-48 (n=6; 6%). Antimicrobial resistance rates were the following: ciprofloxacin (76%), trimethoprim-sulfamethoxazole (75%), tobramycin (62%), gentamicin (34%), amikacin (25%), tigecycline (21%), fosfomycin (10%), and colistin (7%). None of the colistin-resistant isolates harbored *mcr-1*. All isolates remained susceptible to ceftazidime/avibactam, but 10% presented elevated MICs (3 and 4 mg/L).

**Conclusions:** KPC-2 was found to be the predominant carbapenemase among *K. pneumoniae* isolates currently circulating at this hospital from northern Portugal, followed by OXA-48. These data actually contrast with those obtained from the rest of the country, where KPC-3 predominates. Moreover, this study showed a high diversity of KPC-2-producing *K. pneumoniae* isolates with a predominance of the ST147 and ST15 clones.

Faecal carriage of extended-spectrum beta-lactamase producing Enterobacteriaceae at hospital admission in Portugal: a prospective survey

Marta Aires De Sousa, Elizeth Lopes, Maria Luisa Godinho Gonçalves, Ana Luísa Pereira, Augusto Costa, H. De Lencastre, Laurent Poirel

1Escola Superior de Saúde da Cruz Vermelha Portuguesa, Lisbon, Portugal, 2Universidade NOVA de Lisboa, Instituto de Tecnologia Química e Biológica António Xavier, Oeiras, Portugal, 3Universidade NOVA de Lisboa, Instituto de Tecnologia Química e Biológica António Xavier, Oeiras, Portugal, 4Hospital SAMS, Lisbon, Portugal, 5The Rockefeller University, New York, United States, 6University of Fribourg, Friburgo, Switzerland

Background: Among Gram-negative bacteria, the wide spread of extended-spectrum β-lactamases (ESBL) producing isolates is considered as a global threat. This study aimed to prospectively evaluate the prevalence of ESBL-producing Enterobacteriaceae fecal carriers at admission in a Portuguese hospital and to determine the epidemiology and antimicrobial resistance pattern of ESBL-producing isolates.

Materials/methods: Between December 1st, 2018 and February 2nd, 2019, rectal swabs were collected within the first 48h from 151 patients admitted to the hospital. In addition, a total of 48 rectal swabs were obtained from weekly screenings of 37 patients hospitalized for more than 48h. All ESBL- and/or carbapenemase-producing enterobacterial isolates were tested for antimicrobial susceptibility, and characterised by PFGE and MLST.

Results: The prevalence of ESBL producers was 17% at hospital admission and 24% among patients hospitalized for >48h, while the prevalence of carbapenemase producers was 3% in both cases. Most of the isolates were Escherichia coli (54%) and Klebsiella pneumoniae (41%). The most common ESBL identified was CTX-M-15 (n=17/34; 50%), followed by CTX-M-14 (n=10; 29%), CTX-M-33 (n=4; 12%), SHV-12 (n=2), and CTX-M-55 (n=1). The 20 E.coli isolates were distributed into 16 pulsotypes and nine sequence types (ST), out of which ST131 included 60% of the isolates. The 15 K. pneumoniae were grouped in 12 PFGE types and nine STs, out of which three (ST17, ST449, and ST147) included 60% of the isolates. A high proportion of isolates showed resistance to ciprofloxacin (86%), SXT (68%), tobramycin (57%), and gentamicin (43%). All isolates remained susceptible to fosfomycin.

Conclusions: A high prevalence of ESBL-producing Enterobacteriaceae was found at hospital admission and more than 50% of the isolates showed resistance to first-line antibiotics for the treatment of uncomplicated lower urinary tract infections. The choice of empiric drugs in the community should be cautious, leaving fosfomycin as a safe alternative.

Abstract 837

**Focus on nuclear imaging and other complementary exams for bacteraemia in early post-operative cardiac surgery**

Michael Thy*1

1 CHU Bichat, Department of Infectious and Tropical Diseases, Paris, France

**Background:** In cardiac surgery, the occurrence of bacteremia after cardiac surgery is common (1). European Society of Cardiology introduced nuclear imaging in the diagnostic management of endocarditis but post-operative inflammation could be false positive diagnosis (2–4) the European Association of Nuclear Medicine (EANM). The aim of this study is to describe the impact of imaging complementary exams in the management of early post-operative bacteremia.

**Materials/methods:** Our study is a monocentric retrospective study included any patient over 18-year-old with bacteremia within 30 days of cardiac surgery hospitalized at Bichat Claude Bernard Hospital from January 2013 to December 2016. We included all the patients who had imaging complementary exams during their hospital stay. Every diagnostic and therapeutic decision was decided with a multidisciplinary expert staff. We excluded the blood cultures considered as contamination.

**Results:** Overall, among the 128 patients who had positive blood culture occurring after cardiac surgery, the different complementary exams exploring infectious complications [echocardiography, CT-scan, 18F-FDG-PET CT (PET/CT) and White blood cell scintigraphy (WBC scintigraphy)] are represented in the Table 1. PET/CT was performed in 18.3% (n=19) of the patients in a median time to scan was 53 days (22.8-105). It led to diagnosis while TTE was negative for 6 patients positive on valve and 8 other diagnosis and while TOE was negative for 5 patients positive on valve and 8 other diagnosis. WBC scintigraphy was performed in 11.5% (n=12) of the patients in a median time to WBC was 60 days (17-105). WBC scintigraphy did not give a better sensibility without any patient positive for WBC scintigraphy and negative for PET/CT. WBC scintigraphy seemed more specific as it confirmed prosthesis infection in 2 patients and infirmed it in 1 patient.

**Conclusions:** In our cohort, we found a positive impact of nuclear imaging with better diagnostic performance on positive blood culture occurring after cardiac surgery. Prospective studies could lead to further responses.

Epidemiology and antimicrobial resistance of methicillin-resistant *Staphylococcus aureus* isolates colonising pigs with different exposure to antibiotics

Elizeth Lopes¹, Teresa Conceição¹, Laurent Poirel², H. De Lencastre¹,³, Marta Aires De Sousa*¹,⁴

¹Universidade Nova de Lisboa, Instituto de Tecnologia Química e Biológica António Xavier, Oeiras, Portugal, ²University of Fribourg, Fribourg, Switzerland, ³The Rockefeller University, New York, United States, ⁴Escola Superior de Saúde da Cruz Vermelha Portuguesa, Lisbon, Portugal

**Background:** In 2016, very high rates of methicillin-resistant *Staphylococcus aureus* (MRSA)-ST398 (99%) were found in different Portuguese pig farms that used colistin, amoxicillin, and zinc oxide as feed additives. Since then, farms A and B banned the use of colistin, and farm C banned the use of both antibiotics. The aim of the present study was to evaluate the impact of the ban of colistin and amoxicillin on pig MRSA carriage rates, clonal types and antimicrobial resistance, and compare data with those obtained in 2016.

**Materials/methods:** In 2018, 103 pigs (52 from farm B using amoxicillin only as a feed additive and 51 from farm C where no antibiotics were included in the feed regimen) were nasally swabbed for MRSA colonization. Isolates were tested for antimicrobial susceptibility, and characterised by *spa* typing, SCCmec typing and MLST. Whole genome sequencing (WGS) was performed for representative isolates.

**Results:** Overall, 96% of the pigs swabbed in 2018 carried MRSA, mostly ST398-SCCmec V-*spa* types t011/t108. MRSA from pigs not receiving antibiotics in the feed regimen showed susceptibility to a higher number of antibiotics, namely erythromycin, ciprofloxacin, gentamicin, and chloramphenicol. Notably, most of these isolates (n=52) presented an unusual erythromycin-susceptibility/clindamycin-resistance phenotype. WGS showed that these isolates lacked the *erm* and the *lnu* genes encoding resistance to macrolides and lincosamides, respectively, but carried the *vga*ALC gene encoding resistance to lincosamides, which is here firstly identified in *S. aureus* ST398.

**Conclusions:** Two years of ban of colistin and amoxicillin as feed additives did not significantly impact the MRSA nasal carriage rates. Nevertheless, the MRSA strains circulating in those farms showed resistance to a lower number of antibiotic classes.

Impact of coagulase-negative staphylococci positive blood culture occurring in early postoperative cardiac surgery

Michael Thy*1

1CHU Bichat - APHP, Department of Infectious and Tropical Diseases, Paris, France

Background: The occurrence of bacteremia after cardiac surgery is common [1]. It often involved coagulase-negative Staphylococci bacteremia [CoNS] but with difficulties to distinguish contamination to real infections [2–4]. The objectives of this study are to describe CoNS bacteremia after cardiac surgery.

Materials/methods: This monocentric retrospective study included any patient over 18-year-old with bacteremia within 30 days of cardiac surgery hospitalized at Bichat Claude Bernard Hospital from January 2013 to December 2016. We excluded all the other identified germ in blood cultures. We divided into 2 groups, one with a diagnosis of infection and the others considered as contamination. We defined contaminant as clinical presentation and laboratory criteria [13]. These criteria included a unique positive blood culture, ≥2 days until the first blood culture became positive, the isolated microorganisms [CoNS, Corynebacterium species, Bacillus species other than anthracis and P. acnes] and clinical risk score including negative blood cultures and a favorable evolution without antibiotics. Sepsis was defined by Sepsis 3.0 criteria [14]. Every diagnostic and therapeutic decision was decided with a multidisciplinary expert staff.

Results: Among the 211 patients screened, 41.2% [n=87] had CoNS bacteremia. 80.4% [n=70] were considered as contamination and 19.6% [n=17] were not considered as contamination. The details of the comparison are shown on Table 1. In the group of CoNS infection, the germ the most represented was Staphylococcus epidermidis [n=10 (58.8%)] with same proportion of the others CoNS in the 2 groups. 2 were considered as an endocarditis based on nuclear imaging and treated as so. The patients with infection by CoNS had significantly more surgical treatment related to the wound sternal infection diagnosis. The hospital length of stay and mortality was significantly higher in the group with infection by CoNS.

Conclusions: Positive blood culture by CoNS occurring after cardiac surgery is a common complication but not always as a contaminant with a high rate of mortality with wound sternal infection as a leading cause and some cases of endocarditis. Prospective studies could lead to further responses.

Investigation of a nosocomial pulmonary tuberculosis in a French university hospital

Elias Christelle*1,2, Christian Dorado-Cortez2, Oana Dumitrescu3, Florence Ader4, Philippe Ceruse5, Claudine Pasquet-Volkmann6, Béatrice Grisi2, Philippe Vanhems7, Cédric Dananché1;2

1Faculté De Medecine Et De Maïeutique Lyon Sud - Charles Mérieux, Oullins, France, 2Unité d’Hygiène et Epidémiologie, Groupe-ment Hospitalier Nord, Hospices Civils de Lyon, Lyon, France, 3Laboratoire des Mycobactéries, Institut des Agents Infectieux, Hôpital de la Croix-Rousse, Hospices Civils de Lyon, Lyon, France, 4Service de Maladies Infectieuses et Tropicales, Hôpital de la Croix Rousse, Hospices Civils de Lyon, Lyon, France, 5Service d’ORL, Hôpital de la Croix Rousse, Hospices Civils de Lyon, Lyon, France, 6Service de Médecine de Santé au travail, Hôpital de la Croix Rousse, Hospices Civils de Lyon, Lyon, France, 7Unité d’Hygiène et Épidémiologie, Groupement Hospitalier Centre, Hospices Civils de Lyon, Lyon, France

Abstract:

Nosocomial pulmonary tuberculosis (TB) remains nowadays poorly known. Healthcare workers (HCW) are at increased risk for TB infection and disease due to a higher risk of TB exposure in a hospital setting. Pulmonary TB infection control measures are a key component to minimize the risk of transmission and to prevent a further spread of the disease, in particular in healthcare facilities. The aim is to describe two cases of nosocomial TB.

Materials/methods:

Following the diagnosis of a pulmonary TB in a HCW in an Ear Nose Throat ward in a French university hospital, a retrospective descriptive review was performed to understand the route of acquisition.

Results:

In August 2018, 6 patients and 107 HCWs were identified as contact subjects following a delayed pulmonary TB diagnostic and delayed airborne precautions implementation in the index patient, a 74-year-old male with an oropharynx cancer. Subsequent to a TB screening, two secondary cases were identified in HCWs. The first HCW, a 30-year-old man developed a nosocomial pulmonary TB three months after exposure, verified by culture. The ongoing whole genome sequencing (WGS) molecular survey implemented in our center confirmed that the isolate was identical to the one of the index case. Moreover, WGS analysis ruled out any possibility of transmission to an 18-year-old woman admitted to the unit concomitantly with the index case and developing pulmonary TB 4 months later. Further contact-tracing resulted in 79 contacts patients from hospital exposure. The second HCW, a 37-year-old female developed a nosocomial latent tuberculosis infection (LTI) following a positive Quantiferon-TB Gold test. No further investigation was conducted given the low risk of transmission of LTI and that the HCW was treated right after the diagnostic.

Conclusions:

HCWs have to rigorously follow TB infection control measures in order to prevent the occurrence of TB nosocomial cases. They have also to comply with TB screening and testing in case of exposure and should receive TB education regularly.

**Abstract 845**

**Characterisation of Staphylococcus aureus in soft tissue infections: relevance of PVL producers**

Nuno Leal1, Gabriela Vieira1, Nádia Osório1, Catarina Maria Antunes Chaves2, Fernando Rodrigues2, Ana Catarina Rodrigues*2

1Instituto Politécnico de Coimbra, Escola Superior de Tecnologia da Saúde de Coimbra, Coimbra, Portugal, 2Centro Hospitalar e Universitário de Coimbra, Coimbra, Portugal

**Background:** Methicillin-resistant *Staphylococcus aureus* (MRSA) is a group of bacteria able to resist to beta-lactamic antibioti-
cs: This profile is mainly due to the presence of the *mecA* gene present in SScmec cassette. MRSA, due to different characteris-
tics, have been distinguished in community-acquired (CA-MRSA) and hospital-acquired (HA-MRSA) strains. The pathogenicity
of *S. aureus* and the production of virulence factors are responsible for severe infections. PVL is an exotoxin produced by *S.
aureus*, able to lyse the defense cells. The genes that encode this enzyme can integrate the SCCmec, mainly the types IV/V,
common in CA-MRSA, causing infections with more difficult and prolonged treatment.

**Materials/methods:** 139 *S. aureus* isolates responsible to skin and soft tissue infections were identified and characterized
according to its antibiotic susceptibility profile, in Centro Hospitalar e Universitário de Coimbra. DNA extraction was done and
the *mecA* and *lukSF* genes detection were performed by PCR.

**Results:** The 139 isolates of *S. aureus*, according to the phenotype for oxacillin, were classified as MRSA 47 (34%) and as
MSSA 92 (66%). All MRSA presented *mecA* gene and, among the MSSA, 49 (53.3%) were positive and 43 (46.7%) negative. The
vancomycin phenotype was sensitive for all isolates and higher MIC levels were found in superficial infections (80.3%, n = 53),
with more methicillin-sensitive isolates (MSSA). The gene that encodes the PVL was found in 2.2% (3) of the isolates: 2 from
pediatric samples (abscess and non-surgical wound exudate [NSWE]) and 1 from a non-pediatric sample (NSWE).

**Conclusions:** The prevalence of PVL was 2.2%. The 3 isolates carrying-PVL were MRSA/MSSA and probably were acquired in
the community, all had *mecA* gene. 2 isolates were found in pediatric samples, in a total of 13 isolates; the other was found in a
non-pediatric sample, from a total of 126 isolates. PVL shown to have a high prevalence within *S. aureus*, causing skin and soft
tissue infections in children with statistical significance, suggesting that this screening should be done for the better treatment
and avoid prolonged infections.

Abstract 846

Outcomes in ventilated patients with hospital-acquired/ventilator-associated bacterial pneumonia (HABP/VABP) treated with imipenem/cilastatin (IMI)/relebactam (REL) versus piperacillin/tazobactam (PIP/TAZ): subgroup analysis of the RESTORE-IMI 2 randomised, controlled trial

1CHU de Nantes, Nantes, France, 2Ivano-Frankivsk Regional Clinical Hospital, Ivano-Frankivsk, Ukraine, 3Hospital Civil de Guadalajara, Guadalajara, Mexico, 4University of the Philippines, Manila, Philippines, 5Northwestern University Feinberg School of Medicine, Chicago, IL, United States, 6Tufts Medical Center, Boston, MA, United States, 7University of Michigan, Ann Arbor, MI, United States, 8Merck & Co., Inc., Kenilworth, NJ, United States

Abstract third-party references: Funding for this research was provided by Merck Sharp & Dohme Corp., a subsidiary of Merck & Co., Inc., Kenilworth, NJ, USA.

Background: In the RESTORE-IMI 2 phase 3 trial, IMI/REL was non-inferior to PIP/TAZ for treatment of HABP/VABP in both primary and key secondary endpoints. Since ventilated HABP (vHABP) and VABP are associated with higher mortality than non-ventilated HABP, we specifically evaluated efficacy and safety outcomes in ventilated patients.

Materials/methods: RESTORE-IMI 2 was a randomized, controlled, double-blind, non-inferiority trial in adults with HABP/VABP. Lower respiratory tract (LRT) specimens were obtained ≤48 hours prior to screening. Patients were randomized to 7-14d of IMI/REL 500mg/250mg or PIP/TAZ 4g/500mg. Primary endpoint: Day 28 all-cause mortality (ACM) in the modified intent-to-treat (MITT) population (randomized patients with ≥1 dose of study drug, excluding patients with only gram-positive cocci present on baseline Gram stain). Key secondary endpoint: clinical response at early follow-up (7-14d after end-of-therapy). Another secondary endpoint was Day 28 ACM in the microbiologic MITT population (MITT patients with baseline pathogen species against which IMI/REL is known to have activity). The safety population included all patients who received study drug. Efficacy and safety endpoints were prospectively evaluated in the sub-population of ventilated patients (i.e., primary diagnosis of vHABP or VABP).

Results: In the MITT population, 122/254 (46.2%) IMI/REL and 126/257 (50.9%) PIP/TAZ patients had a primary diagnosis of vHABP or VABP. Of these, 39.3% were ≥65 years old, 66.3% had APACHE-II scores ≥15 (median score: 17.5 IMI/REL, 18.0 PIP/TAZ), and 19.4% had moderate/severe renal impairment. Baseline characteristics in ventilated patients were generally balanced between treatment arms. Most frequent baseline LRT pathogens (assessed in ventilated patients of the microbiologic MITT population) were A. calcoaceticus-baumannii complex (23.0% of patients), K. pneumoniae (21.5%), P. aeruginosa (20.1%), and E. coli (15.8%); baseline pathogens were balanced between arms. IMI/REL was associated with lower ACM than PIP/TAZ and comparable clinical response rates in the ventilated sub-population (Table). In the safety population of ventilated patients, rates of overall adverse events (AEs) [IMI/REL 114/124 [91.9%] vs PIP/TAZ 116/136 [92.6%]] and therapy discontinuations due to any AEs [IMI/REL 10/124 [8.1%] vs PIP/TAZ 14/136 [10.3%]] were similar in both groups.

Conclusions: IMI/REL is an efficacious and well-tolerated treatment option for mechanically ventilated patients with nosocomial pneumonia.

Abstract 849

Baseline microbiology, susceptibility, molecular characterisation, and emergence of non-susceptibility in a recent randomised, controlled trial (RESTORE-IMI 2) comparing imipenem/cilastatin (IMI)/relebactam (REL) versus piperacillin/tazobactam (PIP/TAZ) for hospital-acquired or ventilator-associated bacterial pneumonia (HABP/VABP)

Katherine Young*, Aileen David-Wang†, Antoine Roquilly‡, Daniel Rodriguez Gonzalez‡, Richard G Wunderink‡, Ivan Titov§, Meredith Hackel†, Krystyna Kazmierczak†, Mark Wise‡, Alok Maniar†, David W. Hilbert†, Maria C. Losada†, Jiejun Du†, Michelle L. Brown†, Amanda Paschke†, Luke F. Chen†

Abstract third-party references: Funding for this research was provided by Merck Sharp & Dohme Corp., a subsidiary of Merck & Co., Inc., Kenilworth, NJ, USA.

Background: RESTORE-IMI 2 showed IMI/REL to be non-inferior to PIP/TAZ for treatment of HABP/VABP. Here we present key microbiologic data from that study.

Materials/methods: Randomized, controlled, double-blind, multinational, non-inferiority, phase 3 trial comparing IMI/REL 500mg/250mg versus PIP/TAZ 4g/500mg in HABP/VABP. Baseline lower respiratory tract (LRT) specimens were obtained ≤48h prior to screening, at end-of-therapy (EOT), and early follow-up (7-14d after EOT). Identification and susceptibility of all pathogens were confirmed at a central laboratory. LRT non-Morganellaceae Enterobacterales and Pseudomonas aeruginosa isolates underwent molecular characterization for β-lactamase genes if they were either imipenem-nonsusceptible isolates or imipenem-susceptible baseline isolates from patients with an imipenem-nonsusceptible isolate of the same species collected subsequently during treatment. The microbiologic modified intent-to-treat (mMITT) population included all patients with ≥1 dose of study therapy, without only gram-positive cocci on their baseline LRT specimen, and with baseline pathogen species known to be potentially susceptible to imipenem/REL.

Results: The mMITT population comprised 215 and 218 patients randomized to IMI/REL and PIP/TAZ, respectively. The most frequent baseline LRT pathogens were Enterobacterales, P aeruginosa, and Acinetobacter calcoaceticus-baumannii complex; 84.0% of pathogens in the IMI/REL versus 70.4% in the PIP/TAZ arm were susceptible to randomized study drug according to EUCAST criteria (Table). In both treatment arms, the baseline LRT pathogens’ imipenem/REL minimum inhibitory concentration (MIC) range, MIC50, and MIC90 were similar. Across pathogens, PIP/TAZ had higher MIC values than imipenem/REL. Imipenem/REL MIC distributions in Enterobacterales and P aeruginosa were like those previously reported in global and European 2016-2018 surveillance. Among molecularly characterized study isolates (n=59, 71.2% imipenem/REL, 30.5% imipenem, 33.9% PIP/TAZ susceptible), 8 were KPC-producing Enterobacterales (100% imipenem/REL, 0% imipenem, 0% PIP/TAZ susceptible); 6 OXA-48-like-producing Enterobacterales (66.7% imipenem/REL, 66.7% imipenem, 0% PIP/TAZ susceptible); 4 metallo-β-lactamase-producing Enterobacterales (0% imipenem/REL, imipenem, and PIP/TAZ susceptible); 3 carbapenemase-negative, ESBL-producing Enterobacterales (100% imipenem/REL, 100% imipenem, and 66.7% PIP/TAZ susceptible); and 29 metallo-β-lactamase-negative P aeruginosa (79.3% imipenem/REL, 20.7% imipenem, and 44.8% PIP/TAZ susceptible).

Conclusions: In RESTORE-IMI 2, pathogen and MIC distributions were comparable to recent surveillance data and other recent HAPB/VABP trials. Most pathogens were susceptible to imipenem/REL. REL restored imipenem susceptibility in KPC-producing Enterobacterales and most metallo-β-lactamase-negative P aeruginosa.

EUA = European Committee on Antimicrobial Susceptibility Testing. IMI/REL = imipenem/cilastatin/relebactam. LRT = lower respiratory tract. M = number of isolates with susceptibility interpretation (based on EUCAST, Version 9.0) available. m = number of isolates with a susceptibility interpretation of ‘susceptible’. mMIT = microbiologic modified intent-to-treat. ND = not determined. n = number of mMITT patients with the pathogen. PIP/TAZ = piperacillin/tazobactam.

Susceptibility interpretation by broth microdilution testing for PIP/TAZ was based on the European Committee on Antimicrobial Susceptibility Testing breakpoint tables for interpretation of minimum inhibitory concentrations, Version 9.0. Imipenem/relebactam susceptibility was determined using the provisional EUCAST breakpoints. For pathogens without IMI/REL breakpoints, the corresponding imipenem interpretive criteria were applied to determine imipenem/relebactam susceptibility.

*Percentage calculated as number of mMITT patients with the pathogen divided by total number of patients in the mMITT population, within that treatment arm. 4Percentage calculated as number of pathogen isolates with a susceptibility interpretation of ‘susceptible’ divided by total number of pathogen isolates with susceptibility interpretation available, within that treatment arm. 5PIP/TAZ is assumed to not have any activity against this pathogen. 6The lowest PIP/TAZ concentration tested (2 µg/mL) is greater than the EUCAST susceptibility breakpoint (0.25 µg/mL) for H. influenzae, so PIP/TAZ susceptibility according to EUCAST criteria could not be categorized for this pathogen.

Abstract 856

Treatment of flaviviruses in solid organ transplant recipients with intravenous immunoglobulin and interferon alpha-2b: a Mayo Clinic Arizona experience

Sabirah Kasule*1, Roberto Patron1, Marie Grill1

1Mayo Clinic Hospital in Arizona, Phoenix, United States

Background: We present a case series of 10 solid organ transplant (SOT) recipients treated for either neuroinvasive West Nile virus (WNV) or St Louis Encephalitis virus (SLEV) at the Mayo Clinic in Arizona between 2011 and 2019.

Materials/methods: Data were queried using the integrating Biology and the Bedside clinical data analytics platform.

Results: All patients were treated with both intravenous immunoglobulin (IVIG) and interferon alpha-2b (IFN alpha-2b). 80% survived with 50% of those recovering completely. On average, recovery occurred on illness day 23, 9 days after treatment initiation. 2 of 4 organ rejections recovered.

Conclusions: Flaviviruses present significant morbidity for SOT patients often requiring ICU admission. IVIG combined with IFN alpha-2b appears to show clinical benefit and is well tolerated in SOT recipients, providing a more standardized role in this population's treatment for neuroinvasive disease. Future prospective studies are needed to confirm these findings.

Abstract 859

Deaths of emerging and re-emerging infectious diseases outbreaks, epidemics and pandemic in the last 10 years: a systematic review

Tran Thuy Huong Quynh*, Huu Nhat Minh Le2, Ahmad Helmy Zayan3, Gamal Goda Abdel-Samea4, Eman Othman5, Huu-Hoai Le6, Thi Nam Giang Hoang7, Khac Linh Le8, Masahiro Hashizume9, Kenji Hirayama10, Nguyen Tien Huy11

Background: The emergence and re-emerge of infectious diseases in the last decade has heightened concerns about the possibility of global outbreaks of disease and the ability of national and international health systems to respond and to overcome such infections successfully with the least possible number of victims. This study aimed to determine the death of the recent major emerging and re-emerging infectious disease outbreaks, epidemics, and pandemics.

Materials/methods: We searched 10 electronic databases: PubMed, Scopus, Gh, Vhl, Popline, Isi, Google Scholar, Sigle, Nyam to assess the death of major emerging and re-emerging infectious disease outbreaks from 2006 to 2015. We used Strobe Statement for assessing the risk of bias in our included observational studies. The study protocol was registered on Prospero, number crd42016038138.

Results: Out of the total included 8315 studies, 187 articles were eligible for analysis. Overall case fatality rate (Cfr) was 6.6%. Cfr was the highest with outbreaks (11.3%) followed by pandemics (3.7%) and epidemics (3.2%). South East Asia was the most affected region in outbreaks with Cfr (21.3%). Burkholderia pseudomallei and Nipah virus had the highest outbreak Cfr (80%, and 78.6%). Cfr increased notably in the last two years of our review at 2014 and 2015 with Cfr 25.4%, and 30.1% respectively. Significant risk of bias found with p-values of (0.001) using Egger's regression intercept.

Conclusions: South East Asia Region had the most death cases of infectious disease outbreaks. Burkholderia pseudomallei and Nipah virus were the causative pathogens that caused the highest number of cases of death.

Abstract 861

Comparison of immune function between T, B lymphocytes, Th17, Th22 and Treg cells in children with hand, foot and mouth disease caused by EV71 and other enterovirus infections

Wen Song*, Shiyong Zhao¹, Yi Wei¹

¹Hangzhou Children’s Hospital, Hangzhou Shi, China

Background: Hand, foot and mouth disease is a global infectious disease caused by enterovirus, which occurs mostly in children under 5 years of age. There are more than 20 enteroviruses causing hand, foot and mouth disease, mainly Coxsackie A group 16 and enterovirus 71. HFMD caused by EV71 infection progresses rapidly, and it is prone to severe cases and even death. The pathogenesis of severe EV71 infection is still not fully understood. To investigate the difference of cellular immune function between enterovirus 71 (EV71) and other enterovirus infections in children with hand, foot and mouth disease, and to provide clinical diagnosis and treatment for hand, foot and mouth disease.

Materials/methods: The data of 94 children with hand, foot and mouth disease admitted to Hangzhou Children’s Hospital from November 2016 to June 2017 were analyzed. Among them, 45 cases were in EV71 infection group and 49 cases were non-EV71 other enterovirus infection group. Determination of serum total T lymphocytes (%), cytotoxic T cells (%), helper T cells (%), total B lymphocytes (%), CD4+/CD8+ ratio, NK cells (%), Th17 cells, Th22 cells (%), Treg cells (%), Treg/Th17 ratio, and comparison between different groups by cytometry.

Results: The levels of Th17 cells (%), Th22 cells (%) and total B lymphocytes (%) in the EV71 infection group were significantly higher than those in the non-EV71 other enterovirus infection group (t=5.672; t=4.934; t=2.074; P<0.05), and the ratio of Treg cells (%) and Treg/Th17 was lower than that of non-EV71 other enterovirus infection group (t=5.817; t=6.351; P<0.05).

Conclusions: Compared with other enterovirus infections, EV71 is more likely to cause cellular immune function disorder, especially the changes of Th17 cells, Th22 cells, Treg cells and total B lymphocytes.

Multiplex detection of meningitis and encephalitis pathogens: a study from laboratory to the clinical

Yan Bing Zhou*1, Wang Min Jin2, Tingna Wu2, Shuo Guo1, Zirui Meng1, Tao Wu2, Binwu Ying2

1West China Medical School of Sichuan University, Chengdu, China, 2West China Hospital of Sichuan University, Chengdu, China

**Background:** Infectious Meningitis and Encephalitis as the potentially life-threatening conditions are mostly caused by bacterial, mycobacterium, fungus and viral agents. As the most devastating disease that results in nearly 150,000 deaths per year, early diagnosis and prompt initiation of treatment offer the chance of better prognosis. However, current laboratory testing projects do not meet demand for clinical diagnosis. Therefore, we come up with utilizing Multiplex detection for Meningitis and Encephalitis of 18 pathogens (MME-18) to help physicians achieve rapid and accurate diagnosis in infectious encephalitis and meningitis.

**Materials/methods:** The hospitalized patients with suspected intracranial infection were analyzed retrospectively between May and July in 2019 in West China Hospital of Sichuan University. MME-18 was designed to detect 18 pathogens in cerebrospinal fluid (CSF) of enrolled patients, including *N.meningitidis, M.tuberculosis, L.monocytogenes, S.pneumoniae, Mycoplasma pneumoniae, S.agalactiae, A.baumannii, H.influenzae, E.coli K1, C.neoformans, enterovirus [EV], mumps virus [MuV], herpes simplex virus type 1 [HSV-1], herpes simplex virus type 2 [HSV-2], Epstein-Barr virus [EBV], varicella zoster virus [VZV], cytomegalovirus [CMV], human herpes virus type 6 [HHV-6]. After using the GeneXpert and RT-qPCR to review the consistency of the results of 3 methods, we further informed clinician of the results and collected the feedback information of diagnosis and treatment.

**Results:** Among a total of 581 tested patients, 149 eligible individuals were enrolled in study. 85(57.05%) of the patients were positive for at least one of the 18 target pathogens. *M.tuberculosis, C.neoformans* and virus were the most common causative agents, including separate and multiple infections. According to the feedback of diagnosis and treatment provided by clinicians, 66(77.64%) patients were confirmed by clinical diagnosis and targeted treatment. 9(10.58%) patients results had not been supported by clinicians, but they were still willing to seek further information. At the same time, 10(11.76%) results were rejected or ignored.

**Conclusions:** MME-18 has much wider and accurate range of pathogenic spectrum while it is able to complete detection within 4.5 hours. Moreover, the MME-18 results may help diagnose and provide clinical treatment suggestion about encephalitis/meningitis.

| Table 1 Demographic and clinical Characteristic of the 149 Patients. |
|---------------------------------|---|

| Age                            | 44.9 |
| Mean — yr                      | 7(4.7) |
| 10 - 19yr                      | 47(31.8) |
| 20 - 39yr                      | 56(37.6) |
| >60yr                          | 39(25.9) |
| Male sex — no. (%)             | 90(59.2) |
| Syndrome — no. (%)             | 58(38.9) |
| Meningitis alone               | 87(58.4) |
| Encephalitis with or without meningitis | 4(2.7) |
| Myelitis with or without meningitis | 29(19.5) |
| Exacerbation of chronic condition — no. (%) | 6(4.0) |
| Immunocompromised — no. (%)    | 4(2.7) |
| HIV-1                          | 2(1.3) |
| Solid-organ transplant         | 6(4.0) |
| ICU admission — no. (%)        | 17(11.4) |
| Death within 30 days — no. (%) | 1(0.8) |
| Median no. of days after hospital admission that CSF was collected for MME-18 assay(range) — days | 2.2(1—8) |
A. Screening, Enrollment, and Follow-up

Clinical diagnosis of TBM agreed with MME-18 results (n=17)

Clinical suspected TBM but MME-18 unsupported (n=17)

MME-18 indicates TBM but Clinical diagnosis unsupported (n=20)

Negative of TBM Control (n=13)

B. Protocol for MME-18 Assay

Figure 1 Results of MME-18 Testing and Clinical Effect
Panel A illustrates the flow of patients through the study. Panel B shows the protocol for multiplex PCR assessment for meningitis and encephalitis assay. Following receiving samples of cerebrospinal fluid (CSF), nucleic acid is isolated. The multiplex PCR is performed while the fragment was analyzed with the use of capillary electrophoresis. Panel C shows the concordance between clinical diagnosis and MME-18 results while the similarity of the red and blue illustrates the consistency of MME-18 and GeneXpert results. The positive results of Mycobacterium tuberculosis were detected in 54 of 149 patients (36.2%), a proportion of 31.4% among 54 patients showed concordant results between clinicians and test results. The diagnostic rate was 68.5%. There were 2 different conditions; one was that clinical suspected tuberculous meningitis (TBM) with negative MME-18 results, the other is that clinical diagnosis of TBM is negative with positive MME-18 results. Panel D shows the pathogens distribution of 149 patients that was enrolled in the study.

**Abstract 865**

**Bacteriophage therapy against multidrug-resistant *Acinetobacter baumannii* infections**

Rohit Rathore*1, Natia Karumidze1,2

1European University, Tbilisi, Georgia, 2G. Eliava Institute of Bacteriophages, Microbiology and Virology, Tbilisi, Georgia

**Background:** *Acinetobacter baumannii* is very powerful superbug and ranked 1st among the world deadliest superbugs. These superbugs are killing about 700,000 people per year. All the drug including the last resort drugs is resistant to this type of bacterial strain. The infections which are caused by these superbugs are hard to treat and are too expensive. In the past, we don’t have any proper ways to treat *Acinetobacter* infection but nowadays we found one therapy which can treat such infections and we called it “Phage Therapy”. A virus is used to treat the infections caused by bacteria. A bacteriophage is a virus which infects bacteria only and is harmless to the human cell, they also have high therapeutic ratio and they are better than any of the antibiotics because they can penetrate biofilm easily and are the future for multidrug-resistant bacteria’s.

**Materials/methods:** In our study we used *A. baumannii* G7 strain, isolated from the wound of a soldier injured during the war in 2008. For antibiotic sensitivity were used five different antibiotics – Amikacin (30µg), Norfloxacin (10µg), Imipenem (10µg), Ceftazidime (10µg) and Rifampicin (5µg) by using Kirby-Bauer Disk Diffusion Susceptibility Test for antibiotics sensitivity fig.1 (picture2). Bacteriophage sensitivity was done towards 5 specific *Acinetobacter* monophages and 6 phage lysates by using Spot-test technique fig.1 (picture1).

**Results:** Disk diffusion susceptibility test revealed that *A. baumannii* strain used in our study was sensitive to norfloxacin and amikacin antibiotics, but showed resistance to ceftazidime, rifampicin and also to imipenem. Bacteriophage sensitivity showed that from the 11 phages 2 of fig. 1[1,2] had complete lysis, fig. 1[3,4] bacteriophages had Semi-confluent lysis. Fig. 5 and 6 bacteriophages had opaque lysis; Five of eleven phages showed resistance.

**Conclusions:** Bacteria are becoming immune to all drugs. Alternatives to antibiotics could be considered bacteriophages. They have many characteristics that make phages as potentially attractive therapeutic agents. And in the future, the only solution for all the bacteria is the phage therapy as one day all the bacteria will become resistant to every drug and in this situation phages will work and become our future.

Abstract 866

**Application of a multiplex polymerase chain reaction test for diagnosing bacterial enteritis in children in a real-life clinical setting**

Eui Soo Lee*, Hyun Woo Lee¹, Seung Beom Han¹

¹The Catholic University of Korea, College of Medicine, Seoul, South Korea

**Background:** Although a variety of multiplex polymerase chain reaction (mPCR) tests have been used for diagnosing bacterial enteritis as a syndromic approach, few studies determined diagnostic accuracy of mPCR tests based on patients’ symptoms and clinical diagnosis in a real-life clinical setting.

**Materials/methods:** Medical records of 710 inpatient pediatric patients (<19 years of age), in whom an mPCR test for 10 bacterial pathogens was performed, were retrospectively reviewed. Based on the clinical diagnosis on discharge, the enrolled patients were divided into two groups: acute gastroenteritis (AGE) group and non-AGE group. Clinical and laboratory characteristics and the mPCR test result were compared between the two patient groups.

**Results:** Among the enrolled patients, 467 (65.8%) and 243 (34.2%) patients were included in the AGE and non-AGE groups, respectively. Upper (37.9%) and lower (21.8%) respiratory tract infections were most common final diagnoses in the non-AGE group. The mPCR test revealed bacterial pathogens in 199 (28.0%) patients: 163 (34.9%) in the AGE group and 36 (14.8%) in the non-AGE group (P<0.001). *Campylobacter* spp. (n=64, 32.2%), *Clostridium difficile* (n=52, 26.1%), *Salmonella* spp. (n=46, 23.1%), and *Clostridium perfringens* (n=41, 20.6%) were most commonly identified. *Campylobacter* spp. (38.7% vs 2.8%, P<0.001) and *Salmonella* spp. (26.4% vs 8.3%, P=0.020) were more frequently identified in the AGE group; whereas, *C. difficile* (18.4% vs 61.1%, P<0.001) and *C. perfringens* (18.4% vs 30.6%, P=0.103) were more frequently identified in the non-AGE group. Among the 199 patients with positive mPCR test results, patients in the AGE group were older (median 7 years vs 2 years, P=0.002), more likely to have gastrointestinal symptoms (100% vs 86.1%, P<0.001), and less likely to have respiratory symptoms (8.0% vs 44.4%, P<0.001) compared to those in the non-AGE group.

**Conclusions:** More detailed history taking and physical examination can reduce performing unnecessary mPCR tests in patients with gastrointestinal symptoms. In pediatric patients suspected to have AGE, the clinical significance of each bacterial pathogen identified by an mPCR test should be determined individually. *Campylobacter* spp. and *Salmonella* spp. can be considered true pathogens, however, *Clostridium* spp. may be a bystander.

Abstract 873

Development of a routine laboratory test enabling the detection of dermatophytes as well as the identification of *Trichophyton rubrum* by means of duplex real-time PCR from mycological samples and cultures

Thomas Pablo¹, Frédéric Decruyenaere¹, Marie Meo¹, Alexandre Mzabi*¹, Monique Perrin¹

¹Luxembourg National Health Laboratory, Department of Microbiology, Dudelange, Luxembourg

**Background:** Dermatophytes are responsible, in majority, for fungal infections of the skin, hair and nails and *Trichophyton rubrum* is the most frequently isolated dermatophyte. The time of growth in culture and microscopic morphology identification (the "gold standard") requires a total of two to four weeks. Molecular methods were developed to improve time for diagnosis and treatment. We will present and demonstrate here the suitability of an in-house method enabling at the same time the detection, through duplex real-time PCR analysis, of dermatophyte positive samples and the direct identification of *Trichophyton rubrum*.

**Materials/methods:** Prior to real time PCR, nucleic acid extraction and purification steps are crucial. Different sample pre-treatment conditions were tested: with and without agitation and/or heating at 95°C (203°F). The highest yield of nucleic acid was obtained with a complete pre-treatment combining agitation and heating. After the pre-treatment, the samples were processed on the NucliSENS® EasyMag® (bioMérieux) according to the manufacturer’s recommendations. Finally, the extracted nucleic acids were performed on the CFX-96™ (Bio-Rad) with specific probes and primers. All positive samples for dermatophytes were identified by sequencing (ITS1 -5.8S-ITS2).

**Results:** One hundred ninety-nine mycological samples were studied (one hundred forty-four nails and fifty-five skin samples) according to conventional methods and DERTR PCR. The sensitivity, specificity, positive and negative predictive values of each target were calculated and are respectively: 97.9%, 76.8%, 57.3% and 99.1% for dermatophytes; 95.2%, 97.9%, 67.8% and 98.6% for *Trichophyton rubrum*. These results demonstrate that the duplex DERTR PCR is a suitable method for rapid diagnosis of dermatophytosis and identification of *Trichophyton rubrum*.

**Conclusions:** We developed an in-house duplex real-time PCR able to detect dermatophytes and identify at the same time *Trichophyton rubrum* from mycological samples and cultures. This method routinely used as enable a diagnosis within four hours in contrast to the two to four weeks required with the conventional methods. This real time PCR has been submitted for accreditation ISO 15189 in November 2019.

Abstract 892

The effect of mesenchymal stem cells on the mortality of severe sepsis and septic shock: a promising therapy

Emine Alp Mese1, Zeynep Burcin Gonen2, Kursat Gundogan3, Aliye Esmaoglu3, Leylagul Kaynar4, Aysun Cetin3, Musa Karakukcu3, Mustafa Cetin3, Gamze Kalın Ünüvar*3, Mehmet Doganay3

1Ministry of Health, Ankara, Turkey, 2Erciyes University Faculty of Dentistry, Kayseri, Turkey, 3University Of Erciyes Faculty Of Medicine, Kayseri, Turkey, 4Erciyes University Medical Faculty, Kayseri, Turkey, 5University Of Erciyes Faculty Of Medicine, Kayseri, Turkey

Background: The aim of this study is to assess the effect of mesenchymal stem cells on the mortality of sepsis and septic shock.

Materials/methods: During two years, 10 patients with severe sepsis and septic shock were included into the study from Medical and Anesthesiology and Reanimation Intensive Care Units. Mesenchymal stem cells (MSCs) treatment was added to standard therapy of sepsis. Patients received 1*10^6/kg MSC on the 1st, 3rd, 5th, 7th and 9th days of ICU admission. Peripheral blood samples from patients were obtained before MSCs treatment and on the day of MSCs treatment for the measurement of cytokine (TNF-α, IFN-γ, IL–2, IL–4, IL–6, IL–10) levels. Outcomes of the patients were compared with the previous observational study conducted in the same ICUs.

Results: In the study group, 6 of 10 patients were male, whose ages were ranged from 22 to 68. Their APACHE II scores were ranged between 14-29. In the control group, 8 of 10 patients were male whose ages were ranged from 29 to 80. Their APACHE II scores were between 18-29. Survival rate for the 7th and 14th days of the 10 patients who were administered stem cell is 100%, survival rate for the 28th day is 70%. Except the patients who had advanced malignancy and uncontrolled source, there were improvements at the laboratory findings (CRP, procalcitonin, leukocyte, etc.) during the times when stem cells were administered to the patients. In the stem cell treatment group, decrease in the SOFA score of the analyses, which were adjusted by age and APACHE II, was statistically significant. A statistically significant change was not observed at the cytokine levels, which was compared the basal measurement of cytokine levels to the days of 1, 3, 5 and 7. In the control group, the survival rate of 10 patients was 60%. The deaths were observed at the control group before the 5th and 7th day of the treatment, no deaths were observed at the stem cell treatment group for the first two weeks and the period of mesenchymal stem cell administration.

Conclusions: Mesenchymal stem cell treatment had positive impact on survival rates of sepsis during the early phase.

Incidence of influenza-like illness among HIV-positive patients: an outpatient clinic survey-based study

André Almeida*, Paulo Barreto, Torcato Marques, Tiago Pacheco, Marta Leal Dos Santos, Sofia Pinheiro, Isabel Germano, Fernando Maltez, Marta Alves, Eugenio Teofilo

1Lisbon, Central Lisbon University Hospital Centre, Lisbon, Portugal, 2NOVA Medical School, Lisbon, Portugal, 3University of Lisbon Medical School, Lisbon, Portugal

Background: HIV infection has been associated with increased susceptibility to Influenza and Influenza-like illness (ILI), as well as to worse clinical outcomes within this disease spectrum. We aimed to assess the incidence and predictors of ILI in a cohort of HIV-infected outpatients.

Materials/methods: A survey about the occurrence of ILI symptoms during the previous winter season was applied between January and May 2018 on three HIV outpatient clinics in a tertiary care centre. ILI case was defined according to the European Center for Disease Control. The survey was complemented with the clinical and laboratory features retrieved from Hospital electronic data records. An explanatory model for ILI was explored by multivariate regression analysis. The study was approved by the institutional ethics committee.

Results: The study included 232 patients (68% males), aged 47±12 years. Most of the patients were on anti-retroviral therapy (97%) and had suppressed viremia (88%). Median CD4 cell count was 684 cells/μL [interquartile range 455-907]. The cumulative incidence rate was 38.4% (95%CI 30.8-47.2). Influenza vaccination on the concerned season was reported by 45.7% of patients. On multivariate analysis, lower ILI incidence was associated with higher CD4/CD8 ratio (aOR 0.38; 95%CI 0.16-0.94; p=0.04) adjusting for CD4 cell counts. This association was observed only for patients with CD4 counts below 500 cells/μL (aOR 0.10; 95%CI 0.01-0.66; p=0.02). Influenza vaccination and absolute CD4 cell counts were not significantly associated with differing incidence.

Conclusions: A high incidence of seasonal ILI was found. A higher risk of ILI may be associated with lower CD4/CD8 ratio, already described as indicator of an immunosenescent phenotype and increased immune activation. CD4/CD8 ratio may contribute on targeting subsets of patients for vaccination.

Abstract 894

Safety of temporary interruption of anti-platelets in dengue fever with thrombocytopenia
Po Ying Chia*1,2,3, Lin Htun Htet2, Yee Sin Leo1,2,3,4,5, David Lye1,2,3,5

1National Centre for Infectious Diseases (NCID), Singapore, Singapore, 2Tan Tock Seng Hospital, Singapore, Singapore, 3Lee Kong Chian School of Medicine, Nanyang Technological University, Singapore, Singapore, Singapore, 4Saw Swee Hock School Of Public Health, National University Of Singapore, Singapore, Singapore, 5Yong Loo Lin School of Medicine, Singapore, Singapore

Background: Thrombocytopenia commonly occurs in dengue and may be complicated by bleeding. Dengue can occur in adults who may be on long term anti-platelet therapy for comorbidities including myocardial infarction or ischemic stroke. In these cases, clinicians may temporarily discontinue antiplatelet therapy to minimize the risk of bleeding, however this may subject these patients to risk of further ischemic events.

Materials/methods: We conducted a retrospective cohort study of laboratory-confirmed adult dengue patients on antiplatelet therapy and evaluated participants whose anti-platelet therapy was continued versus discontinued. Primary outcome was a composite outcome of major adverse cardiac and cerebrovascular events (MACCE), and all-cause mortality in-hospital and for 1-year post discharge. Secondary outcomes were occurrence of platelet and blood transfusion, and occurrence of dengue hemorrhagic fever (DHF), dengue shock syndrome, dengue with warning signs and severe dengue according to World Health Organization criteria.

Results: In total, 66 patients admitted for dengue fever were on anti-platelet therapy, of which 15 patients were continued on the anti-platelet therapy. We found discontinuation of antiplatelet therapy did not result in higher MACCE and mortality, with 4 (2 non-fatal strokes and 2 mortalities) occurring in the continuation group and 5 (3 non-fatal strokes and 2 mortalities) occurring in the discontinuation group (p=0.192). On the other hand, continuation of antiplatelet therapy did not result in more platelet or blood transfusion (p=0.489 and p=0.567 respectively), DHF (p=0.923) or bleeding manifestations.

Conclusions: Our results suggest that discontinuation or continuation of antiplatelet therapy based on clinical judgement in dengue with thrombocytopenia, is largely safe but further studies are needed.

Species identification and antifungal resistance of yeasts causing fungaemia at a tertiary care hospital in Madrid, Spain: the coast is clear

Judith Diaz-Garcia 1,2; Carlos Sanchez Carrillo 1,2; Elena Reigadas Ramirez 1,2; Patricia Muñoz 1,2,4; Pilar Escribano 1,2; Jesus Guinea Ortega 1,2,3

1 Gregorio Marañón Hospital, Madrid, Spain; 2 Instituto de Investigación Sanitaria Gregorio Marañón, Madrid, Spain; 3 CIBER Enfermedades Respiratorias-CIBERES, Madrid, Spain; 4 Facultad de Medicina, UCM, Madrid, Spain

Background: Recent reports alert on an increase of fungaemia episodes caused by either echinocandin resistant C. glabrata isolates or multi-resistant species such as C. auris. We assessed the aetiology and antifungal susceptibility of agents causing fungaemia at a tertiary care hospital in Madrid (Spain) for 12 years.

Materials/methods: Isolates causing fungaemia in patients admitted to Hospital General Universitario Gregorio Marañón from 2007 to 2018 were tested for molecularly identification and in vitro susceptibility to amphotericin B, azoles, anidulafungin, and micafungin according to EUCAST EDef 7.3.1. Fluconazole and echinocandin resistance were assessed using the updated clinical breakpoints v.10.0. Multiple positive blood cultures in a single patient were considered different episodes when separated ≥1 week. Mutations in FKS and ERG11 genes were sought in either echinocandin-resistant isolates or C. albicans fluconazole-resistant isolates, respectively.

Results: We studied 921 episodes from 805 patients (90% of patients developed a single episode). Episodes were caused by C. albicans (45.4%, n=418), C. parapsilosis complex (27%, n=248), C. glabrata complex (12.2%, n=112), C. tropicalis (6.8%, n=63), C. krusei (2.3%, n=21), other Candida spp. (3.1%, n=29), and non-Candida yeasts (3.3%, n=30). Overall, 4.7% (n=42) of Candida isolates were fluconazole-resistant (C. krusei [n=19], C. glabrata [n=11], C. albicans [n=3], C. parapsilosis complex [n=2], and other Candida spp. [n=7]). Echinocandin resistance involved only 0.8% (n=7) of Candida isolates (C. tropicalis [n=3], C. krusei [n=2], C. albicans [n=1], and C. glabrata [n=1]). One out of three fluconazole-resistant C. albicans isolates harboured ERG11 mutations (A114S/G464S). FKS mutations were found in 5/7 echinocandin-resistant isolates (C. tropicalis [R647G FKS1, S645F FKS1]; C. krusei [L701M FKS1, n=2]; and C. glabrata [F659S FKS2]). Non-Candida yeasts showed intrinsic echinocandin resistance and decreased fluconazole susceptibility. Antifungal resistance rate proved steady over the years and was mainly affected by the presence of intrinsically resistant isolates [Figure]. Resistance to amphotericin B was not detected.

Conclusions: Our fungaemia epidemiology did not differ from that previously reported in Spain and C. auris has not been detected in our hospital. Fluconazole and/or echinocandin resistance rates were low and dramatically impacted by species with intrinsic diminished antifungal susceptibility, and did not show signs of increase.

1Gregorio Marañón Hospital, Madrid, Spain, 2Instituto de Investigación Sanitaria Gregorio Marañón, Madrid, Spain, 3Vall d’Hebron University Hospital, Barcelona, Spain, 4University Hospital La Paz, Madrid, Spain, 5Hospital Universitario A Coruña, A Coruña, Spain, 6Hospital Universitario Central de Asturias, Oviedo, Spain, 7Ctra.Colmenar-Hospital Ramon Y Cajal, Madrid, Spain, 8Hospital Universitario Reina Sofia, Córdoba, Spain, 9Donostia University Hospital, Donostia, Spain, 10Hospital Universitario Miguel Servet, Zaragoza, Spain, 11Hospital Universitario de Burgos, Burgos, Spain, 12Hospital 12 De Octubre, Madrid, Spain, 13Hospital de Bellvitge, L’Hospitalet de Llobregat, Spain, 14University Hospital Complex of Granada, Granada, Spain, 15Hospital San Pedro de Alcantara, Cáceres, Spain, 16Facultad de Medicina Universidad Complutense de Madrid, Madrid, Spain, 17CIBER Enfermedades Respiratorias-CIBERES, Madrid, Spain

Background: Azole-resistant Aspergillus fumigatus isolates, though relatively common in the North of Europe, have been sporadically reported in Spain. We report the largest survey conducted in Spain to assess the burden of azole resistance in A. fumigatus.

Materials/methods: The 30 participating hospitals, covering the majority of Spanish regions, stored all morphologically identified A. fumigatus complex clinical isolates – regardless their clinical significance – from the 15th of February to the 14th of May, 2019. Identification was confirmed by MALDI-TOF and antifungal susceptibility testing performed according to EUCAST 9.3 methodology. Resistant isolates were molecularly identified and cyp51A gene was sequenced in A. fumigatus sensu stricto isolates (itraconazole and/or voriconazole MIC ≥ 2 mg/L).

Results: A total of 848 A. fumigatus complex isolates of 726 patients were collected in 29/30 participating hospitals: A. fumigatus sensu stricto (n=828) and cryptic species [A. lentulus [n=6], A. fumigatiafinis [n=6], Neosartoria tseruiae [n=3], N. udagawae [n=2], A. novafumigatus [n=2], A. thermomutatus [n=1]]. Isolates were mostly (94%) from the lower respiratory tract. The vast majority of patients yielded either A. fumigatus sensu stricto (n=711) or cryptic species (n=10) exclusively, but 5 patients had coexistence of A. fumigatus sensu stricto + cryptic species. Amphotericin B resistance was found exclusively in cryptic species. A total of 64 (7.5%) isolates were resistant to ≥1 azoles. Azole resistance was higher in cryptic species than in A. fumigatus sensu stricto (95%, 19/20 vs. 5.5%, 45/828; Figure), with isavuconazole showing the lowest number of non-wild type isolates. Most of A. fumigatus sensu stricto resistant isolates showed cyp51A gene mutations [TR34-L98H, n=20; other mutations, n=5; WT, n=10]. A. fumigatus sensu stricto harbouring either the TR34-L98H (n=20) or TR46/Y121F/T289A (n=1) mutations were found in patients cared at hospitals located at 7/24 studied cities. We found 50 (7%) patients carrying either cryptic species (n=35) or A. fumigatus sensu stricto (n=15) resistant isolates.

Conclusions: We found 7% of patients carrying azole resistant A. fumigatus complex isolates in Spain. TR34-L98H or TR46/Y121F/T289A were the dominant cyp51A gene mutations in patients (60%) carrying resistant isolates although their presence was not widespread.

¹CHU-II Colavi Sô-Ava, Colavi, Benin, ²CHU-MEL Cotonou, Cotonou, Benin, ³Limoges, Tropical Neuroepidemiology, INSERM UMR 1094, Limoges, France, ⁴Limoges University Hospital, Parasitology Laboratory, Tropical Neuroepidemiology, INSERM UMR 1094, Limoges, France, ⁵Limoges University Hospital, Paediatric department, Limoges, France, ⁶Limoges University Hospital, department of ophthalmology, Limoges, France, ⁷Sorbonne Paris Cité, MERIT UMR 26 1, Paris, France, ⁸Université de Toulouse, PHARMADEV, IRD UPS, Toulouse, France, ⁹Hôpital Bichat Claude Bernard, Parasitology Laboratory, MERIT UMR 261, Paris, France, ¹⁰Limoges University Hospital, Department of infectious Diseases and Tropical Medicine, Tropical Neuroepidemiology, INSERM UMR 1094, Limoges, France

Background: Malaria morbidity and mortality have declined since year 2000 and viral central nervous system infections have been reported as an important cause of hospital admission with coma in malaria-endemic Eastern Africa. Our objectives were to describe the etiologies, management and outcome of non-traumatic comas in small children in Benin.

Materials/methods: This study took place in 2 teaching hospitals. All HIV negative children between 2 and 6 years of age, with a Blantyre Coma Score below or equal to 2 were included. Along with a workup screening for malaria severity signs, a blood culture, a Tropical Fever PCR test (Fast-track diagnostics) and a cerebrospinal fluid (CSF) analysis, including a multiplex PCR (Biofire, Mérieux) were performed. All children with malaria were treated with intravenous artesunate. Patients also had free access to other drugs, including transfusions, prescribed at the study physician’s discretion.

Results: Between March and November 2018, 84 children were included with a M/F sex ratio of 0.68 and a mean age of 43 months. A history of fever was declared in all children, with a mean duration of 4 (1 - 14) days and 90% (76/84) of them had received care provided by a health professional before admission, but only 11 children were given an adequate antimalarial oral therapy. Malaria was the only identified cause of coma in 86% (73/84), 5 had an associated infection (1 aseptic meningitis, 1 Staphylococcus aureus bacteremia, 1 Streptococcus bacteremia, 1 West Nile virus infection, 1 HHV6 CSF infection) and 6 had a non-malarial coma (1 dengue, 1 E. coli bacteremia, 4 unknown). Most (58/84) children received blood transfusions and 23% (20/84) ceftriaxone at admission; the lethality rate was 30 % (26/84).

Conclusions: Cerebral malaria remains by far the most common cause of non-traumatic coma in the study area, with a high lethality rate despite an access to standardized care. For most children, missed opportunities to receive an early and effective antimalarial treatment have been declared. Severe malaria needs to be prevented, but efforts to struggle against malaria should not overlook the capacity building for providing care to life-threatening forms of the disease.

Abstract 901

The progress towards achieving the UNAIDS ambitious 95% viral suppression target among adults living with HIV in South-Western Nigeria

Saheed Usman*

1APIN Public Health Initiatives, Abuja, Nigeria

Background: In sub-Saharan Africa where genotypic drug resistance testing is rarely performed and poor adherence is blamed for the inability to achieve viral suppression and treatment failure, programmatic approaches to preventing & handling these are thus essential. Hypothesis tested was antiretroviral therapy adherence effect on viral load outcome. This study was aimed at determining and monitoring HIV/AIDS disease progression using viral load to provide prognostic information and evaluate patients for viral suppression.

Materials/methods: This study was an observational study of subjects living with HIV already initiated on antiretroviral therapy for at least six months, enrolled in health facilities across Ondo State, South-Western Nigeria, during a 12-month observation period starting October 2018 till September 2019. Quantitative viral load analysis was done using Polymerase Chain Reaction, Roche Cobas Taqman 96 Analyzer. All data were statistically analyzed, using Statistical Package for the Social Sciences (SPSS), with multiple comparisons done using Post Hoc Bonferonni test.

Results: A total of 8124 adults living with HIV eligible for the study were recruited. Most of them are in the age range of 35 – 39 years, with a mean age of 42.02 ± 10.88 years. 7162 (88.2%) & 1771 (21.8%) of the subjects had viral suppression of <1000 RNA and <20 RNA copies per ml respectively. The unsuppressed subjects went through enhanced adherence counselling (EAC) for three months and viral load test repeated thereafter. 192 patients who had completed the three sessions of EAC and repeated viral load increased the entire suppression numbers to 7339 (90.3%) & 1824 (22.5%) <1000 RNA copies per ml and <20 RNA copies per ml respectively during the period of observation. ART adherence has significant effect on viral load outcome ($\chi^2 = 7.63$, df = 1, P = 0.001).

Conclusions: Current ART regimen & HIV treatment enhanced adherence counseling are key to the achieving viral suppression, thus, routine viral load monitoring will ultimately help in HIV/AIDS disease progression follow up and reduce treatment failure tendencies. This will help more patients stay on first line regimen and prolong their life expectancy, indicating that the UNAIDS last 95 target is achievable.

Abstract 902

Characterisation and virulence of fibronectin-binding protein of Streptococcus intermedius

Minoru Sasaki*, 1, Yoshitoya Kodama1, Taichi Ishikawa1, Yu Shimoyama2

1Iwate Medical University, Shiwagun, Japan

Background: Streptococcus intermedius, a member of the anginosus group of streptococci, is a common commensal organism found in the human oral cavity and gastrointestinal and urogenital tracts. Furthermore, S. intermedius is associated with purulent infections, abscesses and infectious endocarditis. The organism secretes the human-specific cytolysin intermedilysin that is highly homologous to the cholesterol-binding cytolysin streptolysin O from S. pyogenes, pneumolysin from S. pneumoniae, and listeriolysin O from Listeria monocytogenes. In this study, we identified other pathogenic factors and described a fibronectin-binding protein (FBP) homolog of S. intermedius (FbpI) that mediated bacterial adhesion to epithelial cells and virulence in mice.

Materials/methods: S. intermedius GAI 1157 [wild-type (WT)] and isogenic mutant ΔfbpI prepared by homologous recombination were used. The binding activities of S. intermedius strains to fibronectin and epithelial cells were determined using [methyl-3H]-thymidine-labelled bacteria. The fibronectin-binding domain was analysed using recombinant full-length (rFbpI) and N- and C-truncated forms of FbpI. The pathogenicity of FbpI was assessed using a mouse infection model. These mice were subcutaneously injected in the back with suspensions of S. intermedius WT or ΔfbpI. The abscesses were removed and weighed.

Results: The amino acid sequence of FbpI was similar to that of atypical FBPs that do not possess a conventional secretion signal and an anchorage motif. rFbpI was bound to immobilised fibronectin in a dose-dependent manner. The fibronectin-binding activity of the N-terminal construct of rFbpI comprising the translation initiation codon methionine of the open reading frame to Lys265 [rFbpI-N] bound immobilised fibronectin to a much lesser extent than rFbpI. In contrast, a construct comprising the C-terminal domain [Ala266 to Met549; rFbpI-C] bound immobilised fibronectin equivalently to rFbpI. Moreover, the adherence of isogenic mutant ΔfbpI to cultured epithelial cells and immobilised fibronectin was significantly lower than that of the WT strain. Furthermore, the abscess formation of ΔfbpI reduced in the mouse infection model compared with that in the WT strain.

Conclusions: Thus, FbpI may play a role in bacterial adhesion to host cells and represent a critical pathogenic factor of S. intermedius.

Staphylococcus aureus inhibits opsonophagocytosis and modulates neutrophils extracellular traps formation efficiently during the early stages of biofilm formation

Andi Rofian Sultan\(^1\), Nicole Lemmens-Den Toom\(^2\), Annelies Verbon\(^2\), Willem J.B. Van Wamel\(^2\)

\(^1\) Hasanuddin University, Department of Microbiology, Faculty of Medicine, Makassar, Indonesia, \(^2\) Erasmus MC, Department of Medical Microbiology and Infectious Diseases, Rotterdam, Netherlands

**Background:** Despite our versatile host immune responses with proven ability to eliminate Staphylococcus aureus invasion, infection with this bacterium is still a serious problem and can be frequently found in clinics, worldwide. Along with acute infection, S. aureus is also associated with biofilm-related chronic infections. In mature biofilms, encapsulated S. aureus cells are well known for their ability to resist the immune system and antibiotic treatment. Contrary, little information is available on immune evasion of S. aureus during the early stages of biofilm formation. Therefore, we studied if S. aureus developed mechanisms to overcome the host innate immune responses during these stages of biofilm development.

**Materials/methods:** S. aureus strains from various genetic background were grown in vitro to form biofilms. The production of immune modulators was studied during the early stage of biofilm formation using mass spectrometry, fluorescence resonance energy transfer (FRET) assay, and Luminex\textsuperscript{\textregistered} based competitive ELISA. The detected immune modulators were studied for their ability to modulate the host innate immune response using several ex vivo setups, like co-incubation of biofilm with complement and study the complement activation. Furthermore, the interactions between biofilm and neutrophils were monitored with confocal microscopy and isothermal microcalorimetry.

**Results:** Contrary to the previous finding, during the early stages of biofilm formation, S. aureus actively releases 87 different proteins which include several immune modulators. Potent immune modulators CHIPS, FLIPr, Map, Sbi, SCIN, thermonuclease (nuc), and Staphylococcal Protein A (SpA) were among the prominent proteins found. We observed that biofilms produce enough SCIN to hinder human complement activation and in this way obstruct C5a release. Furthermore, SpA was found to stimulate NETosis, leading to death of neutrophils. Finally, the thermonuclease produced during the early stages of biofilm formation, broke down these NETs.

**Conclusions:** The main mechanisms of neutrophils to eliminate bacteria, Opsonophagocytosis and NETs formation, can be jeopardized by S. aureus during the early stages of biofilm formation; opsonization and phagocytosis are inhibited by SCIN, while NETs formation and destruction are modulated by SpA and thermonuclease, ensuring the survival of these young S. aureus biofilms.

Using mechanisms of action to assess new antibiotics against Gram-negative bacteria
Yu-Kuo Tsai¹, CI-Hong Liou², Jung-Chung Lin², Chang-Phone Fung³, Feng-Yee Chang², L. Kristopher Siu*¹

¹KeMyth Biotech Company, Incubation Center, National Health Research Institutes, Miaoli, Taiwan, ²Tri-Service General Hospital, Taipei, Taiwan, ³Taipei Veterans General Hospital, Taipei, Taiwan

Abstract:
In our previous study, a strategic system for testing antibiotics against specific resistance mechanisms has been constructed by using *Klebsiella pneumoniae* (J Antimicrob Chemother 2017; 72: 3302-16), which can facilitate the development of antibiotics that are robustly effective against multidrug-resistant bacteria. Given that the genetic background of several bacterial pathogens with high resistance rates is quite different from that of *K. pneumoniae*, specific resistance genes can be found in these pathogens. In this study, the strategic system has been constructed by using *Acinetobacter baumannii*.

Materials/methods: In-frame deletion, site-directed mutagenesis and plasmid transformation were used to generate genetically engineered strains with various resistance mechanisms from two fully susceptible *A. baumannii* strains. Antimicrobial susceptibility testing was used to test antibiotics against these strains in vitro.

Results: A total of 50 engineered strains with various resistance mechanisms from *A. baumannii* KAB1544 and ATCC 17978 were constructed. These strains included 31 strains with chromosome-mediated resistance and 19 strains with plasmid-mediated resistance, and each of the 50 resistance mechanisms showed similar effects on the MICs for KAB1544 and ATCC 17978. Compared to the parental strains, the engineered strains related to some efflux pumps showed a significant (≥4-fold) difference in the MICs of β-lactams, quinolones, aminoglycosides, tetracyclines, folate pathway inhibitors and/or phenicols, while no significant (≥4-fold) effects on the MICs were found for the engineered strains lacking OmpA, CarO, Omp25, Omp33, OmpW or OprD. Mechanisms due to GyrA/ParC mutations, β-lactamase, aminoglycoside-modifying enzyme, 16S rRNA methylase and tet resistance gene contributed their corresponding resistance as previously published.

Conclusions: Strains constructed in this study have clear resistance mechanisms and can be used to screen and assess compounds against specific resistance mechanisms for treating *Acinetobacter*. In addition to our previously published system for *Enterobacteriaceae* and our under-construction system for *Pseudomonas*, the combination of these three systems could increase the coverage of bacterial types for drug assessment and facilitate the selection process of new candidates in the drug development against superbugs.

Abstract 908

**Using machine learning for improving MLST analysis of nanopore sequenced bacteria**

Oscar Aspelin*1, Emil Carlsson1

1928 Diagnostics, Gothenburg, Sweden

**Background:** Due to the inherently high random and systematic error rates in Oxford Nanopore sequencing data, bacterial typing methods such as MLST are not easily implemented in a long read bioinformatic workflow. To account for the high error rates, different polishing tools have been developed. Here, we investigate if polishing with Racon and Medaka can improve MLST analysis for Nanopore data assembled with the Flye assembler.

**Materials/methods:** We have trained recurrent neural networks for polishing long read assemblies with the Medaka software from Oxford Nanopore Technologies. One of the pre-trained Medaka models was individually fine-tuned on three different data-sets consisting of *Enterococcus faecium*, *Klebsiella pneumoniae* and *Staphylococcus aureus*. We evaluated both Flye assemblies polished by Racon and non-polished Flye assemblies.

Quast and DNAdiff were used to analyze the quality of the polishing and all assemblies were also subjected to a BLAST based MLST analysis where the number of correctly predicted STs and alleles were counted.

**Results:** By training a model on a subset of a specific dataset and evaluating on the remaining samples, we saw a substantial increase in sequence identity for the test samples. The results also show that polishing with Racon prior to polishing with Medaka can actually decrease the performance compared to using Medaka directly on a draft assembly.

Running MLST analysis on the draft assemblies (48 test samples in total) resulted in zero correct STs. However, using the fine-tuned Medaka models, we could correctly predict 42 STs, with an allele prediction rate of 97.6%. The model trained on the *K.pneumoniae* dataset was also evaluated on a larger, unseen *K.pneumoniae* dataset. The MLST analysis for this dataset, consisting of 36 samples, resulted in zero correct STs for the draft assemblies and 26 correct STs after polishing with Medaka. The allele prediction rate increased from 69.4% for the draft assemblies to 96.0% after polishing with Medaka.

**Conclusions:** This study shows that using machine learning for polishing assemblies enables MLST analysis of Nanopore data. However, a more diverse training set is needed in order to build a more robust polishing model.

Abstract 909

Performance of the urine flow cytometer Sysmex UF-5000 in rapid diagnosis of urinary tract infections

Kjersti Haugum*1,3, Maria Schei Haugan1, Jannicke Skage1, Mariann Tetik1, Aleksandra Jakovljev1,3, Hans-Jonny Schjelderup Nilsen1

1St. Olav’s University Hospital, Trondheim, Norway, 2Norwegian University of Science and Technology, Trondheim, Norway

Background: Urinary tract infection (UTI) is one of the most common bacterial infections worldwide. Urine culture is the gold standard method to diagnose UTI, but is time consuming and tedious. Urine flow cytometry (FCM) can differentiate and quantify particles in urine, and is an alternative method for ruling out UTI. The aim of this study was to evaluate FCM as a rapid screening method to predict urine samples with negative or mixed culture growth.

Materials/methods: We performed standard microbiological analysis and FCM with the Sysmex flow cytometer UF-5000 on 3919 urine samples from both outpatients and hospitalized patients. 2565 (65%) samples were from women and 1354 (35%) were from men. Positive urine culture was defined as growth ≥10⁴ cfu/mL. Results from 17 FCM parameters and culture were evaluated to identify a) positive culture versus no culture and b) mixed culture (>2 organisms) versus pure culture (≤2 organisms) by the use of FCM.

Results: Positive culture (≥10⁴ cfu/mL) was found in 2257/3919 (57%) urine samples; 1351 were pure and 906 were mixed cultures. ROC curve analyses comparing results from culture growth with different FCM parameters identified bacterial count (BACT; area under the curve [AUC] 0.939) and leucocyte count (WBC; AUC 0.809) as possible independent predictors for bacterial growth. Subpopulation analyses [men/women/inpatients/outpatients/immunocompromised/pregnant] revealed little association between FCM results and culture growth in pregnant women, leading to exclusion of this subpopulation (n=452). Investigation of different cut-offs for BACT and WBC, separate and in combinations, indicated that WBC marginally improved the outcome in combination with BACT (sensitivity 96.6%; negative predictive value [NPV] 92.3%), compared to BACT alone (sensitivity 95.2%; NPV 91.2%) using BACT/WBC cut-off 30. There was no difference between urine from in- or outpatients. Analyses comparing FCM parameters squamous epithelial cells (SquaEC) and epithelial cells (EC) with mixed culture indicated that neither were predictors for mixed culture.

Conclusions: FCM cannot predict mixed culture growth [ie, indication of contamination of specimen], but it can predict negative culture growth in both men (NPV 94.7%) and non-pregnant women (NPV 84.7). This reduces time-to-negativity compared to gold standard, which could potentially reduce unnecessary usage of antibiotics.

Abstract 911

High prevalence of antimicrobial resistance in community-acquired urinary tract infections in Harare, Zimbabwe

Ioana Diana Olaru¹, Mutsawashe Chisenga², Rashida Ferrand³, Shunmay Yeung³, Heidi Hopkins⁴, Richard Stabler⁴, Prosper Chonzi⁴, John Bradley⁵, Katharina Kranzer¹

¹London School of Hygiene and Tropical Medicine/ Biomedical Research and Training Institute, Harare, Zimbabwe, ²Biomedical Research and Training Institute, Harare, Zimbabwe, ³London School of Hygiene and Tropical Medicine, London, United Kingdom, ⁴Department of Health, Harare City Council, Harare, Zimbabwe

Background: Antimicrobial resistance (AMR) is compromising our ability to successfully treat infections. The Global Action Plan on AMR proposed by the WHO emphasizes the importance of strengthening surveillance in the attempt to limit the effects of AMR. There are few data on gram-negative AMR prevalence in sub-Saharan Africa especially from the outpatient setting. First-line treatment for urinary tract infections [UTIs] as recommended by Zimbabwe National Guidelines is amoxicillin or a fluoroquinolone which may not be optimal in the context of increasing AMR.

The aim of this study is to estimate the prevalence and risk factors for AMR in isolates from outpatients presenting with suspected UTIs to primary care clinics in Harare.

Materials/methods: Adult outpatients presenting with symptoms of UTI to six clinics in southern Harare between July and November 2019 were recruited. A urine sample was collected and inoculated on chromogenic agar. Cultures were considered positive if a growth of >10³ CFU/ml of a known pathogen was obtained. Antimicrobial susceptibility testing [AST] using disc diffusion and EUCAST breakpoints was performed.

Results: Of the 383 adult participants recruited into the study, 256 (66.8%) were female. HIV infection was present in 90/337 (26.7%) patients who knew their status. 125 (32.6%), 222 (58.0%), and 36 (9.4%) cultures yielded an organism at >10³ CFU/ml, no growth, and contamination respectively. The most common pathogen was E. coli, identified in 106/125 (85%) to ampicillin, 94 (82%) to cotrimoxazole, 22 (18%) to ciprofloxacin, and 21 (18%) to third generation cephalosporins. No carbapenem resistance was recorded. HIV infection and a previous UTI were associated with the presence of third-generation cephalosporin resistance (Table).

Conclusions: The prevalence of resistance to first-line antibiotic treatment for uncomplicated UTI in this setting was high, emphasizing the need for AMR surveillance to inform setting specific guidelines. HIV infection may be a driver for AMR in this setting highlighting the need to give special consideration to this group when making empirical treatment decisions.

Abstract 913

**Lassa fever infection and prevention control availability and use at healthcare facilities in South-Western Nigeria**

Ibiwumi Usman*1, Saheed Usman2

1Ladoke Akintola University of Technology Ogbomoso Nigeria, Ogbomoso, Nigeria, 2Nnamdi Azikiwe University Awka Nigeria, Awka, Nigeria

**Background:** Lassa fever is a zoonotic infection caused by arenavirus contracted primarily through contact with the contaminated excreta of Mastomys natalensis rodents. Secondary transmission of the virus between humans occurs through direct contact with infected blood or bodily secretions. The objective of this study was to assess the availability of infection & prevention control measures, consumables & their use in healthcare facilities in Western Nigeria.

**Materials/methods:** This study was a cross sectional study. Data was collected by trained volunteers and supervised by appointed supervisors and investigators, by a face-to-face interview using a pre-tested structured questionnaire on Lassa Fever. Frequency count was generated for all variables and statistical test of significance was performed with Chi-Square test.

**Results:** Eighty five healthcare facilities & workers were surveyed, out of which 80 (94.1%) had wash hand basins but only 48 (56.5%) had running water or any kind of water supply. Most, 55 (64.7%) & 49 (57.6%) of the healthcare workers do not practice hand washing before/after patient contact & had not been trained on infection control while only 48 (56.5%) were regularly using personal protective equipment such as white coat & gloves. There was no association between availability of personal protective equipment & its use ($\chi^2 = 3.02$, df = 1, $P = 0.403$).

**Conclusions:** Healthcare facilities do not meet the minimum standard for infection prevention & control measures. It is therefore recommended that government at all levels should immediately prioritize the infection prevention & control programs its health facilities to curb future spread of infectious diseases even in hospital premises among healthcare workers.

Abstract 917

Achieving the third 95: Keeping adolescents living with HIV virally suppressed in rural Nigeria in test and treat era using continuous quality improvement model of peer counseling & support group

Saheed Usman*1

1APIN Public Health Initiatives, Abuja, Nigeria

**Background:** In 2016, Nigeria transitioned to “Test & Treat”, a policy where all people living with HIV (PLHIV) are treated with lifelong antiretroviral therapy (ART). There are unique challenges achieving viral suppression in ALHIV mainly due to increased stigma, discrimination & lack of social support. Hypothesis tested was antiretroviral therapy adherence effect on viral load outcome. We examined viral suppression among adolescents living with HIV in rural Western Nigeria.

**Materials/methods:** This study was an observational study of adolescents living with HIV (ALHIV) already initiated on antiretroviral therapy for at least six months, enrolled in health facilities in rural parts of Western Nigeria, during a 12-month observation period starting October 2018 till September 2019. Quantitative viral load analysis was done using Polymerase Chain Reaction, Roche Cobas Taqman 96 Analyzer. All data were statistically analyzed, using Statistical Package for the Social Sciences (SPSS).

**Results:** A total of 316 subjects eligible for the study were recruited. Most of them are in the age range of 10 – 19 years, with a mean age of 13.51 ± 2.86 years. 222 (70.3%) & 52 (16.5%) of the subjects had viral suppression of <1000 and <20 RNA copies per ml respectively. The 94 subjects went through peer counseling by trained ALHIV and enhanced adherence counseling (EAC) for three months and viral load test repeated thereafter. 22 patients who had completed the three sessions of EAC and repeated viral load increased the entire suppression numbers to 244 (77.2%) & 60 (19.0%) <1000 and <20 RNA copies per ml respectively during the period of observation. The ALHIVs in the process joined the institutionalized social-media driven support group & adolescent decentralized care model ensuring they achieve the third 95 at undetectable viral load level. ART adherence has significant effect on viral load outcome ($\chi^2 = 20.902$, df = 1, $P = 0.001$).

**Conclusions:** Antiretroviral therapy (ART) treatment adherence counseling is key to the achieving viral suppression and determine infection prognosis, thus, developing robust continuous quality improvement (CQI) plans to address issues across the cascade ultimately helping in the monitoring of HIV/AIDS disease progression and decrease treatment failure tendencies.

**Presenter email address:** senatorhopsy@yahoo.com
Abstract 922

**Assessment of viral load suppression rates among paediatric patients living with HIV in South-Western Nigeria**

Saheed Usman*

1APIN Public Health Initiatives, Abuja, Nigeria

**Background:** In resource-limited settings, where genotypic drug resistance testing is rarely performed and unsuppressed viral load outcome is a function of poor drug adherence, programmatic approaches in scaling up optimal adherence is essential. The aim of this study was to assess the viral load suppression rates among pediatric patients living with HIV using ART multi-month scripting model in south-western Nigeria.

**Materials/methods:** This study was a longitudinal study conducted on 283 paediatric patients living with HIV (136 males and 147 females) enrolled into antiretroviral therapy from a selected health facilities across Western Nigeria, during a 12-month observation period starting October 2018 till September 2019. Quantitative viral load analysis was done using Polymerase Chain Reaction, Roche Cobas Taqman 96 Analyzer. All data were statistically analyzed, using Statistical Package for the Social Sciences (SPSS), with multiple comparisons done using Post Hoc Bonferroni test.

**Results:** Most of the respondent were within the age range of 6 – 9 years, with a mean age of 6.07 ± 2.08 years. 167 (59.0%) & 37 (13.1%) of the subjects had viral suppression of <1000 RNA copies per ml and <20 RNA copies per ml respectively. The unsuppressed subjects went through enhanced adherence counselling (EAC) for three months and viral load test repeated thereafter. 33 patients who had completed the three sessions of EAC and repeated viral load increased the entire suppression numbers to 200 (70.7%) & 60 (19.0%) <1000 RNA copies per ml and <20 RNA copies per ml respectively during the period of observation. ART adherence has significant effect on viral load outcome from the study hypothesis tested ($\chi^2 = 15.763$, df = 1, $P = 0.001$).

**Conclusions:** Current ART regimen & HIV treatment enhanced adherence counseling are key to the achieving viral suppression, thus, routine viral load monitoring will ultimately help in HIV/AIDS disease progression follow up and reduce treatment failure tendencies. This will help more paediatric patients stay on first line regimen and prolong their life expectancy, indicating that the UNAIDS last 95 target is though achievable but more work is still to be done.

**Abstract third-party references:** F Jena University Hospital, Center of Sepsis Care and Control, Section of Experimental Virology, Institute of Medical Microbiology

**Background:** The seasonal influenza virus (IV)-associated bronchopneumonia is one of the infectious diseases with the highest population-based mortality. Beyond the virulence of the virus itself, epidemiological data suggest that bacterial co-infections are the major cause of increased mortality. In this context, *Staphylococcus aureus* (*S. aureus*) represents a frequent causative bacterial pathogen in secondary pneumonia. Post-influenza models of *S. aureus* pneumonia demonstrate the severe outcome of a coinfection associated with substantial morbidity and mortality. To date, investigations concerning microbial infections of the lung are usually carried out in animal models. However, lung anatomy and physiology, as well as composition of the immune system differ significantly between rodents and humans.

To investigate the interactions between epithelial, endothelial and immune cells after IV / *S. aureus* co-infection, we established a human alveolus-model that generated a reactive tissue-tissue interface between the vascular endothelium and the airway-facing epithelium.

**Materials/methods:** MOTiF biochips were seeded with human endothelial cells on the vascular site and with epithelial cells and macrophages on the airway site. This organoid was cultured for up to 14 days with a stable and stable air-liquid interphase under dynamic flow conditions.

**Results:** Dynamic conditions that maintain the air-liquid-interface allow a stable barrier with high transepithelial resistance and an intact vasculature. We provide evidence for an increase of barrier integrity after introduction of macrophages, as proven by TEER measurement and permeability tests. Our data indicate a stable surfactant production of alveolar epithelial cells type II. Subsequent infection has been successfully established and pathogenicity factors can be investigated.

**Conclusions:** We established a functional, biochip-based human *in vitro* alveolus model that is suitable for investigation of complex co-infections and immune functions. Separated airway and vascular chambers allow infections with pathogens from the airway site.

Inducing an immune response using this method, it is possible to observe migration of immune cells from the vascular site to the infection to study species-specific mechanism of pathogens. Our results suggest that the endothelium is disrupted earlier than the epithelium, and *S. aureus* is able to inhibit the IV-induced apoptotic cellular response on the level of procaspase 8 inhibition.

Abstract 929

Pilot evaluation of machine learning for the classification of *Streptococcus pneumoniae* PCV-13 serotypes from non-PCV13 serotypes based on MALDI-TOF MS analysis

Jonathan Zintgraff1, Maria Florencia Rocca1, Daniela Napoli2, Maria Moscoloni1, Gustavo Ayala1, Claudia Lara1

1INEI-ANLIS “Dr Carlos G Malbran”, Buenos Aires, Argentina

**Background:** *Streptococcus pneumoniae* serotyping is limited to Reference Laboratory. Knowing the serotype is of great significance from an epidemiological and preventive perspective because it makes possible to define the distribution of serotypes causing invasive pneumococcal disease (IPD). The PCV-13 includes 13 serotypes {1,3,4,5,6A,6B,7F,9V,14,18C,19A, and 23F}. The main aim of this work was to assess if the mass spectra obtained by MALDI-TOF MS showed specific discriminatory peaks, using machine learning algorithms, and if those peaks were able to differentiate PCV-13 serotypes from NON-PCV13 serotypes. Therefore using this methodology as screening tool in order to then, use the reference method in a more targeted way.

**Materials/methods:** The study included PCV-13 isolates and the top 10 of the most prevalent NON-PCV13 isolates {12F, 24F, 13, 8, 11A, 15B, 16F, 22F, 7C and 23B}, which were selected according to the Argentina national epidemiology, all isolates were previously serotyped by Quellung reaction. Mass spectrum analysis was performed using a MicroFlex LT mass spectrometer [Bruker Daltonik GmbH] and the procedures were conducted according to the manufacturer’s instructions. Classification models were generated using the machine learning [ML] algorithms in ClinProTools, namely QuickClassifier [QC], Supervised Neural Network [SNN], and Genetic Algorithm [GA]. All the peaks in the spectra were used in model generation.

**Results:** In this first part of the pilot evaluation, we were able to discriminate two groups types, making it possible to differentiate PCV-13 from NON-PCV13 isolates. GA, showed the best cross-validation and recognition capacity values. (Table 1)

**Conclusions:** A combination of MALDI-TOF MS analysis and ML models may be a potentially efficient screening tool for *Streptococcus pneumoniae* serotipification, although an external validation must be done in a second part of the pilot evaluation and more isolates whose serotypes are unknown should be challenged with all the algorithms in order to evaluate the real use of this methodology.

Factors influencing vaccination coverage among children age 12–23 months in Afghanistan

Mubarak Mohammad Yousuf*1, Ahmad Khalid Aalemi2, Karimullah Shahpar3

1Microbiology Department, Kabul University of Medical Sciences- KUMS, Kabul, Afghanistan, 2Epidemiology Department, Kabul University of Medical Sciences, Kabul, Afghanistan, 3Infectious Diseases Department, Kabul University of Medical Sciences, Kabul, Afghanistan

Abstract third-party references: ICF

Background: Childhood vaccination plays a key role in reducing morbidity and mortality from vaccine-preventable diseases. Numerous studies have assessed the influence of demographic and socioeconomic factors on child immunization around the world. There are few such studies in Afghanistan, however. Therefore, this study aimed to identify factors influencing vaccination status among children age 12–23 months in Afghanistan.

Materials/methods: Nationally representative data from the 2015 Afghanistan Demographic and Health Survey were used for this study. A sample of 5,708 children age 12-23 months with a vaccine card and immunization history was analyzed. Multinomial logistic regression was used to identify significant relationships between cofactors and vaccination status.

Results: In the study, half of the subjects were boys (51%), almost half were born at home (48%), and about three-fourths were residents of rural areas (76%). Background characteristics positively associated with vaccination status included delivery in a health facility, maternal age 30-39, attending at least four visits for antenatal care (ANC), health facility visit in the past 12 months, paternal professional occupation, and family in the richer wealth index.

In bivariate analysis, the central region showed the highest prevalence of full vaccination among children age 12-23 months. Controlling for cofactors, however, children in the northeast region were more likely to be vaccinated compared with children in the central region, while children in the southern region were less likely to be fully vaccinated.

Conclusions: This study identified maternal age, ANC visits, place of delivery, health facility visits in past 12 months, paternal occupation, wealth quintile, and geographic region as the factors influencing child’s vaccination status in Afghanistan.

Key words: vaccine; immunization; children age 12-23 months; influencing factors; Afghanistan.

Abstract 931

A multi-site evaluation of antifungal prescribing and the use of fungal diagnostics in critical care

Clare Logan*1,2, Carolyn Hemsley1, Amanda Fife3, Jonathan Edgeworth1, Duncan Wyncoll5, Phil Hopkins6, Tihana Bicanic1,2

1St George’s Hospital, Infectious Disease & Microbiology, London, United Kingdom, 2St George’s, University of London, Institute of Infection & Immunity, London, United Kingdom, 3Guys & St Thomas NHS Foundation Trust, Department of Infection, London, United Kingdom, 4King’s College Hospital, Department of Microbiology, London, United Kingdom, 5Guys & St Thomas NHS Foundation Trust, Critical Care Department, London, United Kingdom, 6King’s College Hospital, Critical Care Department, London, United Kingdom

Background: Critical care patients are at higher risk of invasive fungal infections (IFI). Understanding the utilisation of antifungal drugs and diagnostics in intensive care units (ICU) is essential for the development of antifungal treatment pathways and stewardship.

Materials/methods: A 6-month evaluation (May-November 2019) of all antifungal prescribing episodes in medical and surgical ICUs across three London Trusts (collectively 168 ICU beds). ‘Antifungal prescribing episode’ was defined as a period of continuous antifungal therapy for a specified indication. Drug; duration; indication; treatment rationale at initiation (prophylaxis, empirical [clinical suspicion alone], pre-emptive [suggestive radiology/positive biomarkers], targeted at IFI, targeted at non-invasive infection [e.g. Oral candidiasis]; fungal diagnostics and final IFI classification were reviewed. Analyses were conducted in Microsoft Excel and GraphPad Prism V7.

Results: There were a total of 353 prescribing episodes in 305 patients (16% patients ≥2 episodes). Prescribing rationale at the start of the episode was 21% prophylaxis (median [IQR] duration of treatment 8 [4-18] days); 48% empirical [7 [3-11] days]; 9% pre-emptive [11 [7-21] days]; 11% targeted for IFI [16 [11-22] days]; 11% targeted for non-invasive infection [4 [2-7] days].

Overall, fluconazole was the most frequently prescribed [fluconazole 42%; echinocandins 38%; triazoles 11%; amphotericin 8%], however echinocandins accounted for the majority (52%) of all empiric/pre-emptive/IFI targeted prescribing.

For empirical therapy, a blood culture was sent in 72% and non-culture based tests in 48%. Serum beta-d-glucan [BDG] turnaround time [TAT] was significantly shorter for the ICU with diagnostics available on-site [median [IQR] TAT of 1 [1-2] day] compared to the two sites processing BDG at external laboratories [14 [12-17] days, 10 [8-12] days] [p =0.001]. There was no significant difference in duration of empirical treatment for those with a negative BDG versus no BDG sent (8 versus 7 days [p=0.37]).

Regarding final IFI classification; 43 (14%) patients had proven IFI [40 invasive candidiasis; 3 invasive mould]. Data on probable/possible/no IFI cases, clinical outcomes and antifungal defined daily dose/occupied bed days will be presented.

Conclusions: In the ICU setting, antifungal prescribing is predominately empirical. Rapid non-culture based diagnostic tests regarded as robust by clinicians, are required to influence antifungal prescribing decision-making in this high-risk patient group.

Abstract 932

**Antibiotic prescribing decisions in intensive care: a qualitative study**

Alyssa Megan Pandolfo*, Rob Horne, Yogini Jani, Natalie Bidad, Stephen Brett, Tom Reader, David Brealey, Virve Irene Enne, David Livermore, Vanya Gant

1University College London, London, United Kingdom, 2Imperial College Healthcare NHS Trust, London, United Kingdom, 3London School of Economics and Political Science, London, United Kingdom, 4University College Hospital, London, United Kingdom, 5Norwich Medical School, UEA, Norwich, United Kingdom

**Abstract third-party references:** On behalf of the INHALE WP2 study group

**Background:** Antimicrobial stewardship (AMS) is a key issue in intensive care units (ICUs) where antibiotics are widely prescribed for complex patients. However, there is limited research examining how antibiotic prescribing decisions are made and how antimicrobial resistance (AMR) concerns impact decision-making in this context. INHALE is a comprehensive research programme exploring the influence of molecular diagnostics on prescribing for hospital acquired pneumonia (HAP) in ICU. This study explored how prescriber perceptions and contextual factors influence antibiotic prescribing decisions in ICUs, prior to implementation of molecular tests.

**Materials/methods:** Four focus groups and 34 vignette-based interviews were conducted with clinicians involved in antibiotic prescribing in four UK ICUs. Focus groups explored clinicians’ perceptions of factors influencing their prescribing decisions and semi-structured interviews explored decision-making processes using two clinical vignettes in the context of HAP. Data were analysed using inductive thematic analysis.

**Results:** Prescriber perceptions were key to decision-making. Most clinicians balanced the societal risks of AMR against the needs of the individual patient, with the latter generally given precedence. In situations of doubt, the default was to prescribe antibiotics on the basis that the antibiotics might prevent patient mortality, with clinicians viewing prescribing as more defensible than not prescribing. The side-effects of antibiotics were rarely mentioned. Clinicians were aware of AMR and strove to withhold potentially unnecessary antibiotics where possible. This aim was counter-balanced by their previous experiences of negative consequences, which motivated the prescribing of antibiotics ‘just in case’ of an infection.

Clinicians’ perceptions interacted with the prescribing context. Examples include a lower perceived threshold to prescribe antibiotics out of hours, the influence of input from non-ICU team members, as well as antibiotic prescribing norms and varied adherence to guideline recommendations across ICUs.

**Conclusions:** When making prescribing decisions, clinicians’ understandable fear of undertreating possible infection and worsening outcomes is often in direct conflict with AMS aspirations. Prescribers seem to be driven by perceived negative consequences for patients and themselves over more distal issues of AMR. Evidence-based support from faster and more effective diagnostics may help reconcile these competing priorities by allowing for earlier antibiotic de-escalation and refinement.

Abstract 933

Resistant bacteria in retail meat
Sanne Malig*, Elisa Knudsen¹, Silje Vermedal Hoegh¹, Ulrik S. Justesen¹

¹Odense University Hospital, Department of Clinical Microbiology, Odense, Denmark

Background: Surveillance of antimicrobial resistance in foodborne bacteria is part of the WHO "Global Action Plan on Antimicrobial Resistance". Often surveillance focuses on specific bacteria, resistance mechanisms or production animals. We wanted to investigate, with a broad-range culture approach and PCR, if retail meat could be a possible source of resistant bacteria.

Materials/methods: Personnel from the Department of Clinical Microbiology, Odense University Hospital, were asked to swab their non-frozen retail meat in the kitchen just before preparation. Samples of pork, chicken and beef (100 of each) distributed evenly over one year were swabbed (10 cm x 10 cm) with FecalSwab (Copan, Italy) and stored at -80°C. All samples were cultured with selective and non-selective media, including media to detect MRSA, VRE, ESBL, CPO and Clostridioides difficile. MALDI-TOF and disk diffusion were used for identification and susceptibility testing. Also, PCR with the Allplex Entero-DR kit (Seegene, South Korea), detecting NDM, KPC, OXA-48, VIM, IMP, CTX-M, VanA, VanB genes, was performed.

Results: Any growth was seen from 92% of the samples (276/300). Staphylococcus aureus was detected in 23 (8%) samples, mainly chicken (17), of which one was an MRSA from pork. Enterococcus spp. were detected in 46 (15%) samples of which one was a VRE from pork. Twenty-nine different species of Enterobacterales was identified and one or more species were detected in 48% of the samples. No ESBLs were detected with the culture method but several of the identified species harbor chromosomal AmpC. Pseudomonas spp. (non-aeruginosa) were detected in 44% (133) of the samples. In 124 samples Pseudomonas was detected on the CPO selective media. From a random sample of 40 isolates, only three was not fully susceptible to meropenem. C. difficile was not detected in any of the samples. With PCR OXA-48 was detected in four samples, CTX-M in two, and vanA (identical with culture) and vanB in one sample each.

Conclusions: Retail meat could be a possible source of resistant bacteria. However, sequence typing is needed to establish that the same bacteria from this study can be found in humans. Even so, good kitchen hygiene will prevent transmission to humans.

Abstract 935

Is there an increased risk for Clostridium difficile infection months after hospitalisation in a room occupied previously by a patient with C. difficile?

Hiba Zayyad1*, Avi Peretz2, Shelly Cohn3, Kozita Labay4
1The Baruch Padeh Medical Center, Infectious diseases and infection control unit, Poriya, Israel, 2Baruch Padeh Medical Center, The Clinical Microbiology Laboratory, Poriya, Israel, 3The Azrieli Faculty of Medicine, Bar Ilan University, Safed, Israel, 4Baruch Padeh Medical Center, Poriya, Israel

Background: Clostridioides difficile (CD) is the most common infectious cause of acquired diarrhoea in healthcare systems with significant morbidity and mortality. Several risk factors for C. difficile infection (CDI) exist; antibiotic use and environmental exposure are probably the most important modifiable risk factors.

Aims: to explore whether hospitalization in room that was previously occupied by a patient with CDI (r-CDI) and cleaned according to standardized protocol is a risk factor for CDI.

Setting: the Baruch-Padeh Medical Center in northern Israel, a 350-bed hospital with a relatively-high rates of acquired CDI (40-45/100,000 cases/patient-days during 2017-2018).

Materials/methods: A retrospective case-control study comparing patients with CDI to a matched control group (age, sex and ward of hospitalization) without CDI during 2017-2018. Clinical and demographic data were collected from electronic medical records, including data on known risk factors, patient-room-placement, and movements during hospitalization. For every participant we determined whether there has been an r-CDI exposure at different timeframes (1, 3, 6 and 12 months previously).

Results: Study population included 75 CDI patients and 75 control patients. The groups had similar performance status and Charlson’s comorbidity index. Length of stay prior to inclusion was similar in both groups, but was on average 2.7 days longer after inclusion in patients with CDI. Thirty-day mortality was higher in patients with CDI (36% versus 16%). In multivariate analysis: the presence of a nasogastric tube, use of 3rd generation cephalosporins and macrolides were independently associated with CDI. Previous exposure to r-CDI was significantly higher in the CDI group through all timeframes examined, the difference was significant if exposure occurred 3, 6 and 12 months previously (p= 0.032, 0.006, and 0.011, respectively); the association was maintained after adjustment for other risk factors (p= 0.014, 0.006, and 0.011, respectively).

Conclusions: Hospitalization in a room previously occupied by a patient with CDI is a significant risk factor for CDI up to 12 months after exposure. This work may assist in planning interventions for reduction of CDI healthcare acquisitions, such as environmental cleaning, antibiotic stewardship and cohorting CDI patients when necessary. Typing of CD isolates is of paramount importance and is currently underway.

Risk factors and clinical characteristics of virus infection after haematopoietic stem cell transplantation

Gamze Kalın Ünüvar*, Zeynep Türe Yuce1, Ayşegül Ulu Kilic2

1University Of Erciyes Faculty Of Medicine, Kayseri, Turkey, 2University Of Erciyes Faculty Of Medicine, Kayseri, Turkey

Background: BK polyomavirus is an important cause of morbidity and mortality in hematological patients after hematopoietic stem cell transplantation (HSCT). It is acquired in childhood and especially becomes latent in urothelial epithelial cells. Reactivation of virus after HSCT can be seen with asymptomatic viruria or hemorrhagic cystitis (HC). The aim of the study was to assess risk factors, clinical characteristics and treatment options of BK virus infection after HSCT.

Materials/methods: We retrospectively analyzed information about patients with HSCT and BK virus (BKV) disease between January 2017-August 2019. Data included; underlying hematological disease, transplantation type, associated graft versus host disease (GVHD) and recent use of immunosuppressive agent.

Results: In total fifty-eight patients with HSCT were evaluated and BKV disease occurred in 20 (34%). The median age was 40 (range, 20 to 68), 50% were male. The most underlying disease was Acute Myeloid Leukemia (n=11). Five patients had autologous and fifteen patients had allogeneic SCT. The median time to engraftment was 15 days (range, 10 to 20). GVHD was seen eleven patients (40% skin, 15% gastrointestinal GVHD). These patients received systemic glucocorticoid therapy or immunosuppressant agents. The median time elapsed to BK virus disease after HSCT was 60 days (range, 30 to 450). Sixteen patients with BKV disease had high grade (grade 3) HC and four patients had low-grade HC (grade 2). While BK viremia was positive in 17 patients (68%), viruria was positive for all patients. Eight patients (15%) were treated with ciprofloxacin and cidofovir combination, six patients (30%) with cidofovir and three patients (15%) with ciprofloxacin. Three of them (20 patients) was treated by intravesical cidofovir. The complete response to the viruria or viremia was obtained from 11 patients (55%).

Conclusions: HC associated with BKV is an emerging clinical problem after HSCT causing prolonged hospitalization and mortality. It can be severe because the treatment options are often ineffective. The main goal of treatment is to reduce the dose of immunosuppressive agents. Close monitoring of BK virus in high-risk patients can be an important method to improve the complication in the early period.

Abstract 937

**The optimal strategy of empirical antibiotic therapies for non-severe community-acquired pneumonia: a bayesian network meta-analysis of randomised controlled trials**

Jonghoo Lee1, Sung Mi Moon* 1

1 Jeju National University Hospital, Jeju, South Korea

**Background:** The 2019 the American Thoracic Society and Infectious Diseases Society of America guideline described that β-lactam (BL) monotherapy should not be routinely used for inpatients with community-acquired pneumonia (CAP) over fluoroquinolone (FQ) monotherapy or β-lactam/macrolide (BL-ML) combination therapy. However, the controversy about empirical antibiotic therapies is still unresolved. We conducted a systematic review and network meta-analysis to assess comparative efficacy of empirical antibiotic treatment strategies for nonsevere CAP.

**Materials/methods:** A systematic search for randomized controlled trials (RCTs) was performed through MEDLINE, EMBASE, and the Cochrane Central Register. We classified patients into FQ, BL-ML, and BL groups. The clinical success rate at the end to study was the primary outcome of interest. A Bayesian network meta-analysis was conducted and treatments were ranked based on their effectiveness.

**Results:** Twenty-three articles were included in the qualitative and quantitative synthesis using pairwise and network meta-analyses. Forest plots from network meta-analyses showed that the clinical success rates of FQ monotherapy were higher than BL monotherapy (OR 1.23; 95% CI 1.04–1.48). The difference in the clinical success rates for FQ monotherapy versus BL-ML combination therapy was not statistically significant (OR 1.19; 95% CI 0.88–1.68). And there was no difference in treatment success between BL monotherapy and BL-ML combination therapy (OR 1.03; 95% CI 0.73–1.43). On node-splitting analysis, inconsistency between direct and indirect comparison did not exist. In the rank-probability test, FQ monotherapy had the highest rank for the clinical success rate, followed by BL-ML combination therapy.

**Conclusions:** Current evidence showed that FQ monotherapy had better treatment outcomes than BL monotherapy for patients with nonsevere CAP. And the efficacy of FQ monotherapy was similar to BL-ML combination therapy. Our findings provide support for the current guidelines recommendations to propose empirical antibiotic treatment strategies for nonsevere CAP.

Abstract 942

Accelerated HIV case finding and bridging the gap in antiretroviral therapy enrolment among prison inmates: a break-even in achieving the 95-95-95 UNAIDS targets among key populations in Western Nigeria

Saheed Usman* 1

1APIN Public Health Initiatives, Abuja, Nigeria

**Background:** The clock is steadily ticking towards 2020 when the UNAIDS 95-95-95 global target in the fight against HIV/AIDS is hoped to be achieved. The hypothesis tested is the significant association between youthful age and HIV test outcome. The aim of the study was to engage in an accelerated HIV case finding and ensure enrolment into care among key populations in Western Nigeria fulfilling the first & second 90 of the UNAIDS targets.

**Materials/methods:** Lay Adhoc Staff/volunteers were purposely selected and trained. Consenting prison inmates had their blood samples taken and tested following the country’s HIV serology National testing algorithm, using the recommended HIV testing kits. Those who tested positive went through a retesting process in the laboratory and confirmed positive. Post-test counselling was then conducted.

**Results:** A total of 771 prison inmates were tested across the four prisons (Male 765, Female 6) with a mean age ± SD is 31.25 ± 9.47 years. Ten of them (Male 9, Female 1) were confirmed new positives with a mean age ± SD is 31.40 ± 6.24 years, yielding a positivity rate of 1.3%. Eight of the ten positives are in their youthful age (<35 years). Odd's ratio shows that youthful age have higher association with HIV test outcome (OR: 2.81, CI: 0.80 – 9.79). The linkage rate for the positives is 100% with good escort service while adherence is ≥ 95%. The patients after six months on tenofovir, lamivudine & dolutegravir achieved viral suppression.

**Conclusions:** This mode of HIV testing service (HTS) has proved to reach a key population yielding more positives in much fewer numbers of people tested and in a short period of time with 100% linkage with better resource/health financing outlook. Community ART Differentiated Service Delivery (DSD) Model is in line for the patients to sustain the gains in the effort to achieve the 95-95-95 fast track UNAIDS targets.

Abstract 943

HIV-related stigma and discrimination in Western Nigeria: experiences of people living with HIV and rights issues
Saheed Usman1, Ibiwumi Usman2

1Nnamdi Azikiwe University Awka Nigeria, Awka, Nigeria, 2Ladoke Akintola University of Technology Ogbomoso Nigeria, Ogbomoso, Nigeria

Background: HIV-related stigma and discrimination continue to be major social determinants driving the epidemic of HIV globally despite the advances in medical treatment and increases in the awareness. Hypotheses tested was right awareness of people living with HIV/AIDS influencing HIV-related stigma & discrimination. The study aimed at assessing the level of HIV/AIDS related stigma and discrimination, forms, effects, and internal stigma experienced by PLHIVs in South-Western Nigeria.

Materials/methods: This cross sectional study was carried out at eight PEPFAR supported primary, secondary and tertiary level hospitals in South-Western Nigeria. The target population was adult (18 years and above) male and female persons living with HIV (PLHIVs) including key population. Data was collected from 278 consenting respondents by trained volunteers by a face-to-face interview.

Results: The mean age ± SD of the respondents was 38.48 ± 11.48 years, 70.05% females, mostly married in a monogamous setting (48.6%), with a formal education (86.3%), traders (33.5%), live in rural area (88.5%) while people in the key populations accounted for 9.4% of the participants. 78.4% elicited negative feelings such as depression and shame after diagnosis. About one-third (33.1%) PLHIVs have ever experienced HIV-related stigma and discrimination mostly gossip, physical abuse, and verbal insult, of which about two-third (63.2%) occurred in the hospital setting, followed by home/community (25.0%). In addition, 8.6% have been refused a job while 5.0% have lost their job because of their HIV status. Rights awareness by PLHIVs does not rule out HIV-related stigma & discrimination experience (χ² = 5.29, df = 1, P = 0.021).

Conclusions: A remarkable proportion of PLHIV still face stigma/discrimination with possible dramatic impact on their treatment and resultant quality of life. Efforts therefore, should be made to ensure PLHIV are not only aware of their rights, but are empowered to seek redress if these rights are violated.

Abstract 947

Should a molecular bacterial syndromic approach totally replace culture for the diagnosis of gastrointestinal tract infections?

Agathe Boudet*, Robin Stephan, Alix Pantel, Marie-Josée Carles, Cécilia Enault, Sylvie Charachon, Jean Philippe Lavigne, Hélène Marchandin

1Université de Montpellier & Centre Hospitalier Universitaire de Nîmes, Nîmes, France, 2Centre Hospitalier Universitaire De Nîmes, Nîmes, France

Background: Molecular panels are rapid and sensitive tools for the syndromic diagnosis of gastrointestinal (GI) infections. Whether they should totally replace traditional approaches or be combined to non-molecular approaches [enrichment step, culture for species/serotype identification/epidemiological investigations, antimicrobial susceptibility testing (AST)] remains questioned. We retrospectively evaluated the routine use of Seegene Allplex GI panel I [7 bacterial targets] in the Nîmes University Hospital, France, during the first 8 months of implementation.

Materials/methods: At laboratory receipt, diarrhoeal faeces from patients not hospitalized for more than 3 days were inoculated into a Selenite broth [subculture on Hektoën medium] and transferred to a FecalSwab seeded on selective medium upon positive PCR result availability. PCR was performed 3 times a week. We comparatively analyzed PCR and culture results, with a focus on the utility on maintaining a subculture after enrichment and on the rate of strain recovery.

Results: 119 PCR were positive (16%) [5 with >1 pathogen], Campylobacter spp. being the most frequently detected pathogens (47%, one third more than before PCR). Strains have been isolated in 82 cases of positive PCR (66%, 52 to 94% according to the pathogen, cycle threshold (Ct): 21 to 44, time to FecalSwab seeding: 1-3 days). In 5 cases, Salmonella were detected by culture only, discrepant results being reproducible in 3 cases [14% of Salmonella infection diagnoses]. One Plesiomonas shigelloides (out of PCR panel) was cultured. tcdB gene was detected in 22 patients over 3 years, of whom 3 had not been diagnosed for Clostridioides difficile infection.

Conclusions: We confirmed the utility of syndromic approaches in increasing the diagnosis yield of GI infections. Detection of toxin B-encoding gene was also helpful when C. difficile infection was not suspected. The incomplete pathogen recovery from FecalSwab was independent of Ct value and time before seeding in our study, and impaired AST and epidemiological investigations. An adequate load of the FecalSwab, hardly standardizable even in case of inoculation in the lab, is confirmed as an important parameter of pathogen detection. Maintaining a culture medium appears necessary for a larger Salmonella recovery and the detection of pathogens not included in the molecular panel.

The influence of delivery mode in the oral mycobiome: from childhood to adulthood

Maria João Maia Azevedo* 1;2;3;4, Paula Campos1, Maria de Lurdes Pereira1;5, Ricardo Araújo2;3, Carla Ramalho2;6;7, Egija Zaura4;8, Benedita Sampaio-Maia1;2;3

1FMDUP - Faculdade de Medicina Dentária da Universidade do Porto, Universidade do Porto, Porto, Portugal, 2i3S - Instituto de Investigação e Inovação da Universidade do Porto, Porto, Portugal, 3INEB – Instituto Nacional de Engenharia Biomédica, Porto, Portugal, 4Academic Center for Dentistry Amsterdam, Amsterdam, Netherlands, 5EpiUnit- Instituto de Saúde Pública, Universidade do Porto, Porto, Portugal, 6Faculdade de Medicina da Universidade do Porto - FMUP, Porto, Portugal, 7Saint John Hospital, Porto, Portugal, 8Vrije Universiteit Amsterdam, Amsterdam, Netherlands

Background: Postnatal acquisition of microorganisms from maternal and environmental sources contributes to the microbiome development of the child, and can potentially influence the future adult microbiome maturation. The mode of delivery may impact oral bacterial colonization as it is observed in several studies; however, the influence of this early life event on oral fungal colonization is still poorly investigated. Therefore, our aims were to perform: 1) a systematic review on the impact of the delivery mode on oral fungi transmission in early age and 2) a cross-sectional study regarding the association between this early life event in oral yeast colonization in young adults.

Materials/methods: A PubMed search was performed from April 25 to June 18, 2019, with inclusion criteria being comparative studies in humans that investigated oral fungi transmission and colonization in relation with the delivery mode. Colonization by yeasts in the oral cavity was evaluated in unstimulated saliva in 185 healthy young adults and correlated with delivery mode. Yeast isolation and identification was performed using Sabouraud Agar medium supplemented with chloramphenicol, followed by ChromAgar Candida and 18S/ITS gene sequencing.

Results: From the 4256 articles retrieved, only 8 articles were included in this review. There was more evidence towards the impact of the delivery mode on the fungal acquisition than against: the majority of the studies (N=6) found a relation between fungal colonization and vaginal delivery and, in 2 of these studies the existence of vertical fungal transmission from mother to child was reported. *Candida albicans* was the most commonly isolated fungal species, followed by *Candida parapsilosis*. Non-cultivable methods of fungal identification were only applied in one of the selected studies. Regarding the cross-sectional study, *Candida* species were isolated from 37.5% of the participants, *Candida albicans* being the most prevalent species. The prevalence of oral yeasts was significantly higher in those who were vaginally delivered compared to those born by caesarean-section.

Conclusions: Together, our results suggest that vaginal delivery appears to promote oral yeast colonization and carriage throughout life, from childhood to adulthood. More longitudinal studies using molecular methods are needed to fulfil the lack of knowledge within this field.

Abstract 951

**Computerised Tomography (CT) as a risk factor for the acquisition of carbapenem-resistant *Acinetobacter baumannii***

Ziv Dadon\(^1\), Eli Ben-Chetrit\(^2\)*, Maymone Dahan\(^3\), Ofer Benjaminov\(^4\), Phillip Levin\(^5,6\)

\(^1\)The Hebrew University of Jerusalem, Department of Cardiology, Shaare Zedek Medical Center, Jerusalem, Israel, \(^2\)The Hebrew University of Jerusalem, The Division of Infectious Diseases, Shaare Zedek Medical Center, Jerusalem, Israel, \(^3\)The Hebrew University of Jerusalem, Information Technology Consultant, Shaare Zedek Medical Center, Jerusalem, Israel, \(^4\)The Hebrew University of Jerusalem, Department of Imaging, Shaare Zedek Medical Center, Jerusalem, Israel, \(^5\)The Hebrew University of Jerusalem, Intensive Care Unit, Jerusalem, Israel, \(^6\)The Hebrew University of Jerusalem, Intensive Care Unit, Shaare Zedek Medical Center, Jerusalem, Israel

**Background:** Multiple inanimate objects have been implicated in the transmission of resistant bacteria in the hospital. We examined whether performance of a CT scan increased the risk for colonization.

**Materials/methods:** All patients undergoing CT and all patients colonized or infected with carbapenem-resistant *Acinetobacter baumannii* (CRAB) were identified for 5 years from 2014-2019. Active admission and weekly surveillance was carried out for this bacterium. Each CT visit was classified as either an "Index Case" (presence of resistant bacteria prior to CT visit), an "Acquisition case" (appearance of resistant bacteria within 14 days of CT in a patient without prior colonization/infection), or a "Null case" (uncolonized/uninfected throughout). The risk of colonization/infection was calculated for patients undergoing CT for the first hour, each subsequent 6 hour period, and for days 2 – 7 after an index case. The results were normalized per 1000 CT scans [Number of acquisitions/number of patients undergoing CT during the relevant period normalized to 1000 scans].

**Results:** CT was performed for 115,680 patients during the study period. There were 324 Index cases and 254 Acquisition cases. The normalized risk of CRAB acquisition for the first 7 days is shown in the table. The odds ratio for acquisition during the first hour after a previous CRAB patient compared to 1 to <6 hours thereafter was 2.4 (95%CI 1.3 – 4.3, p=0.003).

**Conclusions:** Acquisition of CRAB following CT scan is more frequent during the first hour after a previous patient with this bacterium had been examined. This probably reflects inadequate environmental cleaning.

Abstract 954

**Individualised autovaccination is a promising strategy for managing recurrent urinary tract infections in women**

Erika Esteve-Palau1, Eva Maria Martinez Franco1, Araceli Gonzalez-Cuevas1, Anna Capella1, Encarna Moreno1, M Carmen Alvarez1, M Carolina Garro1, Manuel Carreras1, Manuel Cespedes1, Daniel Cuadras1, Vicens Diaz-Brito Fernandez2.

1 Parc sanitari Sant Joan de déu de Sant Boi, Sant Boi de Llobregat (Barcelona), Spain

**Background:** more than 20% of patients with urinary tract infection are at risk of recurrence. rUTI are a pervasive condition that negatively impacts patients’ Quality of Life (QoL). Causes of recurrence are multifactorial and include non-modifiable risk factors (nmRF). Antibiotic prophylaxis is broadly used to treat rUTI. However, its use is not devoid of adverse effects and can lead to resistance. Efficacy of mono/polyvalent inactivated bacteria has only been demonstrated in selected patient cohorts. Here, we show preliminary results of an ongoing prospective study aimed at evaluating the efficacy of an individualized autovaccine for outpatient management of rUTI in real-life conditions.

**Materials/methods:** women with uncomplicated rUTI were offered participation in a prospective study involving daily administration of a sublingual autovaccine (Uromune®) during 3 months. Individualized vaccines were generated for each patient by isolating inactivated bacteria from their urine culture (UC) samples. Demographic variables and rUTI nmRF were recorded. UC results, number of relapses and QoL using two questionnaires (daily activities: QoLQAct; emotions: QoLQEm) were evaluated as outcomes.

**Results:** the first 18 patients that have finished treatment were evaluated. Age mean±SD was 72.3±7.2 years. Mean±SD nmRF was 5.1±1.6, mainly menopause 18 (100%), urogenital surgery 16 (88.9%), urinary incontinence 13 (72.2%), and diabetes mellitus 9 (50%). Autovaccines were mostly generated from *E. coli* [12 (66.7%)] and *K. pneumoniae* [3 (16.7%)] strains. UC negativity was reached in 61.1% of patients and 82.4% showed a decrease in number of relapses (mean number pre-post 2.9 vs. 1.1, p<0.01). Similarly, QoL parameters improved in 76.5% of patients in QoLQAct (mean score pre-post 2.7 vs 1.5, p=0.02) and 70.5% in QoLQEm (mean score pre-post 11.5 vs 6.5, p=0.01). Improvements were observed regardless of bacteria strain.

**Conclusions:** This is, to our knowledge, the first prospective study evaluating autovaccination for the management of rUTI. We observed promising rates of UC negativization, decrease in rUTI episodes and improvement QoL parameters in non-selected women. Our results suggest that Uromune® autovaccine may be a valid strategy for reducing antibiotic consumption and for improving QoL in women with rUTI.

Abstract 957

Results of a schistosomiasis screening programme in an immigrant population
Luis Casado1, Jose A Boga2, Mercedes Rodriguez-Perez2, Jonathan Fernandez-Suarez3, Ana Perez-Garcia3, Alicia Garcia4, Candela Menendez3, Azucena Rodriguez-Guardado4

1Hospital de la Cruz Roja, Gijon, Spain, 2Hospital Universitario Central de Asturias, Oviedo, Spain, 3Fundación Hospital de Aviles, Aviles, Spain, 4Hospital Universitario de Cabueñes, Gijon, Spain

Background: Schistosomiasis is one of the most prevalent tropical diseases in the world. If the infection progresses without treatment, it can produce long-term complications like liver cirrhosis and bladder tumors among others. The results of a schistosomiasis screening program in the sub-Saharan immigrant population are described.

Materials/methods: A prospective screening program of schistosomiasis in all sub-Saharan patients attending in a Tropical Medicine Unit, in Asturias, Spain was performed between January 2009 and December 2017. Three formalin-ether concentrated stool samples and an enzyme-linked immunosorbent assay for serum anti-Schistosoma spp antibodies were used as screening. If urinalysis showed hematuria, we perform three urine analysis for Schistosoma haematobium. We considered infection to be established if the microscopic visualization and/or the ELISA were positive.

Results: We analyzed 481 patients (52% women; average age 34 years; mean age in Spain 1,043 days). The most frequent areas of origin were Central Africa (51.7%), West Africa (45.3%), and East Africa (2.9%). Fifty-nine patients (12.3%) had a positive serology for Schistosomiasis (59.3% were male; mean age of 29 years, mean time in Spain: 641 days). Five patients had a S. intercalatum in stool and three had S. haematobium in urine. Most of them came from Central (45.8%) and West Africa (52.5%), although without significant differences. There is not significantly differences in sex, age or length of stay in Spain, although 62.7% of infections were significantly detected in patients who had been less than one year in Spain (37/22 versus 202/220 p = 0.023 OR 1.832 [1.045-3.2 10]. Twenty-one (35.6%) patients were asymptomatic in the rest the most frequent symptoms were hematuria (10 patients) and abdominal pain (5 patients) and diarrhea (5 patients). One patient with S. intercalatum infection has bloody stools. Twenty-two patients showed eosinophilia in blood.

Conclusions: In our series, schistosomiasis was detected in 12.3% of our patients, most of them diagnosed by serology. It appeared more frequently in male patients from Central and West Africa who had been less than one year of residence in Spain, although without significant differences. A third of them were asymptomatic.

An ultrasensitive rapid single molecule counting method detects Bacillus anthracis lethal factor directly in blood samples

Don Straus*, Andrew Tempesta¹, Sadanand Gite¹, Stephen Schulz², Bruce Walsh¹, Jayson Bowers¹

¹First Light Diagnostics, Inc., 2 Omni Way, Chelmsford, United States

Abstract third-party references: This project has been funded in whole or in part with Federal funds from the Department of Health and Human Services; Office of the Assistant Secretary for Preparedness and Response; Biomedical Advanced Research and Development Authority, under Contract No. HHSO100201500022C

Background: Following a bioterrorism attack or infectious disease outbreak, large numbers of people will require a rapid diagnosis to ensure delivery of life-saving therapeutic treatment. We present data for a highly sensitive anthrax test that runs on a benchtop platform that can be deployed in hospitals, clinics, or physician office laboratories. The new anthrax test detects Lethal Factor (LF), the earliest detectable biomarker for Bacillus anthracis infection, from a fingerstick blood sample in 20 minutes. Sensitive detecting LF, which appears in the blood before PCR tests can detect the pathogen, offers the possibility of identifying infected victims early increasing the chances for successful treatment.

Materials/methods: The test uses non-magnified digital imaging to count target-specific magnetic and fluorescent particles that have been tethered together by single LF molecules. A novel dye-cushion eliminates the need for sample preparation. A blood sample (70 µL), either fingerstick or venous, is added directly to the disposable cartridge, minimizing sample handling. Once loaded onto the analyzer, the test proceeds automatically and generates a result in approximately 20 minutes. Contrived clinical samples prepared with blood drawn by venipuncture or fingerstick were used to estimate the limit of detection (LoD), precision, and dynamic range.

Results: The LoD of the Anthrax Toxin Test, determined using whole blood samples spiked with pure LF protein, is 61 pg/mL (Figure 1). The dynamic range of the test covers 5 logs of LF concentration, an important performance metric given the broad range of LF concentrations observed over the course of anthrax infection. In a simulated clinical study, whole blood collected by fingerstick from 40 healthy individuals was tested either spiked with 150 pg/mL purified LF or unspiked. In this study, the test demonstrated 100% sensitivity and 100% specificity.

Conclusions: The performance data demonstrate that the new anthrax test is highly sensitive, rapid, and specific for the detection of B. Anthracis LF in whole blood. Valuable features for crisis surge testing include minimum sample handling, a 20 minute test turnaround, and the benchtop analyzer’s throughput.

Figure 1. Analytical sensitivity of the LF test.

Multi-centre evaluation of the BIOFIRE FILMARRAY BCID 2 Panel for the detection of microorganisms and resistance markers in positive blood cultures

Kristen Holmberg*1, Yang Lu1, Sophia Vourli1, Spyros Pournaras2, Kathy Everhart3, Amy Leber3, Rebecca Barr4, Judy Daly5, Tai Henry5, Amy Johnson5, Joan-Miquel Balada-Llasat6, Daniel Rhoads6, Michael Jacobs6, Kathleen Mckinley7, Amanda Harrington7, Fan Zhang8, Gregory Berry8, Moon Jeong9, Rosemary She9, Michela Fantini10, Giorgio Dirani10, Silvia Zannoli10, Vittorio Sambri10,11, Usha Spaulding1, Kevin Bourzac1

1BioFire Diagnostics, LLC, UT, United States, 2National and Kapodistrian University of Athens, Athens, Greece, 3Nationwide Children’s Hospital, OH, United States, 4Primary Children’s Hospital, UT, United States, 5The Ohio State University Wexner Medical Center, OH, United States, 6University Hospitals Cleveland Medical Center, OH, United States, 7Loyola University Medical Center, IL, United States, 8Northwell Health Labs, NY, United States, 9University of Southern California, CA, United States, 10Unit of Microbiology, The Ramagna Hub Laboratory, Pievesestina, Cesena, Italy, 11University of Bologna, Bologna, Italy

Background: The BioFire® FilmArray® Blood Culture Identification 2 (BCID2) Panel is a rapid diagnostic test that provides results for 26 bacterial analytes, seven fungal analytes, and ten antimicrobial resistance (AMR) genes from positive blood culture (PBC) specimens in about an hour. The BCID2 Panel builds upon the existing BCID Panel with several additional assays that include Bacteroides fragilis, Candida auris, and additional AMR genes [CTX-M, IMP, mcr-1, mecA/C and MREJ, NDM, OXA-48-like, and VIM]. Here, we summarize studies conducted to establish clinical performance using an Investigational Use Only version of the BCID2 Panel.

Materials/methods: A total of 1074 residual PBCs were enrolled at 7 US and 2 EU sites between October 2018 and May 2019. BCID2 Panel performance was compared to routine standard of care microbial culture, as well as molecular methods for AMR genes. In addition, BCID2 Panel MRSA results were compared to the FDA-cleared Xpert® MRSA/SA BC test (Cepheid, Inc).

Results: The BCID2 Panel identified at least one organism in 90.9% of enrolled PBCs. Among the 12.8% of positive specimens with multiple organism detections by the BCID2 Panel, combinations of gram-positive (GP) bacteria mixed with gram-negative (GN) bacteria, GP with yeast, GN with yeast, and combinations of all three were observed. The BCID2 Panel demonstrated an overall sensitivity of 99.2% and specificity of 99.6% for the identification of microorganisms compared to culture. Concordance between the BCID2 Panel and the Xpert MRSA/SA BC test for the identification of MRSA was 91.2% positive percent agreement (PPA) and 97.9% negative percent agreement (NPA); however, 100% concordance was observed when compared to phenotypic MRSA characterization by the laboratory. The overall PPA and NPA for the remainder of the BCID2 Panel AMR genes as compared to molecular methods was 98.9% and 99.9%, respectively. The overall success rate of obtaining valid results in initial specimen tests was 99.7%.

Conclusions: The new BCID2 Panel is a sensitive, specific, and robust test for rapid detection of microorganisms [including mixed polymicrobial samples] and a variety of AMR genes in PBCs.

Data presented are from assays that have not been cleared or approved for diagnostic use.

Abstract 965

**Shortened antibiotic treatments for Gram-negative bacteraemia in cancer patients: less is possible**

Fabian Herrera¹, Diego Torres¹, Alberto Carena¹, María Laura Jorge¹, Elena Temporiti¹, Federico Nicola¹, Andres Nicolas Rearte*¹, Sofia Zerboni¹, Florencia Bues¹, Pablo Bonvehi¹

¹CEMIC, Buenos Aires, Argentina

**Background:** There are no studies published evaluating 7-day treatment for Gram-negative bacilli (GNB) bacteraemia exclusively in cancer patients and neutropenia.

**Materials/methods:** Prospective observational study performed from May 2014 to August 2019. Adult cancer patients with GNB bacteraemia were included, with the following criteria: having received appropriate empirical antibiotic treatment (EAT), complete clinical response within 7 days with source control and having survived 48 hours after completion of treatment. According to the duration of the antibiotic treatment they were divided into: short, median 7 days (ST) or long, median 14 days (LT). A 30-day follow-up was performed to assess mortality and recurrence of bacteraemia. Categorical variables were analyzed by the Fisher exact test or the Chi-square test and continuous variables were analyzed by the U Mann-Whitney test.

**Results:** 74 patients were included (ST: 36 and LT: 38). No differences were observed in baseline characteristics between ST and LT respectively: age 57 years (47-68) vs 60 years (47-66) (p=0.70); hematologic malignancy 52.8% vs. 44.7% (p=0.48); chemotherapy: 97.2% vs 89.5% (p=0.18); neutropenia 58.3% vs 60.5% (p=0.84); Charlson score 2 (2-4) vs 2 (2-3) (p=0.69); Pitt score 1 (0-2) vs 1 (0-2) (p=0.22). ST patients had a higher APACHE II score: 21 (19-23) vs 17 (14-20) (p<0.0001). There were no differences in clinical presentation and microbiological characteristics between ST and LT respectively: bacteraemia with clinical source 72.2% vs. 76.3% (p=0.68); hypotension 27.8% vs. 34.2% (p=0.55), E. coli 52.9% vs. 31.6% (p=0.065), Klebsiella spp. 27.8% vs. 39.5% (p=0.28); Multidrug-resistant GNB 27.8% vs. 21.1% (p=0.50). Treatment, outcome and recurrence between ST and LT were respectively: combined EAT 38.5% vs 44.7% (p=0.61); prolonged infusion 36.1% vs. 10.5% (p=0.012); ceftazidime-avibactam treatment: 22.2% vs 0 (p=0.002); overall mortality 2.8% vs. 7.9% (p=0.61); recurrence 2.8% vs. 0 (p=0.30). The length of hospitalization in days since bacteraemia and Clostridiodes difficile colitis between ST and LT were respectively: 7 (6-15) vs. 12 (7-19) (p=0.021) and 0 vs 8.9% (p=0.08).

**Conclusions:** In patients with cancer and GNB bacteraemia who receive appropriate EAT, with complete clinical response, 7-day duration may be adequate. They could also benefit from a shorter hospitalization.

Abstract third-party references: On behalf of Argentinean Bacteraemia in Cancer and Hematopoietic Stem Cell Transplant Study Group

Background: There are no studies published demonstrating that treatment with ceftazidime-avibactam (CA) for carbapenemase-producing Enterobacteriaceae bacteraemia (CPEB) improves survival in patients with hematologic malignancies and neutropenia.

Materials/methods: Prospective observational study performed from May 2014 to August 2019. Adult patients with hematologic malignancies or hematopoietic stem cell transplantation and KPC or OXA48-CPEB were included from 12 centers of Argentina. We compared patients who received definitive treatment with CA with patients treated with other antibiotics (OA). The 30-day mortality was examined by the Kaplan-Meier method with the log-rank test, and the Cox regression model was used to test statistical significance.

Results: 110 patients were included (CA: 22 and OA: 88). No differences were observed in baseline characteristics between CA and OA respectively: age 47 years (37-60) vs 50 years (39-64) (p=0.53); acute leukemia 68.2% vs. 59.1% (p=0.43); neutropenia 81.8% vs 84.1% (p=0.79); high risk by MASCC score: 100% vs 94.6% (p=0.31); neutropenia duration > 10 days: 81.8% vs 84.1% (p=0.79); Charlson score 2 [2-2] vs 2 [2-3] (p=0.27); Pitt score 0 [0-1] vs 1 [0-2] (p=0.11); APACHE II score: 13 [11-20] vs 12 [8-17] (p=0.092). There were no differences in clinical presentation and microbiological characteristics between CA and OA respectively: bacteraemia with a clinical source: 68.2% vs. 62.5% (p=0.62); hypotension: 22.7% vs. 36.4% (p=0.31); KPC-CPEB: 95.5% vs 92% (p=0.58); Klebsiella spp.: 90.9% vs. 90.9% (p=1); colistin-resistance: 27.3% vs. 31.8% (p=0.68); Meropenem MIC ≥ 16: 68.2% vs 69.9% (p=0.88). Treatment and outcome between CA and OA were respectively: appropriate empirical treatment: 81.8% [64% received CA] vs 52.3% [p=0.015]; combined definitive treatment: 63.6% vs 92% [p=0.001]; 7-day clinical response: 86.4% vs 52.3% (p=0.004); ICU admission: 18.2% vs 43.3% (p=0.048); 30-day mortality 18.2% vs. 50% (p=0.008). In the multivariate analysis the factors significantly associated with mortality were: Pitt score: OR 1.3, 95% CI, 1.1-1.45 (p=0.0001) and breakthrough CPEB: OR 2.1, 95% CI, 1.2-3.8 (p=0.011), while definitive treatment with CA was a protector factor for survival: OR 0.34, 95% CI, 0.12-0.9 (p=0.049).

Conclusions: Oncohematological patients with CPEB receiving definitive treatment with CA had clinical and survival benefit over OA treatments.

The dominant model analysis of Sirt3 genetic variants is associated with susceptibility to tuberculosis in a Chinese Han population
Tao Wu1,2, Lin Jiao1, Hao Bai1, Minjin Wang1, Xuejiao Hu1,3, Zhenzhen Zhao1, Binwu Ying1

1West China Hospital of Sichuan University, Chengdu, China, 2People’s Hospital of Ningxia Hui Autonomous Region (First Affiliated Hospital of Northwest Minzu University), Yinchuan, China, 3Guangdong Provincial People’s Hospital & Guangdong Academy of Medical Sciences, Guangzhou, China

Background: Tuberculosis (TB) is a complex infectious disease caused by the pathogen Mycobacterium tuberculosis (Mtbc) which has coexisted with humanity since the Neolithic. Recent research indicated that SIRT3 plays a pivotal role in promoting the antimycobacterial response of mitochondria and autophagy during Mtbc infection.

Materials/methods: A case-control study comprised 900 TB patients and 1534 healthy controls were retrospectively enrolled to assess the association between Sirt3 gene polymorphisms and TB susceptibility. In total of five single-nucleotide polymorphisms (SNPs) (rs511744, rs3782118, rs7104764, rs536715, and rs28365927) which were selected through database 1000 Genomes Project and offline software Haploview V4.2, and genotyped by a customized 2×48-Plex SNPscanTM Kit.

Results: Our results suggested that the minor allele genotypes (A carriers) of rs3782118 confers the decreased risk of TB susceptibility ($p$ Bonferroni = 0.032), and a similar but more significant effect was observed under the dominant model analysis ($OR = 0.787, 95\% CI = 0.666-0.931, p_{Bonferroni} = 0.026$). Haplotypes analysis showed that haplotype AGAAG (rs511744 / rs3782118 / rs7104764 / rs536715 / rs28365927) was associated with an increased risk of TB ($p = 0.023, OR = 1.159, 95\% CI = 1.019-1.317$). In stratification analysis, we found that rs3782118 was associated with decreased risk of TB in female subgroup under the dominant model analysis ($p_{Bonferroni} = 0.016, OR = 0.678, 95\% CI = 0.523-0.878$). Moreover, functional annotations for three loci (rs7930823, rs3782116, and rs3782115) which are strongly linked to rs3782118 indicated that they may be responsible for the changes in some motifs.

Conclusions: Our study suggested that the SNP rs3782118 was associated with a lower susceptibility to TB, especially under the dominant model analysis, and that the haplotype AGAAG (contains the major allele G of rs3782118) was associated with an increased risk of TB. Further independent cohort studies are necessary to validate the protective effect of Sirt3 genetic variants on the risk of TB.

Abstract 970

**Measles: clinical manifestations and complications during an outbreak in Bulgaria in 2019**

Petar Velikov*, Nicole Kyuchukova¹, Tatyana Chervenyakova²

¹Specialized hospital for active treatment of Infectious and Parasitic Diseases “Prof. Ivan Kirov”, Sofia, Bulgaria

**Abstract third-party references:** Specialized hospital for Active treatment of Infectious and Parasitic Diseases “Prof. Ivan Kirov”

**Background:** Measles is caused by one of the most pathogenic viruses known to man. Almost every infection is manifested clinically and frequently leads to serious complications. The aim of the present study is to review the clinical presentation of measles during an outbreak in 2019.

**Materials/methods:** Between February and August 2019 in our Institution, a total of 341 cases of measles were hospitalized and verified through IgM antibodies and/or through molecular confirmation for the presence of the virus.

**Results:** 172 are male, 169 are female. In regards to the immunization status, 82 are under the age of immunization - 13 months. From the remaining patients, 106 have unknown status, 119 have not been immunized, 32 have received 1 dose of measles vaccine and 2 have received 2 doses.

In regards to the initial infection, in 77 cases this occurred through contact with a family member and in 49 cases during a prior hospitalization.

**Clinical manifestations and complications:**

**Conclusions:** Measles affects primarily individuals who have not been immunized (90.02%), which leads to the necessity for implementation of further practices, aiming at increasing the proportion of immunized individuals in Bulgaria. A significant number of Hospital-acquired infections (14.31%) were noted. This requires further evaluation of the methods for infection control in regards to highly contagious diseases.

Our data shows that generally clinical manifestations during the outbreak in Bulgaria correspond to those described in literature. In regards to complications, bronchitis is more frequently noted in older patients (12-56 y. 44%), while pneumonia is more frequently seen in younger patients (<13 m. 14%).

**Increasing influenza vaccination rates among healthcare workers and residents of long term care facilities for the elderly in Graz, Austria**

Ines Zollner-Schwetz, Andrea Gurde T, Christian Pux, Karin Prisching, Walter Schippinger, Eric Stoiser, Robert Krause, Elisabeth König

1Medical University of Graz, Section of Infectious Diseases, Graz, Austria, 2Geriatric Health Centres Graz, Graz, Austria

**Background:** Although annual vaccination against influenza is recommended in Austria for those over 50 years of age, all patients with chronic health conditions and health care workers (HCW) vaccination rates in Austria are as low as 20% according to OECD data. The aims of our study were (1) to evaluate the vaccination rate of residents and HCWs in long-term care facilities (LTCF) in the season 2017/2018, (2) to explore motivations against vaccination, (3) to increase vaccination rates in the season 2018/2019 by a multi-modal intervention bundle.

**Materials/methods:** In January 2018, the rates of influenza vaccination of residents and HCWs of 4 LTCFs (Geriatric Health Centres Graz, Austria) were determined. Residents and HCWs were asked to respond to a survey anonymously asking for their motivation not to get vaccinated. In autumn 2018 an intervention bundle was conducted including: personal letters to all HCWs and residents, posters presenting peers in favour of vaccinations on display, meetings between local experts and residents, training sessions of influenza prevention for HCWs. Vaccination for HCWs was offered free of charge. Vaccination rates were again determined in January 2019.

**Results:** In the season 2017/2018, the vaccination rates were 6% (22/377) in residents and 1% (3/234) in HCWs. Following the interventions, there was a statistically significant increase in vaccination rates to 19% and 20% in residents and HCWs respectively (p < 0.001). 37% (141/377) of residents and 29% (67/234) of HCWs responded to the survey (table 1). 32% of HCWs questioned effectiveness of influenza vaccination.

**Conclusions:** A multi-modal intervention bundle was successful in significantly increasing influenza vaccination rates but vaccination rates were still low. The study revealed strong skepticism about the effectiveness of influenza vaccinations and vaccinations in general among HCWs.

Abstract 972

**Radiologic features of Pneumocystis pneumonia differ between patients with and without HIV Infection**

Huan-Yi Wu*, Kuan Sheng Wu, Susan Shin-Jung Lee, Ding-Yu Chang, Shr-Hau Dai, Shu-Hung Kuo, Chih Chen Chou, Ya-Wei Weng, Yu-Ting Tseng, Ju-Kuan Chen, Cheng-Len Sy, Hung-Chin Tsai, Yao-Shen Chen

1Kaohsiung Veterans General Hospital, Division of Infectious Diseases, Department of Internal Medicine, Kaohsiung, Taiwan, 2National Yang-Ming University, Taipei, Taiwan, 3Kaohsiung Veterans General Hospital, Division of Pulmonary Medicine, Department of Internal Medicine, Kaohsiung, Taiwan, 4Kaohsiung Veterans General Hospital, Department of critical care medicine, Kaohsiung, Taiwan, 5Kaohsiung Medical University, Graduate Institute of Clinical Medicine, Kaohsiung, Taiwan

**Background:** Pneumocystis pneumonia (PCP) is the leading opportunistic infection in patients with acquired immune deficiency syndrome in Taiwan. However, patients with hematologic diseases and under immunosuppressant use are also at a higher risk for PCP. Radiologic findings on chest computed tomography (CT) scan can be used to aid the diagnosis especially when invasive procedures to obtain tissue for the histopathologic diagnosis is often difficult in critically-ill patients. The aim of the study is to compare the differences in the radiologic features in PCP between patients with and without HIV infection.

**Materials/methods:** We retrospectively reviewed the chest CT findings in 101 patients diagnosed with Pneumocystis pneumonia with or without HIV infection from January 2014 to August 2019. Each image was reviewed by a radiologist and a chest medicine specialist and findings were recorded as diffuse consolidation, ground glass opacity, intralobular/interlobular lines, crazy-paving pattern, pulmonary cysts, pneumothorax, tree-in-bud pattern, pulmonary nodules, pleural effusion, intrathoracic adenopathy, architectural distortion and/or traction bronchiectasis. The distribution were recorded as peripheral or central distribution.

**Results:** The mortality rate was 15.4% (6/39) in HIV-infected patients and 43.5% (27/62) in non-HIV-infected patients in the study. Diffuse consolidation (30.6% vs 12.8%, p=0.04), pleural effusion (43.5% vs 5.1%, p<0.001) and intrathoracic adenopathy (27.4% vs 10.3%, p=0.04) were more often seen in non-HIV-infected patients and HIV-infected patients presented more frequently with ground glass opacity (94.9% vs 67.7%, p<0.001) and peripheral distribution (49.7% vs 29.0%, p=0.05).

**Conclusions:** This study showed that HIV-infected patients and non-HIV-infected patients presented differently on chest CT image; non-HIV-infected patients tend to have atypical presentations such as diffuse consolidation, pleural effusion and intrathoracic adenopathy. HIV-infected patients more often presented with ground glass opacity and peripheral distribution.

Invasive pulmonary aspergillosis after heart transplantation

Karina Monosova*, Maria Simonenko¹, Yulia Sazonova¹, Ksenia Zagorodnikova¹, Larisa Vasiljeva¹, Rubinchik Vadim¹, Maria Bortsova¹, Petr Fedotov¹

¹National Medical Research Center. VA Almazov, Sankt-Peterburg, Russian Federation

**Background:** Mold infections are an important cause of morbidity and mortality in the solid organ transplant population. Invasive pulmonary aspergillosis (IPA) are an infrequent but major complication of heart transplantation (HTx). We sought to describe the frequency and determine risk factors of this mold infection at our centre.

**Materials/methods:** From January 2010 to October 2019 it was performed 133 HTx (46±14 year-old; male – 97%). Immunosuppressive therapy was guided by transplant center protocol: methylprednisolone, tacrolimus, mycophenolate mofetil/everolimus plus induction (basiliximab - 80% (n=107), anti-thymocyte globulin - 15% (n=20)). We retrospectively analyzed early and long-term post-heart transplant results.

**Results:** During the whole follow-up 52 episodes of pneumonia were diagnosed, 16 (31%) of them were IPA [54±7 year-old], most cases [91%] were probable. Aspergillus fumigatus was the most common species isolated. All recipients were treated with voriconazole [from 2 to 6 months] with positive clinical outcomes in 81% (n=13) of them. Three patients (n=2 – in 1 month after HTx) died which was associated with sepsis and right ventricular heart failure. Adjunctive therapies included reduction of immunosuppressive therapy and colonystimulating factors for neutropenic patients. Risk factors of IPA were found: prolonged duration in ICU (n=8), neutropenia (n=8) and high doses of immunosuppression, such as triple-drug therapy including steroids (n=14), treatment for 2R/3A rejection (n=3) and 1 month after the conversion to everolimus (n=1).

**Conclusions:** IPA occurred in 31% of all post-HTx pneumonias. The development of IPA was associated with a combination of risk factors. Timely diagnosis of IPA allows initiating antimycotic therapy with positive clinical outcomes.

Abstract 979

Globally intravenous dosing of antibiotics in infants and children clusters around a small number of strategies but is not completely uniform

Michelle Clements*1, Julia A. Bielicki2, Silke Gastine3, Yingfen Hsia2, Neal Russell2, Joe Standing3, Sarah Walker1, Mike Sharland2

1MRC Clinical Trials Unit at UCL, London, United Kingdom, 2Paediatric Infectious Diseases Research Group, St George’s, University of London, London, United Kingdom, 3UCL Great Ormond Street Institute of Child Health, London, United Kingdom

Background: Little is known about consistency of antibiotic prescribing in children.

Materials/methods: We investigated variation in dosing in mg/kg/day in the 16 most common antibiotics [with at least 90 doses recorded] prescribed for intravenous treatment [not prophylaxis or decolonization] across four years of data from the Global Point Prevalence Survey.

Results: Data consisted of 3,572 doses from 2,627 children in 62 hospitals in 23 countries. Almost half (46%) of doses were from the WHO European Region, 31% the Americas, 12% South-East Asia, 6% Western Pacific Region and 5% African Region; none were from Eastern Mediterranean Region. The median age of children was 36 months (IQR: 9–96 months, Range: 1 month–17 years).

The three most common antibiotics were ceftriaxone (14% of doses), meropenem (12%) and vancomycin (11%). Approximately half of antibiotic doses (56%) were for community-acquired infections. The most common diagnoses were bacterial LRTI (24%), sepsis (18%) and Febrile neutropenia/Fever (13%); 16 other diagnoses comprised the remaining 45% of diagnoses but each represented less than 7% doses individually.

Figure 1: Daily dosing in 16 IV antibiotics in children. Vertical lines show minimum and maximum Blue Book recommendations.

The spread of dosing in mg/kg/day for each antibiotic ranged widely: from two-fold (cefazidime) to more than 20-fold (ceftriaxone; figure 1). Dosing in mg/kg/day clustered around a small number of peaks, and all antibiotics had at least one dose used in at least 10% of children. Five antibiotics [amikacin, ampicillin, cefepime, metronidazole, teicoplanin] had a dose used in more than 40% of children, and most antibiotics showed up to three clear peaks in dosing strategy.

Conclusions: Dosing in IV antibiotics appears to cluster around a small number of strategies. Differences could reflect true differences in dosing strategy [e.g. reflecting different recommendations for meningitis] or equipoise towards dosing. Guidance and trials should aim to differentiate between commonly used doses and their relationship to clinical outcomes.

Abstract 980

The Danish nationwide surveillance of azole-resistance in Aspergillus fumigatus: data from the first nine months
Malene Risum1, Rasmus Krøger Hare1, Jan Berg Gertsen2, Flemming Rosenvinge1, Sofia Sulim4, Ea Marmolin5, Bent Lewe Reder6, Jette Bangsborg2, Esad Dzajic8, Michael Pedersen9, Karen Marie Thyssen Astvad9, Steen Lomborg Andersen10, Maiken C. Arendrup1,11,12
1Statens Serum Institut, Unit of Mycology, Copenhagen, Denmark, 2Aarhus University Hospital, Department of Clinical Microbiology, Aarhus, Denmark, 3Odense University Hospital, Department of Clinical Microbiology, Odense, Denmark, 4Aalborg University Hospital, Department of Clinical Microbiology, Aalborg, Denmark, 5Vejle Sygehus, Department of Clinical Microbiology, Vejle, Denmark, 6Slagelse Sygehus, Department of Clinical Microbiology, Slagelse, Denmark, 7Herlev Hospital, Department of Clinical Microbiology, Herlev, Denmark, 8Sydvestjysk Sygehus, Esbjerg, Department of Clinical Microbiology, Esbjerg, Denmark, 9Hvidovre Hospital, Department of Clinical Microbiology, Hvidovre, Denmark, 10Sygehus Sønderjylland, Sønderborg, Department of Clinical Microbiology, Sønderborg, Denmark, 11Copenhagen University Hospital, Rigshospitalet, Copenhagen, Denmark, 12Copenhagen University, Department of Clinical Medicine, Copenhagen, Denmark

Background: Azole resistant [azole-R] Aspergillus fumigatus has been increasingly reported worldwide and associated with human and environmental azole use. The environmental resistance mechanisms TR34/L98H or TR46/Y121F/T289A were first found in Denmark in 2007 and 2012, respectively. A nationwide surveillance was established in October 2018. We report results from the first 9-month's surveillance.

Materials/methods: Inclusion criteria were: a) isolates regarded clinically significant and b) isolates detected on a Monday to represent background prevalence. Isolates from same patients were defined as unique if found >30 days apart or with a different susceptibility pattern. The EUCAST E. Def 10.1 method using VIPcheck azole agar plates [Mediaproducts BV, Groningen NL] was used for screening, EUCAST E. Def 9.3.1 for susceptibility testing, and cyp51A sequencing for characterisation of target gene mutations. An isolate was deemed non-susceptible if intermediate or resistant according to EUCAST breakpoints v9.0.

Results: At the time of writing, susceptibility testing was performed for 703 A. fumigatus isolates from 508 patients. Fifty-three (7.5%) isolates were marked “Monday samples.” Thirty-two patients harboured a non-susceptible A. fumigatus isolate (6.3%), incl. 29 resistant (5.7%). A target gene mutation was found in 27 isolates [all resistant], including 20 with tandem repeats from airway samples suggesting environmental origin (3.9% of all patients, 69% of resistant isolates, Table). Among the patients with non-susceptible isolates underlying diseases were: cystic fibrosis (CF, 15/32), other pulmonary disorders (12/32), solid organ transplantation and trauma (one each) and unknown (three patients). Nine out of 20 (45%) with a tandem repeat originated from CF patients. Among the Monday samples TR/L98H was detected in 3/51 (5.9%) at patient level. The TR/L98H isolates originated from all parts of Denmark except the north-Jutland, where it has previously been found. All isolates, except one, with other Cyp51A alterations originated from Zealand.

Conclusions: We report a nationwide azole non-susceptibility and resistance rate of 6.3% and 5.7%, respectively, in A. fumigatus at the patient level. The underlying resistance mechanisms were target gene mutations in all but two resistant cases and notably, the vast majority (69%) were of environmental origin. This implicates that the use of azole fungicides has an impact on human health.

New raw materials for serology immunoassay quality controls
Pauline Monsbrot*, Gaël Champier1, Claudia Dollack2, Thomas Schumacher1, Marie-Laure Dardé3, Sebastien Hantz4
1ArkAb, Limoges, France, 2Institut Virion\Serion GmbH, Institut Virion\Serion GmbH, Wurzburg, Germany, 3Limoges, Faculté de médecine, Limoges, France, 4Faculté de Médecine, UMR Inserm 1092, Limoges, France

Background: Reliable antibody-detection in patient samples requires high quality reference materials to determine cut-off values and test assay integrity. Immunoassay quality controls are mainly based on human disease state plasma which is a critical component for the development and manufacturing of diagnostic tests. However, for most indications, plasma sourcing is difficult [availability, expected features, time consuming].

ArkAb and SERION Immunologics collaborated to develop a range of substitutes to disease state plasma for immunoassay quality controls based on human chimeric monoclonal antibodies (mAbs). This study shows performance obtained for anti-Toxoplasma gondii IgM mAbs tested with several diagnostic kits.

Materials/methods: InEps™ transgenic mice expressing human/mouse chimeric IgM were immunized to obtain specific mAbs through classic hybridoma development technique [immunization, B Cells immortalization, IgM specific secreting hybridomas screening and stabilization, pre-industrial IgM mAb production].

First, after production using a standardized and controlled bioprocess, performance of two mAb clones was tested on different diagnostic kits from three various manufacturers. Anti-Toxoplasma gondii IgM were titrated in several dilution rates following manufacturer's instruction and results were compared.

Second, mAb IgM batches reproducibility was tested. In this regard, three independent batches from one clone were produced and tested on a Vidas® Toxo IgM assay from bioMérieux.

Results:

mAb IgM candidate performance: Two clones of human chimeric monoclonal anti-Toxoplasma gondii IgM were titrated with different diagnostic kits. Results showed that the batches reacted in each assay until a pre-dilution of 1/16. Linearity was checked and the coefficient of determination was very good (R²=0.99).

mAb IgM reproducibility: Three independent batches of one clone were produced and tested. The standard deviation was calculated and showed that batches have reproducible reactivity in the Vidas® Toxo IgM assay from bioMérieux.

Conclusions: Human chimeric monoclonal anti-Toxoplasma gondii IgM products were tested and validated in various diagnostic assays. Results showed excellent performance and reproducibility obtained with this synthetic product. Human/mouse chimeric mAb can be easily and efficiently used as an alternative to disease state plasma for immunoassay quality controls.

A full range of products is available for infectious disease diagnostics and show equivalent performances.

Abstract third-party references: Spanish Network for the Research in Infectious Diseases (REIPI), GEMARA-Spanish Society of Infectious Diseases and Clinical Microbiology (SEIMC)

Background: Klebsiella pneumoniae is responsible for severe nosocomial infections due to the continuous emergence of multi-drug resistant (MDR) pathogens. The decline in the effectiveness of antimicrobial treatments against MDR bacteria has generated a special interest in the study of bacteriophages. In this study, we identified a total of 42 Caudoviral bacteriophages present in 17 clinical strains of K. pneumoniae that produce carbapenemases belonging to 14 different STs corresponding to a total of 1.66 Mbp of sequence information (genomic/proteomic features). We determined their evolutionary relationship using comparative bioinformatic tools and microscopy techniques.

Materials/methods:
- 17 genomes of clinical strains of K. pneumoniae were sequenced and assembled de novo using the illumina-Miseq system and Velvet V1.2.10, respectively.
- Bioinformatic tools: PHASTER (bacteriophage identification), RAST PSI-BLAST and HHpred (protein annotation), ClustalW (evolutionary relationship), MVP (study interaction between bacteriophage and bacterial host) and GEPARD (dot plot alignment of nucleotide sequence).
- Microscopy studies were carried out by TEM assays.

Results: The study of the genomes resulted in the identification of 42 bacteriophages (Figure 1A), highlighting four of them with 33.3, 36.1, 39.9 and 42.2 kb genome sizes and similar genomic features present in several clinical strains and included in clusters (A, B and D) by phylogenetic analysis. Moreover, these bacteriophages showed high homology with international 4762, 4901,3499 and 4280 clusters of MVP. Bioinformatic analysis revealed the presence of 2363 proteins belonging to viral structure, transcription/replication and regulation. Although the majority of proteins had unknown functions, some of them showed an association with virulence (compounds of secretion systems-T3SS/T4SS or regulators-Mar like), antibiotic resistance (terB protein), and viral defense (Toxin-antitoxin modules, CRISPR-Cas and methyltransferase proteins) in bacteriophage genomes (Figure1B).

Conclusions: The presence of 42 caudoviral bacteriophages in the 17 clinical strains of K. pneumoniae showed relation with international 4762,4901,3499 and 4280 clusters of MVP database. Moreover, these bacteriophages harbored virulence, resistance and defense viral proteins that could determine the bacterial behavior. Future lines of research should focus on obtaining more information about genes of unknown function to achieve a better understanding of viral genomes for possible therapeutic application.
**Figure 1A** Transmission electron microscopy (TEM) images showing the different families of bacteriophages present in the different clusters. (A,B,C,F,G) Myoviridae family obtained from bacteriophages ST11-OXA245phi3.1, ST13-OXA48phi12.1, ST405-OXA48phi12.2, ST101-KPC2phi6.3 and ST846-OXA48phi9.2 of cluster A1, A2, B, D and E, respectively. (D,I) Siphoviridae family obtained from bacteriophages ST13-OXA48PHI12.2 and ST974-OXA48phi18 of cluster C and E, respectively. (E,G) Podoviridae family obtained from bacteriophages ST147-VIM1phi7.2 and ST11-VIM1phi8.2 of cluster D and E, respectively. **Figure 1B** Illustration representative of transmission of virulence, resistance and viral defense genes by bacteriophages in the bacterial chromosome of *Klebsiella pneumoniae* clinical isolates from this study.

Abstract 985

**Efficacy and safety of ceftazidime-avibactam in adults with Gram-negative bacteraemia from five phase III randomised clinical trials**

John E. Mazuski1, Florian Wagenlehner2, Antoni Torres3, Yehuda Carmeli4, Joseph Chow5, Dalia Wajsbrot6, Greg Stone7, Paurus Irani8, Veronica Mascalzùllo1, Karen Cheng10, Margaret Tawadrous*7

1Washington University School of Medicine, St. Louis, United States, 2Justus-Liebig University, Giessen, Germany, 3Hospital Clinic, University of Barcelona, Barcelona, Spain, 4Tel Aviv Sourasky Medical Center, Tel Aviv, Israel, 5Pfizer, Collegeville, United States, 6Pfizer, New York, United States, 7Pfizer, Groton, United States, 8Pfizer, Tadworth, United Kingdom, 9Allergan plc, Madison, United States, 10Pfizer, Sandwich, United Kingdom

**Background:** An exploratory analysis was conducted in a subset of patients with Gram-negative bacteraemia from five randomised, controlled, multicentre Phase III trials in adults with complicated intra-abdominal infection [cIAI], complicated urinary tract infection [cUTI], hospital-acquired pneumonia [HAP] and ventilator-associated pneumonia [VAP], including infections caused by ceftazidime non-susceptible and multidrug-resistant Gram-negative bacteria.

**Materials/methods:** In each trial, RECLAIM and RECLAIM 3 [cIAI; NCT01499290/NCT01726023], REPRISE [cIAI/cUTI; NCT01644643], RECAPTURE [cUTI; NCT01595438/NCT01599806] and REPROVE [HAP/VAP; NCT01808092], patients were randomised 1:1 to intravenous ceftazidime-avibactam [plus metronidazole for those with cIAI] or comparators (carbapenems in >97% patients) for 5–21 days [treatment durations were defined by protocol for each study]. Efficacy assessments included clinical and microbiological responses at a test-of-cure [TOC] visit [timed according to study protocol] in the Gram-negative extended microbiologically evaluable [GNeME] population bacteraemia subset. Safety outcomes [including adverse events [AEs] and clinical laboratory assessments up to the last visit] were summarised for patients with any positive bacterial blood culture at baseline who received ≥1 dose of study treatment.

**Results:** The overall Phase III pool included 3172 patients [ceftazidime-avibactam treated patients, n=1855; comparator group, n=1857], of whom 101 [ceftazidime-avibactam, n=54; comparator, n=47] comprised the GNeME bacteraemia subset. The most common primary diagnoses among these patients [acute pyelonephritis [47%] and VAP [15%]] and the most frequently isolated pathogens [Escherichia coli [69%], Klebsiella pneumoniae [21%] and Pseudomonas aeruginosa [17%]] were consistent with the overall Phase III pool. Considering the low denominators in the bacteraemia subset, favourable clinical and microbiological response rates at TOC were generally similar for ceftazidime-avibactam and comparators within each indication and combined across indications [Table]. For 30 bacteraemia patients with ceftazidime non-susceptible isolates, overall favourable microbiological response rates were 6/11 [54.5%] for ceftazidime-avibactam ± metronidazole and 9/19 [47.4%] for comparator [difference 7.2%; 95% CI –28.72, 41.08]. The pattern of AEs in patients with bacteraemia was similar between treatment groups and consistent with the known safety profile of ceftazidime-avibactam.

**Conclusions:** This analysis provides supportive evidence of the efficacy and safety of ceftazidime-avibactam in patients with Gram-negative bacteraemia associated with cIAI, cUTI or HAP/VAP.

Study sponsored by Pfizer.

| Table. Clinical cure and favourable microbiological response rates at TOC for patients with Gram-negative bacteraemia associated with cIAI, cUTI or HAP/VAP treated with ceftazidime-avibactam and comparators (GNeME population) |
|---|---|---|---|---|---|---|---|
| Clinical cure | Favourable microbiological response |
| | Clinical cure | Comparator, n (%) | Difference, n (%) | Comparator, n (%) | Difference, n (%) |
| CAZ-av & MTZ, n (%) | Comparator, n (%) | CAZ-av & MTZ, n (%) | Comparator, n (%) |
| 
| UTI | 9/11 (81.8) | 9/10 (90.0) | -0.2 | 9/11 (81.8) | 9/10 (90.0) | -0.2 |
| 
| UTI, including acute pyelonephritis | 29/29 (100) | 29/29 (100) | 0.0 | 29/29 (100) | 29/29 (100) | 0.0 |
| 
| HAP, including VAP | 10/15 (66.7) | 5/6 (83.3) | -1.4 | 10/15 (66.7) | 5/6 (83.3) | -1.4 |
| 
| Overall | 47/54 (86.9) | 38/47 (80.5) | 4.1 | 47/54 (86.9) | 38/47 (80.5) | 4.1 |

Data posted from RECLAIM (NCT01499290), RECLAIM 3 (NCT01726023), REPRISE (NCT01644643), RECAPTURE (NCT01595438/NCT01599806) and REPROVE (NCT01808092). Clinical and microbiological responses at TOC and timing of TOC visits were as defined in each study protocol. All clinical cure definitions included resolution of signs and symptoms of the primary infection such that no additional antibiotics were required. Favourable microbiological response at TOC for patients in the bacteraemia subset required clearance of bacteraemia from post-baseline blood samples with eradication/remission of infection (and no new infection) at the primary infection site; for patients with UTI in RECAPTURE a urinalysis demonstrating <100 CFU/mL of the original uropathogen was also required.

CAZ-av = ceftazidime-avibactam; MTZ = metronidazole; CAZ = ceftazidime; CAZ-av = ceftazidime-avibactam; MTZ = metronidazole; inc = infection; n = number of patients with outcome; R = ratio of patients in group; TOC = test-of-cure; HAP, ventilator-associated pneumonia.

Abstract 986

**Development of an antifungal stewardship programme at a London teaching hospital**

Laura Whitney1, Richard Wilson*1, Frances Davies1, Meg Coleman1, Jim Woo1, Renuka Palanicawandar1, Mark Gilchrist1

1Imperial College Healthcare NHS Trust, London, United Kingdom

**Background:** The need for antifungal stewardship (AFS) is gaining recognition due to increasing incidence of invasive fungal infection and antifungal resistance. This triggered an AFS quality improvement scheme initially implemented in London hospitals (April 2018), then throughout England (April 2019). Here we describe the first 18-months of an AFS programme in a London teaching hospital.

**Materials/methods:** A series of interventions were implemented (April 2018-November 2019) including; establishing a multidisciplinary (MDT) AFS team, monitoring antifungal consumption and usage through regular audit, monthly fungal MDT reviews of patients on Ambisome®, guideline updates, a quality improvement project to optimise azole therapeutic drug monitoring (TDM) and weekly AFS rounds for in-patients.

**Results:** Antifungal consumption increased from 63,000 DDDs in 2016-17 to predicted 70,000 in 2019-20 (fig.1) with expenditure reducing in year 1 (by £30,000), but predicted to increase in year 2 (due to increasing expenditure on mold-active azoles).

![Figure 1: Total Antifungal Expenditure and Consumption](image)

An audit of 86 patients on antifungal treatment showed high compliance with Trust guidelines on treatment choice (87%) and appropriate imaging (93%). Utilisation of fungal biomarkers for suspected invasive mold infection was relatively low; galactomannan sent in 73% patients in 2018 and 65% in 2019 and beta-D-glucan in 53% and 97%, respectively. Prolonged turn-around-times (median 14d) impact the utility of these tests. MDT reviews of patients on AmBisome® (average 6/month) advise to de-escalate or stop in 39% of patients (28% and 11%, respectively), with additional diagnostics often recommended (44%). Durations of empiric therapy for invasive mold infection where a diagnosis of IFI was not established were shorter after MDT initiation (median 8d in 2019 vs. 16d in 2018).

Appropriate azole TDM increased from 20% of patients to 70-90% following the quality improvement project. Weekly AFS rounds began in November 2019. To date 11 patients have been reviewed with interventions recommended in 82%. These include stopping (n=4) or defining treatment duration (n=1), and recommending diagnostics (n=1) and TDM (n=5).

**Conclusions:** A multi-faceted approach with increased MDT working and central funding has optimised antifungal usage within our organization. Lessons learned from our long-standing antibiotic stewardship programme have facilitated this. Work continues to identify areas for further improvement.

Clinical experience of oral ibrexafungerp for treatment of four patients with invasive candidiasis from the FURI study

Juergen Prattes*, Christoph Zurl¹, Nkechi Azie², David Angulo Gonzalez², Robert Krause¹

¹Medical University of Graz, Section of Infectious Diseases and Tropical Medicine, Graz, Austria, ²Synexis, Inc., Jersey City, United States

Abstract third-party references: Synexis

Background: Ibrexafungerp is a novel glucan synthesis inhibitor and the first member of a new class of triterpenoid antifungals. Its mode of action is inhibition of 1,3-β-D-glucan synthesis of the fungal cell wall, similar to echinocandins. However, ibrexafungerp is available orally and retains activity in candida strains resistant to echinocandins. As part of the open-label FURI trial, we report on four invasive candidiasis cases treated with oral ibrexafungerp at the Medical University of Graz.

Methods: FURI is an open-label Phase3 trial to determine the efficacy and safety of oral ibrexafungerp in patients with invasive fungal infections that are refractory to or intolerant of standard antifungal treatments or for whom long-term intravenous (IV) treatment is not feasible.

Results: Twenty-five patients were screened for study inclusion and four patients were ultimately included. The main underlying diseases were malignancy in two patients, psoriatic arthritis and kidney/pancreas transplantation in one patient each. The types of invasive candidiasis were as follows: Femoro-tibial osteomyelitis due to C. glabrata and C. albicans (N=1), candidemia due to C. parapsilosis (N=1), intraabdominal abscess due to C. krusei (N=1) and oropharyngeal candidiasis due to C. krusei and C. albicans (N=1). Two patients received oral ibrexafungerp because long-term IV treatment with an echinocandin was not feasible, one due to azole toxicity and one because of refractory disease despite standard antifungal treatment. The treatment duration with ibrexafungerp ranged from seven to 75 days.

At the end of treatment, two patients (candidemia and abscess) had a complete response, one patient (osteomyelitis) had a partial response and one (oropharyngeal candidiasis) had stable response (persisting thrush).

Most common adverse events possibly or probably related to ibrexafungerp were diarrhoea (n=3), nausea (N=1), rash (N=1) and tooth discoloration (N=1). Gastrointestinal adverse effects resolved in two out of three patients after a couple of days.

Conclusions: Oral ibrexafungerp was well tolerated, besides gastrointestinal side effects in the first days of loading dose. Ibrexafungerp was shown to be an effective treatment for invasive candidiasis infections. In addition, in-hospital stays could be significantly reduced in two patients as long-term IV treatment would be avoided with the use of oral ibrexafungerp.

The evolving landscape of group A Streptococcus in marginalised populations in England and Wales

Juliana Coelho¹, Natalie Groves¹, Roger Daniel¹, Karen Broughton¹, Colin Brown¹, Lara Utsi², David Leeman³, Katy Sinka⁴, Isabel Oliver⁵, Derren Ready*¹

Background: The PHE streptococcal reference laboratory types all GAS isolates recovered from patients with invasive infections, and from superficial infections for outbreak-related cases. Increasing numbers of GAS isolates from people who inject drugs (PWID), people in prison and/or people who are homeless have been detected, and national investigation established. Surveillance data from the reference laboratory indicates an increase in the number of reported iGAS isolates from an average of 9.5 cases between 2010-2015 to 1 45 cases in 2017; 277 cases in 2018; 190 cases so far in 2019. We report here characterisation of strains received from January 2018 to August 2019 associated within this marginalised population.

Materials/methods: GAS isolates were characterised by emm gene sequence typing. PWID, prison and homeless status were updated from health protection management systems (HPZone) from 2018 onwards, leading to increased case ascertainment. Whole genome sequence data was obtained for a sample of cases to identify risk factors for transmission.

Results: 32 clusters of GAS infections were identified; 17 linked to PWID/homeless shelters and 15 to prisons with a total of 332 and 73 isolates received from these settings, respectively. The dominant emm types were emm 108.1 (29%), emm 66.0 (27%) and emm 94.0 (8%), and do not reflect those commonly found in the general population, being emm 1.0 (20%), emm 89.0 (10%) and emm 3 (8%). SNP analysis of WGS data of emm 108.1 strains suggest recent clonal expansion of single lineage within this population; data from the emm 66.0 strains revealed a number of geographically related clades, suggesting that this strain has been circulating for longer has become established within this population. Infections in PWID, the homeless community and prisoners were predominately found in males, and spread across England and Wales concentrating in some English cities.

Conclusions: These findings indicate increasing burden of severe, invasive GAS infections in PWID, with clusters emerging in prisons in England and Wales, dominated by lineages not commonly found in other communities. Data suggests recent clonal expansion of emm 108.1 strain and increased incidence of previously established emm 66.0 strains. Further investigations are underway to understand transmission networks.

Abstract 990

Development of a simultaneous population pharmacokinetic model for aztreonam-avibactam

Rujia Xie*, Phylinda Chan, Margaret Lynn Mcfadyen, Susan Raber

1Pfizer, Singapore, Singapore, 2Pfizer, Sandwich, United Kingdom, 3Pfizer, La Jolla, United States

Background: In previously reported population pharmacokinetic (PK) analyses and exposure simulations, aztreonam and avibactam were modelled separately to select the Phase IIa (completed) and Phase III (planned) aztreonam-avibactam dosage regimens [maintenance dose 1500/500 mg 3-h intravenous infusions every 6 h for adult patients with estimated creatinine clearance [CrCl] > 50 mL/min], including loading doses and adjustments for renal impairment.

Materials/methods: The existing aztreonam and avibactam models were updated with additional adult [one Phase IIa trial] and paediatric [avibactam only; one Phase I and two Phase II trials] clinical PK data to develop a simultaneous aztreonam-avibactam population PK model to account for correlation in PK of the two components. Population PK analyses were conducted using nonlinear mixed-effects modelling with first-order conditional estimation method with interaction. Models were evaluated using pre-defined goodness-of-fit criteria and prediction-corrected visual predictive checks (pcVPCs).

Results: In total, 2921 aztreonam plasma concentrations from 141 adults [patients and healthy volunteers], 16,175 avibactam plasma concentrations from 2349 adults, and 510 avibactam plasma concentrations from 154 paediatric subjects [3 months to <18 years] were included in the analysis. The final aztreonam and avibactam population PK models were two-compartment disposition models with first-order elimination, with correlation in interindividual variability (IIV) on clearance [CL] and central volume [Vc]. Body weight [standard allometry] and body surface area-normalised CrCl [nCrCL], or postmenstrual age for subjects <2 years, were key covariates that predicted clearance of both drugs. Estimated base and final model PK parameters for the reference typical healthy subject weighing 70 kg are shown in the Table; final estimates for aztreonam CL, and for the exponent of nCrCL on aztreonam clearance, were similar to previous analyses. In pcVPCs, model predictions of observed data were generally adequate.

Conclusions: Simultaneous modelling of aztreonam and avibactam enables estimation of the correlation of PK IIV on CL and Vc of the two drugs, facilitating efficient parametric simulation. Simulations using these models further support the adult aztreonam-avibactam dosage regimens [including renal dose adjustments] selected for Phase III evaluation and provide initial weight-based doses for evaluation in paediatric studies.

Abstract 994

Prospective surveillance of health-care associated infections in residents in long term care facilities in Graz, Austria

Elisabeth König*, Mara Haubenwallner¹, Christian Pux², Karin Prisching³, Walter Schippinger⁴, Eric Stoiser⁴, Robert Krause¹, Ines Zollner-Schwetz¹

¹Medical University of Graz, Section of Infectious Diseases, Graz, Austria, ²Geriatric Health Centres Graz, Graz, Austria

Background: Residents in long term care facilities (LTCF) are at increased risk for healthcare-associated infections (HCAI). Incidence rates in the literature range from 1.8 - 13.5 infections per 1,000 resident days. However, data on HCAIs in residents of LTCFs in Austria are scarce. Therefore, the aims of our study were (1) to evaluate the incidence rate of HCAIs per 1,000 resident days in four LTCFs in Graz, Austria (2) to characterise the spectrum of HCAIs and (3) to study the use of antimicrobial substances.

Materials/methods: We conducted a prospective surveillance study from January 1 to December 31, 2018 in four LTCFs of the Geriatric Health Centre of the City of Graz with a total of 388 beds. HCAIs were defined based on ECDC HALT project.

Results: During the 12-month surveillance period, 306 infections of 182 residents (130/182 female) were recorded (136,988 resident days). The mean age of the residents was 85.8 ± 9.2 years (range 51-102 years), 56% (103/182) of residents were older than 85 years. The overall incidence rate of HCAIs was 2.2 per 1,000 resident days. Urinary tract infections occurred most frequently (160/306, 52%, 1.17 per 1,000 resident days), followed by skin, soft tissue and mucosal infections (85/306, 27%, 0.62 per 1,000 resident days), table 1. Only 7/306 (2.2%) HCAIs were acquired outside the LTCFs. 14.3% (23/160) of UTIs were device-associated. 262/306 (85.6%) infections were treated with oral antimicrobial substances. For UTIs (n=160) the most commonly used substances were quinolones (25%), folate antagonists (23%) and pivmecillinam (21%).

Conclusions: The overall incidence rate for HCAI was relatively low at 2.2 per 1,000 resident days. To our knowledge this is the first study on prospective surveillance of HCAIs in LTCFs in Austria.

**Abstract 995**

**Melioidosis in French Guiana? Cases with a clinical isolate of Burkholderia sp., Cayenne, 2012 – 2018**

Yann Lambert¹, Vincent Sainte-Rose², Cyril Leborgne², Brigitte Moreau², Magalie Demar²

¹Centre Hospitalier de Cayenne, Centre d’Investigation Clinique Antilles-Guyane, Cayenne, French Guiana, ²Centre Hospitalier de Cayenne, Laboratoire de biologie polyvalente, Cayenne, French Guiana

**Background:** Melioidosis is an infectious disease caused by *Burkholderia pseudomallei*, a Gram-negative bacterium found in tropical soil and water. It is frequently diagnosed in South-East Asia and Northern Australia. The variety of its clinical presentations complicates the diagnosis of melioidosis, especially in low-incidence areas where it is often little known. For the past few years, cases have been regularly reported in Amazonian countries such as Colombia, Venezuela and Brazil. The disease has never been identified in French Guiana.

**Materials/methods:** Microbial identification of bacterial species at Cayenne Hospital has been relying on VITEK 2 since 2012 and MALDI-TOF since 2014. These two automated techniques have been known to regularly confuse *B. pseudomallei* with other species of the *Burkholderia* genus, in particular that of the *B. cepacia* complex. Cases associated with a *Burkholderia* sp. isolate between 2012 and 2018 were identified from the databases of the bacteriology laboratory of Cayenne Hospital. The clinical history of each case was then documented from their medical record.

**Results:** 63 cases were identified. 51 cases, of which 15 premature neonates, were diagnosed with a nosocomial *B. cepacia* infection or colonization associated with a stay in an intensive care unit. For nine cases the nosocomial origin of the *Burkholderia* isolate cannot be ruled out. Three cases have a clinical history and risk factors compatible with melioidosis; two of them are associated with a clinical isolate of either *B. pseudomallei* or *B. thailandensis*.

**Conclusions:** We hypothesize that melioidosis is encountered in French Guiana sporadically, in consistence with other Amazonian territories. Three observations suggest an endemic potential of melioidosis in French Guiana. Firstly, the possible soil contamination from the regular importation of vegetal species from South-East Asia. Secondly, the high prevalence in French Guiana of known risk factors for melioidosis, diabetes in particular. Thirdly, the population of clandestine gold miners, potentially at risk for transmission through their high mobility in the Region of the Guyana Shield and their repeated exposure to muddy and anthropized soils.

Abstract 996

Antibacterial prescribing in the outpatient setting: results from a longitudinal surveillance programme and a sentinel network of physicians: Switzerland, 2018

Catherine Pluess-Suard1, Damir Perisa1, Olivier Friedli1, Mirjam Mäusezahl-Feuz2, Andreas Kronenberg1

1University of Bern, Bern, Switzerland, 2Federal Office of Public Health, Bern, Switzerland

Background: Inappropriate or unnecessary use of antibacterials may foster the development of antibiotic resistance. Our goals were to assess the global antibacterial use, the number of antibacterial prescriptions and the proportion of antibacterial classes per clinical indications in the outpatient setting in Switzerland.

Materials/methods: We analyzed two sources of data: (i) IQVIA®, a private provider of manufacturers’ sales, delivered aggregated data which were then converted in the ANRESIS database into defined daily doses (DDD) using the 2019 WHO DDD definition and (ii) all consultations with antibacterial prescriptions reported from 146 practitioners from general and internal medicine during 2018 using the representative Swiss Sentinel Surveillance Network “Sentinella”. The network covers all regions of Switzerland. Extrapolation on population level was done by attributing the estimated covered population to each Sentinella physician. Data from pediatricians were excluded.

Results: In 2018, the total consumption of antibacterials for systemic use in outpatients was 9.0 DDD per 1000 inhabitants per day, corresponding to a reduction of 9% since 2015 (p<0.05). A total of 14092 antibacterial prescriptions were issued by participating physicians in 2018, corresponding to 110.3 antibacterial prescriptions per 1000 inhabitants. Bladder infections (26%), upper respiratory tract infections (26%) and lower respiratory tract infections (20%) were the main clinical indications for prescribing antibacterials. Acute bronchitis and streptococcal pharyngitis accounted resp. for 9% and 7% of total antibacterial prescriptions. Fosfomycin (31%), fluoroquinolones (24%), co-trimoxazol (21%), and nitrofurantoin (15%) were the most prescribed antibacterials for bladder infections. For lower respiratory infections, amoxicillin (33%), macrolides (29%) and penicillins with beta-lactamase inhibitors (9%) were the most prescribed antibacterial classes. Fluoroquinolones accounted for 7% of antibacterials for this indication.

Conclusions: Even if antibiotic consumption in Switzerland is low in comparison with other European countries, the quality of antibacterial prescriptions can be optimized, particularly in reducing (i) the use of antibacterials in acute bronchitis, a viral infection in more than 90% of cases and (ii) the use of fluoroquinolones for bladder infections. Resources for antibiotic stewardship programs in the outpatient setting are also needed in countries with low antibacterial consumption.

Genomic epidemiology and resistome analysis of Helicobacter pylori

Tal Domanovich-Asor1, Yair Motro1, Boris Khalfin1, Hillary Craddock*1, Avi Peretz2, Jacob Moran-Gilad1

1Ben Gurion University of the Negev, MAGICAL Group, Faculty of Health Sciences, Beer Sheva, Israel, 2Bar-Ilan University, Clinical Microbiology Laboratory, Baruch Padeh Medical Center, Poriyah and Azrieli Faculty of Medicine, Galilee, Israel

Background: Antimicrobial resistance (AMR) in Helicobacter pylori (HP) is increasing globally and can result in treatment failure and inappropriate antibiotic usage. Whole genome sequencing (WGS) allows a comprehensive analysis of the resistome as well as typing and can thus be used to explore the phylogeny of HP in relation to underlying mechanisms of AMR.

Materials/methods: HP isolates (n=48) recovered from routine clinical samples in northern Israel underwent phenotypic antimicrobial susceptibility testing (AST) against five antimicrobials using an E-test as per BSAC guidelines. Literature review identified 114 point mutations reported to correlate with phenotypic resistance against those antibiotics. WGS was performed on an Illumina platform following library preparation using Nextera FLEX. Publicly-available HP genomes (n=992) were assembled (total isolate n=1,040). Analysis was conducted via our in-house bioinformatics pipeline for resistome analysis targeting point mutations in the relevant genes (bpb1A, 23s rRNA, gyrA, rdxA, frxA, and rpoB) and phylogenomic analyses using multilocus sequence typing (MLST) and core genome (cg)MLST methods (chewBBACA and GrapeTree).

Results: Phylogenomic analysis revealed a notable geographical clustering of HP genomes across world regions. The majority of Israeli isolates clustered together, closely with the Asian branch (Figure 1). Resistance to at least one antibiotic was observed in 79% of Israeli isolates. Resistance rates were as follows: 54% for clarithromycin, 31% for metronidazole, 10% for amoxicillin, 4% for rifampicin, and 2% for levofloxacin. Genotype-to-phenotype correlation was inconsistent; for every analysed gene at least one phenotypically susceptible isolate was found to have a mutation previously associated with resistance. This was also observed regarding mutations used in commercial kits to diagnose AMR in HP cases; for example, our study observed that 10/17 isolates with the A2143G/23s rRNA mutation are phenotypically susceptible. Furthermore, 13 novel point mutations were identified which were associated with a resistant phenotype in some but not all studied isolates.

Conclusions: This is the largest study to date featuring the global phylogeny of HP based on >1K genomes in conjunction with a global snapshot of the HP resistome. Analysis of a unique set of Israeli isolates demonstrates that inconsistencies and limitations in inferring a genotype-to-phenotype correlation in HP remains challenging.

Abstract 998

Carrier prevalence of vancomycin-resistant Enterococcus faecium (VREfm) among patients admitted to emergency departments in Copenhagen (Denmark) compared with VREfm prevalence of the background population

Ingrid Maria Cecilia Rubin1, Mette Pinholt1, Henrik Calum1, Christiane Pahl Kavalris2, Michelle From-Hansen1, Marie Stangerup2, Henrik Westh3, Jenny Knudsen3

1Hvidovre Hospital, Department of Clinical Microbiology, Hvidovre, Denmark, 2Bispebjerg Hospital, Infection Control, København, Denmark, 3Rigshospitalet, Department of Clinical Microbiology, København, Denmark

Background: The aim of our study was to describe the prevalence of VREfm-carriers admitted to two of the hospitals in the Capital Region of Denmark during a 3-week screening period. The main outcome was to examine the prevalence of unknown VREfm-carriers. The secondary outcome was to compare this with the VREfm prevalence in the background population.

Materials/methods: We obtained a rectal swab from all adult patients willing to participate, who were admitted to either the Emergency Department at Bispebjerg Hospital or Frederiksberg Hospital during a 3-week period in June and July 2019. All patients were screened for age, hospital admissions in the last 6 months and antibiotic consumption within the last 6 months. The swabs were analyzed for VREfm by culture and PCR for the vanA gene at the Department of Clinical Microbiology, Hvidovre Hospital. We also obtained 100 fecal samples sent to our department by General Practitioners in the Capital Region of Denmark. The following exclusion criteria were set up: age below 50, VREfm and Clostridium difficile positive within 6 months, hospital admission within 6 months and travel abroad. They were subsequently screened for VREfm as mentioned above.

Results: We included 172 patients who were admitted during the 3-week period. The median age was 72 years. In total, 11 (6.3%) were colonized with VREfm. 6 (3.4%) were known VREfm-carriers and 5 (2.9%) were unknown VRE-carriers. Of these unknown carriers, all had been hospitalized and received antibiotics within the last month.

Of the 100 fecal swabs sent by the General Practitioners, 1 out of 100 (1%) had a positive vanA PCR and none were culture positive.

Conclusions: Hospital admission and antibiotic use within the last month predispose to colonization with VREfm. We found a prevalence of 2.9% of unknown VRE-carriers. In comparison, we found that 1% of the patients without prior hospitalization or antibiotic use, were VREfm positive.

Admission VRE screening could help relieve the burden of VREfm transmission within our hospitals. From this study our recommendation is to screen all patients admitted to the ER who have been hospitalized within the last month.

**Modulation of the microbiota by oral intake of a synbiotic mixture in healthy volunteers: a single-centre one-armed pilot study**

Ingrid Maria Cecilia Rubin*, Sarah Mollerup*, Mette Pinholt*, Martin Schou Pedersen†, Thomas Kallemose†, Henrik Westh‡, Andreas Munk Petersen§,

1Hvidovre University Hospital, Department of Clinical Microbiology, Hvidovre, Denmark, 2Hvidovre University Hospital, Department of Clinical Microbiology, Hvidovre, Denmark, 3Hvidovre University Hospital, Clinical Research Centre, Hvidovre, Denmark, 4Hvidovre University Hospital, Gastrounit, Hvidovre, Denmark

**Background:** A synbiotic product combines one or more probiotic microorganisms with a prebiotic fibre. Synbiotics have been demonstrated to change the microbiota composition in different patient populations.

Prebiotics, which are carbohydrates that are only metabolized by the gut bacteria, have gained much attention in recent years for their health benefits through stimulating growth of specifically the anaerobic bacteria from the *Bacteroides* family that produce short chain fatty acids.

Whether the microbiota in a steady state in healthy individuals will change by the addition of synbiotics is unexplored. Our aims were to monitor the GI-function and explore the modulation of the healthy microbiota by synbiotics in a pilot trial of healthy volunteers.

**Materials/methods:** We recruited 15 healthy volunteers who consumed a synbiotic mixture consisting of *Lactobacillus rhamnosus* [LGG®], *Lactobacillus acidophilus* [LA-5®], *Lactobacillus paracasei* [L. casei 431®], *Bifidobacterium lactis* [BB-12®] and the plant carbohydrate inulin [15g] for four weeks. Faecal samples were collected at visit 1 (baseline) as well as at completion of the intervention. All participants completed a faecal diary based on the Bristol Stool Scale and recorded their gastrointestinal (GI) well-being. We used shotgun metagenomic sequencing for the microbiome studies on an Illumina NextSeq, and performed taxonomic profiling using MetaPhlAn2.

**Results:** 14 out of 15 volunteers successfully completed the four-week synbiotic intervention. One participant was not compliant with the intervention and was therefore excluded from the analyses. At the end of the intervention, 36% experienced a better GI-function in the self-reported diary, 43% reported an unchanged GI-function, while 21% reported a worse GI-function. For our microbiome analyses, the α-diversity was unchanged before and after the intervention. We found a higher relative abundance of *Bifidobacterium* and *Lactobacillus* spp. after the intervention.

**Conclusions:** The intervention with synbiotics leads to higher relative abundance of the potentially beneficial species of *Bifidobacterium* and *Lactobacillus* but it did not affect the α-diversity. Most participants [79%] reported an unchanged or better GI-function at the end of the intervention.

Rapid, sensitive diagnosis of bloodstream infection using clinical metagenomics

Lluis Moragues Solanas*, Andrew Rogers2, Gemma Kay1, Sonia La Fauci2, William Mullen2, Justin O’grady1

1Quadram Institute Bioscience, Norwich Research Park, Norwich, United Kingdom, 2Momentum Bioscience Ltd, Blenheim Office Park, Oxford, United Kingdom

Background: In the UK, approximately 250,000 cases of sepsis are reported annually, of which ~20% result in death. The estimated economic impact of sepsis is £2 billion/annum. Patients with sepsis need rapid treatment with effective antibiotics, otherwise mortality rates increase dramatically. Rapid and accurate diagnostics are needed to identify the infecting pathogen to determine the appropriate therapy. However, current diagnostic methods rely on blood culture which has low sensitivity and takes 2-5 days before results are available. Here we describe a novel clinical metagenomics-based method for the diagnosis of bloodstream infection in patients suspected of sepsis, combining highly sensitive microbial cell capture with efficient host depletion and nanopore sequencing.

Materials/methods: Whole human blood was diluted (1:1) in liquid transfer medium (Momentum Bioscience Ltd., UK). *Escherichia coli* was incubated at 37°C for 2 hours in the blood-transfer medium, and subsequently tested at 10⁴ to 10² CFU/mL. Samples were subjected to simultaneous blood lysis and magnetic bead-based microbial capture (Momentum Bioscience Ltd.), saponin-based host DNA depletion, whole genome amplification (REPLI-g Single Cell kit, Qiagen) and MinION sequencing (RPB004 kit, Oxford Nanopore Technologies Ltd., UK). Sequence data was analysed using EPI2ME software (Oxford Nanopore Technologies Ltd.). Samples were classified as positive for a pathogen if present at >1% of the total classified reads.

Results: *E. coli* was detected in all samples tested after 1.5 hours sequencing demonstrating a limit of detection <100 CFU/mL (Table 1). Antimicrobial resistance genes were detected in all samples but transferrable resistance prediction was unreliable at low genome coverage (<5x).

Conclusions: This proof-of-principle study demonstrates sensitive pathogen and antibiotic resistance profiling directly from blood in <8 hours using nanopore sequencing-based clinical metagenomics. This approach combined with ETGA® [Enzyme Template Generation & Amplification] technology (Momentum Bioscience Ltd.), enables the detection of viable micro-organisms from whole blood for the rapid diagnosis and management of bloodstream infections.

Abstract third-party references: Part of this research was supported by Fondazione CRT 2019 (P.I. Prof. Valeria Allizond)

**Background:** Biomedical implants and devices, an essential part of the medical treatments for improving therapeutic efficiency, still suffer from bacterial infections that hamper patients’ recovery and even threaten patients’ lives. Although antibiotics are widely used to treat those infections, it has brought serious problems of antibiotic resistance. Metal ions, such as silver, are believed to be promising additives in developing antibacterial biomaterials, owing to possessing favorable bactericidal effects against antibiotic-resistant bacteria. Furthermore, the incorporation of bioactive, stiff inorganic materials (e.g., hydroxyapatite, HA, and β-tricalcium phosphate, β-TCP) into synthetic biodegradable polymers, such as poly(ε-caprolactone) (PCL) polymer can lead to significant enhancements in mechanical properties, bioactivity, and bone regeneration ability in vivo. The present research purpose is the development of novel PCL-based scaffolds, modified with both silver, to supply antibacterial behavior, and biphasic calcium phosphates (BCP; the mixture of HA and β-TCP) denoted as to impart bioactive/bioresorbable properties.

**Materials/methods:** PCL and BCP/PCL porous pellets, functionalized with silver ions (Ag⁺) were developed by salt-leaching method and both sodium chloride, NaCl, and sodium nitrate, NaNO₃ were used as pore formers. Samples were further characterized from the morphological and chemical point of view. *Staphylococcus aureus* ATCC 29213 adhesion on PCL-based biomaterials was assayed through a sonication protocol to dislodge adherent microorganisms without altering their viability. The planktonic bacteria number was also determined.

**Results:** Field Emission Scanning Electron Microscopy showed that the samples were characterized by square-shaped macropores (Figure 1), whose average dimension was in agreement with that of the starting salt. The presence of PCL and BCP phases and of Ag, in the correct amount, were confirmed by X-Ray Diffraction and Energy Dispersive X-ray Spectroscopy analysis, respectively. The antibacterial tests revealed a significant (p<0.001) decrease either of adherent staphylococci on the Ag-functionalized surfaces (Figure 2) or planktonic bacteria, thus proving the Ag release from the enriched PCL-based samples.

**Conclusions:** Due to the combined antimicrobial and biodegradable properties, the PCL-based scaffolds enriched with silver showed good potential for bone tissue engineering and offer a promising strategy, as an ideal microbial anti-adhesive tool for the reduction in BAls and antimicrobial molecules-targeted delivery.

**Figure 1:** FESEM micrographs of PCL scaffolds obtained by using NaCl (a) and NaNO₃ (b) salts as templates (analysis carried out on the materials sections); (c): higher magnification FESEM micrograph of PLC/BCP sample, showing the fine and homogeneous distribution of the calcium phosphate particles inside the polymer matrix (see the black arrows); Ag-functionalized PCL scaffolds obtained by using NaCl (d) and NaNO₃ (e) salts as templates (analysis carried out on the materials sections); (f): Typical microporous surface of the scaffolds.
Figure 2: Adhered S. aureus ATCC 29213 (log$_{10}$ CFU/ml) on different PCL-based biomaterial pellets: PCL (polycaprolactone), BCP/PLC (polycaprolactone functionalized with biphasic calcium phosphates), PCL+Ag (polycaprolactone enriched with silver ions), BCP/PLC +Ag (polycaprolactone functionalized with biphasic calcium phosphates and enriched with silver ions).

Abstract 1006

In vitro evaluation of the influence of immunosuppressive agents on human polyomavirus BK replication

Signorini Lucia*1, Evaldo Favi2, Mariano Ferrezzo1, Maria Dolci1, Rosalia Ticozzi1, Pasquale Ferrante1, Serena Delbue1

1University of Milan, Milan, Italy, 2Ospedale Maggiore Policlinico, Milan, Italy

Background: Human Polyomavirus BK (BKPyV) infection is common, ranging from 60% to 100% in the general population. After primary infection, which occurs asymptotically during childhood, BKPyVs establishes a life-long latency in tubular kidney epithelial cells. The immunosuppressive therapy, typical of transplant recipients, is a risk factor for BKPyV reactivation, that causes Polyomavirus Associated Nephropathy (PVAN), and organ rejection in 1 to 10% of patients. Immunosuppression treatment is a complex therapy, constituted by a combination of mTOR and calcineurin inhibitors (FK506, Rapamycin and Everolimus) and antiproliferative agents, such as mycophenolic acid (MPA). In the case of post-transplant BKPyV reactivation, the reduction of the immunosuppressive regimen and the administration of Leflunomide, a nonspecific antiviral treatment, are used as effective actions.

Materials/methods: HEK293T cell line was infected with BKPyV virions. Infected cells were treated with FK506, Rapamycin, Everolimus, and MPA, as single or coupled drug treatments, after the evaluation of the IC50 for each drug. Leflunomide treatment was used as control of viral replication inhibition. The viral replication, in presence or absence of drugs, was tested by means of BKPyV specific quantitative real time PCR (qPCR) on cell medium. BKPyV mean replication level in treated cells was expressed as percentage of replication and normalized using the BKPyV replication level of not treated infected cells.

Results: BKPyV mean replication level were 87.03%, 70.29%, 68.41% and 44.38% after treatment with FK506, MPA, Rapamycin and Everolimus respectively. The treatment composed by FK506 and Everolimus, or MPA or Rapamycin was associated with mean replication level of 69.27%, 79.75% and 90.72% respectively. Additionally, the BKPyV mean replication level was 79.71% and 58.27% after the treatment with MPA and Sirlimus and with MPA and Everolimus, respectively.

Conclusions: Immunosuppressive therapy based on FK506 administration represents an important risk factor for the reactivation of BKPyV and the development of PVAN. However, FK506 post-transplant treatment is fundamental to maintain an adequate level of immunosuppression. For this reason, the administration of FK506 in association with Everolimus, instead of MPA, could represent an alternative therapeutic strategy, able to guarantee a good immunosuppressive regimen and a limited reactivation of BKPyV.

Abstract 1007

Impact of lung transplantation on the phylogenetic diversity of *Pseudomonas aeruginosa* isolates from end-stage cystic fibrosis patients

Rucha Datar*1, Andreu Coello Pelegrin2, Sylvain Orenga3, Audrey Perry4, Julie Samuel4, Alex Van Belkum2, Herman Goossens5, Valérie Chalansonnet1

1bioMérieux, Microbiology Research, La Balme-les-Grottes, France, 2bioMérieux, La Balme Les Grottes, France, 3bioMérieux, Microbiology Research, La Balme Les Grottes, France, 4Freeman Hospital, Newcastle upon Tyne, United Kingdom, 5University of Antwerp, Antwerpen, Belgium

**Background:** Impaired lung function and chronic infections due to colonization and infection by complex microbiota elevates the health risk of patients with cystic fibrosis (CF) which can ultimately lead to full respiratory insufficiency and death. For patients with end-stage CF lung disease, lung transplantation (LTx) is the only remaining therapeutic option. In this context, *Pseudomonas aeruginosa* is a principal cause of chronic lung infections and such strains display different phenotypic and genomic characteristics compared to their wild-type ancestors.

The aim of this study was to analyze the epidemiology and evolution of *P. aeruginosa* strains serially obtained from CF patients, and a non-CF bronchiectasis patient, who underwent LTx (Newcastle upon Tyne, UK).

**Materials/methods:** A panel of 708 *P. aeruginosa* strains from different niches and 4 different strain collections were analyzed for genomic relatedness. These comprised the bioMérieux collection (*n* = 219), Kos collection (*n* = 390), Pirnay collection (*n* = 63) and sequential strains from six LTx patients (*n* = 36). For each LTx patient, samples were collected before, during and after the LTx at different time points. Multi-locus sequence typing (MLST) and construction of a core genome based phylogenetic tree using bioinformatics tools was employed to define the genomic relatedness among the different *P. aeruginosa* strains.

**Results:** The genome wide assessment showed clustering with respect to the origin of the isolates i.e from patients from whom they were isolated implying intra-individual variability. The MLST profiles showed the *P. aeruginosa* strains from the Newcastle CF patients, but not the bronchiectasis one, had previously unidentified sequence types. Strains from Newcastle were scattered among the phylogenetic tree, indicating that the patients were neither cross-colonized nor cross-infected.

**Conclusions:** *P. aeruginosa* isolates from CF patients disclose very specific traits, but they could be phylogenetically distant between patients. On the other hand, LTx and associated treatment had no impact on the phylogenetic type of the *P. aeruginosa* strain harbored by each studied patient. Studying the presence of SNPs may aid our understanding of elevated resistance to the drugs used for treatment.

Impact of underlying comorbidities on outcomes of patients treated with ceftaroline fosamil for complicated skin and soft-tissue infections: pooled results from three phase III clinical trials

Mark H. Wilcox1, Michal Kantecki2, Jean L. Yan3, Matthew Dryden4

1Leeds Teaching Hospitals & University of Leeds, Leeds, United Kingdom, 2Pfizer, Paris, France, 3Pfizer, New York, United States, 4Royal Hampshire County Hospital, Winchester, United Kingdom

Background: In three Phase III studies, ceftaroline fosamil was shown to be non-inferior to vancomycin plus aztreonam for the treatment of complicated skin and soft tissue infections (cSSTI). This exploratory analysis evaluated the impact of underlying comorbidities on clinical outcomes in patients with cSSTI pooled from these three studies.

Materials/methods: CANVAS 1 (NCT00424190), CANVAS 2 (NCT00423657) and COVERS (NCT01499277) were Phase III, multi-centre, randomised double-blind studies of ceftaroline fosamil [600 mg every 12 hours [q12h; CANVAS 1 and 2]; 600mg every 8 hours [q8h; COVERS]] vs vancomycin plus aztreonam [1 g q12h each [CANVAS 1 and 2]; vancomycin 15 mg/kg q12h and aztreonam 1 g q8h [COVERS]] in hospitalised adults with cSSTI. The primary efficacy variable in each trial was clinical response at the test-of-cure (TOC) visit in the modified intent-to-treat and clinically evaluable (CE) populations. Subgroup analyses exploring the impact of age and various baseline comorbidities were performed on the pooled CE population.

Results: In total, 1808 patients were included in the CE population (1005 ceftaroline fosamil; 803 vancomycin plus aztreonam). Baseline patient characteristics were generally balanced across treatment groups. Overall clinical cure rate at TOC in the CE population was 89.7% for ceftaroline and 90.8% for vancomycin plus aztreonam (difference [95% confidence interval]: –1.13 [–3.87, 1.67]). Clinical response rates at TOC by comorbidity are shown in the Table; results were generally consistent with those of the overall cSSTI population.

Conclusions: This analysis provides supportive evidence of the efficacy of ceftaroline fosamil in patients with cSSTI with underlying comorbidities.

Study sponsored by Pfizer.

Abstract 1015

Association of single nucleotide polymorphisms in IL1B and IL28B genes with the outcome of congenital cytomegalovirus infection

Beata Kasztelewicz*, Dominika Jedlińska-Pijanowska1, Justyna Czech-Kowalska1, Anna Dobrzańska1, Katarzyna Dzierzanowska-Fangrat2

1Children’s Memorial Health Institute, Department of Clinical Microbiology and Immunology, Warsaw, Poland, 2The Children’s Memorial Health Institute, Warsaw, Poland

Background: Cytomegalovirus (CMV) is the most common viral cause of congenital infections, which can result in a spectrum of neurodevelopmental disorders. The factors that render developing foetus prone to CMV are not well defined. The aim of this study was to evaluate polymorphisms in genes involved in human viral defence mechanisms in relation to risk and clinical outcome in newborns with congenital CMV infection (cCMV).

Materials/methods: This prospective study comprised 236 newborns, including 92 with cCMV infection confirmed by CMV-DNA detection in urine samples collected during the first 2–3 weeks of life (case group). A healthy control group consisted of 144 CMV-uninfected newborns. All children with cCMV infection underwent complete physical examination, ophthalmologic and hearing evaluation, and cranial ultrasound and/or magnetic resonance imaging. Using hypothesis-driven candidate genes and their function in viral infections, a panel of 8 single-nucleotide polymorphisms (SNPs, including: IL1B rs16944, IL12B rs3212227, IL28B rs12979860, CCL2 rs1024611, DC-SIGN rs735240, TLR2 rs5743708, TLR4 rs4986791, TLR9 rs352140) was genotyped in all newborns by TaqMan SNP Genotyping Assays (Applied Biosystems) and related to the outcome. The association between SNP genotype and cCMV infection or clinical outcome was analysed by co-dominant, dominant, recessive and over-dominant models.

Results: SNP in IL1B gene was associated with increased risk of cCMV under the over-dominant model [OR = 1.74 (95%CI: 1.03 – 2.95); p = 0.039]. On the other hand, analysis in the cCMV subgroup revealed that the same SNP had protective effect by reducing the risk of ventriculomegaly, under the dominant model [OR = 0.40 (95% CI: 0.17 - 0.97); p = 0.039]. In addition, SNP in IL28B gene was associated with ventriculomegaly and thrombocytopenia, under over-dominant model [OR = 2.46 (95%CI 1.03-5.90); p = 0.04 and OR = 2.55 (95%CI 1.03-6.32); p = 0.042, respectively]. Genotype distribution of the remaining SNPs investigated did not show any significant differences.

Conclusions: SNP in IL1B gene may influence both the susceptibility and the clinical course of congenital CMV infection. SNP in IL28B may be associated with increased risk of ventriculomegaly and thrombocytopenia in cCMV newborns. Further, large prospective and genome-wide studies are needed to confirm these finding.

Abstract 1018

**Analytical performance evaluation of the BIOFIRE Blood Culture Identification 2 (BCID2) panel**

Briana Flaherty*, Maggie Buccambuso1, Nick Francis1, Joel Manwaring1, Josh Southwick1, Jamie Larsen1, Jennifer Arce1, Kandrie Mylroie1, Elaine Ong1, Kevin Ekins1, Jess Gann1, Tyson Dawson1, Hannah Burton1, Chad Russell1, Jared Brooksby1, Sky Hansen1, Caroline Dubost2, Christopher Cantrell3, Elizabeth Amiott1

1BioFire Diagnostics, LLC, Salt Lake City, United States, 2BioMérieux, SA, Grenoble, France, 3BioMérieux, Inc, Durham, United States

Abstract third-party references: BioMérieux, BioFire Diagnostics, LLC

**Background:** The BioFire Blood Culture Identification 2 (BCID2) Panel is the next-generation BioFire system for rapid detection of bacteria, yeast and select antimicrobial resistance (AMR) genes in positive blood cultures. Analytical studies evaluated compatibility of the panel with different bottle types and culture systems, established the limit of detection (LoD), reactivity, and specificity of the assays, and assessed the robustness of results from samples containing potentially interfering substances.

**Materials/methods:** Blood culture system compatibility was evaluated by determining organism titers and panel test results from seeded positive blood cultures grown to positivity (and 24 hours post-positivity) in 13 different bottle types incubated in 2 continuously monitoring blood culture systems. Limits of detection were estimated by serial dilution of contrived samples, and LoD was subsequently confirmed by detection in a minimum of 95% of 20 or more replicates. Analytical reactivity and specificity were evaluated by testing over 450 on-panel isolates and 200 off-panel species, and panel robustness was assessed by testing low-level analytes in the presence of over 50 substances. All testing used Investigational Use Only kits.

**Results:** Titers in positive blood cultures from different systems (0-24 hour post-positivity) ranged from f3.0E+05 – 4.5E+07 CFU/mL for yeast and f3.0E+06 – 3.0E+09 CFU/mL for bacteria, which are ≥30-fold higher than the detection capability of the assays (LoD of 5.0E+02 – 1.0E+04 CFU/mL for yeast and 1.0E+03 – 1.0E+06 CFU/mL for bacteria). Testing near LoD demonstrated assay reactivity with a diverse collection of species and AMR genes in isolates from around the globe, and the panel provided reliable results in the presence of potentially interfering substances. Testing at high concentration (>1.0E+08 CFU/mL) demonstrated few instances of cross-reactivity with unrelated off-panel species.

**Conclusions:** The BioFire BCID2 Panel assays are robust, specific, and reactive with expected diversity of bacterial and yeast causes of bloodstream infection. Rapid identification of organisms in blood culture, along with information about antimicrobial resistance gene status for select microorganisms, may aid in timely diagnosis and appropriate treatment decisions for bloodstream infections.

The panel has not been cleared for diagnostic use by the FDA or other regulatory entities.

Abstract 1019

Activity of omadacycline and comparator agents against bacterial pathogens from the United States by infection type (2019)

Michael Huband*1, Michael A. Pfaller1, Jennifer Streit1, Leonard Duncan1, Robert Flamm1

1 JMI Laboratories, North Liberty, United States

Abstract third-party references: This study was performed by JMI Laboratories and supported by Paratek Pharma, LLC, which included funding for services related to preparing this abstract.

Background: Omadacycline (OMC) is a novel aminomethylcycline approved by the FDA in 2018 to treat acute bacterial skin and skin structure infection (ABSSSI) and community-acquired bacterial pneumonia (CABP) for indicated organisms. OMC phase 2 clinical trials for the treatment of uncomplicated urinary tract infection (UTI; NCT03425396) and acute pyelonephritis (NCT03757234) have completed. OMC has activity against bacterial isolates expressing common tetracycline (TET), penicillin, macrolide and/or fluoroquinolone resistance mechanisms.

Materials/methods: A total of 7,000 clinical isolates were collected from 31 medical centers in the United States in 2019 as part of the SENTRY Surveillance Program. Isolates were collected from bloodstream infection (25.5%), skin and skin structure infection (SSI; 21.5%), pneumonia in hospitalized patients (21.6%), urinary tract infection (UTI; 14.8%), intraabdominal infection (5.4%), community acquired respiratory tract infection (8.9%) and other infection types (2.3%). Only 1 isolate/patient/infection episode was included. Identifications were confirmed by MALDI-TOF. Broth microdilution susceptibility testing of OMC and comparators was conducted according to CLSI M07 (2018) and M100 (2019) guidelines. Results were interpreted using FDA, CLSI (2019) and/or EUCAST (v9.0) breakpoints.

Results: OMC was highly active against Staphylococcus aureus isolates [MIC90, 0.12 mg/L; 99.0% susceptible (S)] from SSSI including 97.8% of MRSA and 97.7% of MSSA from RTI (Table). All (100%) Staphylococcus lugdunensis, Enterococcus faecalis (including vancomycin-resistant [R]) and Streptococcus pyogenes (including macrolide-R) isolates from SSSI were S to OMC. Similarly, 100% of Streptococcus anginosus isolates [MIC90, 0.06 mg/L; multiple infection types] were S to OMC (ABSSSI breakpoints). 99.7% of Streptococcus pneumoniae [CABP] isolates were S to OMC as were 100% of penicillin-R and tetracycline-R S. pneumoniae and all Haemophilus influenzae isolates [MIC90, 1 mg/L; CABP]. OMC was active against Enterobacter cloacae (91.5%) and Klebsiella pneumoniae isolates from SSSI and K. pneumoniae isolates from RTI (91.7%, CABP breakpoints). OMC inhibited 99.5% of Escherichia coli [MIC90, 2 mg/L] and 96.2% of K. pneumoniae [MIC90, 4 mg/L] UTI isolates at ≤4 mg/L.

Conclusions: OMC demonstrated potent in vitro activity against staphylococci, streptococci, E. faecalis, H. influenzae, E. cloacae, K. pneumoniae, and E. coli from ABSSSI, CABP, and UTI including drug-resistant isolates.

Gene expression analysis of transport channels in *Enterococcus faecium*

Zakia Alhareth¹¹, Katie Laird², Laura Smith², Jane Dixon², Lucy Owen²

¹¹De Montfort University, Leicester, United Kingdom, ¹²De Montfort University, Leicester, United Kingdom

**Background:** An important aspect of the bacterial response towards stress and environmental stimuli is alteration of gene expression levels¹. A combination of carvacrol, cuminaldehyde, and vancomycin has previously been shown to re-sensitise vancomycin-resistant *E. faecium* (VRE) to vancomycin ². The effect of treatment with the novel antimicrobial combination for 60minutes on gene expression in VRE was analysed by microarray analysis. Microarray data showed that 15 genes were differentially regulated and five genes associated with transport channels were chosen for further analysis; *bcr*, *ecfa_1*, *ecsa_1*, *ylob*, and *nhac_2*. A time course study using qPCR was conducted to further understand the antimicrobial mechanism of action of the novel formula.

**Materials/methods:** qPCR was carried out to validate the microarray data at 60mins. In addition, alterations in the expression levels of the five genes were assessed at 10mins, 30mins, 2hrs and 6hrs, in response to cuminaldehyde and carvacrol alone, in combination, and in combination with the vancomycin.

**Results:** VRE responds to the novel formula in the initial stages of exposure; at 10mins significant changes (*p*≤0.05) were demonstrated in the expression of the five genes, *bcr*, *ecfa_1*, *ecsa_1*, *ylob*, *nhac_2* with fold changes of -1.35, -1.41, -3.95, -5.67, and -6.31 respectively. At 60mins only *nhac_2* showed a significant fold change of -3.09. At 2hrs there were significant fold changes for *bcr* at 15.03, *ecfa-1* at 2.85 and *nhac_2* at 4.7, whereas at 6hrs there were no significant changes for any of the five genes tested.

**Conclusions:** This study has demonstrated that treating VRE with EOs alone and in combination with vancomycin has resulted in fold changes in the expression levels of the transport genes of interest. A new EO-vancomycin formulation to combat VRE could be developed through exploiting transport channels in *Enterococcus* sp.

Abstract 1032

Prospective evaluation of serological and virological response in chronic hepatitis B genotype E treated with tenofovir or entecavir

Ilaria De Benedetto*1, Lucio Boglione2, Tommaso Lupia3, Giuseppe Cariti2, Giovanni Di Perri3

1University of Torino - Amedeo di Savoia Hospital, Torina, Italy, 2Amedeo di Savoia Hospital, Torina, Italy, 3University of Torino - Amedeo di Savoia Hospital, Torino, Italy

Background: European clinical practice guidelines [EASL] on chronic hepatitis B recently recognized the importance of migration flows in changing the prevalence and incidence of hepatitis B infection in low endemic European countries such as Italy and Germany. Even though differences among genotypes are reported for geographical distribution, virological and serological outcomes and response to IFN therapy, less is known about the role of different genotypes in treatment with nucleos(t)ide analogues. Phylogenetic analyses have shown that genotype E, which is mainly diffused in West Africa, is relatively recent. Decline in qHBsAg during the treatment with entecavir predict longer time to achieve HBsAg loss compared to A and D genotype.

Materials/methods: We prospectively evaluated qHBsAg decline in chronic hepatitis B, HBeAg-negative, E genotype, treated with tenofovir 245 mg [TDF] or entecavir 0.5 mg [ETV] from 2008 to 2014. Inclusion criteria were naïve patients with active chronic hepatitis B with no co-infection HCV, HDV, HIV. qHBsAg test was performed with ARCHITECT HBsAg (Abbott Diagnostics, Ireland)

Results: Sixty-five west-african patients [58; 89.2% males] were enrolled. Median age was 29 years-old [IQR 22-36] and the most prevalent route of transmission was familiar [25; 38.5%]. Median liver stiffness was 7.4 kPa [IQR 4.5-9.3], ALT 65 U/L [IQR 31-122], HBV-DNA 3.4 Log IU/ml [IQR 2.8-4.5], qHBsAg 3.4 Log UI/ml [IQR 2.8-4.5]. According to clinical evaluation, 40 patients (61.5%) started ETV whereas 25 patients (38.5%) TDF. The decline in qHBsAg in ETV-patients showed a statistically significative difference compared to TDF-patients at 2 (p<0.001), 3 (p< 0.001), 4 (p<0.001) and 5 years (p<0.001). At the same time-points higher response rate in HBV-DNA suppression were observed in patients receiving TDF. In the absence of resistance-associated mutations, in 20% of ETV-patients HBV-DNA persisted detectable at 5 years. This might be explained by a lower affinity of ETV to polymerase binding site, resulting in an incomplete saturation and consequently in residual viremia.

Conclusions: In E genotype TDF-treated patients had a significantly higher decline in qHBsAg and HBV-DNA over time achieving higher rates of HBV-DNA suppression with no failure after 5 years. TDF could represent the optimal choice in this setting of patients.

Abstract 1034

Prevalence and antimicrobial susceptibility of *Campylobacter* species isolated from Greek diarrhoeal patients (2010-2018)

Sofia Maraki*, Victoria Eirini Mavromanolaki2, Dimitra Stafylaki1, Eleni Nioti1, George Minadakis1, Anna Kassimati2

1University Hospital of Heraklion, Heraklion, Greece; 2University of Crete, Heraklion, Greece

**Background:** *Campylobacter* species are the leading cause of bacterial foodborne illness throughout the world. In humans, most enteric infections caused by *Campylobacter* spp. are considered self-limited and generally do not require antimicrobial treatment. However, in severe or prolonged disease treatment can shorten illness duration. Aim of the present study was to determine the antimicrobial susceptibility of *Campylobacter* species isolated from stool samples of symptomatic patients in a university hospital in Crete, Greece, through a 9-year period.

**Materials/methods:** A total of 365 *Campylobacter* spp. were isolated from stool samples from 2010 to 2018. Identification of the isolates was performed by conventional methods and antimicrobial susceptibilities to ciprofloxacin, erythromycin, and tetracycline were assessed by the disk diffusion method. The results were interpreted by using EUCAST breakpoints.

**Results:** Considering a single *Campylobacter* isolate per patient, 274 *C. jejuni* subsp. *jejuni* (76.1%) and 91 *C. coli* (24.9%) isolates were identified from stool samples of patients with age ranging from 2 days to 91 years and median age 21 years. Among *C. jejuni* isolates, 74.8% (205/274) were resistant to ciprofloxacin, 1.5% (4/274) to erythromycin, and 50.7% (139/274) were resistant to tetracycline. Among *C. coli* isolates, 74.7% (68/91) were resistant to ciprofloxacin, 5.5% (5/91) to erythromycin, and 52.7% (48/91) were resistant to tetracycline. Among ciprofloxacin resistant *C. jejuni*, 1% (2/205) of isolates were found to be resistant to erythromycin, and 59% (121/205) were also resistant to tetracycline. Furthermore, 0.7% (2/274) of isolates were resistant to all three antibiotics. Similarly, among ciprofloxacin resistant *C. coli*, 7.4% were resistant to erythromycin, and 57.4% were also resistant to tetracycline. Among all *C. coli*, 4.4% (4/91) were resistant to all three antibiotics.

**Conclusions:** In our area, high prevalence rates of resistance to ciprofloxacin and tetracycline were observed among *Campylobacter* spp. Erythromycin remains the preferred treatment option for *Campylobacter* infections.

Abstract 1036

**Accuracy and clinical impact of fungal cell-free DNA PCR panel on plasma for diagnosis of invasive fungal infection**

Fiona Senchyna*, Catherine Hogan1,2, Dora Ho1, Aruna Subramanian1, Indre Budvytiene3, Saurabh Gombar1, Helio Costa1,2, Martynas Budvytis3, Niaz Banaei1,2

1Stanford University School of Medicine, Stanford, United States, 2Stanford University Medical Center, Palo Alto, United States, 3California Polytechnic State University, San Luis Obispo, United States

**Background:** Invasive fungal infection (IFI) is an important cause of morbidity and mortality in oncology and transplant patients. Diagnosis of IFI is often delayed due to need for invasive biopsy and low sensitivity of conventional diagnostics. We evaluated the performance and clinical impact of a fungal cell-free DNA (cfDNA) PCR panel to noninvasively diagnose the 12 most common IFI organisms.

**Materials/methods:** A probe-based PCR panel targeting *Aspergillus* spp., Mucorales agents, *Candida* spp., *Fusarium* spp., *Scedosporium* spp., *Pneumocystis jirovecii* and several pathogenic dimorphic fungi was created using previously published primers and primers designed with a novel bioinformatic pipeline. Plasma cfDNA was extracted on a Promega Maxwell RSC instrument. Assay sensitivity and specificity were assessed using plasma samples from 104 patients with 115 known IFIs consisting of *Aspergillus* spp. (n = 26), Mucorales agents (n = 23), *Candida* spp. (n = 33), *Fusarium* spp. (n = 3), *Scedosporium/Pseudallescheria boydii* complex (n = 6), *Coccidioides immitis/posadasii* (n = 14), *Histoplasma capsulatum* (n = 6), *Blastomyces dermatitidis* (n = 1), and *Pneumocystis jirovecii* (n = 4); and 65 non-IFI patients. Plasma volumes ranging from 1mL to 4mL were tested. Prospective testing was carried out on high-risk patients to determine clinical impact on antifungal therapy and patient management.

**Results:** Sensitivity and specificity of fungal cfDNA PCR on banked plasma samples from patients with proven IFI and non-IFI controls was 56.5% (65/115) overall, and 69.6% (48/69) in cases tested with higher (optimal) plasma volume. In optimal volume samples, sensitivity was 91.7%, 57.9%, and 77.3% for Mucorales, *Aspergillus* spp., and *Candida* spp., respectively. Overall specificity was 99.4%. In a prospective evaluation of 155 patients with suspected IFI, fungal cfDNA testing was positive in 19.4%, leading to positive clinical impact in 40.0% of patients. Clinical impact was highest in patients with a diagnosis of Mucorales infection, with 81.8% (9/11) of results leading to therapeutic optimization or avoidance of surgical biopsy.

**Conclusions:** Fungal cfDNA detection with a PCR panel offers a rapid and accurate non-invasive approach for early diagnosis of IFI, providing actionable results for personalized treatment.

Abstract 1038

**High prevalence of multi-stress tolerant Campylobacter species causing human infection**

Shaimaa Fekry* 1, Mohamed Elhadidy 2

1College of Medicine and Heath Sciences, UAEU, AlAin, United Arab Emirates, 2University of Science and Technology, Zewail City of Science and Technology, Giza, Egypt, Cairo, Egypt

**Background:** Campylobacter jejuni and Campylobacter coli are zoonotic pathogens commonly associated with human gastroenteritis. The main cause of human campylobacteriosis is consumption of contaminated poultry meat and other sources as raw milk. Campylobacters encounter variety of stress conditions that potentially affect bacterial survival during food processing, preservation, and cooking; thus, impacting their transmission to humans through the food chain. To survive under harsh conditions, biofilm formation is suggested to be another mechanism for bacterial adaptation in the food environment, thus switching its physiological state to promote survival under stress conditions. The aim of this study is to access the resistance of Campylobacter isolates to adverse stress conditions encountered throughout the food chain and compare the biofilm-forming ability of these strains under both microaerobiosis and aerobiosis.

**Materials/methods:** Phenotypic stress tolerance of (n=111) C. jejuni and C. coli isolates recovered from three different sources including patients suffering from gastroenteritis (n=57), broiler carcass (n=30), and dairy products (n=24) was investigated. To assess the capabilities of hyper-aerotolerant (HAT) and aerotolerant (AT) strains to survive under harsh conditions in foodborne transmission and infection, the survival rate of these isolates under different stress conditions (aerotolerance, temperature variations, freezing and thawing, peracetic acid treatment and osmotic stress) that can be encountered during food processing was investigated. Moreover, the capability of isolates to form biofilm under microaerophilic and aerophilic conditions was examined using crystal violet biofilm assay.

**Results:** HAT strains were highly dominant presenting 63% of the tested isolates, 22% were AT whereas 11% were aero-sensitive (AS). HAT strains exhibited a significant tolerance to stress conditions compared to AS and AT strains (Figure 1). Analyzing the tendency of biofilm formation, it was found that half of HAT strains formed biofilm under microaerophilic/normal conditions while 44% and 85% of HAT and AT strains successfully formed biofilms under aerophilic conditions, respectively.

**Conclusions:** The enhanced ability of HAT strains to cope to numerous stressors (cross protection), and to form biofilm, would potentially impact human infection by increasing the potentials of the foodborne transmission of Campylobacter under aerobic conditions. Thus, HAT strains would potentially be of higher transmission risk than AS ones.

**Figure 1:** HyperAerotolerant, Aerotolerant and Aerosensitive Campylobacter response to different stress conditions

Abstract 1040

**Trends in resistance of bloodstream infection pathogens in Northwest Russia from 2015 to 2018**

Vladimir Musatov* 1;2, Aleksei Iakovlev1;2, Johan Struwe1, Jari Jalava4, Outi Lyytikainen1, Dmitriy Titkov5, Elena Ivanova6, Tatiana Noskova1, Tamara Ngunyushkina1, Tatiana Poutonen8, Aleksandra Vorontsova5, Elena Larionova8

1 Botkin Clinical Infectious Disease Hospital, St. Petersburg, Russian Federation, 2 St. Petersburg State University Medical Faculty, St. Petersburg, Russian Federation, 3 Public Health Agency of Sweden, Stockholm, Sweden, 4 Finnish Institute for Health and Welfare, Helsinki, Finland, 5 Finnish Institute for Health and Welfare, Helsinki, Finland, 6 Regional Clinical Hospital, Murmansk, Russian Federation, 7 Regional Clinical Hospital, Pskov, Russian Federation, 8 Hygiene and Epidemiology Centre of Republic of Karelia, Petrozavodsk, Russian Federation, 9 City Hospital No 1, Arkhangelsk, Russian Federation

Abstract third-party references: This abstract was produced and data collected as part of the Nordic Council of Ministers’ Programme “Nordic-Russian Cooperation on Antimicrobial Resistance (AMR) Containment, 2019-2020.

**Background:** The Nordic Council of Ministers launched in 2019 a Nordic-Russian Cooperation Programme on Antimicrobial Resistance, and this study was proposed as part of the baseline mapping in five Russian partner-regions of the cooperation programme.

**Materials/methods:** Results of blood cultures and their antimicrobial susceptibility from 5 laboratories of the Northwest Russia (Karelia Republic, Arkhangelsk Oblast, Murmansk Oblast, Pskov Oblast and St. Petersburg City) between 2015 and 2018 were analysed. Antimicrobial resistance was determined by EUCAST or CLSI criteria.

**Results:** A total of 55,839 blood samples were investigated and 3,026 microorganisms detected (average level at 5.4%). *Staphylococcus aureus* (1055/34.9%) and *Klebsiella pneumoniae* (695/23.0%) were the most frequently identified bacteria followed by *Escherichia coli* (476/15.7%), *Enterococcus faecium* (474/15.7%), *Acinetobacter baumannii* (235/7.8%) and *Pseudomonas aeruginosa* (91/3.0%). A considerable increase in the proportion of positive cultures was observed: 3.7% (2015) – 4.1% (2016) – 5.9% (2017) – 9.4% (2018). An increase in *K. pneumoniae* detection was seen: 14.1% (2015) – 18.4% (2016) – 25.8% (2017) – 28.8% (2018). In contrast, a decrease was noted in the frequency of *S. aureus* (38.0% vs 32.3%) and *E. coli* (18.2% vs 13.7%). The levels of *E. faecium*, *A. baumannii* and *P. aeruginosa* remained stable.

The average proportion of MRSA through the study period was 17.1% (180/1055). The proportion of ESBL-producing *K. pneumoniae* decreased from 70.2% in 2015 to 34.8% in 2018, with average at 49.2%. On average, carbapenem-resistant *K. pneumoniae* was registered in 32.9% cases (229 samples). Over the study period, the proportion of carbapenem-resistant *K. pneumoniae* increased: 16.7% (2015) – 20.3% (2016) – 47.4% (2017) – 46.3% (2018). The level ESBL-producing *E. coli* varied from 30.6% to 51.0%, showing an increasing tendency (average resistance proportion at 40.5%). A total of 10 carbapenem-resistant *E. coli* cultures were identified (average 2.1%). The detection of vancomycin-resistant *E. faecium* remained low (average 1.3%).

**Conclusions:** The increased pathogen detection, mainly due to *K. pneumoniae*, and an enhancement in the level of resistant Enterobacteriaceae shows the importance of further systematic harmonized surveillance and regional cooperation in the Northwest Russia to build adequate response. In the participating regions, microbiology results are stored based on the number of tests, therefore methodology requires standardization.

Abstract 1041

**Healthcare-associated infections reporting in developing countries: challenges and corrective measures**

Nahid Dehghan-Nayeri¹, Leili Rostamnia², Arash Seifi³*, Shokoh Varaei³, Ali Akbari Sari¹, Hamid Haghani⁴, Vahid Ghanbari⁵

¹Tehran University of Medical Sciences, Nursing and Midwifery Care Research Center, School of Nursing and Midwifery, Tehran, Iran, ²Kermanshah University of Medical Sciences, School of Nursing and Midwifery, Kermanshah, Iran, ³Tehran University of Medical Sciences, Department of Infectious Diseases, Faculty of Medicine, Tehran, Iran, ⁴Tehran University of Medical Sciences, Medical-Surgical Department, School of Nursing and Midwifery, Tehran, Iran, ⁵Tehran University of Medical Sciences, Department of Health Management and Economics, School of Public Health, Tehran, Iran, ⁶Iran University of Medical Sciences, Department of Biostatistics, College of Management and Medical Information, Tehran, Iran, ⁷Tehran University of Medical Sciences, Department of Health in Emergency and Disaster, School of Public Health, Tehran, Iran

**Background:** Health-care associated infections (HAIs) are the most frequent types of adverse events for providing health care. HAIs surveillance system is a critical part of their prevention and control. The accuracy of HAIs reporting in Iran appears to be questionable. This paper seeks to address challenges of HAIs reporting in national Iranian Nosocomial Infection Surveillance System (INIS) and discusses how to solve them.

**Materials/methods:** The study has been conducted with qualitative approach in two phases. In order to explore effective factors on HAIs case finding and reporting in INIS six related documents and opinions of sixteen experts were analyzed using Walt and Gillson’s policy analysis framework. The experts were selected from hospitals affiliated with Tehran University of Medical Sciences (TUMS) and Ministry of Health (MOH). Consequently an expert panel session was held due to provide the best strategies to deal with each of reported issues.

**Results:** Inappropriate organization structure, poor documentation, lack of participation of stakeholders, inadequate educational programs, health planning without scientific evidences, deficits in executive and evaluation infection prevention and control, individual conflicts of interest lead to poor case finding and reporting of HAIs in INIS. Identifying the lead organization for infection prevention and control programs (IPCs), managerial supports from IPCs, advocacy in order to enhancing health staffs knowledge and participation, developing and implementation a comprehensive HAIs information management system, and provide appropriate job motivation for infection prevention and control team in hospitals are suggested strategies to improve HAIs case finding and reporting in INIS.

**Conclusions:** Our findings indicate that a number of organizational and individual factors lead to inaccurate HAIs reporting in INIS. Accurate case-finding and reporting needs the implementation of some strategies to enhance staffs capabilities and motivation, updating guidelines and software and changing in organizational structure.

Survey of attitudes, beliefs, and knowledge of community pharmacists in the United States on antimicrobial stewardship

Dana Bowers* 1, Christopher Bran Morales 1, Christopher Daly 2, David Jacobs 2

1 Washington State University College of Pharmacy and Pharmaceutical Sciences, Yakima, United States, 2 University of Buffalo School of Pharmacy and Pharmaceutical Sciences, Buffalo, United States

Background: Approximately 50% of antibiotics are either inappropriate or unnecessary, a problem that antimicrobial stewardship (AMS) programs seek to address. Even though the majority of antibiotic prescribing occurs in the outpatient community setting, most AMS programs are focused on inpatient training and services. In order to address the feasibility of community AMS programs, we performed a cross-sectional survey of community pharmacists investigating their attitudes, beliefs and knowledge towards community-based AMS services.

Materials/methods: The electronic survey was distributed over 6 weeks from June 1, 2019 through July 24, 2019 to pharmacists licensed in the state of Washington, U.S.A. The 40-item survey instrument was developed based on a review of the published literature. We ensured all questions and answer choices were pertinent to community pharmacy respondents. The survey included the following domains: perceptions towards AMS, current pharmacy practices, perceived barriers and facilitators to community AMS services. The questionnaire was pilot tested for readability, length and relevance of specific items. Survey participants were included if they had experience in a community pharmacy setting and completed at least one category of AMS questions.

Results: A total of 204 participants met inclusion criteria. Respondents were mostly female (63.2%), aged 30 – 39 years old (38.7%) and between 1 – 10 years of experience (38.7%). A majority of pharmacists agreed that AMS is important to improve patient care (90.1%), reduce inappropriate antimicrobial use (85.7%) and reduce antimicrobial resistance (89.7%). However, 40.3% of pharmacists disagreed that they have the necessary training to participate in AMS. Most pharmacists actively participate in AMS activities such as contacting the prescriber for appropriateness (73.9%), antimicrobial prescription checking for adverse drug reactions or allergies (92.1%) and effectively counseling on appropriate use of antimicrobials (92.1%). Some potential perceived barriers identified were time (39.0%) and financial compensation (68.7%). Lastly, facilitators for community AMS identified were education to patients (82.4%) and healthcare providers (90.2%) and increased access to patient electronic health record (92.3%).

Conclusions: Our results suggest that AMS is important to patient outcomes in the community setting and could be implemented when identified barriers are addressed.

**In vitro surveillance of eravacycline against Gram-positive pathogens, including resistant isolates, collected from European hospitals in 2018**

Sara Hwang¹, Stephen Hawser², Ian Morrissey*², Federica Monti², Ekaterina Efimova¹, Melanie Olesky¹

¹Tetraphase Pharmaceuticals, Watertown, MA, United States; ²IHMA, Monthey, Switzerland

**Abstract third-party references:** IHMA, Monthey, Switzerland, Tetraphase Pharmaceuticals

**Background:** Eravacycline (ERV) is a fully-synthetic, fluorocycline antibacterial approved for the treatment of complicated intra-abdominal infections (cIAI) in patients ≥18 years of age in both Europe and the US. Previous surveillance studies of ERV have demonstrated potent *in vitro* activity against specific Gram-positive pathogens. The purpose of this study was to further monitor the *in vitro* activity of ERV against *Staphylococcus aureus* (including methicillin-resistant *S. aureus*, MRSA), *Enterococcus* spp. (including vancomycin-resistant *Enterococcus*, VRE) and *Streptococcus* spp.

**Materials/methods:** Clinical isolates were collected from European hospitals during 2018 from multiple infection sources, including bodily fluids, gastrointestinal, genitourinary and respiratory. Minimum inhibitory concentrations (MICs) were determined by CLSI broth microdilution. Antibiotic susceptibility was determined with EUCAST version 9.0 breakpoints.

**Results:** Summary MIC data for ERV and select comparators are shown in the Table. The MIC₉₀ values of ERV for *S. aureus*, *Enterococcus* spp. and *Streptococcus* spp. were 0.12 mg/L, 0.12 mg/L and 0.03 mg/L, respectively. ERV MICs were 2- to 8-fold lower than tigecycline. ERV susceptibilities ranged from 94.7–100%, including for resistant organisms.

**Conclusions:** ERV demonstrated high susceptibility rates against clinically important Gram-positive pathogens, including resistant isolates. Furthermore, ERV MIC values were up to 8-fold lower than for tigecycline. This activity suggests ERV play a role in empiric treatment choice for cIAI where Gram-positive pathogens are suspected as part of causative infection flora.

Abstract third-party references: On behalf of the PICNICC investigators

Background: Antibiotics are used to reduce morbidity and mortality in children with febrile neutropenia (FN) undergoing treatment for malignancy, but variation exists among guidelines for prescribing, especially with regard to aminoglycoside therapy.

Materials/methods: We aimed to review antibiotic prescribing and guideline compliance in children with febrile neutropenia. We analyzed data from the prospective PICNICC cohort study, collected from children <18 years admitted to tertiary centers in Australia with FN between November 2016 and January 2018.

Results: Among 858 episodes of febrile neutropenia, children were prescribed up to 4 concurrent antibiotics in the first 12 hours. Piperacillin-tazobactam was the most commonly prescribed antibiotic (n=519, 60.5%) and aminoglycosides were prescribed in 255 episodes (29.7%). Of 1380 antibiotics prescribed in total, 1285 (93.1%) were marked by site research assistant as compliant with local hospital guidelines. Composite unfavorable outcome of death, ICU admission, relapse of infection or late-onset sepsis occurred in 54 episodes (6.3%). In FN episodes with receipt of aminoglycosides in the 1st 12 hours, the adjusted hazard ratio for unfavorable outcome was 3.1 (95% CI 1.7-5.7). On independent assessment of state guideline criteria, 46% (n=184) of guideline-eligible patients did not receive an aminoglycoside but there was no increased risk of unfavorable outcome in this group.

Conclusions: We found substantial variation in antibiotic prescribing for febrile neutropenia in this cohort. We found no evidence for improved outcome with aminoglycosides, even in those who met local guideline criteria for this therapy. Aminoglycosides appear to be associated with unfavorable outcome when given empirically for FN in children and their inclusion in guidelines should be reviewed.

In vitro surveillance of eravacycline against Gram-negative pathogens, including multidrug-resistant isolates, collected from European hospitals in 2018

Sara Hwang1, Stephen Hawser2, Ian Morrissey*2, Nimmi Kothari2, Ekaterina Efimova1, Melanie Olesky1

1Tetraphase Pharmaceuticals, Watertown, MA, United States, 2IHMA, Monthey, Switzerland

Abstract third-party references: Tetraphase Pharmaceuticals, IHMA, Monthey, Switzerland

Background: Eravacycline (ERV) is a fully-synthetic, fluorocycline antibiotic approved for the treatment of complicated intra-abdominal infections (cIAI) in patients ≥18 years of age in Europe and the US. The purpose of this study was to monitor the in vitro activity of ERV against European Gram-negative isolates, including multidrug-resistant (MDR) isolates, collected in 2018.

Materials/methods: Isolates were collected during 2018 from various body sites. Minimum inhibitory concentrations (MICs) were determined by CLSI broth microdilution. Antibiotic susceptibility was determined with EUCAST version 9.0 breakpoints. MDR was defined as resistance to ≥3 antibiotics from aztreonam, a carbapenem (meropenem or ertapenem [ETP]), cefepime/ceftaxime/cefazidime/ceftiraxone (any one), gentamicin, levofloxacin, piperacillin-tazobactam, tetracycline or tigecycline (TIG).

Results: Summary MIC data for ERV and select comparators are shown in the Table. ERV MIC90 values for all-Enterobacteriaceae and MDR-Enterobacteriaceae were 0.5 mg/L and 1 mg/L, respectively. ERV MIC90 for MDR-Enterobacteriaceae was within one dilution as compared for all-Enterobacteriaceae isolates. ERV susceptibilities ranged from 81.6–99.5% for all- and MDR-Enterobacteriaceae. ERV MIC50/90 against carbapenem-resistant Acinetobacter baumannii (CRAB) were 4-fold lower than TIG.

Conclusions: ERV exhibited potent in vitro activity and higher susceptibility rates than TIG against clinically important Gram-negative pathogens, including resistant isolates. This ongoing surveillance further demonstrates the benefit of ERV in the treatment of cIAI, particularly where Enterobacteriaceae are suspected as the causative agent.

Abstract 1054

Establishment and clinical application of a multiple touchdown PCR for detection of carbapenemase genes

Xiaojun Li*, Ning Sun, Liping Zhang, Bai-Zeng Yu, Wei-Ping Wang, Xingyue Yao, Juan Yu

1Department of Clinical Laboratory Science, Jinling Hospital, School of Medicine, Nanjing University, Nanjing, China, 2Lishui People’s Hospital, Zhongda Hospital Lishui Branch, Southeast University, Nanjing, China

Background: Carbapenem-resistant Enterobacteriaceae (CRE) is rising rapidly all over the world. Early detection and identification of carbapenem resistant bacteria are important to control the spread and outbreak of infection. In the present study, we established a multiple touchdown PCR (MT-PCR) assay for detection of five carbapenemase genes.

Materials/methods: CRE resistant genes, including blaOXA-48, blaIMP, blaVIM, blaNDM and blaKPC were selected as target genes. The blaIMP carried P. aeruginosa, blaVIM carried P. putida, blaNDM carried K. pneumoniae, blaKPC carried K. Pneumonia, blaOXA-48 carried E. Coli (DH5α) were applied as positive controls, and the bacteria carried no target genes as negative control. The MT-PCR assay was developed and subsequently analyzed the specificity, sensitivity, and clinical application performance.

Results: The MT-PCR assay was successfully established for the detection of five carbapenemase genes, with limits of detection of 2×10^2 cfu/mL for blaOXA-48, blaVIM and blaKPC, and 2×10^3 cfu/mL for blaIMP and blaNDM. The results obtained from MT-PCR were completely consistent with single PCR in the detection of 42 carbapenem-resistant clinical isolates. Compared to antimicrobial susceptibility testing (AST) as the reference method, there was no significant difference between the results from MT-PCR (genotype) and the results from AST (phenotype) in the detection of 67 clinical sterile body fluid samples, and the clinical sensitivity and specificity was 80% and 100%, respectively.

Conclusions: The MT-PCR assay can be effectively used to detect five carbapenemase genes in clinical isolates and sterile body fluid samples.

Impact of an antimicrobial stewardship team on the de-escalation of carbapenem use in a tertiary hospital

Masayuki Maeda*, Yasuhiro Nagatomo, Yuika Naito, Etsuko Akima, Kaori Nakane, Kazuhisa Ugajin, Masayuki Yoshikawa, Takahiro Takuma, Issei Tokimatsu, Yoshihito Niki

1 Showa University, Tokyo, Japan, 2 Showa University Hospital, Tokyo, Japan

**Background:** Carbapenems have a broad spectrum of activity and are used for empirical therapy against life-threatening infections. When inappropriate carbapenem use, such as prolonged therapy, is observed, a de-escalation (DE) strategy would change to a narrower spectrum antibiotic when susceptible bacteria were identified. However, the DE strategy has not been considered in clinical settings. We aimed to determine whether an antimicrobial stewardship team (AST) intervention could promote DE of carbapenem therapy.

**Materials/methods:** The AST intervention, launched in July 2017, consisted of a daily post-prescription review and feedback (PPRF) strategy. We evaluated the rate of switching to other antimicrobials or discontinuing carbapenems within 7 days during the pre-intervention (from July 2016 to June 2017) and post-intervention (from July 2017 to June 2018) period. DE was defined as changing to a narrower spectrum beta-lactam antimicrobial or by discontinuation of the carbapenem.

**Results:** A total of 2,685 patients were prescribed carbapenems. Confirming the use with prescribers by face-to-face or telephone contact was the primary intervention by AST (976/1,350), followed by a recommendation for discontinuation or change to another antibiotic (720/1,350). The rate of change to narrower spectrum beta-lactams significantly increased during the post-intervention period (7.0% vs. 13.0%; P < 0.001; Table). In a multivariate analysis, AST intervention was significantly associated with DE therapy (odds ratio: 1.30; 95% confidence interval: 1.10–1.54; P = 0.002).

**Conclusions:** Daily PPRF by AST could enhance the carbapenem antimicrobial stewardship by accelerating DE of carbapenem.

Abstract 1058

**Essential human resources for antimicrobial stewardship teams in Japan: estimates from a nation-wide survey**

Masayuki Maeda*1, Yuichi Muraki1, Tadashi Kosaka1, Takehiro Yamada1, Yosuke Aoki1, Mitsuo Kaku1, Masafumi Seki1, Yoshinari Tanabe1, Naohisa Fujita1, Yoshihito Niki1, Kunihiko Morita1, Katsunori Yanagihara1, Koichiro Yoshida1, Tatsuya Kawaguchi1

1The Antimicrobial Stewardship Committee of the Japanese Society of Chemotherapy, Tokyo, Japan

**Background:** Antimicrobial stewardship requires structural prerequisites for implementation of antimicrobial stewardship programs (ASPs), such as the presence of a multidisciplinary antimicrobial stewardship team (AST). In 2018, we reported data of a nationwide survey on the implementation of ASPs and staff resources in Japan. The survey revealed a shortage in manpower at most Japanese hospitals. The study aimed to describe the potential staffing structures for ASTs proposed based on a nation-wide survey conducted by the Japanese Society of Chemotherapy (JSC).

**Materials/methods:** Data on implemented ASPs and staff full-time equivalents (FTEs) at 1358 healthcare facilities, which were collected by the nationwide ASP survey of JSC in 2018, were analyzed. Multivariate analysis was performed to evaluate whether physician and pharmacist FTEs were associated with the number of implemented ASPs in each facility, defined as the number of responses in the previous survey.

**Results:** Table 1 presents independent factors related to the number of implemented ASPs. Middle-to-large hospitals, additional reimbursement for infection prevention, presence of an on-site microbiology laboratory, AST organization, physician FTE, and pharmacist FTE were significantly associated with the increased number of implemented ASPs. Additional reimbursement was the strongest contributor for the implementation of ASPs. Among factors regarding staff resources, the contribution of pharmacist FTE to the implementation of ASPs was stronger than that of physician FTE.

**Conclusions:** Our nationwide survey analysis revealed that pharmacist and physician FTEs were significantly associated with the implementation of ASPs after adjustment for several confounders. The current findings reveal the human resources for core members of ASTs that are required for the implementation of functional and sustainable ASPs at Japanese hospitals. This study provides a directive for structural and financial support of ASTs and should aid in planning for the enhancement of AST practices.

Abstract 1063

**Diagnostics value of Epstein-Barr virus DNA load in whole blood and plasma from paediatric transplant recipients**

Beata Kasztelewicz*, Joanna Teisseyre, Katarzyna Janiszewska, Irena Jankowska, Piotr Kaliciński, Katarzyna Dzierzanowska-Fangrat

1Children’s Memorial Health Institute, Department of Clinical Microbiology and Immunology, Warsaw, Poland, 2The Children’s Memorial Health Institute, Warsaw, Poland

**Background:** High and/or rising EBV viral loads pose a risk for development of EBV-related post-transplant lymphoproliferative disorder (PTLD), hence quantitative EBV DNA testing was incorporated into routine medical practice to assist in diagnosis and monitoring of transplant recipients. However, there is no consensus regarding the threshold of EBV DNA that warrants preemptive therapy or further diagnostic workup as well as there is no consensus on optimal component of peripheral blood for measuring viral loads. The aim of the study was to assess the utility of EBV DNA monitoring in whole blood (WB) and plasma in paediatric liver transplant recipients (LTx).

**Materials/methods:** This prospective study included 1262 matched WB and plasma samples from 296 LTx patients. To evaluate the diagnostic performance of an EBV DNAemia in whole blood and plasma, a receiver operating characteristics (ROC) curve analysis were conducted. Apart from 2 patients with PTLD confirmed within the study period, data of EBV DNAemia in additional 9 samples (including 5 WB and 4 plasma samples) of 4 patients included in the study but with PTLD diagnosed before [2 patients] and after (2 patients) the study period, were included in the ROC analysis.

**Results:** Higher EBV DNAemia in both whole blood and plasma was detected in patients with PTLD compared to non-PTLD patients [median 4.23 vs 3.48 log_{10} copies/mL; p = 0.044 and median 3.97 vs 1.7 log_{10} copies/mL; p < 0.0001, respectively for WB and plasma samples]. The value of the area under the ROC curve was 0.96 (95% CI 0.94 - 0.99; p = 1.2 x 10^{-24}) and 0.83 (95% CI 0.76 - 0.90; p = 7.0 x 10^{-5}) for EBV DNA load in plasma and WB, respectively (Figure). The optimal cut-off value of EBV DNAemia in plasma was 2.4 log_{10} copies/mL with sensitivity of 100%, specificity of 92.8%, positive predictive value (PPV) of 8.2% and negative predictive value (NPV) of 100%, whereas optimal cut-off value for EBV DNAemia in WB was 3.4 log_{10} copies/mL, with sensitivity of 100%, specificity of 70.3%, PPV of 2.4% and NPV of 100%.

**Conclusions:** Monitoring of EBV DNA in plasma samples had better diagnostics performance compared to WB.

**Figure.** A receiver operating characteristic (ROC) curve of EBV DNAemia in whole blood (WB) and plasma for identification PTLD.

The ROC curve analysis, included samples obtained from 290 non-PTLD patients and 6 PTLD patients. Only samples collected up to one month prior to and at the PTLD diagnosis were considered (samples of PTLD patients collected after treatment was initiated, were excluded). The true positive rate (sensitivity) is plotted in function of the false positive rate (1-specificity) for different cut-off points.

Abstract 1065

**HLA-DPB1*05:01 is associated with adverse drug reactions to rifampin and isoniazid for treatment of latent tuberculosis infection in South Korea**

Eun-Jeong Joo*, So Yeon Park¹, Jungok Kim², Hae Suk Cheong³, Han-Na Kim⁴, Joon-Sup Yeom⁵

¹Sungkyunkwan University School of Medicine/Kangbuk Samsung Hospital, Seoul, South Korea, ²Hallym Medical University/Kangdong Sacred Heart Hospital, Seoul, South Korea, ³Chungnam National University College of Medicine/Chungnam National University Hospital, Seoul, South Korea, ⁴Sungkyunkwan University School of Medicine/Kangbuk Samsung Hospital, Seoul, South Korea, ⁵Yonsei University College of Medicine/Severance Hospital, Seoul, South Korea

**Background:** Healthcare-workers (HCWs) with latent tuberculosis infection (LTBI) are a potential risk group for tuberculosis leading to its transmission to other HCWs and patients. Therefore, screening and treatment for LTBI are recommended in HCWs. However, adverse drug reactions (ADRs) for rifampicin (RFP) and isoniazid (INH) is often challenging in initiating and completing LTBI treatment. Previous pharmacogenetics studies have reported the association of variants in the human leukocyte antigen (HLA) region with a drug-associated hypersensitivity reaction. The purpose of this study is to evaluate the association between HLA polymorphism and RFP- and INH-associated ADRs.

**Materials/methods:** The present analysis included HCWs who have begun treating LTBI with 3 month-regimen of RFP and INH between February and September 2017 and agreed to perform the HLA genotyping. Participants were questioned about and examined for adverse events during treatment. Association analysis for HLA alleles were conducted with PyHLA for ADRs to RFP and INH.

**Results:** A total of 66 subjects were enrolled; 13 (19.7%) of them met the criteria for hypersensitivity reaction while on RFP and INH treatment. Among 53 treatment tolerant group, 15 participants showed mildly elevated liver enzymes during the follow-up monitoring. In association analyses for HLA alleles with hypersensitivity reaction, we observed the HLA-DPB1*05:01 allele was associated with an increased risk of hypersensitivity reaction (OR, 4.13; 95% CI, 1.47-11.59; \(p = 0.0539\)). In a subgroup-analysis for moderate hypersensitivity reaction, strong associations were identified in DPB1*05:01 (OR, 9.0; 95% CI, 2.37-41.34; \(p = 0.0009\)) and DQA1*01:02 (OR, 7.44; 95% CI, 1.80-30.85; \(p = 0.0354\)). We also found an additional effect of the DPB1*05:01 for mild hepatotoxicity (OR, 5.78; 95% CI, 2.17-15.36; \(p = 0.0026\)).

**Conclusions:** The majority of participants with HLA-DPB1*05:01 allele had higher hypersensitivity reaction on RFP and INH therapy than participants without. The presence of HLA-DPB1*05:01 was also associated with an increased risk for mild hepatotoxicity during RFP and INH treatment. Our results indicated patients carrying the HLA-DPB1*05:01 allele were correlated with a considerable higher risk of ADRs to RFP and INH in the Korean population.

Abstract 1066

Triple site versus urine only N. gonorrhoea/C. trachomatis testing among Israeli MSM in the condom fatigue era: a prospective study

David Roy Zoker1, Dan Turner1, Ronen Ben-Ami1, Amos Adler1, Ilan Singer1, Yotam Dizitzer1, Tami Halperin*1

1Tel Aviv Sourasky Medical Center / Medical Tourism, Tel Aviv-Yafo, Israel

Background: Chlamydia trachomatis (CT) and Neisseria gonorrhoea (NG) are the most common sexual transmitted infections (STIs) especially among men who have sex with men (MSM). Three site testing is the recommended test for asymptomatic sexually active MSM, especially for those who are using pre exposure prophylaxis or living with HIV, practicing condom less sex. STIs such as C. trachomatis and N. gonorrhoea are site specific and are detectable mostly at the infection site. We prospectively compared triple site and urine only C. trachomatis and N. gonorrhoea testing among asymptomatic Israeli MSM.

Materials/methods: Asymptomatic MSM > 18 years of age were eligible to participate if they had not received any relevant antibiotic treatment in the previous 3 months. Participants provided informed consent, received verbal and written instructions on specimen collection and then self-collected a urine specimen, pharyngeal and rectal swabs. All samples were tested on site using the Xpert CT/NG assay (Cepheid, Sunnyvale, California, USA), according to manufacturer's instructions.

Results: The study cohort included 218 male participants. 34.5% were using PrEP, 24.3% were HIV carriers. 64 participants (29%) were positive to C. trachomatis or N. gonorrhoea in one of the tested sites or more. N. gonorrhoea was detected among 56% (47 samples) of the positive samples while in 44% (37 samples) of them C. trachomatis was detected. Most of detected samples were obtained from rectal swabs (61%), additional 35% were obtained from oral swabs, only 2.2 % were obtained from urine samples.

Conclusions: High infection rates (29%) were detected among asymptomatic Israeli MSM tested for C. trachomatis and N. gonorrhoea, in one or more of the tested sites, mostly rectal. Urine testing had a very low sensitivity raising the question of necessity to screen urine in asymptomatic MSM. The current study underscores the importance of triple site testing for a highly at-risk population.

Performance evaluation of the Xpert HBV Viral Load assay for the quantification of hepatitis B virus DNA in plasma samples

Hoyin Lam*1, Bone Tang1

1Hong Kong Sanatorium & Hospital, Hong Kong, Hong Kong

Background: Accurate quantification of Hepatitis B virus (HBV) DNA in the patients with chronic HBV infection is important for providing treatment indication and monitoring treatment efficacy. In this study, we would like to evaluate the performance of the new Cepheid Xpert HBV Viral load assay (Xpert-HBV) in comparison to the QIAGEN artus HBV QA-RQ kit (artus-HBV) for the quantification of HBV DNA in plasma sample. Also, the analytical characteristics of Xpert-HBV were studied.

Materials/methods: A total of 137 archived plasma samples that submitted to our laboratory for HBV DNA quantification between January and October 2016 were used for performance evaluation. All plasma specimens were processed and quantified for HBV DNA using Xpert-HBV and artus-HBV. To access the analytical sensitivity and the precision of Xpert-HBV, a standard panel of HBV containing plasma sample (AcroMetrix HBV Panel 1.2 mL, Thermo Scientific) was serially diluted to 7 HBV concentrations (5, 10, 25, 50, 100, 250 and 500 IU/mL), in which 5 replicates of each HBV DNA concentration were tested.

Results: Of the 137 samples tested, 133 (97.1%) had the qualitative results that agreed on the two platforms. All 4 samples with the discordant qualitative result (detected by artus-HBV but not by Xpert-HBV) had the HBV viral load below the limit of detection of artus-HBV (<10.22 IU/mL). Further analysis of 107 samples quantified by both assays showed an excellent correlation ($R^2=0.9771$) across the dynamic range of quantification. Average bias between two assays, as determined in Bland-Altman analysis, was 0.20 Log$_{10}$ IU/mL (Xpert minus artus-HBV; ±1.96 S.D: -0.29 to 0.70 Log$_{10}$ IU/mL). All the replicates in 7 different HBV DNA concentrations of the standard panel tested positive by Xpert, except a replicate of 5 IU/mL. The precision of Xpert over the 5 HBV DNA concentrations (25, 50, 100, 250 and 500 IU/mL) ranged from 2.3% to 8.5%.

Conclusions: An excellent correlation between Xpert and artus-HBV could be demonstrated in this study. The good clinical and analytical performance, random access capability and rapid turnaround (≤60 minutes per samples) make the assay becomes a valuable tool for HBV DNA quantification in hospital-based laboratories.

Abstract 1071

**Performance evaluation of the Alinity m HBV assay for the quantification of hepatitis B virus DNA in plasma samples**

Hoyin Lam*, Man Kin Ng¹, Bone Tang²

¹Hong Kong Sanatorium & Hospital, Hong Kong, Hong Kong

**Background:** Quantification of Hepatitis B virus (HBV) DNA plays an important role in monitoring HBV infection and in assessing the treatment efficacy. In this study, we evaluate the performance of the new Abbott Alinity m HBV assay (Alinity-HBV) in comparison to the QIAGEN artus HBV QA-RQ kit (artus-HBV) for the quantification of HBV DNA in plasma sample. Also, the analytical characteristics of Alinity-HBV were studied.

**Materials/methods:** A total of 195 archived plasma specimens that submitted to our laboratory for HBV DNA quantification between January and December 2017 were used for performance evaluation. Linearity of the Alinity-HBV was evaluated on dilutions series of a clinical sample ranging from 8.60 to 1.60 Log_{10} IU/mL. To assess the assay precision, a standard panel comprising 8 different HBV concentration levels (5, 10, 25, 50, 75, 100, 250 and 500 IU/mL) was prepared, of which 8 replicates of each HBV DNA concentration were tested twice a day for four consecutive days.

**Results:** Of the 195 samples tested, 193 (99.0%) had the qualitative results that agreed on the two platforms. Among the two samples with discordant qualitative result (positive by Alinity-HBV but negative by artus-HBV), both of them had the result below the limit of detection of Alinity-HBV (<10 IU/mL). Further analysis of 138 samples quantified by both assays showed an excellent correlation ($R^2=0.9752$) across the dynamic range of quantification. Average bias between two assays, as determined in Bland-Altman analysis, was -0.08 Log_{10} IU/mL (Alinity minus artus; ±1.96 S.D: -0.64 to 0.47 Log_{10} IU/mL). The slope of the regression line for the linearity analysis was 0.9998. All the replicates in 8 different HBV DNA concentrations of the standard panel tested positive by Alinity-HBV, except 2 replicate of 5 IU/mL. The precision of Alinity-HBV over 6 HBV DNA concentrations (25, 50, 75, 100, 250 and 500 IU/mL) ranged from 2.7% to 8.5%.

**Conclusions:** An excellent correlation between Alinity-HBV and artus-HBV could be demonstrated in this study. The good clinical and analytical performance, random access capability and the extended linear range of quantification make the assay becomes a valuable tool for high-throughput HBV DNA quantification in hospital-based laboratories.

Predicting *Pseudomonas aeruginosa* susceptibility phenotypes from whole genome sequence resistome analysis

Sara Cortes-Lara*,1 Carla Lopez Causape1, Ester Del Barrio-Toñio1, Antonio Oliver1

1Hospital Universitario Son Espases, Instituto de Investigación Sanitaria de las Islas Baleares, Palma, Spain

**Background:** Frequent *Pseudomonas aeruginosa* antimicrobial resistance is driven by a complex repertoire of resistance phenotypes, resulting from both, mutation-driven and horizontally-acquired mechanisms. The objective of this work was to develop and validate a resistance genotype score, based on the analysis of the whole genome sequence resistome, to predict *P. aeruginosa* antimicrobial susceptibility phenotype.

**Materials/methods:** Published data on clinical strains and in vitro resistance evolution experiments, were used to define the genes potentially involved in mutation-driven and horizontally-acquired resistance for ceftazidime, ceftolozane/tazobactam, meropenem, ciprofloxacin and tobramycin. Resistance genes/mutations were scored from 0 (no effect) to 1 (clinical resistance, EUCAST breakpoints); the negative effect of mutations known to increase susceptibility was also considered. Resfinder was used to detect horizontally-acquired determinants. The first step for the analysis of mutational mechanisms was to determine the natural polymorphisms existing in the genes involved in mutation-driven resistance. For this purpose, 50 wildtype strains obtained from 51 different hospitals during a 2017 multicenter study were fully sequenced and analyzed. Once the resistance genotype score was developed, its capacity to predict the susceptibility phenotype was tested in 204 isolates randomly selected from the 51 hospitals (4 from each hospital). Phenotypic and genetic assays for the characterization of resistance mechanisms were performed as needed.

**Results:** The analysis of the 50 wildtype strains allowed to develop a catalogue of natural polymorphisms in genes involved in mutation-driven resistance. None of the wildtype strains showed horizontally-acquired determinants and the scores were always <1; however a few wildtype isolates showed mutations clearly involved in resistance (for example 2 isolates showed OprD inactivating mutations). The capacity of the score to predict susceptibility (<0.5) or resistance (≥1) in the 204 clinical isolates is shown in the Table.

**Conclusions:** Although a margin for improvement is evidenced, an overall good correlation between the resistance genotype score and the susceptibility profile was documented. Further refining of the score system, automatization and testing of large international cohorts should follow.

Mortality outcome in critically ill CRO infection patients treated with polymyxin-B and its prediction based on morbidity and mortality scores

Saiprasad Patil1, Bipin Jibhkate2, Kalpesh Shah3, Kamal Parikh4, Amal Bhattacharya5, Nitin Shinde6, Sagar Bhagat1, Hanmant Barkate1

1Glenmark Pharmaceuticals Limited, Mumbai, India, 2Wockhardt Hospitals, The Umrao IMSR, Mira Bhayandar, India, 3Dr Jivraj Mehta Smarak Health Foundation, Ahmedabad, India, 4Sterling Hospital, Rajkot, India, 5Parul institute of medical sciences & research, Vadodara, India, 6Kaushalya speciality clinic, Nagpur, India

Abstract third-party references: Glenmark Pharmaceuticals Ltd.

Background: We intent to observe the 28-day mortality in critically ill CRO infected patients treated with polymyxin-B and to analyze the impact of variables along with morbidity and mortality scores on prediction of mortality.

Materials/methods: Retrospective cohort study was planned in all consecutive polymyxin-B treated patients suffering from CRO infections at 5 centers. Patient's demographics, clinical history, and polymyxin-B therapy details were captured. CCI, Pitts score, INCREMENT scores were computed. Along with 28-day mortality, impact of variables was analyzed using Chi-square and Mann-Whitney test amongst survivors and non-survivors.

Results: 51 patients received polymyxin-B during study period, 49 considered suitable for further analysis. Pneumonia (47%) and BSI (18.3%) were the main infections with underlying bacteremia in 85.7% patients. K. pneumoniae (N=23) was the most common pathogen followed by A. baumannii complex. Mean CCI, Pitts and ICS (N=23) scores were 3.16±2.46, 6.32±2.51 and 9.86±5.17 respectively. Mean dose of Polymyxin-B was 11.8 Lakh U/day ±2.73, Range: 10-19.5 L U/d) administered for mean duration of 7.5 days (±4.02, Range: 3-16 days). All-cause 28-day mortality was 30.6%. No significant association between sepsis severity (p = 0.35), neutropenia (p = 1), polymyxin-B dose ≥ 15LU/d (p = 1) and treatment duration > 7d (p = 0.13) with mortality was observed. However, near significant association of 28-mortality was noticed only with CCI ≥ 2. (Table 1)

Conclusions: Polymyxin-B therapy was associated with good (69.4%) overall survival in critically ill patients with CRO infections. We couldn't find significant association of important variables or morbidity or mortality scores with 28-day mortality. Further validation is required in larger cohort to predict the mortality of CRO infection in Indian setting.

Table 1: Mortality association of variables in critically ill patients with CRO infection. (N=49)

Abstract 1075

**Evaluation of simultaneous detection of pathogens associated with sexual transmitted infection and vaginal disorders on a real-time qPCR microfluidics platform in an asymptomatic female college student’s cohort**

María Isabel Montesinos Hernández1*, Marie Hallin2, Lotfi Triki3, Busra Tüglü1, Sophie Lorea1, Anne De Vleeschouwer2, Sophie Henrard1, Zoe Kipouros3, Marie-Luce Delforge1, Jean-Christophe Goffard1

1LHUB-ULB Hospital Erasme, Bruxelles, Belgium, 2LHUB-ULB CHU Saint-Pierre, Bruxelles, Belgium, 3Hospital Erasme, Bruxelles, Belgium

**Background:** This study aimed to characterize the performance of a customized microfluidics platform – the Taqman® Array Card (TAC) on vaginal samples in comparison to conventional tests for the diagnosis of sexual transmitted infections (STI), bacterial vaginosis (BV) and vulvovaginal candidiasis (VC).

**Materials/methods:** This study, carried out prospectively from November 2017 to April 2019, included 211 asymptomatic female college students recruited for STI screening. Sera were collected and screened for HIV, HBV, HCV and syphilis on the Liaison XL platform, while vaginal samples were tested by TAC targeting 29 bacteria, 6 yeasts, 3 viruses and 1 parasite involved in STI, BV and VC. *Chlamydia trachomatis* (CT) and *Neisseria gonorrhoeae* (NG) targets were compared with the Abbott Real-time CT/NG assay. *Candida* spp. and *Trichomonas vaginalis* (TV) targets were compared to culture. Targets involved in BV were compared with Nugent’s score (NS) in all samples and to NS and AmpliSens Florocenosis/Bacterial vaginosis-FRT PCR in 132 samples.

**Results:** CT was detected in 9 samples (4%) by TAC and Abbott PCR. No NG or TV was detected by either of the tests. Poor sensitivity (68%) was observed for *C. albicans* by TAC compared to culture. NS identified 99 (75%) students with normal flora, 33 (25%) with intermediate or BV compatible flora. Applying different interpretative algorithms, TAC’s best sensitivity, specificity, PPV and NPV scores to detect disturbed flora were 67%, 94%, 79% and 89%, respectively. Applying the manufacturer’s interpretation algorithm, AmpliSens PCR’s sensitivity, specificity, PPV and NPV were: 85%, 90%, 74% and 95% respectively. All sera were negative for HIV, HCV and syphilis; one was compatible with recovered HBV.

**Conclusions:** TAC is a customized panel-based molecular platform that allows simultaneous detection of STI and vaginal disorders pathogens, simplifying laboratory workflow and reducing turnaround time. CT was the only STI pathogen detected, present in a low percentage in this asymptomatic female cohort. TAC needs to be improved regarding *Candida* spp detection. AmpliSens PCR showed better performances and ease of interpretation than TAC to identify disturbed flora in this asymptomatic cohort. Samples from BV symptomatic patients are needed to optimize an accurate algorithm for BV diagnosis by TAC.

Rapid detection of methicillin-resistant Staphylococcus aureus in patients with late hospital-acquired/ventilator-associated pneumonia

Linda Bussini*1, Caterina Monari2, Renato Pascale2, Matteo Rinaldi1, Stefano Ianniruberto1, Elena Rosselli Del Turco1, Simone Ambretti1, Maddalena Giannella1, Pierluigi Viale1

1Policlinico Sant’Orsola-Malpighi, University of Bologna, Bologna, Italy, 2University of Campania Luigi Vanvitelli, Caserta, Italy

Background: New syndromic rapid diagnostic tests seem to be promising for antimicrobial stewardship purposes. We have tested one of them, the FilmArray Pneumonia Panel plus [FA-PPP], in patients diagnosed with hospital-acquired pneumonia (HAP), including ventilator-associated pneumonia (VAP) episodes, with the aim to describe its potential impact on the management of anti-methicillin resistant Staphylococcus aureus (MRSA) therapy.

Materials/methods: Single-center observational study of consecutive adult patients diagnosed with HAP, hospitalized from June 2018 to October 2018. We performed FA-PPP on residual samples of endotracheal aspirate (ETA) or bronchoalveolar lavage (BAL) obtained for the etiological diagnosis of pneumonia. The gold standard was culture method. The cut-off of bacterial growth considered as positive was ≥10⁷ cfu/ml for ETA and BAL, respectively. The performance of the test did not interfere in the decision-making process, so that patients were managed according to the standard of care.

Results: 58 patients were diagnosed with late-onset (≥5 days after admission) HAP, 74% was on mechanical ventilation at diagnosis. Collected samples included 43 ETA and 15 BAL. FA-PPP resulted positive for MRSA in 7 cases, but in only one of them standard culture showed the growth of MRSA. On the contrary, none of the 51 samples with a negative FA-PPP result showed bacterial growth on standard culture (Table 1). According to the observed prevalence of MRSA (1.7%), FA-PPP sensitivity, specificity, positive predictive value (PPV) and negative predictive value (NPV) for MRSA detection were 100%, 89%, 14% and 100%, respectively. According to the data of our Microbiology laboratory showing a pre-test probability (overall prevalence of MRSA among isolates from lower respiratory tract samples) of 5%, positive and negative likelihood ratio were 9.5 and <0.1 respectively.

Conclusions: Our findings suggest that FA-PPP could be useful in reducing exposure to anti-MRSA drugs in patients with late HAP/VAP. However, further studies assessing the impact of such test on therapeutic management and patient outcome are needed.

Abstract 1079

ETEST Eravacycline for antimicrobial susceptibility testing of Enterobacteriaceae and Enterococcus spp.: performance results from a multi-centre study

Laurine Blanchard*1, Thomas Armstrong1, Denys Gerald1, Yun Ying2, Michael Kresken1,6, Jessica Carpenter3, Veronique Sauvonnet1, Gilles Zambardi2

1bioMérieux, bioMérieux, Marcy-l’Étoile, France, 2BioMerieux Inc., Hazelwood, United States, 3Indiana University School of Medicine, Indianapolis, United States, 4med fusion, Lewisville, United States, 5Antimicrobials Intelligence GmbH, Rheinbach, Germany, 6Rheinische Fachhochschule Köln gGmbH, Cologne, Germany, 7bioMérieux, La Balme-les-Grottes, France

**Background:** Eravacycline (XERAVATM), a fluorocycline antibiotic developed by Tetraphase Pharmaceuticals Inc. for the treatment of complicated intra-abdominal infections. This study evaluated the performance of ETEST® Eravacycline (ERV), a new gradient diffusion strip, for determining the minimum inhibitory concentration (MIC) of Enterobacteriaceae, Enterococcus faecalis and Enterococcus faecium as compared to CLSI/ISO-20776-2 broth microdilution reference method (BMD).

**Materials/methods:** A set of 679 isolates including 542 Enterobacteriaceae, 137 Enterococci was tested at 4 clinical trial sites using ETEST® ERV and BMD. Results were analyzed for essential (EA) and category (CA) agreements, major (ME) and very major (VME) error rates using EUCAST breakpoints (E. coli: ≤ 0.5 [S], > 0.5 [R] mg/L, Enterococcus spp.: ≤ 0.125 [S], > 0.125 [R] mg/L) as well as FDA breakpoints (Enterobacteriaceae: ≤ 0.5 mg/L [S], Enterococcus faecium and Enterococcus faecalis: ≤ 0.064 mg/L [S]). Results for Klebsiella pneumoniae were analyzed for EA only for EU claim as EUCAST breakpoints have not been established.

**Results:** Results are summarized in the table below. ETEST® ERV performance for Enterobacteriaceae and Enterococcus spp. met FDA and ISO acceptance criteria for EA (≥ 90%), CA (≥ 90%), ME (≤ 3%) and VME (≤ 2 or ≤ 3% respectively). A trend to over-estimate E. coli, C. freundii and K. aerogenes MICs was observed.

**Conclusions:** Results of this study support the accuracy of ETEST® ERV for determining MICs of Enterobacteriaceae, and Enterococcus spp. As such, the ETEST® ERV is considered as substantially equivalent to BMD.

Abstract 1080

**Metagenomic sequencing of urine to differentiate infected from contaminated samples**

Gail Hayward*1, A. Sarah Walker1, Tim Peto1, Dona Foster1, David Eyre1, Teresa Street1, Nicholas Sanderson1, Leanne Barker2, Gillian Rodger1, Derrick Crook1, Martin Llewelyn3

1University of Oxford, Oxford, United Kingdom, 2University of Warwick, Warwick, United Kingdom, 3Brighton and Sussex Medical School, Brighton, United Kingdom

**Background:** Culture-based diagnostics for urinary tract infection are neither sensitive nor specific. Currently, bacterial growth in urine is semi-quantified and interpreted using thresholds defined over fifty years ago. In reality culture yield depends on patient characteristics and sample handling, and is biased towards easily culturable organisms. Culture is slow, yielding results after treatment decisions. Contamination of urine by perineal flora results in both false-negative and false-positive results. Up to 50% of urines yield ‘mixed growth of uncertain significance’ (MGUS). Metagenomic DNA sequencing could potentially give rapid and unbiased assessment of bacterial DNA in urine.

**Materials/methods:** The CONDUCT trial collected samples from >1000 women with UTI symptoms. We selected 184 urines yielding pure growth (PG) in culture (>10^5 organisms/ml) (n=34), no significant growth (NSG) (n=34) or MGUS (n=116) and compared culture findings with analysis of Illumina HiSeq metagenomic sequencing data and Centrifuge taxonomic classification.

**Results:** The taxonomic profiles of PG and NSG urines were strikingly different (figure). In all 25 PG urines with cultures containing coliforms or Proteus, reads mapping to Enterobacteriaceae or Morganellaceae families respectively predominated, and accounted for >90% of bacterial reads in 20/25. Among nine PG urines yielding Gram-positive organisms, reads mapping to the corresponding family only predominated in four. Among NSG urines, bacterial reads mostly mapped to common perineal commensals; the commonest family usually accounted for a minority of total reads. A single family predominated in 7/34 NSG urines: Enterobacteriaceae [3], Bifidobacteriaceae [3] and Pseudomonadaceae [1]. Bifidobacteriaceae reads represented Gardnerella spp. which is not identified by urine culture. Among MGUS urines, both profiles were apparent. In 33/116, >90% of reads mapped to Enterobacteriaceae, Staphylococcaceae or Enterococcaceae. In 26/116, the commonest family accounted for only 10% of reads; these were typically common perineal commensal families.

**Conclusions:** Our data provide proof-of-principle that the diversity and identity of bacteria present in urine revealed by metagenomic sequencing can differentiate infected from contaminated samples. Our findings highlight how this approach can now be developed through optimizing sample processing and taxonomic classification.

**Figure**

**Abundance and taxonomic classification of the commonest bacterial family present in 184 urines analyzed by Illumina HiSeq metagenomic sequencing.**

In vitro activity of ceftazidime/avibactam against ceftazidime-resistant Enterobacterales and Pseudomonas aeruginosa from hospitalised patients in Germany: 2016-17

Michael Kresken*1,2; Miriam Korte-Berwanger2,3; Niels Pfennigwerth4; Sören G. Gatermann4

1Antiinfectives Intelligence GmbH, Rheinbach, Germany; 2Rheinische Fachhochschule Köln GmbH, Cologne, Germany; 3Landeszentrum für Gesundheit Nordrhein-Westfalen, Bochum, Germany; 4Ruhr-University Bochum, German National Reference Centre for Multidrug-Resistant Gram-negative Bacteria, Bochum, Germany

Abstract third-party references: On behalf of the Working Party "Antimicrobial Resistance" of the Paul-Ehrlich-Society for Chemotherapy

Background: The combination of ceftazidime plus avibactam (CTV) possesses potent activity against Gram-negative bacteria (GNB) including multi-drug resistant pathogens producing class A (ESBLs, KPCs and others), class C (AmpC), and various class D (including OXA-48) β-lactamas. CTV, however, is not active against Metallo-β-lactamase (MBL)-producing GNB. The purpose of this study was to evaluate the in vitro activity of CTV against ceftazidime (CTZ)-resistant Enterobacteriales (CTZ-R-ENT) and CTZ-resistant Pseudomonas aeruginosa (CTZ-R-PAE), including carbapenem-resistant isolates.

Materials/methods: Susceptibility testing was performed with the broth microdilution method according to the standard ISO 20776-1. EUCAST clinical breakpoints (v.9.0) were applied for interpretation of MICs: S-susceptible, standard dosing regimen; I-susceptible, increased exposure; R-resistant). Phenotypic detection of ESBLs in ENT was performed according to the EUCAST algorithm. Genetic testing on carbapenemases was performed at the German National Reference Centre for Multidrug-Resistant Gram-negative Bacteria.

Results: 1621 ENT and 575 PAE collected at 22 laboratories were tested. There were 232 (14.3%) CTZ-R-ENT (MIC>4 mg/l) and 72 (12.5%) CTZ-R-PAE (MIC>8 mg/l). 119/304 (39.1%) isolates were obtained from intensive care patients. Of the CTZ-R-ENT, 117 group 1 isolates and seven group 2 isolates with an inducible chromosomal AmpC showed an ESBL-phenotype. 23/232 (9.9%) CTZ-R-ENT had meropenem MICs >0.125 mg/l. A carbapenemase was detected in six CTZ-R-ENT, namely in Citrobacter freundii (VIM-1), Enterobacter cloacae (OXA-48), Escherichia coli (NDM-5), Klebsiella oxytoca (VIM-4), and Klebsiella pneumoniae (n=2, VIM-like). Of the 72 CTZ-R-PAE, 24 were carbapenem-susceptible (imipenem MIC≤4 mg/l; meropenem MIC≤8 mg/l), 17 were additionally resistant to one carbapenem, and 31 were additionally resistant to both imipenem and meropenem. Carbapenemases were detected in 12 CTZ-R-PAE: VIM-like (n=6), IMP-like (n=3), GIM-1 (n=2) and NDM-like (n=1). Susceptibility to CTV (MIC≤8 mg/l) was observed in 226/232 (97.4%) CTZ-R-ENT, 226/227 (99.6%) non-MBL-producing CTZ-R-ENT, 55/72 (76.4%) CTZ-R-PAE, and 55/60 (91.7) non-MBL-producing CTZ-R-PAE. Number and percent CTV-susceptible and CTV-resistant isolates for various subgroups of CTZ-R-ENT and CTZ-R-PAE are presented in the Table.

Conclusions: Overall, >99% and about 92% of the non-MBL-producing CTZ-R-ENT and CTZ-R-PAE, respectively, from hospitalized patients in Germany were CTV-susceptible. Based on these findings, CTV represents a valuable option for targeted treatment of infections caused by these pathogens.

Table: Number and percent ceftazidime/avibactam susceptible (CTV-S) and resistant (CTV-R) isolates for various subgroups of ceftazidime-resistant Enterobacterales (CTZ-R-ENT) and P. aeruginos (CTZ-R-PAE)

Effectiveness of IV fosfomycin in critically ill patients with CRE infection and analysing the impact of variables on mortality in Indian setting

Saiprasad Patil* 1, Prachee Sathe 2, Ajay Bulle 3, Siddharth Shah 4, Sagar Bhagat 1, Hanmant Barkate 1

1Glenmark Pharmaceuticals Limited, Mumbai, India, 2Ruby Hall Clinic, Pune, India, 3Meditrina Institute of Medical Sciences, Nagpur, India, 4Bhatia Hospital, Mumbai, India

Abstract third-party references: Glenmark Pharmaceuticals Ltd.

Background: Though clinical evidence on usage of fosfomycin in CRE infections is promising its limited. We intent to observe the clinical outcome with fosfomycin and also to check the impact of variables amongst survivors and non survivors.

Materials/methods: Multicentric retrospective study conducted among critically ill patients with CRE infection treated with IV fosfomycin. Patient’s medical records analyzed and important variables like mechanical ventilation, mental status, fosfomycin dose and duration, along with CCI, Pitts and INCREMENT score were compared between survivors and non-survivors.

Results: Among 51 critically ill CRE infection patients, successful clinical outcome was observed in 47% patients. Klebsiella was the most common (74.5%) organism and septic shock (41.2%) was the most common clinical diagnosis. Underlying bacteremia was present in 88.2% of the patients. Mean dose of fosfomycin was 13.2 g/d (±3.12, Range: 8-24 g/d) administered for mean duration of 6.7 days (±5.93, Range: 3-39 days). Pitt score was significantly higher among non-survivors (5.44 ± 2.33 vs. 4.36 ± 2.16, p=0.04), however no significant difference was seen in CCI (p=0.22) and INCREMENT score (p=0.1) among survivors and non-survivors. Septic shock was the only factor associated with significant (0.008) impact on the survival. Overall mortality was 35.2%.

Conclusions: IV Fosfomycin therapy was associated with good (64.7%) overall survival in CRE infections in critically ill patients. Presence of septic shock significantly impacted the mortality. Such association was lacking for other variables in our study.

Abstract 1095

**Methicillin-resistant* Staphylococcus aureus* USA300 persister cells show chaperone upregulation in contrast to planktonic cells and the biofilm phenotype**

Jelle Vlaeminck*1, Basil Britto Xavier1, Qiang Lin1, Sarah De Backer1, Henri De Greve2,3, Samir Kumar-Singh1,4, Herman Goossens1, Surbhi Malhotra-Kumar1

1University of Antwerp, Laboratory of Medical Microbiology, Vaccine & Infectious Disease Institute, Antwerp, Belgium, 2Vrije Universiteit Brussel, Structural Biology, Brussels, Belgium, 3Vrije Universiteit Brussel, Structural & Molecular Microbiology, Structural Biology Research Center, Brussels, Belgium, 4University of Antwerp, Molecular pathology group, Laboratory of Cell Biology & Histology, Antwerpen, Belgium

**Background:** Bacteria produce biofilms – bacterial communities embedded in an extracellular matrix that protects the organisms from antibiotics and the host immune response – and persisters (PS) – cells that neither grow nor die in the presence of bactericidal agents, thus exhibiting multidrug tolerance. We developed distinct models to isolate PS and biofilms formed by methicillin-resistant* Staphylococcus aureus* USA300 (MRSA-USA300), a highly virulent clone that causes fulminant infections. Here, we compared the transcriptomic profiles of MRSA-USA300 biofilms and PS against planktonic (PL) cells.

**Materials/methods:** MRSA-USA300 biofilm was grown in brain heart infusion (BHI) medium with 0.1% glucose under static conditions for 24h, 48h and 72h. PS were isolated by treating a 16h stationary phase culture with 5 µg/ml ciprofloxacin for 24h. Samples were taken at 0h, 0.5h, 1h, 2h, 4h, 6h, 8h and 24h, washed and plated for viable cell count. As a comparator, PL cultures were generated in parallel in both cases. Total RNA-extraction (MasterPure™ Complete DNA/RNA Purification Kit, Lucigen), rRNA depletion (Ribo-Zero rRNA Removal Kit (Gram-Positive Bacteria), and RNA-seq (NextSeq, Illumina) were performed on all samples. Differential-gene-expression analysis was performed using DESeq2 with log2 fold change (FC) > 1 or < -1 and p≤0.05 considered significant.

**Results:** MRSA-USA300-PS were successfully generated after 24h ciprofloxacin treatment, typified by a biphasic killing curve (Figure A). Components of chaperone-complex dnaK-dnaJ-grpE and complementary genes clpB and tig showed significant upregulation (log, FC: 2.47, 2.08, 3.15, 2.14 and 1.32 respectively) in PS compared to PL (p≤0.001). In contrast, significant downregulation of said genes, except tip (p>0.05), was observed in biofilm (log, FC: -2.72, -1.13, -1.95 and -3.10 respectively) compared to PL (p≤0.024) (Figure B). In addition, chaperone-complex groEL-groES gene showed significant upregulation in PS (log, FC: 1.70 and 2.70 respectively; p≤0.001) and again contrasting significant downregulation in biofilm (log, FC: -2.01 and -1.98 respectively; p≤0.004) compared to PL (Figure C).

**Conclusions:** Our data shows that MRSA-USA300-PS upregulate chaperone-complexes, in contrast to the biofilm phenotype, as was previously suggested for *E. coli* PS. Upregulated chaperone expression aids in preventing protein misfolding and aggregation under stress conditions. Increased activity would also lead to ATP-depletion, a known feature of PS.
Biphasic killing curve of MRSA-USA300 treated with 5 µg/ml ciprofloxacin

A

B Differential expression dnaK-dnaJ-grpE-clpB-tig in biofilm and PS compared to PL

C Differential expression groEL-groES in biofilm and PS compared to PL

Figure: A) When treating MRSA-USA300 with 5µg/ml ciprofloxacin, the killing curve has a biphasic nature. The susceptible cells die faster in the earlier stages of antibiotic treatment whilst the killing plateaus at 6-8h indicating that, at this stage, only PS form a major part of the bacterial population. 0h equals start of antibiotic treatment of a 16h stationary culture. B) Differential expression analysis of dnaK-dnaJ-grpE-clpB-tig shows significant upregulation (log_2 FC > 1; green) in PS compared to PL but contrasting downregulation (log_2 FC < -1; red) in biofilm compared to PL. tig did not show significant differential expression in biofilm (white). (dnaK: Chaperone protein DnaK – dnaJ: Chaperone protein DnaJ – grpE: Nucleotide exchange factor GrpE – clpB: Chaperone protein ClpB – tig: Trigger factor Tig) C) Additionally, differential expression analysis of groEL-groES shows significant upregulation (log_2 FC > 1; green) in PS compared to PL but contrasting downregulation (log_2 FC < -1; red) in biofilm compared to PL.

Abstract 1096

Antimicrobial prophylaxis administration after umbilical cord clamping in caesarean section does not increase risk for surgical site infection: a prospective analytic study with 55,901 patients

Rami Sommerstein*1, Jonas Marschall1, Andrew Atkinson1, Daniel Surbek1, Maria Dominguez2, Nicolas Troillet3, Andreas F. Widmer4

1Bern University Hospital, Bern, Switzerland, 2Rutgers State University, New Brunswick, United States, 3Valais Hospital, Central Institute, Sion, Switzerland, 4Basel University Hospital, Basel, Switzerland

Background: The World Health Organization (WHO) recommends administration of surgical antimicrobial prophylaxis (SAP) in cesarean section prior to incision to prevent surgical site infections (SSIs), including endometritis. However, SAP may disrupt the developing neonate’s gastrointestinal microbiome if given before umbilical cord clamping.

Materials/methods: Analytic study within the Swiss national SSI surveillance system, from 2009 to 2018. Multicenter study including patients from 178 hospitals. We included all cesarean section patients that were given the SAP agents cefuroxime, cefazolin, amoxicillin/clavulanate or ceftriaxone, either within 60 minutes before incision or after clamping. Data of the 30 day post-discharge follow-up was available in 89%. We assessed the association between SAP administration relative to incision and clamping and the SSI rate, using generalized linear multilevel models, adjusted for patient characteristics, procedural variables, and health-care system factors.

Results: A total of 55,901 patients met the criteria: SAP was administered before incision in 26,405 patients (47.2%) and after clamping in 29,496 patients (52.8%). Overall 846 SSIs were documented, of which 379 (1.6% [95% CI, 1.4-1.8%]) occurred before incision and 449 (1.7% [1.5-1.9%]) after clamping (p=0.759). The adjusted odds ratio (OR) for SAP administration after clamping was not significantly associated with an increased SSI rate (1.14, 95% CI 0.96-1.36; p=0.144) when compared to before incision. Supplementary and subgroup analyses supported these main results.

Conclusions: The results of this large prospective study provide strong evidence that the risk of SSI for the mother in cesarean section is not increased if SAP is given after umbilical cord clamping compared to before incision. Given the latest research on the potentially detrimental effects of early-life antimicrobial exposure, guidance from WHO and other national organisations should reflect this.

Figure: Unadjusted generalized additive model with surgical site infection as the dependent variable and timing relative to incision as the predicting variable

**Abstract 1098**

**Laser light scattering technology in the diagnosis of infections in children on dialysis**

Liubov Boronina*¹, Elena Samatova²

¹Ural state medical University, , Yekaterinburg, Russian Federation, ²Regional Children Clinical Hospital, Yekaterinburg, Russian Federation

**Background:** to assess the possibility of using laser light scattering technology for the diagnosis of infections in children on dialysis.

**Materials/methods:** From January to September 2019, 148 samples, 106 urine and 42 dialysates, were examined from 115 children from the nephrological Department with a chronic renal failure diagnosis.

Dialysate samples were analyzed both by classical culture method on blood-serum agar, thioglycol and two-phase medium and by ALIFAX HB&L LIGHT analyzer (Alifax, Italy) based on laser light scattering technology inoculating 500 µl of the sample into specific enriched broth vials.

Native urine samples, detected positive by ALIFAX HB&L LIGHT analyzer with cutoff of 10E3 CFU/ml, were cultured on blood agar by the Eisenberg method

**Results:** A complete agreement within the 2 methods was found in 42 dialysate samples: 38 negative (90.5%) and 4 positive (9.5%) results.

A pyogenic coccus *Staphylococcus aureus* with a count of 10E4 CFU/ml was detected in two different specimens and in a wound drainage sample cultured along with peritoneal catheter outlet, where *S. aureus* was isolated in moderate growth.

*Corynebacterium sp.* was one of the dialyzates isolated, it belongs to the skin biota and represents a potential contaminant during sample collection.

Polymicrobial culture was detected from one patient, including *E. coli*, *Candida sp.*, *S. haemolyticus*. The latter two are skin and mucous normobiota that could contaminate the sample or colonized the peritoneal catheter.

After three hours’ incubation using alternative technology, a negative result was obtained for 81 urine samples (76.4%), and a positive result for 25 samples (23.5%). Enterobacterales were identified in 39.3% (*E. coli, M. morganii, C. amalonaticus, E. cloacae*), non-fermenting gram-negative bacteria in 14.3% (*P. aeruginosa, R. picketi, Oligella sp.*), Enterococcus sp. in 21.4%, coagulase-negative staphylococci in 10.7% (*S. haemolyticus, S. epidermidis*), *S. viridans* in 7.1%, *C. albicans* and *Corynebacterium sp.* in 3.6%.

**Conclusions:** In our workflow, the data on the absence bacteriuria in urine is received by the physician within 3-4 h allowing a better management of young patients and avoiding unnecessary use of antibiotics in 2/3 cases. Moreover, the system is highly sensitive detecting minimum bacterial concentration in small amount of sample.

Abstract 1103

Improved molecular diagnosis of dermatomycosis
Livia Berlinger*, Renate Lombriser¹, Arlette Gisler², Stanislava Steiner², Sigrid Pranghofer¹, Martin Altwege²

¹Bioanalytica AG, Microbiology, Lucerne, Switzerland

Background: PCR is more sensitive than culture and microscopy for the detection of dermatophytes in clinical specimens. However, most assays focus on the detection of the entire group and few important species. We have evaluated the EuroAssay Dermatomycosis, a commercially available test permitting detection and identification of a large number of dermatophyte species and a few other fungi relevant in dermatomycosis.

Materials/methods: A total of 206 clinical specimens (124 nail, 78 skin and 4 hair specimens) from patients with suspected dermatomycosis were included in the study. Specimens were analyzed by microscopy, culture and PCR (EuroAssay Dermatomycosis; Euroimmun). For molecular detection, DNA was extracted with the EZ1Tissue Kit (Qiagen) after overnight incubation in ATL buffer (Qiagen) containing proteinase K. Amplification, hybridization and read-out was according to the instructions of the manufacturer. Fungal species were categorized in three groups A to C based on their clinical significance (true pathogen, possible pathogen, no pathogen). Specimens were grouped accordingly considering the fungal species with the highest significance only.

Results: Group A and group B organisms were found by culture and PCR in 42 and 9, by PCR only in 43 and 22, and by culture only in 4 and 1 specimens, respectively. Thus, PCR detected significantly more group A (85 versus 46) and group B organisms (31 versus 10) than culture. The concordance of species identification by culture and PCR was 100% for the 51 specimens categorized into the same group (A or B) by both methods. Additional organisms of equal or lower significance were found by culture (N=2), PCR (N=6) or both (N=4). Microscopy was positive in 35/42 (83.3%) of specimens with group A organisms detected by culture and PCR and was negative in 82/85 (96.5%) specimens without clinically significant organism (group C).

Conclusions: The Euroimmun assay is significantly more sensitive than culture and microscopy and provides accurate species identification. Microscopy may be especially helpful when PCR detects possibly pathogenic organisms.

Abstract 1106

**Human papilloma virus-testing in extragenital samples: usefulness and importance of complete genotyping**

Andrea García Caballero*1, Mario Rodríguez1, Rafael Canton Moreno2, Juan Carlos Galán1, Beatriz Romero1

1Hospital Ramón y Cajal, Madrid, Spain, 2Hospital Universitario Ramón y Cajal, Madrid, Spain

**Background:** Human papillomavirus (HPV) infection outcomes range from benign to malignant processes. The correlation between cervical cancer and HPV infection is almost complete, but the impact of HPV infection in the development of tumours in other human anatomical sites (such as anal or head-neck) appears to be slightly lower. There is a growing interest to evaluate the relationship between the presence of HPV in extragenital sites and the development of cancerous processes. However, routine systems for cervical cancer screening are not useful for detection of all HPV-types, especially in extragenital samples.

**Materials/methods:** All extragenital samples tested for HPV from September 2017 to October 2019 in a tertiary hospital in Madrid (Spain) were reviewed. DNA extraction from biopsies was performed using Wizard® SV Genomic DNA Purification System (Promega) and HPV-typing using HPV Direct Flow Chip Kit (Master Diagnóstica). This assay detects 18 high-risk or putative high-risk genotypes (hrHPV) and 17 low-risk genotypes (lrHPV). Demographics and clinical information of the patients were also reviewed.

**Results:** 39 extragenital samples from 35 patients (median age 56.5 years, interquartile range: 37.5-67.5 years; 63.6% males) were analyzed. Most common type of samples were laryngeal biopsy (n=18, 46.2%), pleural biopsy (n=7, 17.9%) and mediastinal adenopathy (n=5, 12.8%). Other 9 samples were recovered from very diverse sites (including 5 oral cavity and 2 skin biopsies). Seventeen samples yielded a positive result (43.6%), but only in 6 of them, hrHPV were detected: HPV-16 in five cases (29.4%) and HPV-58 in one (5.9%). Among them, five cases corresponded to five distant metastases (one pulmonary and four mediastinal adenopathies) from cervical cancer (HPV-16 in four cases and HPV-58 in one). Besides, HPV-16 was detected in a pleural biopsy, being the same HPV-type previously detected in the primary amygdala epidermoid carcinoma. The remaining positive results were lrHPV: 8 HPV-6 (47.1%) and 3 HPV-11 (17.6%), all detected in laryngeal samples.

**Conclusions:** The hrHPV detected in extragenital samples corresponded to distant metastases, suggesting viral dissemination from primary cervical or head-neck carcinoma. The implementation of the nonavalent vaccine could avoid these cases, because all HPV-genotypes detected are included in this vaccine.

Abstract 1108

Reduced in vitro killing of methicillin-resistant *Staphylococcus aureus* blood culture isolates by vancomycin as the bacterial inocula increases

Amal Alsaeed1, Joe Rubin1, Stephen Sanche1,2, Harry Deneer2, Joseph Blondeau*1,2

1University of Saskatchewan, Saskatoon, Canada, 2Royal University Hospital, Saskatoon, Canada

**Background:** MRSA blood stream infections (with or without endocarditis) and other serious life threatening infections require prompt and adequate therapy. Vancomycin remains a drug of choice for treating MRSA infections including bacteremia, however, failures necessitating different drugs (i.e. ceftaroline/ceftobiprole, linezolid, daptomycin) are becoming more common. We had previously reported mutant prevention concentration (MPC) values for vancomycin against MRSA strains of ≥32 µg/ml. In an attempt to determine if higher MPC values could impact bacterial activity, we compared killing of MRSA by vancomycin at 4 different drug concentrations and against increasing bacterial densities.

**Materials/methods:** Four unselected MRSA strains were exposed to 4 different vancomycin drug concentrations [minimum inhibitory concentration (MIC), MPC, maximum serum concentration ([Cₘ₃₅; 20 µg/ml]), maximum tissue concentration (Tissue-max; 10 µg/ml)] and the log₁₀ reduction and percent kill of viable cells recorded at 0.5, 1, 2, 4, 6, 12 and 24 hours after drug exposure against bacterial densities ranging from 10⁶-10⁹ colony forming units per milliliter (cfu/ml). Measurements at each time point were in triplicate and results averaged.

**Results:** The MIC/MPC values for the 4 strains were 1/≥32, 0.5/16, 0.5/4 and 1/2. MIC and MPC drug concentrations were poor at killing over all inocula tested. At the 10⁶ cfu/ml density a 1.9 and 3.7 log₁₀ reduction was seen at 12 and 24 hours respectively for the Cₘ₃₅ drug concentration which decreased to a 0.7 and 2.4 log₁₀ reduction at the 10⁷ inocula and growth at the 10⁸ and 10⁹ cfu/ml inocula. For the Tissue-max drug concentration, a 2.1 and 3.3 log₁₀ reduction was seen following 12 and 24 hours of drug exposure at the 10⁶ cfu/ml inocula, a 0.5 and 1.8 log₁₀ reduction at the 10⁷ cfu/ml inocula and growth or a 0.09 log₁₀ reduction at the 10⁸ and 10⁹ cfu/ml.

**Conclusions:** Patients are infected with higher bacterial densities than used in MIC susceptibility testing. Determining antimicrobial activity against higher bacterial densities is essential. As bacterial densities increased, the bacterial activity of vancomycin decreased. Such a finding is a concern for vancomycin therapy where higher bacterial burdens may be present and could explain vancomycin failures.

**Added value of throat and perineal *Staphylococcus aureus* screening, in addition to nasal screening, for identifying patients at risk of *S. aureus* surgical site infection**

1 University Medical Center Utrecht, Julius Center for Health Sciences and Primary Care, Utrecht, Netherlands, 2 AstraZeneca, Microbial Sciences, BioPharmaceuticals R&D, Gaithersburg, United States, 3 Boehringer Ingelheim Pharmaceuticals, Ridgefield, United States, 4 University of Antwerp, Laboratory of Medical Microbiology, Vaccine and Infectious Disease Institute, Antwerp, Belgium, 5 University Medical Center Freiburg, Institute for Medical Biometry and Statistics, Freiburg, Germany, 6 University of Geneva Hospitals and Faculty of Medicine, Infection Control Programme; Service of Infectious Diseases, Geneva, Switzerland, 7 University Medical Center Utrecht, Department of Medical Microbiology, Utrecht, Netherlands, 8 Amphia Hospital, Breda, Netherlands

Abstract third-party references: This research project receives support from the Innovative Medicines Initiative Joint Undertaking under grant agreement n° 115523, 115620, 115737 resources of which are composed of financial contribution from the European Union Seventh Framework Programme [FP7/2007-2013] and EFPIA companies in kind contribution.

**Background:** Nasal carriage of *Staphylococcus aureus* (SA) increases the risk of surgical site infection (SSI). In centres with pre-operative SA decolonization protocols, it is a common practice to screen the nose only. The aim of this analysis was to estimate the added value of screening the throat and the perineum, in addition to the nose, for identifying patients at risk of SA SSI.

**Materials/methods:** We analysed preliminary data from a prospective observational cohort study conducted at 33 European hospitals (ASPIRE-SSI). Adult patients undergoing surgical procedures were screened pre-operatively in the nose, throat and perineum. All SA colonized (at any of three body sites) and a sample of non-colonized subjects were enrolled into the study cohort in a 2:1 ratio, and followed for 90 days after surgery. Two weighted multivariate mixed-effect logistic regression models, including common risk factors for SSI and a random intercept for hospital, were developed: nasal-only colonization (n-model) or any of the three body sites (ntp-model). The predictive performance of the two models was compared by estimating the area under the receiver operating characteristic curve (AUC), adjusted for the sampling design.

**Results:** We included 3039 SA carriers of whom 72 (2.4%) developed SA-SSI. 2360 SA carriers were positive in the nose (of whom 62 [2.6%] developed SA-SSI) and 679 were negative in the nose and positive in the throat and/or perineum (of whom 10 [1.5%] developed SA-SSI). Out of 6205 non-carriers from the source population, we included 1470 (23.7%) who served as controls (of whom 12 [0.8%] developed SA-SSI). Taking into account the sampling of controls, the sensitivity of the screening increased from 51.7% in the n-model to 60.0% in the ntp-model, while the specificity decreased from 73.9% to 66.3%. The prediction models yielded an AUC of 0.74 (95%CI: 0.67-0.81) in the n-model and 0.74 (95%CI: 0.67-0.81) in the ntp-model.

**Conclusions:** Extending SA pre-operative screening to throat and/or perineum led to identification of 679 additional at-risk subjects (29% increase) and 10 additional SA-SSI episodes in this at-risk group (14% increase), suggesting a potential benefit when implemented in clinical practice.

Background: In high-income countries, respiratory syncytial virus (RSV) contributes significantly to morbidity in children, placing a substantial burden on the health system. The development of an RSV vaccine has been identified as a public health priority. More data are needed by policy-makers to understand the burden of RSV throughout the lifespan, but particularly among children in order to help identify priority populations as vaccines are developed and licensed.

Materials/methods: We used population-based health administrative data to calculate rates of RSV hospitalizations in children born between May 2009 and June 2015 in Ontario, Canada. Children were followed until their first RSV-hospitalization, death, 5th birthday, or the end of the study period (June 2016). RSV hospitalizations across the province were identified with a validated algorithm using international classification of diseases 10th revision (ICD-10) codes and/or laboratory-confirmed outcomes collected from a subset of hospitals. We calculated hospitalization rates by various characteristics of interest, including finely-stratified age groups, sex, and comorbidities, overall and by gestational age. We also examined RSV hospitalizations by calendar month in order to understand temporal trends, including for individual age groups.

Results: The overall hospitalization rate for children <5 years was 4.2 per 1,000 person-years (PY) with a wide range across age groups [from 0.52 per 1,000PY in children aged 36-59 months to 29.6 per 1,000PY in children aged 1 month]. Rates of RSV hospitalization were higher in males compared to females [4.7 and 3.7 per 1,000PY, respectively] and in children who were born at a younger gestational age [ranging from 3.9 in those born at ≥37 weeks to 23.2 per 1,000PY in those <28 weeks]. For all age groups, rates were highest between December and March; however, there was substantial variation within age groups by calendar month, with the highest risk of RSV-hospitalization in those who were 1 month of age in February (Figure 1).

Conclusions: Our results reiterate the high burden of RSV hospitalization and highlight young infants at increased risk, including with respect to seasonality. These results may help inform current and future prevention efforts.

Figure 1. Rate of RSV hospitalization by age group and calendar month

Fitness cost of mgrB alterations in carbapenem-resistant *Klebsiella pneumoniae* isolates from Moscow

Olga Shamina*1, Olga Kryzhanovskaya1, Anna Lazareva1, Nikolay Mayanskiy2

1National Medical Research Center for Children’s Health, Moscow, Russian Federation, 2Russian Children Clinical Hospital, Pirogov Russian National Research Medical University, Moscow, Russian Federation

**Background:** Several mechanisms of resistance to colistin have been described in *Klebsiella pneumoniae*. One of them includes chromosomally encoded alterations in MgrB, which lead to lipopolysaccharide modification. To assess the impact of this colistin resistance mechanism on the bacterial fitness, we analyzed growth capacity among colistin-susceptible (Col-S) and colistin-resistant (Col-R) *K. pneumoniae* and performed competitive growth experiments.

**Materials/methods:** Colistin susceptibility among carbapenem-resistant (Carba-R) *K. pneumoniae* collected from patients at ICUs in Moscow was determined using the broth microdilution method. In Col-R (MIC >2 mg/L) isolates, the structure of mgrB was detected using the Sanger sequencing. Growth rates were determined by OD600 measuring for 15 hours every 30 minutes. The fitness of Col-R isolates was assessed against a Col-S strain using a competitive growth assay. Exponentially growing cells of Col-R and Col-S strains were mixed in a 1:1 proportion and grown in Luria-Bertani (LB) broth for 18 h. After incubation, the mixture was directly plated onto LB agar plates with or without 10 mg/L of colistin. The competitive index (CI) was calculated as a ratio between the number of Col-R and Col-S colonies.

**Results:** Among 22 Carba-R *K. pneumoniae*, 16 and 6 isolates were Col-R and Col-S, respectively. Colistin MICs of Col-R strains ranged from 16 to 1024 mg/L. In 8 Col-R isolates, the following mgrB alterations were detected: [1] IS*Kpn14*, IS*1A*, and IS*1R* (n=2, n=1 and n=1, respectively; IS1 family); [2] IS*Kpn26* and MITE*Kpn1* (n=1 and n= 2, respectively; IS5 family); [3] mgrB deletion (n=1). Eight Col-R carried a wild-type mgrB. Growth rates of Col-S and Col-R isolates did not differ significantly. Competitive co-culturing experiments demonstrated that 15 of 16 (94%) isolates carrying disrupted or wild-type mgrB displayed similar CIs, which were below 1 ranging from 0.01 to 0.3. One Col-R isolate with wild-type mgrB exhibited the equal fitness with the Col-S isolate (CI=1). Thus, 15 of 16 Col-R *K. pneumoniae* demonstrated a reduced fitness (CI<1) comparing to the Col-S strain.

**Conclusions:** Although colistin resistance did not affect the growth rates, the vast majority of Col-R *K. pneumoniae* demonstrated a reduced fitness (irrespective of the mgrB status) in competitive experiments.

Abstract 1119

Inhibitory effect of whole blood on the antiseptic action of E-101 solution, a myeloperoxidase-mediated formulation, compared to conventional wound cleansers

Gerald Denys*, Jessica Carpenter1, Robert Allen2, Jackson Stephens, Jr.3

1Indiana University School of Medicine, Indianapolis, United States, 2Creighton University Medical Center, Omaha, United States, 3Exoxemis, Inc., Little Rock, United States

Background: E-101 Solution (E-101) is a myeloperoxidase-mediated antimicrobial wound wash for physical irrigation, cleansing, and moisturizing of open wounds. It is composed of porcine myeloperoxidase (pMPO), glucose oxidase (GO), in an aqueous vehicle and activated by the addition of glucose. Once activated, hydrogen peroxide (H₂O₂) is produced in situ by GO dehydrogenation of glucose and reduction of oxygen. The MPO-catalysed oxidation of chloride ion by H₂O₂ generates hypochlorous acid (HOCl). Once generated, HOCl reacts in a diffusion-controlled reaction with a second H₂O₂ molecule to yield singlet oxygen. We evaluated the effect of blood on the performance of E-101 and three commercially available wound cleansers comprised of stabilized organic derivatives of HOCl.

Materials/methods: Antiseptics were tested against Escherichia coli ATCC 8739, Pseudomonas aeruginosa ATCC 9027, Staphylococcus aureus ATCC 6538, Candida albicans ATCC 10231, and Aspergillus braziliensis ATCC 16404 in accordance with the antimicrobial effectiveness test USP-51. Comparative antiseptics included Vashe (SteadMed), Microcyn (Oculus Innovative Sciences), and NeutroPhase (NovaBay Pharmaceuticals, Inc.). All antiseptics were tested in the absence and presence of 1, 2, and 5% whole human blood. Time kill studies were also performed with E-101 solution against P. aeruginosa ATCC 27853, S. aureus ATCC 43300, E. coli ATCC 25922, and Candida auris CDC B11903 in absence and presence of 2, 5, 10, and 20% blood.

Results: In the USP-51 test, E-101 demonstrated >2-log₁₀ reduction against bacterial and fungal isolates in the presence of 5% blood at day 14 and day 28. With the exception of NeutroPhase vs S. aureus, all comparative antiseptics demonstrated <2-log₁₀ reduction in the presence of 5% blood at days 14 and 28. Time kill results for E-101 against E. coli and P. aeruginosa showed a >5-log₁₀ reduction in the presence of 2, 5, 10 and 20% blood; for S. aureus a >5-log₁₀ reduction in the presence of 2% and 5% blood; for C. auris a >5-log₁₀ reduction in the presence of 2% blood.

Conclusions: E-101 remains active in the presence of blood containing catalase and other competitive substances. In contrast, comparative antiseptics with the active component HOCl were easily inactivated by the presence of blood.

Hershey Medical Center, Hershey, United States, \(^13\) Nationwide Children’s Hospital, Columbus, United States, \(^14\)Children’s Hospital Los Angeles, Los Angeles, United States, \(^15\)Primary Children’s Hospital, Salt Lake City, United States, \(^16\)bioMérieux, Centre Christophe Mérieux, Grenoble, France

**Background:** Bone and Joint Infections (BJIs) present with non-specific symptoms that may include pain, swelling, and fever and are associated with high morbidity and significant risk of mortality. BJIs can be caused by a variety of bacteria and fungi, including anaerobes and microorganisms that can be challenging to culture or identify by traditional microbiological methods. Clinicians currently rely primarily on culture to identify the pathogen(s) responsible for infection. The BioFire® FilmArray® Bone and Joint Infection (BJI) Panel (BioFire Diagnostics, Salt Lake City, UT) was designed to detect 15 gram-positive (seven anaerobes) and 14 gram-negative bacteria (one anaerobe), two yeast, and eight antimicrobial resistance (AMR) genes from synovial fluid specimens in about an hour. The objective of this study is to evaluate the performance of an Investigational Use Only (IUO) version of the BioFire BJI Panel compared to various reference methods.

**Materials/methods:** Remnant synovial fluid specimens, which had been collected for routine clinical care at 13 study sites in the US and Europe, are undergoing testing using an IUO version of the BioFire BJI Panel. Performance is determined by comparison to Standard of Care (SoC) testing consisting of bacterial culture at each study site (performed according to each site's routine procedures).

**Results:** To date, 336 specimens (out of an anticipated 1,500) have been collected and tested with the panel. The majority are from knee joints (71.7%) and arthrocentesis (86.6%) is the most common collection method. Compared to SoC culture, overall sensitivity is 90% and specificity is 99.8%. Testing is ongoing.

**Conclusions:** The BioFire® BJI Panel is a sensitive, specific, and robust test for rapid detection of a wide range of analytes in synovial fluid specimens. The number of microorganisms and resistance markers included in the BioFire BJI Panel, together with a reduced time-to-result and increased diagnostic yield compared to culture, is expected to aid in the timely diagnosis and appropriate management of BJIs.

*Data presented are from assays that have not been cleared or approved for diagnostic use.*

Abstract 1129

**National ambulatory care prescribing of oral antibiotics and prevalence of inappropriate prescribing in the United States, 2009 to 2016**

Eric Young* 1, Alexander Yap 1, Rupesh Panchal 1, Kelly Reveles 1

1 The University of Texas at Austin - College of Pharmacy (PHR), UT Health San Antonio, San Antonio, United States

**Background:** Antibiotic resistance is a global public health issue. A significant proportion of antibiotic use occurs in the outpatient setting for conditions not commonly caused by bacterial pathogens. Despite initiatives to decrease inappropriate antibiotic use, it is unclear how national prescribing rates have changed in recent years. This study aimed to describe outpatient antibiotic prescription trends and evaluate changes in inappropriate prescribing in the United States (U.S.) over an eight-year period.

**Materials/methods:** This was a cross-sectional study using the Centers for Disease Control and Prevention’s National Ambulatory Medical Care Survey (NAMCS) from 2009 to 2016. All patient visits were eligible for inclusion. Antibiotic use was defined by at least one oral antibiotic prescription during the visit as identified by Multum code(s). Patient visits were categorized by health care provider, geographic regions within the U.S., and season. International Classification of Diseases, 9th Revision, Clinical Modification (ICD-9-CM) codes were used for survey years 2009 to 2015 and ICD-10 codes were used for 2016. Appropriate, possibly appropriate, and inappropriate antibiotic use were defined by the patient’s ICD codes during their visit. Lastly, baseline characteristics were compared between visits involving receipt of an antibiotic and those that did not utilizing chi-square or Wilcoxon rank-sum tests where appropriate.

**Results:** A total of 7 million visits were included for analysis, of which 793,415,182 (11.3%) included an antibiotic. Prescribing rates were relatively stable over the study period, ranging from 102.9 to 124.9 prescriptions per 1000 visits; however, 2016 had one of the lowest prescribing rates (107.7 prescriptions per 1000 patient visits). The most commonly prescribed antibiotic class was macrolides (25 prescriptions per 1000 visits). The South region and winter season had the highest antibiotic prescription rates (118.2 and 129.7 prescriptions per 1000 visits, respectively). Of patients that received an antibiotic, 55.9% were classified as inappropriate use, 8.4% had an appropriate indication, and 35.7% had a possibly appropriate indication.

**Conclusions:** There was no significant reduction in outpatient antibiotic prescribing rates among outpatients in the U.S. from 2009 to 2016 and inappropriate antibiotic prescribing was common. Further public health campaigns are warranted to promote outpatient antimicrobial stewardship programs.

Comparison of multidrug-resistant *Salmonella enterica* serovar I 4,[5],12:i:- and *Salmonella enterica* serovar Typhimurium isolated from swine in the USA

Selma Gonzalez*1, Keri Norman1, Roger Harvey1, H. Morgan Scott3, Sara Lawhon3, Javier Vinasco3

1Texas A&M University - College of Veterinary Medicine, Veterinary Integrative Biosciences, College Station, United States, 2United States Department of Agriculture - Agricultural Research Sciences, College Station, United States, 3Texas A&M University - College of Veterinary Medicine, Veterinary Pathobiology, College Station, United States

**Background:** The Centers for Disease Control and Prevention has reported an increase in multi-drug resistant (MDR) *Salmonella enterica* serovar I 4,[5],12:i:-, which has been increasingly isolated from swine and pork products. *Salmonella I 4,[5],12:i:-* is antigenically similar to *Salmonella enterica* serovar Typhimurium yet lacks the phase 2 flagellar antigen; thus, is referred to as monophasic *Salmonella Typhimurium*. The overall objective of this study is to determine and compare phenotypic and genotypic traits of monophasic and biphasic *Salmonella Typhimurium* isolated from swine head trim and cheek meat collected from a pork processing plant in the United States.

**Materials/methods:** Phenotypic antimicrobial susceptibility patterns were identified by broth microdilution on a Sensititre® system. Bacterial growth curves were determined using a BioScreen C under different concentrations of enrofloxacin, tetracycline, ceftiofur, and ciprofloxacin; growth curves were analyzed using a 4-parameter Gompertz-model in Stata® to evaluate bacterial fitness. Motility and biofilm assays were used to assess swimming and swarming and biofilm production capabilities between monophasic and biphasic Typhimurium strains. Whole genome sequencing was performed on an Illumina MiSeq and Oxford Nanopore MinION to detect resistance genes, plasmids, and point mutations. Whole-genome alignment was performed to detect differences in the phase 2 flagellar antigen region using Geneious Software.

**Results:** Phenotypic and genotypic analyses confirmed all 47 *Salmonella I 4,[5],12:i:-* isolates were MDR, 45 displaying the common ASSuT phenotype and 2 the SSuT phenotype, while 44 displayed the ASSuT genotype. Thirty-seven also harbored the plasmid-mediated quinolone resistance gene, qnrB. There was no fitness cost to *Salmonella I 4,[5],12:i:-* harboring the qnrB, *bla*CMY and *tet* genes. There were no significant differences between *Salmonella I 4,[5],12:i:-* and *Salmonella Typhimurium* swarming motility. However, the swimming motility *Salmonella Typhimurium* was greater over a period of 18 hours. Further analyses of bacterial growth curves, motility and biofilm assays, whole-genome alignment, and hybrid assembly between MinION and Illumina reads are ongoing.

**Conclusions:** This study is important to determining the pathogenicity traits of MDR *Salmonella I 4,[5],12:i:-* in order to develop mitigation strategies and prevent this serovar from dissemination into the food chain and ultimately aid in preventing salmonellosis linked to swine and pork products.

Effectiveness and safety of aminoglycosides for the empirical treatment of patients with upper urinary tract infection

Meital Elbaz1, Hila Zadka2,3, Ahuva Weiss-Meilik2,3, Ronen Ben-Ami4,5

1Tel Aviv Sourasky Medical Center, Internal Medicine, Tel Aviv-Yafo, Israel, 2Tel Aviv Sourasky Medical Center, Tel Aviv-Yafo, Israel, 3Tel Aviv Sourasky Medical Center, Data Science and Quality Division, Tel Aviv-Yafo, Israel, 4Tel Aviv Sourasky Medical Center, Infectious Diseases Unit, Tel Aviv-Yafo, Israel, 5Tel Aviv University, Sackler Faculty of Medicine, Tel Aviv-Yafo, Israel

Background: Aminoglycosides have favorable urinary tract pharmacokinetics and in vitro activity against uropathogens, but their use is limited by concerns over nephrotoxicity. We implemented an institutional program to promote aminoglycosides as initial empirical treatment of patients with upper urinary tract infection (UTI).

Materials/methods: We reviewed the records of patients with upper UTI at the Tel Aviv Medical Center from January 2017 to April 2018. The primary outcome was death within 30 days of index culture. Initial treatment with an aminoglycoside was compared to non-aminoglycoside antibiotics. Propensity score matching was performed to adjust for between-group differences in baseline covariates.

Results: The study cohort included 2,026 patients, 715 treated with aminoglycosides and 1,311 treated with non-aminoglycoside drugs; 589 patients (29%) were bacteremic. Treatment with aminoglycosides was associated with a higher likelihood of in vitro activity against clinical isolates (odds ratio, 2.0; P <0.001). Death at 30 days occurred in 55 (7.6%) versus 145 (11%) of patients treated with aminoglycosides and non-aminoglycoside drugs, respectively (adjusted hazard ratio, 0.78; P =0.013). Aminoglycosides were non-inferior to comparator drugs in all patient subgroups, stratified according to age, glomerular filtration rate, bacteremia, hemodynamic shock and infection with 3rd generation cephalosporin-resistant Enterobacterales. Aminoglycosides were associated with significantly shorter hospital stay, fewer days of antibiotic treatment, and lower rates of readmission within 90 days. The rate of acute kidney injury was similar for aminoglycosides and comparators (2.5% versus 2.9%, respectively; P =0.6).

Conclusions: Within the context of an institutional program, initial empirical treatment of upper UTI with aminoglycosides was associated with higher rates of appropriateness and lower overall mortality compared to non-aminoglycoside drugs, without excess nephrotoxicity.

Background:

Mucormycosis is a clinically heterogenous invasive mycosis that can affect a broad population of human hosts. Incidence and associated patient risk factors vary significantly across geographical locations. IsraMOLD is an ongoing prospective multicenter laboratory-based survey of invasive mold disease in Israel. We report on the microbiological and clinical characteristics of mucormycoses identified in IsraMOLD.

Materials/methods:

Clinical filamentous fungal isolates were collected at 10 medical centers throughout Israel [7 tertiary and 3 community hospitals]. Clinical data were collected prospectively by researchers at each center. Isolate identification and drug-susceptibility testing were performed at a central reference laboratory. Mucorales species were identified by sequencing the internal transcribed spacer (ITS) and large subunit (LSU) ribosomal DNA segments.

Results:

363 mold isolates were collected from 1/2015 to 9/2019. Of these, 63 isolates (17%) were Mucorales, second only to Aspergillus species (236 isolates, 65%). 46 isolates (73%) represented invasive infection; neutropenia, stem cell transplantation and high-dose corticosteroid treatment were associated with invasive mucormycosis, whereas structural lung disease was associated with colonization. Median patient age was 49 years [range 1-87 years]; 8 (17%) were aged under 18 years. Predominant risk factors were hematologic malignancy (15 patients, 32%), stem cell transplantation (24%), corticosteroids (24%), diabetes mellitus (21%), and trauma (8.7%). The frequent species were Rhizopus [n=26], Lichtheimia [n=12] and Mucor [n=6]. Pulmonary mucormycosis was associated with hematologic malignancy and corticosteroid treatment, rhino-orbital mucormycosis was associated with hematologic malignancy and Rhizopus species, and soft tissue mucormycosis with trauma, Lichtheimia and Mucor species. Sixteen patients [34%] died within 30 days, similar to other invasive molds [logrank P=0.34]. Death was associated with pulmonary disease, stem cell transplantation, GVH and corticosteroids. Surgery, performed in 28 patients [60%], was not associated with increased survival rate.

Conclusions:

The annual incidence of mucormycosis in Israel was 1.5 per million population, high compared to other surveys. Hematologic malignancy emerged as the predominant risk factor. Mortality rate was similar to that of other invasive mycoses, possibly reflecting improvements in the diagnosis and pharmacotherapy of mucormycosis.

Evaluation of the accuracy of the panel for antimicrobial susceptibility testing of Enterobacteriaceae and carbapenemase detection

Hanwool Cho1,2*, Yeon-Joon Park1,2, Jungok Kim1, Jieun Choi1,2, Sungil Ha2, Youngjong Cha2

1Catholic University of Korea, Seoul, South Korea, 2Seoul St. Mary’s hospital, Seoul, South Korea

Background: The recent spread of carbapenemase-producing organisms (CPO) is a global threat. Carbapenem resistance in Enterobacteriaceae can be mediated by extended-spectrum beta-lactamase (ESBL) or AmpC beta-lactamase production in combination with decreased permeability or by carbapenemase production. In 2017, the Phoenix™NMIC-500 panel was launched. In this study, we evaluated the accuracy of antimicrobial susceptibility testing (AST) of Phoenix™NMIC-500 against Enterobacteriaceae.

Materials/methods: A total of 239 isolates were tested. They consisted of 47 CPO, 45 non-carbapenemase-producing carbapenem-resistant Enterobacteriaceae (non-CP-CRE), 47 ESBL-producing Enterobacteriaceae with ciprofloxacin MIC ≤1mg/L, 49 ESBL-producing Enterobacteriaceae with ciprofloxacin MIC ≥2mg/L, and 51 non-ESBL-producing Enterobacteriaceae. Bacterial isolates were subcultured on sheep blood plate and were tested for imipenem, meropenem, ertapenem, amikacin, gentamicin, ciprofloxacin, fosfomycin, ceftazolin, ceftriaxone, nitrofurantoin with Phoenix™NMIC-500. As a reference method, broth microdilution was performed for all antibiotics tested except fosfomycin, for which agar dilution method was performed according to CLSI M07. The rate of category agreement (CA), very major error (VME), major error (ME), minor error (MinE) were calculated. We also evaluated the detection of ESBL and carbapenemase of the panel compared with the PCR results for ESBL and carbapenemase genes.

Results: The CA and error rates are described in the Table. In general, CA was >90% for all antibiotics tested. The ciprofloxacin CA of ESBL-producing Enterobacteriaceae with ciprofloxacin MIC ≤1mg/L and ≥2mg/L are 66.0%, 100%, respectively. The sensitivity and specificity of ESBL detection are 71.1% (69/97), 98.0% (50/51), respectively, and those of carbapenemase detection are 97.9% (46/47), 82.9% (160/193), respectively. Most (30/35) of isolates giving false-positive CPO results were non-CP-CRE. The rate of correct classification of CPO was 85.1% (40/47).

</tbody>
</table>

Conclusions: The Phoenix™NMIC-500 panel could provide alternative AST result to the reference method, except ciprofloxacin, especially in Enterobacteriaceae with low MICs. The detection of ESBL showed low sensitivity and CPO showed low specificity.

Abstract 1142

Comparative variant analysis of *Aspergillus fumigatus* genomes for identification of novel mutations in candidate genes possibly be involved in mediation of azole resistance

Birgit Spiess*, Tobias Boch, Maximilian Mossner, Daniel Nowak, Julian Skladny, Cornelia Lass-Flörl, Oliver Bader, Thomas Miethke, Jörg Steinmann, Peter-Michael Rath, Anne Dietz, Natalia Merker, Verena Nowak, Wolf-Karsten Hofmann, Dieter Buchheidt

1University Hospital Mannheim, Heidelberg University, Department of Hematology and Oncology, Mannheim, Germany, 2Queen Mary University of London, Barts Cancer Institute, Evolution and Cancer Laboratory, London, United Kingdom, 3Medical University of Innsbruck, Institute of Hygiene and Medical Microbiology, Innsbruck, Austria, 4University Medical Center Göttingen, Institute for Medical Microbiology, Göttingen, Germany, 5University Hospital Mannheim, Heidelberg University, Institute of Medical Microbiology and Hygiene, Mannheim, Germany, 6Medical Center Nuremberg, Private Medical Paracelsus University, Institute of Clinical Hygiene, Medical Microbiology and Clinical Infectiology, Nuremberg, Germany, 7University Hospital Essen, Institute of Medical Microbiology, Essen, Germany

**Background:** Invasive pulmonary aspergillosis (IPA) is a life-threatening infectious disease in immunocompromised patients. In view of characterization of azole resistance whole genome sequencing (WGS) of *Aspergillus fumigatus* specimens was performed with the aim to identify novel genetic alterations leading to resistant phenotypes.

**Materials/methods:** In total, twenty-four *A. fumigatus* isolates from immunocompromised patients were investigated composed of 20 azole resistant and four susceptible samples. WGS was performed using the Illumina next generation sequencing (NGS) system. Results were mapped against the *A. fumigatus* AF293 genome followed by Burrows-Wheeler-Aligner (BWA) based sequence alignment. After variant calling by the use of GATK Haplotype caller, the annotation of variants was performed by implementation of SnpEff and programs based on annotation information provided by the *Aspergillus* genome database.

**Results:** Inspection of the small variant annotation revealed known mutations in the *cyp51A* gene for 11 out of the 20 resistant isolates. The TR46/Y121F/T289A variant was detected in five, the TR34/L98H alteration in two samples. With focus on further members of the ergosterol biosynthetic pathway, mutations in the genes *Hmg1* and *Erg6* were identified. Concerning *Hmg1*, two different mutations located in the sterol sensing domain were detected in two samples. In one sample a mutation in the HMG-CoA reductase domain was found. Three *Erg6* missense variants have been identified in five samples all negative for *cyp51A* mutations. Twenty-seven mutations have been found in the transmembrane transporter *abcA* gene, one missense mutation in the *mdr1* gene was detected in one sample. Missense mutations in the putative ABC multidrug transporter *sitT* have been found in 12 of the resistant strains.

**Conclusions:** Pending further validation in a larger cohort, on protein level and *in vivo*, the WGS of the genomes of azole resistant *A. fumigatus* strains identified several candidate genomic alterations that might pinpoint alternative pathways to acquisition of resistance, independent of the previously described *cyp51A* mutations. The discovery of previously undescribed resistance pathways in fungal strains might aid in identifying suitable biomarkers for effective clinical and epidemiological surveillance. The study was supported by a scientific grant from Gilead Sciences, Germany.

Phylogenetic analysis of complete genomes reveals the circulation of multiple lineages of rabies lyssavirus in India
Harsha Pulleri Kandi Anuraj*, Chitra Pattabiraman1, Gowri Yale2, Anita Mahadevan1, Reeta S Mani1

1National Institute Of Mental Health and Neurosciences, Bangalore, India, 2Mission Rabies, Goa, India

Background: Rabies is fatal zoonotic encephalitis caused by viruses of the Lyssavirus genus, in the family Rhabdoviridae. About 60,000 people die of rabies world-wide every year; India accounts for almost a third of this global burden. Most studies on the phylogenetic analysis/molecular epidemiology of RABV reported from India are based on partial gene sequencing, with only a single report of a complete RABV genome. Further molecular epidemiological and phylogenetic analysis of full-length genomes provide more accurate and precise information compared to partial gene sequences. It is in this context that metagenomic sequencing of rabies infected human and canine brains was carried out by MinION Oxford Nanopore (ONT), Oxford, UK.

Materials/methods: Extracted RNA from post-mortem human brain tissues from confirmed cases of rabies infection (n = 5) and brain tissue from laboratory confirmed canine rabies cases (n = 9) were subjected to metagenomics by protocol supplied by ONT. Fast5 files generated by MinION sequencing were base called, demultiplexed, trimmed, filtered and aligned to human and canine reference genomes. Unaligned reads were analysed further using Geneious Prime software. Mapping based assembly was done with rabies sequences and consensus sequences were submitted to Genbank. Phylogenetic analysis was done with using the maximum likelihood method. Model selection and tree building were carried out using iqtree and visualized in Figtree software.

Results: Full length genome of RABV was obtained in three canine and one human sample. Phylogenetic analysis revealed that RABV sequences from canine samples belonged to the Arctic like lineages and that from human brain sample clustered into the Cosmopolitan lineage.

Conclusions: Phylogenetic analysis of RABV whole genome sequences revealed circulation of two different lineages of RABV in India. Therefore extensive molecular epidemiological survey using full genome sequences of ample number of samples would be useful to study the epidemiology and heterogeneity of circulating Rabies lyssavirus in India.

Abstract 1152

Efficacy of ceftazidime-avibactam for multidrug-resistant Gram-negative bacteria infections: a retrospective evaluation in a Belgian teaching hospital

Veronique Goncette¹, Nathalie Layios¹, Frederic Frippiat*¹

¹University Hospital of Liège, Liège, Belgium

Background: Ceftazidime/avibactam (CAZ/AVI) demonstrates in vitro activity against multidrug-resistant (MDR) Gram-negative bacteria, including KPC-producing Klebsiella pneumoniae (KPC-Kp) and extended-spectrum beta-lactamases (ESBL)-producing Enterobacteriaceae, but clinical data remain limited.

Materials/methods: We aimed to evaluate the CAZ/AVI use in our Belgian tertiary hospital, from December 2016 to October 2019. Patients with confirmed infections and local laboratory in vitro confirmed sensitive strains to CAZ/AVI (≤ 8mg/L) who received CAZ/AVI for ≥ 48h, either as intermittent infusion of 2,5g every 8 hours or as a 24-hour continuous infusion (CI), were included in our retrospective study. Dosage adjustments for renal impairment were taken into account as per manufacturer prescription. Each initiation of treatment was supervised by an infectious disease (ID) specialist.

Results: Thirty-three episodes of infections (EI) occurred in twenty-seven patients and were predominantly caused by KPC-Kp and Pseudomonas aeruginosa (62% and 23,5%, respectively) (Table 1). Complicated intra-abdominal infections (24%), ventilator-associated pneumonia and tracheobronchitis (30%) and complicated urinary tract infections (24%) were the most frequent sites of infection. Bacteremia occurred in 36% of cases. Sepsis and septic shock were present in 36 % and 9 % of cases, respectively. CAZ/AVI was initiated as a first antibiotic therapy in 14 EI (42%). Other antibiotics were prescribed in 58% of the remaining cases with a median duration of 5,5 days before initiation of CAZ/AVI. CAZ/AVI was used as monotherapy in 76 %. Clinical cure or improvement was achieved in 84 % and microbiological cure was observed in 69 % of EI respectively. Median duration of therapy was 11,5 days. Thirty days after the CAZ/AVI treatment onset, eight patients (30%) had died. Except for one patient, no death was directly attributed to infection. Emergence of CAZ/AVI resistance occurred in one patient but was deemed not clinically relevant. Interestingly, 10/33 EI (30%) were treated with CI and reached 70% and 86% of clinical and microbiological cure respectively.

Conclusions: In our cohort of difficult-to-treat infections due to multidrug-resistant Gram-negative bacteria with limited therapeutic options, CAZ/AVI was used predominantly as monotherapy, under ID supervision and allowed good clinical and microbiological outcome with relatively low short-term mortality including when administered as a CI.

Continuous infusion and outpatient parenteral antimicrobial therapy with ceftazidime-avibactam: evaluation of efficacy based on therapeutic drug monitoring

Veronique Goncette, Nathalie Layios, Frederic Frippiat

1University Hospital of Liège, Liège, Belgium

Background: Based on recent PK/PD evidence, continuous infusion (CI) of beta-lactam administration is increasingly recommended for serious infections. Since 2016, the combination of ceftazidime and avibactam (CAZ/AVI) is administered per manufacturer prescription as an intermittent infusion of 2.5g every 8 hours thus CI has not yet been evaluated in clinical trials.

Materials/methods: We aimed to evaluate the use of CI of CAZ/AVI in a retrospective case series, from December 2016 to October 2019. All isolates displayed in vitro susceptibility to CAZ/AVI in agreement with EUCAST breakpoint. Patients were initially given CAZ/AVI as CI of 5g q12h. CAZ/AVI dosages were adjusted according to therapeutic drug monitoring (TDM) of ceftazidime with a therapeutic goal of 4-5xT>MIC in the plasma and/or at the site of infection. The latter was extrapolated from plasma concentrations and literature data.

Results: CAZ/AVI was administered as CI in ten of thirty-three infectious episodes in twenty-seven patients treated with CAZ/AVI in our hospital. These infections were mainly caused by Pseudomonas aeruginosa (54.5%). Bacteremia occurred in 30% of cases and septic shock was only present in one patient. CAZ/AVI was used as monotherapy in 60% of cases. Clinical cure or improvement was achieved in 70% of cases and microbiological cure was achieved in 6/7 (86%) evaluable cases (Table 1). Thirty days after the CAZ/AVI treatment onset, two patients (20%) had died, with death possibly related to uncontrolled infection in one case. Three patients were discharged home with an outpatient parenteral antimicrobial therapy (OPAT). Based on repeated TDM (3.5 samples/patient), therapeutic goals were achieved in 100% of cases in plasma and 88% of cases at the site of infection (8/10 evaluable). CAZ/AVI looked stable for 12-hour infusions and no drug-related adverse events were noted.

Conclusions: Although the sample size was limited, our case series shows promising clinical results for CI of CAZ/AVI, including for OPAT. Based on repeated TDM, therapeutic goals were achieved in 100% of cases in plasma. CAZ/AVI looked stable for 12-hour infusions and no drug-related adverse events were noted.

Transmission dynamics of multidrug-resistant Escherichia coli sequence type 131 in the community

Yin Mo1,2,3,4, Matthew Moore2, Kithalakshmi Vignesvaran3, Wesley Yeung1, Siyu Peng1, Enying Tan1, Melissa Chua4, Lingyue Zhou1, Ivan Seah1, Paul Tambyah1,4

1National University Hospital, Singapore, Singapore, 2University of Oxford, Nuffield Department of Medicine, Oxford, United Kingdom, 3Mahidol Oxford Tropical Medicine Research Unit, Bangkok, Thailand, 4National University of Singapore, Singapore, Singapore

Background: E. coli sequence type (ST) 131 is a predominant cause of community-onset extended-spectrum beta-lactamase-producing Enterobacteriaceae bloodstream infections globally.

Materials/methods: We performed a prospective study from February 2017 to November 2018 to investigate E. coli ST131 transmission dynamics in Singaporean households. We enrolled hospitalized patients with E. coli infections and screened their clinical isolates with qPCR. Families of index participants with E. coli ST131 infections and non-ST131 infections were further consented for a household transmission study. We modelled the transmission dynamics using a multistate model.

Results: One-hundred and thirty participants were enrolled. They contributed 635 stool samples at 2- to 6- week intervals, 200 food and environmental samples. The specimens yielded 6571 isolates (up to 12 E. coli isolates per sample), 7.9% (516/6571) of which were tested positive for E. coli ST131 via qPCR. All but two ST131 positive samples were human stools [one raw chicken and one toilet swab]. During the year of follow-up, 52% (67/130) participants carried E. coli ST131 on at least once occasion and 85% (29/34) of families had at least one family member carrying ST131. The estimated probability for any individual to become colonized with E. coli ST131 in one year was 81% (95% CI 76-85%). The estimated duration of carriage in individuals is 68 days per year. Carriage of E. coli ST131 was strongly associated with the presence of a high-density carrier in the same family [an individual with any stool sample containing ST131 in >20% of all E. coli isolates]. Comorbidities and prior hospital admissions were not associated with carriage. Index patients infected with ST131 had significantly longer mean duration of carriage [137 days vs 21 days] and at higher densities [20% vs 6%] compared to those infected with non-ST131 E. coli. Whole genome sequencing of the ST131 isolates suggest high within-host diversity with multiple lineages of ST131 and repeated acquisition/ decolonization episodes within host across time points and between family members.

Conclusions: There is a high prevalence of E. coli ST131 in the Singapore community where transmission is largely through human-to-human contact particularly in families with high density carriers as ‘reservoirs’.

Abstract 1160

**Streptococcal and Staphylococcus aureus prosthetic joint infections: are they really different?**

Yousra Kherabi*, Valérie Zeller¹, Y. Kerroumi¹, Vanina Meyssonnier¹, Beate Heym¹, Olivier Lidove¹, Simon Marmor¹

¹Hopital de la Croix Saint-Simon, Paris, France

**Background:** Streptococci are the second most frequent bacteria isolated in prosthetic joint infections (P JIs) after staphylococci. Only few studies, including a small number of patients, compared streptococcal and staphylococcal P JIs. The objective of our study was to compare characteristics and outcomes of streptococcal and methicillin-susceptible *S. aureus* (MSSA) P JIs.

**Materials/methods:** Monocentric cohort study including all monomicrobial streptococcal and MSSA prosthetic knee (KP JIs) and hip (HP JIs) infections managed in our reference center from 01/2010 to 07/2017. We compared epidemiological data of the population, PJI type and outcome according to the medico-surgical strategy. The following events were noted: reinfection including relapse with the same and new infection with different bacteria, PJI-related and non-related death. Patients were followed for at least 2 years.

**Results:** Two hundred twenty-three P JIs, 91 streptococcal and 132 MSSA, developing on 92 knees and 131 hips, in 209 patients, were included. Comparison between the 2 groups (streptococci vs MSSA) showed that streptococcal PJI patients were older (77 vs 74 years, p=0.031), had more frequently cancer (10% vs 2%, p=0.016) and developed more frequently hematogenous acquired P JIs (88% vs 48%, p=0.0001). Surgical strategies did not differ between groups: debridement and implant retention (DAIR) (17/91 vs 29/132, p=NS), exchange arthroplasty (50/91 vs 84/132, p=NS).

At 2 years, all medico-surgical strategies taken together, reinfection rates were higher in the MSSA group (figure). Reinfection rates after DAIR (n=44) were higher in the MSSA group (2/15 vs 13/29, p=0.032), but not different after exchange arthroplasty (n=129) (5/50 vs 6/79, p=NS). Prolonged suppressive antibiotic therapy (n=33) was more commonly used in the streptococcal group (21/86 vs 12/123, p=0.002). Relapses were higher in the MSSA group (1/21 vs 4/13, p= 0.004).

**Conclusions:** Streptococcal compared to MSSA P JIs showed different characteristics and outcomes. Patients were older, had more frequently cancer, and PJI spread more frequently via the hematogenous way. Outcome after DAIR or suppressive antibiotic therapy was better, but no difference was observed after prosthesis exchange.

ESBL-producing Escherichia coli causing community-onset bloodstream infection and the association of bacterial clones and virulence genes with septic shock

Inga Fröding*1,2, Badrul Hasan1, Isak Sylvin1, Pontus Naucler4,5, Christian Giske1,2

1 Karolinska Institutet, Department of Laboratory Medicine, Stockholm, Sweden, 2 Karolinska University Laboratory, Department of Clinical Microbiology, Stockholm, Sweden, 3 Science For Life Laboratory, Stockholm, Sweden, 4 Karolinska Institutet, Department of Medicine, Stockholm, Sweden, 5 Karolinska University Hospital, Stockholm, Sweden

Background: Bloodstream infections (BSI) due to extended-spectrum β-lactamase-producing Escherichia coli (ESBL-EC) are an important cause of morbidity and mortality. The relative influence of host immunocompetence versus microbiological virulence factors (VF) in the acquisition and outcome of BSI is poorly understood.

Materials/methods: Whole genome sequencing was used on 278 blood culture isolates of ESBL-EC from 260 patients with community-onset infection collected during 2012-2015 in Stockholm, Sweden. Patient data was collected from medical records. The association of 108 virulence genes (26 operons), sequence types and antimicrobial resistance (ResFinder v2.1) to severity of disease and source of infection was assessed with multivariable logistic regression. SNP-phylograms were obtained with Enterobase.

Results: Results are shown in Figure 1. The fluoroquinolone-resistant high-risk clone ST131 subclade C2 comprised 30% and the emerging clone ST1193, 2%. Risk factors remaining in the final multivariable model for association with septic shock/short-term mortality had the following odds ratios (95% confidence intervals) and p-values: patient history of hematologic cancer/transplantation: 10.8 (95%CI 3.2-36.6), p<0.001, reduced daily living activity: 3.8 (1.4-9.9), p=0.007, infection source urinary tract infection (UTI)/prostate biopsy: 0.3 (0.1-0.9) p=0.026, presence of the E. coli VF iss (increased serum survival) 5.5 (1.3-22.8), p=0.019, multidrug-resistance 0.3 (0.1-0.9), p=0.019 and pap 0.2 (0.1-0.6), p=0.004. Adhesins, particularly pap, were associated with UTI-derived BSI, while isolates from post-prostate biopsy BSI had low overall virulence, low adhesin occurrence and commonly belonged to ST131 subclade C1, ST131 subclade A/B, ST1193 and ST648. ST131 was associated with recurrent episodes and repeated isolates from the same patient were often closely related.

Conclusions: ST131 subclade C2 was the dominating clone in community-onset ESBL-EC BSI in Stockholm. Detection of iss in the E. coli-isolate was associated with septic shock in immunocompetent patients and ISS could be a potential target for anti-virulence treatment.
Figure 1. Maximum likelihood SNP-phylograms with data on patient history, outcome, virulence operons, phenotypic AST and resistance genes. Reference genome EC958 was used for SNP-mapping. The tree scale is number of substitutions per site. Patient isolates and reference genomes shown A) ST131 (n=121) B) Other STs (n=139). SNP: Single nucleotide polymorphism. AST: Antimicrobial susceptibility testing. Cx: Clonal complex.

Abstract 1164

Persistent human papilloma virus type 16 infections in an established cohort of Slovenian women

Tina Triglav*, Lea Hošnjak1, Anja Oštrbenk1, Mario Poljak1

1University of Ljubljana, Faculty of Medicine, Institute of Microbiology and Immunology, Ljubljana, Slovenia

Background: Human papillomavirus (HPV) variants are associated with viral persistence and development of cervical cancer. The objective of our study was to determine and evaluate viral variants in paired HPV16-positive cervical smear samples, obtained at two sampling points (initial and after three years) from women aged 20-64, who were included in the previously described cohort of Slovenian women, attending the routine organized cervical cancer screening program.

Materials/methods: The presence of high-risk HPV infections in baseline and follow-up cervical samples was evaluated using the RealTime High Risk HPV test (Abbott, Wiesbaden, Germany), which allows concurrent partial genotyping for HPV16 and HPV18. In paired samples of women, in whom the presence of HPV16 was found in both samples, the complete long control genomic region (LCR) was amplified using the previously described conventional in-house PCR with g16f-7122/g16r-913 primers, and subsequently Sanger sequenced on the ABI3500 Genetic Analyzer (Thermo Fischer Scientific, Waltham, MA, USA). The obtained nucleotide sequences were edited and compared to HPV16 reference isolates using the Vector NTI Advance v11 software (Invitrogen, Carlsbad, CA) and phylogenetic relationships were inferred from the maximum likelihood tree, obtained based on the MAFFT alignment of eligible nucleotide sequences.

Results: At baseline, 160/4,432 (3.6%) women were HPV16 DNA positive. Of these 160 samples, 104 follow-up samples were available, of which 36 (34.6%) were HPV16-positive. Due to degradation of extracted DNA, further three samples were excluded from subsequent analyses. In available 33 paired cervical samples, identical HPV16 LCR viral variants were identified, suggesting the presence of persistent HPV16 infections. Using phylogenetic analyses, all HPV16 viral variants, obtained from samples of Slovenian women, clustered to the European HPV16 lineage (A).

Conclusions: Identical HPV16 LCR viral variants were found in all 33 paired cervical smears and all identified viral variants clustered to the European HPV16 lineage (A), confirming a significant burden of persistent HPV16 infections in our cohort of Slovenian women.

**Comparison of the Accelerate Pheno rapid diagnostic system with standard of care for diagnosing Gram-negative bloodstream infections: bacterial identification, antimicrobial sensitivity and turnaround time**

Luke Blagdon Snell*¹², Jasper Vink¹², Lyndsay Rowley³, Tinuke Awokiyesi⁴, Andrew Taylor⁵, Robert Rusek⁴, Dakshika Jeyaratnam⁴, Simon Goldenberg¹²

¹Dept of Infection, Guy’s and St Thomas’ NHS Foundation Trust, London, United Kingdom, ²Centre for Clinical Infection & Diagnostics Research, King’s College London, London, United Kingdom, ³Viapath, London, United Kingdom, ⁴Department of Microbiology, King’s College Hospital NHS Foundation Trust, London, United Kingdom, ⁵Department of Medical Microbiology, St George’s Hospital, London, United Kingdom

**Abstract third-party references:** Accelerate Diagnostics Inc., AZ, USA

**Background:** The Accelerate Pheno system (AXDX) is a diagnostic assay providing rapid identification (ID) of bacteria and yeast from blood cultures, as well as phenotypic antimicrobial susceptibility testing (AST). This multicentre study evaluated the accuracy and rapidity of AXDX in characterising Gram-negative bloodstream infections (BSI) in comparison with standard of care (SOC).

**Materials/methods:** Positive blood cultures with Gram-negative bacteria from three hospital sites were processed in parallel using AXDX and SOC (MALDI-TOF for identification, VITEK2 for AST). ID discrepancies between AXDX and SOC were classified as either false positive or false negative. Categorical agreement (CA) occurred when AXDX and SOC had the same interpretation of susceptibility of the isolate/antibiotic combination. ‘Very major errors’ (VME) occur when AXDX reported susceptibility but SOC resistance. Multidrug-resistant organisms of interest (MOI) are those resistant to co-amoxiclav and gentamicin. Time difference to AST between AXDX and SOC was calculated for these MOI if patients were on inactive therapy as identified on chart review.

**Results:** 148 blood cultures were included. Of these, 141/148 (95.2%) had valid, reportable results on AXDX. 148 organisms were identified. 133/148 organisms were ‘on-panel’ Gram-negatives. AXDX identified 126/133 organisms correctly (sensitivity 93.3%). 1,128 Gram-negative probes were deployed with 4 false positive results giving a specificity of 1124/1128 (99.6%). From AST, CA was 94.9% (1,270/1,338). There were only 4 VME out of 262 resistant AST results. Turnaround time (TAT) for both ID and AST were calculated for AXDX and SOC. Timing data was available for 111/141 (78%) of blood cultures. Compared with SOC, AXDX gave an average reduction in ID TAT of 16.8 hours ([CI 15.1-18.4 hours, p<0.0001]) and an average reduction in AST TAT of 31.2 hours ([CI 29.9-32.5hrs, p<0.0001]).

There were 15 MOI. 9 of these patients were on inactive therapy, for whom AXDX gave an average time saving to AST results of 12hrs 04min.

**Conclusions:** AXDX provides accurate ID and AST for Gram-negative BSI, and has a significantly improved TAT that may optimise antimicrobial therapy.
Figure: Box plot of TAT for ID and AST from time of blood culture positivity (AXDX vs SOC)

Abstract 1171

Rapid identification of pathogens, antibiotic resistance genes and plasmids in blood cultures by nanopore sequencing

Arne T axt1,2, Ekaterina Avershina3, Stephan Frye4, Umaer Naseer5, Rafi Ahmad*3,6

1Oslo University Hospital, Oslo, Norway, Department of Microbiology, Division of Laboratory Medicine, Oslo, Norway, 2Inland Norway University of Applied Sciences, Department of Biotechnology, Hamar, Norway, 3Inland Norway University of Applied Sciences, Hamar, Norway, 4Oslo University hospital Ullevål, Oslo, Norway, 5Folkehelseinstituttet, Oslo, Norway, 6UiT The Arctic University of Norway, Tromsø, Norway

Background: Bloodstream infections (BSIs) and sepsis are major causes of morbidity and mortality worldwide. Blood-culture-based diagnostics usually requires 1-2 days for identification of bacterial agent and an additional 2-3 days for phenotypic determination of antibiotic susceptibility pattern. With the escalating burden of antimicrobial resistance (AMR) rapid diagnostics becomes increasingly important to secure adequate antibiotic therapy. Whole genome sequencing approaches offer a way to reduce clinical test turnaround times compared to conventional culture-based methods.

Materials/methods: We spiked eight blood cultures with blaCTX-M positive Escherichia coli and Klebsiella pneumoniae, mecA positive Staphylococcus aureus, or a combination of these, and incubated them until they were flagged as positive. We measured the DNA concentrations and extracted bacterial DNA for sequencing with nanopore. For real-time analyses we used (a) What’s In My Pot, Centrifuge and BLAST against the NCBI Prokaryotic RefSeq for identification of bacterial species; (b) BLAST search against CARD and ResFinder databases for identification of resistance genes; and (c) PlasmidFinder and BLAST searches against plasmid database for identification of plasmids. We verified our results through whole genome sequencing with short-read Illumina sequencing and hybrid assembly using nanopore and Illumina sequences.

Results: Identification of pathogens was possible after 10 minutes of real-time sequencing, and all predefined AMR-encoding genes and plasmids from the different culture experiments were detected within one hour. Furthermore, we demonstrate correct identification of plasmids and blaCTX-M subtypes using de novo assembled nanopore contigs. This proof-of-concept study represents a molecular approach to diagnosis of BSIs which can provide clinicians with detailed information on etiologic agent and AMR within four hours of a blood culture becoming positive. To our knowledge this is the first study applying nanopore sequencing to blood cultures for a rapid and comprehensive analysis of pathogens, plasmids and AMR-encoding genes.

Conclusions: We have shown that with a sequence-based approach to diagnostics it is possible to identify pathogens and specific AMR-encoding genes using raw nanopore sequencing data, obtained within four hours after a blood culture is flagged as positive by the incubation system. Results from this study hold great promise for future applications in clinical microbiology and for healthcare surveillance purposes.

Abstract third-party references: Funding: Innovative Medicines Initiative 2 Joint Undertaking under grant agreement No 777363. This Joint Undertaking receives support from the European Union’s Horizon 2020 research and innovation programme and EFPIA.

Background: DRIVE (Development of Robust and Innovative Vaccine Effectiveness) aims to establish a public-private platform to annually estimate brand-specific influenza vaccine effectiveness (IVE), in accordance with revised EMA guidance on influenza vaccines. IVE analyses and interpretation are conducted by public partners in the consortium.

Materials/methods: In 2018/19, four test-negative design (TND) studies in primary care (Austria, Italy, England), five TND studies in hospitals (Finland, Italy, Romania, Spain), and one register-based cohort study (Finland) were conducted. Case definitions were ILI, SARI and laboratory-confirmed influenza (LCI), respectively. Site-specific IVE estimates were centrally calculated and pooled through meta-analysis. Data cut-off was the end of influenza circulation at the study site level, or April 30, whichever occurred first.

Results: For the TND studies, 1897 LCI cases and 2570 controls from primary care and 1444 LCI cases and 3440 controls from hospitals were retained for analysis. Confounder-adjusted pooled IVE estimates against LCI for any vaccine were 48% (95%CI 0-78) and 38% (-65-81) in those <17 years (y) in primary care and hospital respectively, 45% (18-63) and 40% (2-63) in those 18-64y, and 18% (-85-71) and 27% (6-44) in those ≥65y. Sample size was still insufficient for reliable brand-specific estimates.

The register-based cohort study included 274,079 vaccinated person-years and 494,337 unvaccinated person-years, obtaining brand-specific IVE. Confounder-adjusted IVE estimates against LCI A, from out- and inpatients combined, were 36% (24-45) for Fluenz Tetra and 54% (47-62) for Vaxigrip Tetra in those <7y and 30% (25-36) for Vaxigrip Tetra in those ≥65y.

Conclusions: DRIVE is a growing new platform, that will expand to thirteen TND sites in 2019/20 and 2 register-based cohort sites. Sample size in future seasons is expected to increase, enabling the calculation of more brand-specific IVE estimates.

1University Hospital Antwerp, National Reference Centre for Enterococci, Edegem, Belgium, 2University of Antwerp, VAXINFECTIO, Antwerpen, Belgium, 3University Hospital Antwerp, Edegem, Belgium

Background: Vancomycin-resistant enterococci (VRE) are a major cause of nosocomial infections for which a only a few treatment options, like linezolid, remain. Linezolid-resistant enterococci (LRE) are still rare but require strict surveillance to identify emerging resistance mechanisms and clones. Linezolid resistance can result from mutational mechanisms [23S rRNA and/or ribosomal protein mutations] or resistance gene acquisition (cfr, cfr(B), optrA and poxT genes). The aim of this study was to investigate the mechanisms of linezolid resistance in Belgian LRE.

Materials/methods: Enterococci (n=2,836), including 2087 VRE, were submitted voluntarily to the Belgian Reference Centre for enterococci between 2013 and 2019. Susceptibility to linezolid was determined by MIC gradient testing according to EUCAST. Conventional PCR was applied for detection of cfr and optrA. WGS was performed on cfr/optrA negative LRE strains using Nextera XT (2 x250bp), MiSeq (Illumina Inc.). Spades v3.10 was used for genome assembly and LRE-finder 1.0 for detection of linezolid resistance mutations or genes. Susceptibility to tigecycline and daptomycin was tested by MIC gradient test for LRE that were also resistant to vancomycin (LVRE).

Results: 38 strains (31 clinical and 7 screening isolates) were identified as LRE (29 E. faecalis and 9 E. faecium) with linezolid MIC levels between 8 and 64 µg/ml (median 16µg/ml). 28/29 E. faecalis LRE were positive for optrA and 5/8 E. faecium LRE carried the G2576T 23S rRNA mutation (Table 1). cfr positive strains were not detected. Of the 8 LVRE (6 vanA and 2 vanB E. faecium strains), 2 were tigecycline resistant (MIC 0.5 µg/ml) and none were daptomycin resistant.

Conclusions: The majority of Belgian LRE are E. faecalis, in contrast to other countries where E. faecium LRE predominate. The linezolid resistance mechanisms in E. faecium LRE consisted of both chromosomal mutations and gene acquisition while E. faecalis LRE contained only transferable resistance determinants, predominantly optrA, which corroborates earlier findings on emerging optrA-mediated resistance.

1Nationwide Children’s Hospital, Columbus, United States, 2The Ohio State University Wexner Medical Center, Columbus, United States, 3The Ohio State University, Columbus, United States

Abstract third-party references: On behalf of the NO-MAS-R Study Group, Nationwide Children’s Hospital, The Ohio State University, Merck & Co. Inc

Background: Antimicrobial agents are the most prescribed medications in the NICU. Global assessment of all antimicrobial use provided to infants in the NICU and reasons for their use may inform future antimicrobial stewardship efforts.

Materials/methods: We conducted a prospective one-day (7/1/2019) global NICU point prevalence study of all antimicrobial use and obtained the following: NICU level, census, birth weight, gestational/postnatal age, diagnoses, culture results, antimicrobial therapy (reason for use; duration of therapy), antimicrobial stewardship program (ASP), and 30-day in-hospital mortality.

Results: 528 (27%; range, 0 to 100%) of 1927 infants in 71 NICUs (67, Level 3/4) from 26 countries (1, low; 12, middle; 13, high income; 5 continents) received at least one antimicrobial agent (91%, antibacterial; 19%, antifungal; 4%, antiviral). Of the 483 infants on antibiotics at a median postnatal age of 12 days (IQR, 4-33), their mean gestational age and birth weight were 32.6 ± 6 weeks and 1980 ±1017 grams, respectively. The most common reasons for receiving antibiotic therapy were rule-out sepsis (26%), “culture-negative” sepsis (16%), prophylaxis (15%), culture-positive infection (15%), and pneumonia (13%). The most frequently used antibiotics were ampicillin (40%), gentamicin (35%), amikacin (21%), vancomycin (15%), and meropenem (10%). For definitive treatment of presumed/confirmed infection, vancomycin (15%), amikacin (13%), and meropenem (10%) were the most prescribed agents. Planned duration of therapy was shorter (3 or 7 days) than actual treatment duration (7 to 14 days). Specifically, duration of antibiotic treatment for “culture-negative sepsis” was 7 days (IQR, 5-10 days) and for culture-positive sepsis was 11 days (IQR, 10-14 days; p-value=0.07). Mortality was 4.7%. 63% of the hospitals had an ASP, but among the 55% that had a NICU-specific ASP, antibiotic utilization rate was significantly lower than among those centers without an NICU-ASP (21% vs. 33%; p<0.01).

Conclusions: Ascertainment of overall antimicrobial use among NICU infants showed marked variability by NICU and country, with a single day prevalence of 27%. The majority of antibiotic use was in infants without a culture-confirmed infection. Duration of therapy was prolonged in most instances, and NICU-specific ASPs were associated with lower antibiotic utilization rates, suggesting the need for their implementation worldwide.

Abstract 1179

Non-lethal concentrations of ceftazidime and ceftazidime-avibactam select for multiple-resistant genotypes

Christopher Fröhlich*1, João Pedro Alves Gama2, Pål Johnsen2, Hanna-Kirsti S. Leiros1, Orjan Samuelsen1,2,3

1UiT The Arctic University of Norway, Department of Chemistry, Tromsø, Norway, 2UiT The Arctic University of Norway, Department of Pharmacy, Tromsø, Norway, 3University Hospital of North Norway, Norwegian National Advisory Unit on Detection of Antimicrobial Resistance, Tromsø, Norway

Background: Drug concentrations below the minimum inhibitory concentration (sub-MIC) resulting from environmental pollution or found in body compartments during therapy can select for antibiotic resistance. OXA-48, unlike other carbapenemases, exhibits negligible hydrolysis towards the cephalosporin ceftazidime (CAZ). Consequently, CAZ and the combination ceftazidime-avibactam (CAZ-AVI) are possible treatment options for infections caused by OXA-48-producers. Here, we show that exposure to sub-MIC concentrations of CAZ and CAZ-AVI selects for clinical resistance and variants of OXA-48.

Materials/methods: E. coli MG1655, harbouring a clinical blaOXA-48-carrying plasmid, was evolved (n=3) for 300 generations in the absence and presence of sub-MIC (0.25xMIC) concentrations of CAZ and CAZ-AVI. At every 50th generation, we determined the proportion of clones exhibiting lower susceptibility towards CAZ/CAZ-AVI and their MICs (broth microdilution). The allele frequencies of blaOXA-48 were identified at 50 and 300 generations using Sanger sequencing.

Results: Sub-MIC evolution using CAZ and CAZ-AVI selected for clones with decreased susceptibility already after 50 generations. No such clones were detectable without selective pressure during the whole evolution experiment, revealing at least a 10,000-fold difference in clones with reduced susceptibility between treatments. We determined the MICs of 50 clones every 50th generation. For CAZ, we found that at all times more than 50% of the tested clones (n=900) exhibited MICs above the clinical breakpoint, but did not show cross-resistance towards CAZ-AVI. For CAZ-AVI, one out of three populations displayed clones (n=18) at 50 generations with an up to 16-fold increase in the CAZ-AVI MICs. Sequencing of blaOXA-48 showed that resistance development towards CAZ-AVI was not due to mutations in blaOXA-48. However, all populations evolved in the presence of CAZ carried clones expressing variants of OXA-48. In total, we identified seven different alleles of blaOXA-48 over the course of the experiment.

Conclusions: Non-lethal concentrations of CAZ and CAZ-AVI select for clinical resistance in E. coli. While the exposure to CAZ-AVI did not select for variants of OXA-48, seven mutants of OXA-48 were identified during the evolution with CAZ. Worryingly, two of the mutants have been described in environmental samples, underlining the importance of antibiotic pollution as a contributor to resistance development.

Costs and benefits of OXA-48 variants selected under sub-lethal concentrations of ceftazidime

Christopher Fröhlich*1, João Pedro Alves Gama2, Klaus Harms2, Pål Johnsen1, Orjan Samuelsen23, Hanna-Kirsti S. Leiros1

1UiT The Arctic University of Norway, Department of Chemistry, Tromsø, Norway, 2UiT The Arctic University of Norway, Department of Pharmacy, Tromsø, Norway, 3University Hospital of North Norway, Norwegian National Advisory Unit on Detection of Antimicrobial Resistance, Tromsø, Norway

Background: OXA-48 hydrolyses the 3rd generation cephalosporin ceftazidime (CAZ) inefficiently. Therefore CAZ is a relevant treatment alternative against infections caused by OXA-48-producing Enterobacterales. Antibiotic concentrations below the minimum inhibitory concentration (sub-MIC) can select for high-level resistance. Indeed, we previously found seven different variants of OXA-48 while evolving blaOXA-48-encoding E. coli at sub-MIC levels of CAZ. These displayed single amino acid substitutions within the active site of OXA-48. Here, we characterise these mutants and show that their expression is beneficial, increasing MIC and bacterial fitness due to enhanced hydrolysis activity.

Materials/methods: blaOXA-48 alleles (wild-type and mutants) were sub-cloned into a pCR-blunt II vector, expressed in E. coli TOP10 and subsequently subjected to MIC testing (broth microdilution). All alleles were expressed from a pDest17 vector in E. coli AI for protein isolation and purification using His-trap columns. Purified enzymes were used to determine the catalytic efficiencies (kcat/KM) and thermostabilities. E. coli MG1655 carrying a pACYC184 vector encoding the blaOXA-48 alleles was used in head-to-head competitions against the wild-type allele at sub-MIC concentrations of CAZ to measure fitness.

Results: Expression of mutant blaOXA-48 alleles decreased CAZ susceptibility by 2 to 32-fold, compared to E. coli carrying wild-type blaOXA-48. However, they displayed significantly increased susceptibilities towards carbapenems and penicillins with MICs decreased up to 32-fold. While the catalytic efficiencies of OXA-48 mutants increased by 2 to 44-fold towards CAZ, activity towards imipenem, meropenem and piperacillin decreased significantly. Additionally, all mutants exhibited thermostabilities 4°C to 8°C lower than wild-type OXA-48. While the expression of the OXA-48 variants did not negatively affect fitness in the absence of drug, at sub-MIC concentrations of CAZ (0.25xMIC wild-type OXA-48) all tested mutants displayed an up to 60% increase in relative fitness.

Conclusions: OXA-48 mutants selected under sub-lethal conditions of CAZ exhibited increased MICs and/or catalytic efficiencies towards CAZ. Resistance development imposed functional trade-offs towards other β-lactams, likely due to increased enzyme flexibility. We found these alleles to be beneficial under sub-MIC conditions, and some have been already described in environmental samples, supporting the idea that β-lactam contamination may facilitate the selection of resistance.

Abstract 1184

Does C Diff Quik Chek display the same sensitivity than C Diff Quik Chek Complete for GDH detection?
Cécile Gateau*1, Rabab Syed-Zaidi1, Anlyata Youssouf1, Valerie Lalande1, Jeanne Couturier1, Frédéric Barbut1,2

1APHP St Antoine, Paris, France

Background: One option for the diagnosis of C. difficile infection is to use an EIA (enzyme immunoassay) for GDH detection (glutamate dehydrogenase) (C Diff Quik Chek (Abbott)) followed, if positive, by an EIA for toxins. Alternatively, a combined test detecting both targets at the same time on the same device (C Diff Quik Chek Complete (Abbott)) can also be used. Based on biologists’ feedback, some discrepancies between GDH detection by a stand-alone test for GDH and the combined test GDH+-toxin have been reported. The objective of this study was to compare the performances of the C Diff Quik Chek and C Diff Quik Chek Complete for detecting GDH compared to culture.

Materials/methods: From November 2018 to March 2019, 88 stool samples positive by culture for C. difficile (58 fresh stools and 30 frozen stools stored at -80°C) and 220 fresh stool samples negative by culture were tested simultaneously by both assays: C Diff Quik Chek and C Diff Quik Chek Complete. Discrepant results were defined as results that do not match with results of culture. In cases of negative-GDH assay and culture-positive, stool samples were tested again by another technician with both assays. In cases of positive-GDH assay from stool samples that were negative by culture, enriched culture was performed. In addition, serial dilution experiments were conducted on 5 culture-positive stool samples. Stool samples were diluted with the diluent from 1/10 to 1/10000 and each dilution was tested by 2 assays.

Results: Among the 88 culture-positive samples, 27 (30.7%) were non toxigenic strains and 61 (69.3%) isolates were toxigenic strains. After resolving discrepant results, both tests displayed a sensitivity and specificity for GDH detection of 97.9% [CI 95% 92.7-99.7] and 97.2% [CI 95% 93.9-99.2], respectively. Using serial dilution experiments, the results of each assays were similar in terms of detection threshold for GDH detection.

Conclusions: The C Diff Quik Chek and C Diff Quik Chek complete display a similar sensitivity and specificity for GDH detection.

Abstract 1185

Epstein-Barr virus biomarkers in HIV-related non-Hodgkin lymphoma in the modern cART era

Julien Lupo*, Raphaëlle Germi1, Rémi Lancar2, Michele Genin2, Dominique Costagliola3, Patrice Morand1, Caroline Besson3

1Université Grenoble Alpes / CHU Grenoble Alpes, Laboratoire de Virologie, Grenoble, France, 2INSERM, Sorbonne Université, Institut Pierre Louis d’Épidémiologie et de Santé Publique, Paris, France, 3INSERM U1184, Center for Immunology of Viral Infections and Autoimmune Diseases, Le Kremlin Bicêtre; Unité d’Hémato-Oncologie, Centre Hospitalier de Versailles, Paris, France

Abstract third-party references: ANRS

Background: The usefulness of Epstein-Barr virus (EBV) biomarkers in HIV-related non-Hodgkin’s lymphomas (NHL) is poorly explored in the context of improvement of the prognosis of these patients in the recent combined antiretroviral therapy (cART) era.

Materials/methods: We evaluated EBV DNA load and a panel of EBV antibodies in HIV-NHL patients prospectively enrolled in the French ANRS-CO16 Lymphovir cohort between 2008 and 2015. Pretreatment whole blood (WB), plasma EBV DNA load and serological profiles were analyzed in 76 HIV-infected patients. Moreover, for the 53 patients with available data, comparisons were performed between values at diagnosis and 6 months after the initiation of chemotherapy.

Results: Pretreatment WB and plasma EBV DNA loads were positive in 80% and 45% of HIV-NHL patients, respectively. Eighteen out of 43 (42%) tested cases for in situ EBV were positive. The detection of the EBV-encoded small RNA (EBER) was associated with plasma EBV DNA positivity (p = 0.002) but not with WB EBV DNA positivity (p = 0.14). Two-year progression-free survival (PFS) estimates did not differ between the patients with pretreatment WB (n = 61) or plasma (n = 34) EBV DNA (+) and the patients with pretreatment WB (n = 15) or plasma (n = 42) EBV DNA (−) [82% vs 67% or 69%, p = 0.15 and 0.52, respectively]. At diagnosis, 62% of patients harbored an EBV reactivation serological profile defined by high anti-EBV IgG antibody levels or high anti-VCA IgG antibody titers combined with high anti-EA IgG antibody titers. Two-year PFS estimates did not differ between the patients with a normal profile or those with a reactivation profile. Following chemotherapy, WB and plasma EBV DNA levels significantly declined from medians of 3970 (interquartile range, 268 – 14400) and 0 (0 – 0) copies/mL to 0 (0 – 0) and 0 (0 – 0) copies/mL, respectively (p < 0.0001 and p < 0.0001, respectively). Anti-EA IgG, anti-EBNA-1 IgG, anti-EBV IgA antibodies significantly dropped at 6 month follow-up (p < 0.0001, p = 0.01 and p < 0.0001, respectively). No significant decrease was observed with the anti-VCA or the anti-EBV IgG antibody titers/levels (p = 0.10 and 0.07, respectively).

Conclusions: WB and plasma EBV DNA loads at NHL diagnosis do not constitute prognostic markers in HIV-NHL patients in the modern cART era.

Needles in a haystack: ultra-orphan invasive fungal infections reported in FungiScope: global registry for emerging fungal infections

Jon Salmanton-Garcia¹, Philipp Köhler²,³, Sibyle Mellinghoff⁴, Hilmar Wisplinghoff⁴,⁵, Oliver A. Cornely¹,²,⁶,⁷,⁸,⁹, Danila Seidel¹

¹Hospital of the University of Cologne, Department of Internal Medicine I, Infectious Diseases, Köln, Germany, ²University of Cologne, Cologne Excellence Cluster on Cellular Stress Responses in Aging-Associated Diseases (CECAD), Cologne, Germany, ³University of Cologne, Institute for Medical Microbiology, Immunology and Hygiene, Cologne, Germany, ⁴Wisplinghoff Laboratories, Cologne, Germany, ⁵Witten/Herdecke University, Institute for Virology and Clinical Microbiology, Witten, Germany, ⁶German Centre for Infection Research (DZIF), Partner site Bonn - Cologne, Cologne, Germany, ⁷University of Cologne, Center for Integrated Oncology CID Köln/Bonn, Cologne, Germany, ⁸University of Cologne, Clinical Trials Centre Cologne (ZKS Köln), Cologne, Germany, ⁹University of Cologne, Center for Molecular Medicine Cologne (CMMC), Cologne, Germany

Abstract third-party references: On behalf of FungiScope® Team

Background: Emerging invasive fungal infections (IFIs) have become a major challenge in patient management, as effective therapies have not been evaluated due to low number of patients affected. Apart from the more frequently described fusariosis, lomentosporiosis, mucormycosis, scedosporiosis, and certain dematiaceous fungi or yeasts, little is known about ultra-orphan IFIs. Our aim is to present an overview of ultra-orphan IFIs collected in the FungiScope® registry

Materials/methods: Ultra-orphan IFIs were collected in FungiScope® registry. Cases were grouped in Rare Ascomycota (sub-groups Rare Dematiaceae, Rare Hypocreales, Rare Saccharomycetales, Rare Eurotiales, and Invasive Dermatomycetes), Rare Basidiomycota, Rare Entomophthorales, and Rare Mucorales.

Results: Between 2003 and June 2019, 187 ultra-orphan IFIs were documented in FungiScope®. Rare Dematiaceae (35.3%), Rare Hypocreales (22.5%), Rare Mucorales (10.7%) or Rare Saccharomycetales (11.8%) caused most IFIs. The majority of the patients had an underlying malignancy (38.0%). Disseminated infection was observed in 48 patients. Complete or partial responses were observed in 67.9% overall, ranging from 50.0% in Rare Entomophthorales to 83.3% in Rare Eurotiales related cases. Overall mortality rate was 28.9%, ranging from 11.1% in Rare Eurotiales to 50.0% in Rare Mucorales.

Conclusions: Physicians are confronted with a complex variety of fungal pathogens, for which treatment recommendations are lacking and successful outcome might be incidental. Only through an international joint effort of physicians and scientists, an adequate number of cases of ultra-orphan IFIs can be collected to further investigate the epidemiology and eventually identify effective therapy regimens.

Abstract 1187

**Effect of antiretroviral therapy on resistant *Escherichia coli***

Robert Hammond* 1, Anthony Coates2, Stephen H. Gillespie1

1University of St Andrews, St Andrews, United Kingdom, 2St George’s, University of London, London, United Kingdom

Dr Robert J H Hammond, University of St Andrews

**Background:** Colistin is one of the last line antibiotics we have in our toolkit against the rising tide of antimicrobial resistance (AMR). When bacteria become resistant to colistin they are classified as untreatable. Zidovudine (AZT) is an antiretroviral that prevents mother-to-child spread of HIV and works by inhibiting DNA reverse transcriptase. Combination therapy is an exciting branch of potential chemotherapy for resistant bacteria. The use of combinations of drugs can overcome resistance mechanism and render untreatable organisms susceptible.

**Materials/methods:** In this work we created a colistin resistant mutant *E. coli* 25922 and subjected it to colistin + zidovudine therapy. We used a Hollow Fiber Bioreactor (HFS) to growth our mutated strain of *E. coli* to $\approx 1 \times 10^5$ cfu/mL in Mueller Hinton cation adjusted broth and then began drug infusion with a syringe driver. We ran four sets of experiments; a drug free trail as a control followed by a colistin only, AZT only and a colistin + AZT run.

**Results:**

Data indicates that the colistin only arm as well as the AZT arm had no effect however when the combination therapy was applied bacterial killing began within 4 hours and continued for 24 hours resulting in a nearly 3-log reduction in viable cells.

**Conclusions:** We hypothesise that AZT is unable to cross the bacterial membrane therefore has no effect on the resistant mutant. However, in the combination therapy the colistin is able to form pores in the bacterial membrane and this facilitates the AZT entry to the cell.

These data imply that combinations of seemingly unrelated antimicrobials could be used as novel treatment options in the cases of extreme drug resistance

Abstract 1188

UV-C light application after terminal disinfection for vancomycin-resistant enterococci: an additional safety?

Aurore Portmann*1, Marc Dangel1, Andrea Büchler1, Adrian Egli2, Andreas F. Widmer1

1Basel, Division of Infectious Diseases & Hospital Epidemiology, Basel, Switzerland, 2University Hospital Basel, Division of Clinical Bacteriology and Mycology, Basel, Switzerland

Background: Surfaces may be contaminated by patients colonized or infected with multidrug resistant microorganisms. The environment of patients colonized/infected with Vancomycin-resistant Enterococci (VRE) are commonly contaminated with VRE. Several studies indicate that VRE may survive in these rooms even after terminal disinfection (TD) after discharge of the patient, an established risk factor for the next patient hospitalized in the same room acquiring VRE. Our aim was to see whether UV-C disinfection of rooms occupied by patients colonized or infected with VRE leads to a measurable decrease in VRE compared to standard TD procedures.

Materials/methods: Between 10/2018-10/2019, 29 rooms from 19 different patients colonized with VRE were examined after discharge (5 VanA [26.3%]/14 Van B [73.7%]). Eight samples per site have been checked: Toilet seat, toilet button flush, toilet paper cover, tap, floor, patient bed bell, bedside drawer and folding table. Standard TD was performed by a commercially licensed product – a mix of quaternary ammonium compound with aldehyde (Deconex® 50 FF, 0.5%) by in-house trained cleaning staff. The microbiological samples were taken using RODAC contact plates and eSwab* at three time points: a) before TD, b) after TD and before UV-C disinfection, c) after TD and UV-C disinfection. When growth was detected, isolates were subcultured on Columbia blood agar and CNA plates, and microorganisms were identified by MALDI-TOF massspectrometry, and strains of patients as well as positive environmental samples were typed by whole genome sequencing.

Results: Overall, 688 samples were analyzed. At time point a) 16% (37/232), b) 2% (5/224) and c) 0% (0/232) samples were positive for VRE. In one patient room, 8 samples could not be taken after TD and before UV-C. Significant reductions were achieved before TD as well as after UV-C disinfection (p<0.0001). The addition of UV-C after TD did significantly reduced the environmental burden with VRE, even after TD (p = 0.028).

Conclusions: The applied TD failed to completely eliminate VRE. The additional exposure with UV-C succeeded to eliminate VRE from the analyzed sites, and may be needed to safely provide a clean room to the next patient.

Abstract 1190

**Systematic evaluation of development pathways of centrally-approved antibiotics in Europe including an innovative graphical illustration method**

Anselm Jorda*1, Markus Zeitlinger1

1Medical University of Vienna, Department of Clinical Pharmacology, Wien, Austria

**Background:** Development of new antibacterial agents is necessary as drug-resistant bacteria are a threat to global health. In Europe, the European Medicines Agency (EMA) has been guiding this development process for more than two decades. We investigated preclinical and clinical studies to illuminate the various phases within the authorization process.

**Methods:** All centrally authorized systemic antibacterial and antimycobacterial drugs were included without any time restriction. Additionally, Food & Drug Administration (FDA)-approved antibiotics of the last three years, which were not yet approved by the EMA, were included. We focused on the preclinical pharmacokinetic/pharmacodynamic (PK/PD) studies and phase II and phase III clinical trials. Furthermore, we investigated the recommended dosing regimens and correlation between preclinical studies and finally approved indications. Tree diagrams as a novel way of illustrating the development process of antibiotics were developed.

**Results:** We included 23 (EMA 18, FDA 5) antimicrobials. Tetracyclines, carbapenems and cephalosporins were the leading classes with 13% each. The recommended dosing interval was significantly shorter in time-dependent versus exposure-dependent drugs (median 8 versus 12, Mann-Whitney U test: p = 0.006). The majority of approved indications used non-inferiority trials (i.e. acute bacterial skin and soft tissue infection, community-acquired pneumonia, complicated intra-abdominal infection, complicated urinary tract infection, and complicated skin and soft tissue infection). Phase II and phase III clinical trials investigating community-acquired pneumonia involved the fewest patients (mean 85 and 494 patients, respectively) while complicated urinary tract infections phase III trials included the largest number (mean 688 patients). The Figure depicts the way to approval of ceftazidime-avibactam as one example. The branches of the development process demonstrate the increasing evidence for clinical efficacy.

**Conclusions:** Some promising drugs were marketed in the last years. The individual steps to their authorization were illuminated. We confirmed the relevance of PK/PD studies in dosing optimization and decision making in modern antimicrobial development and identified important differences in pathways according to antimicrobial class and target indication.
Infection: infections due to aerobic gram-negatives

2 Phase III: 1033 patients with complicated urinary tract infection (comparator: doripenem)

Indication: infections due to aerobic gram-negatives

2 Phase III: 1066 + 441 patients with complicated intra-abdominal infection (comparator: meropenem)

Phase III: 879 patients with hospital-acquired pneumonia (comparator: meropenem)

Lung infection mouse model (P. aeruginosa)

Thigh infection mouse model (P. aeruginosa)

Phase III: 137 + 218 patients with complicated urinary tract infection (comparator: imipenem & doripenem)

Phase II: 204 patients with complicated intra-abdominal infection (comparator: meropenem)

Phase II: 204 patients with complicated intra-abdominal infection (comparator: meropenem)

Phase III: 1033 patients with complicated urinary tract infection (comparator: doripenem)

Phase III: 333 patients with ceftazidime-resistant gram-negatives (comparator: best available therapy)

Phase III: 1066 + 441 patients with complicated intra-abdominal infection (comparator: meropenem)

**Background:** Isavuconazonium sulfate (ISAVUSULF) is the prodrug of isavuconazole (ISAV), a broad-spectrum mould-active triazole with proven efficacy in treating invasive aspergillosis and mucormycosis in adults. The purpose of this study (NCT03241550) was to evaluate the pharmacokinetics (PK), safety and tolerability of multiple-dose oral ISAV in paediatric subjects at risk for invasive mycoses.

**Materials/methods:** Subjects were grouped into two age cohorts [6–<12 years and 12–<18 years]. The ISAVUSULF formulation was a novel 74.5 mg oral capsule equivalent to 40 mg ISAV. Subjects received a target dose of 10 mg/kg [to a maximum of 372 mg], q8h on days 1 and 2, then once daily on days 3–28. Plasma ISAV concentrations were used to update a population PK model previously built using intravenous (IV) data from paediatric subjects [1–<18 years] in this study, plus IV data from a phase I study in adults (NCT01555866). Monte Carlo simulations were performed and area under the concentration–time curve at steady state [AUC_{ss}] was calculated. The target exposure range was based on efficacious ranges from adults in the phase III SECURE (NCT00412893) and VITAL (NCT00534049) studies; an upper safety threshold was derived from an adult study (NCT01565720) that used a supratherapeutic dose [1116 mg] with increased adverse events [AEs].

**Results:** Of 20 enrolled subjects, 19 were evaluable for PK and safety. Using modelling and simulation, paediatric ISAV exposures at the studied oral dosage were similar to paediatric exposures following IV administration and to exposures shown to be efficacious in adults, and were significantly below the safety threshold reported previously following supratherapeutic dosing in adults [Figure]. AEs were reported in 18 subjects, with drug-related AEs in 10. Six drug-related AEs [nausea, vomiting, pyrexia, elevated alanine aminotransferase, elevated aspartate aminotransferase, abdominal pain] led to treatment withdrawal in 3 subjects. No deaths were reported.

**Conclusions:** Oral ISAVUSULF administered to paediatric subjects [10 mg/kg, q8h on days 1 and 2 and once daily thereafter] resulted in steady-state ISAV exposures similar to those observed with IV administration and comparable to the efficacious range observed in adults. The safety profile was similar to that of adults.
**Figure. Paediatric and adult exposures to isavuconazole**

Box-and-whisker plots of simulated drug exposure (AUC_{SS}) for paediatric age cohorts (1–<6 [IV only], 6–<12, 12–<18 years; oral or IV ISAVUSULF 10 mg/kg to a maximum of 372 mg, q8h on days 1 and 2 and once daily thereafter) and predicted drug exposure (AUC_{SS}) for adult populations (data from the SECURE [NCT00412893] and VITAL [NCT00634049] studies; oral or IV ISAVUSULF 372 mg once daily). Boxes represent the medians (thick black lines) and interquartile ranges, whiskers represent the range of maximum and minimum values within 1.5 x the interquartile range, and outliers are shown as circles. The blue line is the AUC_{SS} from the SECURE study (25th percentile; 60 mg/h/L) that represents the lowest targeted value. The green and orange lines are the minimum (233 mg/h/L) and mean (353 mg/h/L) AUC_{SS} values, respectively, in a high-dose adult study (1116 mg; NCT01585720) with increased adverse events.

AUC_{SS}, area under the concentration–time curve at steady state; ISAVUSULF, isavuconazonium sulfate; IV, intravenous; PO, oral; q8h, every 8 hours; Y, years.

Meropenem-Vaborbactam (VABOREM) in treatment of patients with hospital- and ventilator-acquired pneumonia (HABP/VABP) and bacteraemia due to carbapenem-resistant Enterobacteriaceae

Matteo Bassetti1, Francesco Menichetti2, George L. Daikos3, Sue Cammarata4, Karen Fusaro5, Daniela Zinzi*6

1Hospital Policlinico San Martino – IRCCS, University of Genoa, Genoa, Italy, 2Cisanello Hospital, Pisa, Italy, 3Mitera Hospital, Athens, Greece, 4Melinta Therapeutics, Melinta, Lincolnshire, United States, 5Melinta Therapeutics, Morristown, United States, 6Menarini Ricerche, Menarini Ricerche, Florence, Italy

Abstract third-party references: Menarini, Melinta

Background: Meropenem-vaborbactam (M-V) is a beta-lactamase inhibitor combination active against carbapenemase-producing Klebsiella pneumoniae. We report outcomes in patients with HABP/VABP and bacteremia due to CRE who were treated with M-V monotherapy vs best available therapy (BAT).

Materials/methods: TANGO 2 was a randomized, Phase 3, open-label trial in patients with confirmed or suspected CRE infections, including cUTI, HABP/VABP, bacteremia, or cIAI. Patients were randomized 2:1 to M-V monotherapy or BAT for 7-14 days. BAT could include (alone or in combination): carbapenem, aminoglycoside, polymyxin B, colistin, tigecycline or ceftazidime-avibactam (monotherapy only). Enrollment was stratified by infection type and geographic region. For the patients with HABP/VABP and with primary bacteremia, the primary efficacy endpoint was all-cause mortality at Day 28. The secondary endpoint was the proportion of patients with clinical cure at test of cure (TOC, 7±2 days following end of treatment). This study was not powered for inferential statistical testing; results are presented descriptively.

Results: Of the 75 patients treated in this study, 34 patients had HABP/VABP or bacteremia; 22 (65%) had baseline CRE, comprising the microbiologic CRE modified intent-to-treat primary population (mCRE-MITT). Patients with HABP/VABP or bacteremia were white (61.2%), with mean age 61.2 y (30-84 y). Most patients were from Europe (52.9%) or North America (29.4%) and had a CrCl ≥50 mL/min (76.5%). Charlson comorbidity score of ≥5 was present in 73.5%. Half of patients had SIRS at baseline; 47.1% of patients were immunocompromised.

In HABP/VABP/bacteremia patients with CRE infection, the all-cause mortality at day 28 was 22.2% [4/18] M-V vs 44.4% [4/9] BAT. Clinical Cure at TOC was seen in 66.7% [12/18] M-V vs 22.2% [2/9] BAT. In the study, incidence of AEs was similar between groups (84 % M-V vs 92% BAT). M-V was associated with fewer drug-related AEs [24% vs. 44%], severe AEs [14% vs. 28%], serious AEs [34% vs. 44%] and less nephrotoxicity vs BAT.

Conclusions: In this prospective comparative trial of M-V monotherapy in CRE infections, M-V showed consistent reduction in mortality and improvement in clinical cure and safety/tolerability over BAT. M-V appears to be an effective treatment option for HABP/VABP/bacteremia due to CRE.

Abstract 1194

Mutant prevention concentration values of linezolid, moxifloxacin and vancomycin against *Staphylococcus pseudintermedius* strains recovered from humans

Leah Blondeau* 1, Joe Rubin1, Rani Kanthan2, Stephen Sanchez1,2, Harry Deneer2, Joseph Blondeau1,2

1University of Saskatchewan, Saskatoon, Canada, 2Royal University Hospital, Saskatoon, Canada

**Background:** SP is a commensal and opportunistic pathogen of dogs and cats. SP recovered from human specimens seems to be increasing and multidrug resistant strains from humans are being reported. Two particular cases from our hospital were a 4 month old pediatric oncology patient with SP bacteremia and the second a middle aged female oncology patient with persistent wound infection and catheter tip colonization. SP strains were recovered from family pets of both patients. We tested the SP strains from humans to determine minimum inhibitory concentration (MIC) and MPC values to L, M and V.

**Materials/methods:** A total of 24 isolates from humans were tested. MIC testing was as per the recommended procedure of the Clinical and Laboratory Standards Institute (CLSI) utilizing a \(10^5\) colony forming unit/milliliter (cfu/ml) inoculum and incubation under ambient conditions for 18 to 24 hours. For MPC testing \(\geq10^9\) CFU were applied to the surface of drug containing agar plates. Inoculated plates were incubated under ambient conditions and screened for growth after 24 and 48 hours of incubation. The lowest drug concentration blocking growth was recorded as the MIC or MPC depending on the method.

**Results:** MIC range values for L, M and V were 1-2, \(<0.016-0.63\) and 0.25-0.5 \(\mu\)g/ml respectively. The MIC\(_{50/90}\) values were 1/2, \(<0.016/0.031\) and 0.25/0.5 \(\mu\)g/ml. MPC range values were 1-2, 0.125-0.25 and 4-8 \(\mu\)g/ml with MPC\(_{50/90}\) values of 2/2, 0.125/0.25 and \(\geq8/\geq8\) \(\mu\)g/ml. Considering CLSI breakpoints (BP) and MPC values, all isolates would be susceptible to linezolid (MIC BP \(<4\) \(\mu\)g/ml) and moxifloxacin (MIC BP \(<0.5\) \(\mu\)g/ml). In contrast all strains would be considered non-susceptible to vancomycin (MIC BP \(\geq4\) \(\mu\)g/ml).

**Conclusions:** SP is being recovered more frequently from human infections including invasive disease (i.e. bacteremia). The high vancomycin MPC values reported here are consistent with similar results for *Staphylococcus aureus* and suggest concern with potential therapeutic failure in patients where vancomycin may be used for treat SP infections.

Abstract 1203

**Real-world experience of dalbavancin use for the treatment of Gram-positive infections**

Nikolaos Spernovasilis*, Anna Mathioudaki†, Petros Ioannou‡, Achilleas Gikas§, Georgios Samonis†, Diamantis Kofteridis†

1University Hospital of Heraklion, Heraklion, Greece, 2Metropolitan Hospital, N. Faliro, Athens, Greece

**Background:** Dalbavancin is a lipoglycopeptide antibiotic with prolonged half-life approved for the treatment of acute bacterial skin and skin structure infections (ABSSSIs). However, in real life it can be used for several gram-positive infections, when protracted treatment is required. We examined the effectiveness and safety of dalbavancin in the treatment of various gram-positive infections other than ABSSSIs.

**Materials/methods:** This retrospective study was performed in the University Hospital of Heraklion in Greece from September 2017 through August 2019. All adult patients who received at least one dose of dalbavancin with a minimum follow-up of three months post-treatment were included.

**Results:** Twelve patients were identified, 7 (58.3%) were female. Mean age was 65.5 (SD, 13.1) years. Dalbavancin was used for treatment of osteomyelitis, prosthetic joint infection, epidural abscess, and permanent pacemaker lead infection (Table). Nine patients (75%) received dalbavancin as targeted therapy, whereas 3 (25%) were treated empirically. The isolated pathogens were methicillin-resistant *Staphylococcus aureus*, methicillin-resistant *Staphylococcus epidermidis* and *Enterococcus* spp. All patients received dalbavancin as sequential therapy after the administration of vancomycin or daptomycin for a median duration of 14 (range, 10-28) days due to the feasibility for early discharge and treatment on outpatient basis. Dalbavancin was administered as 1000 mg i.v. on Day 1 followed by 500 mg i.v. weekly. The median duration of dalbavancin therapy was 21 (range, 7-42) days. Eleven patients (91.7%) had favourable outcome, while 1 (8.3%) patient with spinal epidural abscess who refused surgical intervention experienced clinical failure. Regarding safety, only the patient with treatment failure experienced a non-clostridial transient diarrhea.

**Conclusions:** The use of dalbavancin for sequential treatment of gram-positive infections other than ABSSSIs seems to be safe and effective. Prospective trials are needed to validate novel indications for this new compound.

Abstract 1204

A multi-modal intervention to improve hand hygiene compliance in peripheral wards of a tertiary care university centre: a cluster randomised controlled trial

Seven Johannes Sam Aghdassi, Petra Gastmeier, Christin Schröder, Michael Behnke, Patricia Manuela Fliß, Janina Wenk, Carolin Plotzki, Tobias Kramer

1Charité – Universitätsmedizin Berlin, corporate member of Freie Universität Berlin, Humboldt-Universität zu Berlin, and Berlin Institute of Health, Institute of Hygiene and Environmental Medicine, Berlin, Germany, Institute of Hygiene and Environmental Medicine, Berlin, Germany, 2BODE SCIENCE CENTER, Bode Chemie GmbH, Hamburg, Germany

Background: Compliance to hand hygiene is a key factor in preventing healthcare-associated infections. It was our objective to assess the effect of a multimodal intervention on hand hygiene compliance at a tertiary care university hospital. As a secondary objective, we investigated the effect of the intervention on the occurrence of device-associated bloodstream infections.

Materials/methods: We performed a single centre cluster randomised controlled trial at a university hospital in Germany. Twenty peripheral wards were invited to participate and randomly assigned to either the intervention (n=10) or control group (n=10). Quarterly, trained observers conducted direct compliance observations on all twenty wards. The intervention entailed dissemination of teaching materials on aseptic procedures, equipment with flexibly mountable alcoholic hand rub dispensers, and quarterly feedback on hand hygiene compliance rates. The duration of the intervention was twelve months in the year 2018. Prospective surveillance was conducted for device-associated infections during the intervention. A multivariable logistic regression analysis was performed to identify factors significantly influencing the likelihood of compliant performance of hand hygiene.

Results: In total, 21424 hand hygiene opportunities were observed. Overall, compliance rates did not change significantly in either group (59% vs. 60% in the control group; 59% vs. 61% in the intervention group). Compliance prior to aseptic procedures improved significantly from 44% to 53% (p=0.03) in the intervention group, while no significant increase was noted in the control group. Multivariable logistic regression analysis revealed that non-nursing, non-physician staff ("others") were significantly less likely to perform compliant hand hygiene than nurses and physicians (p<0.01). In the intervention group, rates of device-associated bloodstream infections were significantly lower than in the control group (p<0.01).

Conclusions: A significant effect of the intervention was observed with regard to hand hygiene compliance prior to aseptic procedures. The lack of a significant overall improvement of hand hygiene compliance shows that comprehensive implementation of hand hygiene interventions and creation of a sense of ownership of the intervention among healthcare workers on multiple wards simultaneously is difficult. Observed differences between professional groups suggest that education of healthcare workers other than nurses and physicians should be a target of future hand hygiene interventions.

Abstract 1205

**Lyme disease spirochete variants and human endothelial cells determinants for transendothelial migration: development of an in vitro system using primary human microvascular endothelial cells**

Claire Kamaliddin*1,2, May Ho2, Xi Tan1, Mildred Castellanos Escamilla1, Rebekah Devinney2, George Chaconas1,2

1University of Calgary, Biochemistry & Molecular Biology, Calgary, Canada, 2University of Calgary, Microbiology, Immunology & Infectious Diseases, The Snyder Institute for Chronic Diseases, Calgary, Canada

**Background:** Lyme disease is a tick born infection caused mainly by *B. burgdorferi* in North America. Hematogenous dissemination is an important pathogenic strategy for Lyme spirochetes. Since *B. burgdorferi* does not produce any toxins or classical virulence factors, it likely uses a mechanism distinct from what has been observed with other pathogens. In spite of the importance of vascular transmigration in Lyme disease pathogenesis there has been little research into this area and there are only a few conflicting reports on whether *B. burgdorferi* endothelial transmigration is transcellular or paracellular. In addition, cellular features are crucial and no published studies have used primary microvascular endothelial cells, which accurately reflect the site of *B. burgdorferi* transmigration.

**Materials/methods:** We aimed to develop an efficient in vitro system to study *B. burgdorferi* migration through human primary microvascular endothelial cells. We are using two types of primary human microvascular endothelial cells: dermal and synovial. Co-culture conditions were optimized based on spirochete growth, viability and length in the new media. Cell viability was assessed using trypan blue stain, as well as immuno-staining for junction (VE-cadherin) and cytoskeleton (F-actin). Transmigration assays are performed using Transwells chambers. Relative percentages of transmigrated spirochetes were estimated by counting the lower transwell chamber.

**Results:** Using wild type *B. burgdorferi* compared to a non-adherent high passage strain, we showed that our system reflects the in vivo conditions, with a 8 fold higher transmigration of the low passage strain after 4 hours of co-incubation in both synovial and dermal endothelial cells. Studies are now in progress to assess *B. burgdorferi* strains deficient for various adhesins as well as to define the major pathway (paracellular or transcellular) involved in the process and to characterize the required cellular signaling pathways.

**Conclusions:** The potential of our proposed study is the use of resulting information to eventually block hematogenous dissemination of *B. burgdorferi* shortly after tick-bite exposure and cripple the ability of the spirochetes to invade host organ systems.

Probability of target attainment analyses inform ceftolozane/tazobactam dosing regimens in hospital-acquired pneumonia/ventilator-associated pneumonia patients with end-stage renal disease on intermittent haemodialysis

Hwa-Ping Feng1, Yogesh Patel1, Zufei Zhang1, Jill Fiedler-Kelly1, Christopher J. Bruno1, Elizabeth G. Rhee1, Carisa De Anda1, Wei Gao1

1Merck & Co., Inc., Kenilworth, United States, 2Cognigen Corporation, a Simulation Plus Company, Buffalo, United States

Abstract third-party references: This work was supported by Merck Sharp & Dohme Corp., a subsidiary of Merck & Co., Inc., Kenilworth, New Jersey, USA (MSD)

Background: Ceftolozane/tazobactam (C/T) combines a potent anti-pseudomonal cephalosporin with a beta-lactamase inhibitor. The 2g/1g C/T high dose by 1-hour infusion every 8 hours (Q8H) was evaluated in participants with hospital-acquired pneumonia/ventilator-associated pneumonia (HAP/VAP) in the Phase 3 study ASPECT-NP, demonstrating safety and efficacy in this population. Both compounds are eliminated renally, and dose adjustment is necessary based on renal function. HAP/VAP patients with end-stage renal disease (ESRD) on intermittent hemodialysis (HD) were not eligible for ASPECT-NP. This study utilized probability of target attainment (PTA) analyses to inform the C/T recommended dosing regimen in this population.

Materials/methods: Population PK models for C and T in HAP/VAP patients were developed to describe C and T concentration data in plasma collected in 16 clinical studies, including ASPECT-NP and in ESRD subjects without infection, and in pulmonary epithelial lining fluid (ELF) collected in 2 Phase 1 studies. The final population PK models were used to simulate C and T concentration-time profiles in plasma and ELF of ESRD patients at three different dose levels by 1-hour infusion Q8H over a 14-day treatment duration, with HD on every other weekday:

- 1g/0.5g C/T loading+200mg/100mg C/T maintenance (2X cIAI/cUTI)
- 1.5g/0.75g C/T loading+300mg/150mg C/T maintenance (3X cIAI/cUTI)
- 3g/1.5g C/T loading+400mg/200mg C/T maintenance (4X cIAI/cUTI)

Daily C and T exposures and PTA in ELF and plasma were estimated.

Results: For the 14-day treatment duration, daily plasma PTA for all 3 regimens was 100% for C at 30%fT>MIC=4mg/L and >99% for T at 20%fT>Ct=1mg/L. Daily ELF PTA was ≥95% for C at 30%fT>MIC=4mg/L for all 3 regimens and was >90% for T at 20%fT>Ct=1mg/L for the 3X and 4X cIAI/cUTI regimens. ELF PTA for T at the 2X cIAI/cUTI regimen was <80% at 20%fT>Ct=1mg/L on HD days. Plasma AUC distribution for T at the 4X cIAI/cUTI regimen extended above the clinical experience of ASPECT-NP.

Conclusions: Based on the results of the analyses, the 1.5g/0.75g C/T loading+300mg/150mg C/T maintenance by 1-hour IV infusion Q8H is considered to balance efficacy and safety considerations and is recommended for ESRD patients with HAP/VAP.

Abstract 1211

**Candida spp. in the respiratory tract secretions of critically ill patients and the impact of antifungal treatment**

Nikolaos Spernovasilis*1, Alexandra Vouidaski2, Christina Alexopoulou1, Andria Papazachariou1, Eleni Paraschou1, Aikaterini Achyropoulou1, Sofia Maraki1, Despo Ierodiakonou1, Georgios Samonis1,2, Diamantis Kofteridis1

1University Hospital of Heraklion, Heraklion, Greece, 2Metropolitan Hospital, N.Faliro, Athens, Greece

**Background:** In critically ill patients *Candida* is often isolated from bronchial secretion (BS) or bronchoalveolar lavage (BAL) samples. The significance of this finding is undetermined. We examined the impact of antifungal treatment in previously immunocompetent patients with intensive care unit (ICU)-acquired respiratory tract infection (RTI) and *Candida* spp. isolation from their BS or BAL.

**Materials/methods:** All adult patients admitted to the ICU of the University Hospital of Heraklion, Greece, from January 2014 through December 2016, with ICU-acquired RTI and *Candida* spp. isolation in their BS were evaluated. Demographics, clinical characteristics, antifungal treatment for any reason ±10 days around *Candida* spp. isolation, and 28-day and in-hospital mortality were recorded. Associations of antifungal treatment and mortality were tested with univariate (chi-square test) and multivariate logistic regression analysis.

**Results:** Seventy-nine patients were evaluated and 58 (73.4%) of them were male. Mean [standard deviation, (SD)] age was 66.1 (16.6) years. Thirty-nine (49.4%) received antifungals and 33 (41.8%) had more than two comorbidities. The mean body mass index (SD) was 28.4 (6.6) and the mean APACHE II score (SD) was 21.6 (7.8). The 28-day and in-hospital mortality rate were 22.8% and 30.4%, respectively. There were no differences in 28-day and in-hospital mortality when patients receiving antifungal treatment were compared to those that did not, even after adjustment for selected confounders [Table].

**Conclusions:** Antifungal treatment in previously immunocompetent patients with ICU-acquired RTI and *Candida* spp. isolation in their secretions did not influence survival. Larger prospective or interventional studies are needed to elucidate the exact importance of *Candida*'s presence in the respiratory tract of ICU-patients.

**Table.** Multivariate logistic regression analysis

Ceftolozane/tazobactam probability of target attainment in patients with hospital-acquired pneumonia/ventilator-associated pneumonia

Zufei Zhang1, Yogesh Patel2, Hwa-Ping Feng*, Matthew G. Johnson1, Jill Fiedler-Kelly1, Christopher J. Bruno1, Elizabeth G. Rhee1, Carisa De Anda1, Wei Gao1

1Merck & Co., Inc., Kenilworth, United States, 2Cognigen Corporation, a Simulation Plus Company, Buffalo, United States

Abstract third-party references: This work was supported by Merck Sharp & Dohme Corp., a subsidiary of Merck & Co., Inc., Kenilworth, New Jersey, USA (MSD)

Background: Ceftolozane/tazobactam (C/T) combines a potent anti-pseudomonal cephalosporin with a beta-lactamase inhibitor. The 2g/1g C/T high dose or equivalent dose adjusted based on renal function administered by 1-hour infusion every 8 hours was evaluated in mechanically ventilated participants with hospital-acquired pneumonia/ventilator-associated pneumonia (HAP/VAP) in the Phase 3 study ASPECT-NP, demonstrating safety and efficacy in this population. Probability of target attainment (PTA) analyses were conducted to support the recommended C/T dosing regimens in HAP/VAP patients.

Materials/methods: Population PK models for C and T in HAP/VAP patients were developed to describe C and T concentration data in plasma from 16 clinical studies, including ASPECT-NP, and in pulmonary epithelial lining fluid (ELF) from 2 Phase 1 studies. The final population PK models were used to simulate C and T concentration time profiles in plasma and ELF in HAP/VAP patients at various dosing regimens over a 14-day treatment duration. PTA in plasma and ELF was calculated using the PK/PD targets of 30% fT>MIC for C and 20% fT>C=1mg/L for T.

Results: Based on projected PTA in plasma and ELF, the C/T dosing regimens in HAP/VAP patients evaluated in ASPECT-NP were:

- 2g/1g C/T (CrCL>50mL/min)
- 1g/0.5g C/T (30mL/min≤CrCL≤50mL/min)
- 500mg /250mg C/T (15mL/min≤CrCL≤29mL/min)

At these C/T dosing regimens, steady-state plasma PTA was 100% for C at 30%fT>MIC=4mg/L and >99% for T at 20%fT>C=1mg/L across renal categories at CrCL up to 150mL/min. Steady-state ELF PTA was >99% for C at 30%fT>MIC=4mg/L and >87% for T at 20%fT>C=1mg/L across renal categories at CrCL up to 150mL/min.

Conclusions: At the dosing regimens evaluated in ASPECT-NP, high plasma and ELF PTA were achieved in HAP/VAP patients across renal function categories. Together with demonstrated safety and efficacy in the study, the PTA results support the appropriateness of these dosing regimens for the treatment of HAP/VAP.

Presenter email address: hwa-ping.feng@merck.com
Abstract 1214

**Exposure-efficacy analyses support optimal dosing regimens of ceftolozane/tazobactam in patients with hospital-acquired pneumonia/ventilator-associated pneumonia in ASPECT-NP**

Wei Gao1, Julie Passarell2, Yogesh Patel2, Zufei Zhang2, Gina Lin1, Jill Fiedler-Kelly2, Christopher J. Bruno1, Elizabeth G. Rhee1, Carisa De Anda1, Hwa-Ping Feng*1

1Merck & Co., Inc., Kenilworth, United States, 2Cognigen Corporation, a Simulation Plus Company, Buffalo, United States

**Abstract third-party references:** This work was supported by Merck Sharp & Dohme Corp., a subsidiary of Merck & Co., Inc., Kenilworth, New Jersey, USA (MSD)

**Background:** Ceftolozane/tazobactam (C/T) combines a potent antipseudomonal cephalosporin with a beta-lactamase inhibitor. A C/T dose of 2g/1g, or adjusted based on renal function, was evaluated in patients with HAP/VAP in the phase 3 ASPECT-NP study, demonstrating safety and efficacy in this population. Exposure–response (E–R) analyses were conducted to assess the potential relationship between plasma pharmacokinetics and the clinical efficacy endpoints to support the optimal C/T dose regimens in adult patients with HAP/VAP.

**Materials/methods:** Plasma C/T exposure metrics (%fT>MIC or %fT>C) for each patient at the end of treatment were derived from the population pharmacokinetic models. Actual dosing records and the highest MIC value for relevant baseline lower respiratory tract (LRT) pathogens identified for each patient were used. The primary efficacy endpoints were all-cause mortality (ACM) at day 28 and clinical response at test of cure. The relationship between %fT>MIC for ceftolozane or %fT>C for tazobactam and efficacy endpoints was explored.

**Results:** In the analysis set (N=231), the ACM rate was 16% (36 died on/before day 28) and clinical cure rate 65% (151 achieved cure). No E–R relationship for ceftolozane %fT>MIC was observed for both clinical endpoints.

Additionally, among 177 patients with a baseline LRT pathogen MIC ≤4μg/mL, a low ACM rate (13%) and high clinical cure rate (71%) were observed versus those with MIC >4μg/mL (24% and 48%, respectively). No E–R relationship for ceftolozane was observed in these 177 patients; 173 patients had 99%fT>MIC, with ACM and clinical cure rates of 13% and 70%, respectively, and the remaining 4 patients had ≥73%fT>MIC, with ACM and clinical cure rates of 0% and 100%, respectively. Tazobactam exposure was not considered related to efficacy, as ACM rates increased and clinical cure rates decreased with increasing tazobactam PK measure %fT>C.

**Conclusions:** There was no E–R trend with C/T, and among those with a baseline LRT pathogen MIC below the breakpoint, all patients achieved exposures above the pharmacokinetic/pharmacodynamic targets. These results support the appropriateness of a C/T 2g/1g dose, or adjusted dose for renal function, in adult patients with HAP/VAP.

**Presenter email address:** hwa-ping.feng@merck.com
Emergence of non-susceptibility among Gram-negative respiratory pathogens from a phase III clinical trial for treatment of nosocomial pneumonia (ASPECT-NP)

Mary Motyl1, Mariana Castanheira2, Matthew G. Johnson1, Brian Yu1, Jennifer A. Huntington1, Patricia Carmelitano1, Christopher J. Bruno1, Carisa De Anda1, Elizabeth G. Rhee1

1Merck & Co., Inc., Kenilworth, United States, 2JMI Laboratories, North Liberty, United States

Abstract third-party references: This work was supported by Merck Sharp & Dohme Corp., a subsidiary of Merck & Co., Inc., Kenilworth, New Jersey, USA [MSD]

Background: The phase 3, randomized, double-blind, multicenter ASPECT-NP trial evaluated ceftolozane/tazobactam 3g every 8 hours (q8h) versus meropenem 1g q8h for 8–14 days in adults for treatment of ventilated nosocomial pneumonia. Genetic typing was performed to assess relatedness of baseline and post-baseline Pseudomonas aeruginosa (PsA) and Enterobacteriales (ENT) isolates.

Materials/methods: Pairs of isolates were selected for molecular typing among patients in the microbiological intention-to-treat population when a susceptible baseline organism and a non-susceptible post-baseline organism of the same genus and species were identified. Applied interpretive criteria to determine non-susceptibility were provisional ASPECT-NP breakpoints (susceptible breakpoints: PsA, ≤8 mg/L; ENT, ≤4 mg/L) for ceftolozane/tazobactam and CLSI breakpoints for meropenem. Multilocus sequence typing was performed among baseline and post-baseline pairs; pulsed-field gel electrophoresis was used for Serratia marcescens and Proteus mirabilis isolates. Emergence of non-susceptibility (EoNS) was defined as the isolation of a non-susceptible post-baseline organism with the same sequence type (ST) as the susceptible baseline organism; in contrast, a non-susceptible post-baseline isolate with a different ST was considered to represent the acquisition of a different strain of the same species (ie, new infection, not EoNS). EoNS was compared between ceftolozane/tazobactam and meropenem treatment arms.

Results: Among susceptible PsA isolates at baseline, EoNS was noted in 1 of 61 (1.6%) isolates in the ceftolozane/tazobactam arm versus 13 of 58 (22.4%) in the meropenem arm. Two additional post-baseline PsA isolates in each of the ceftolozane/tazobactam and meropenem arms were non-susceptible but had different STs. In the meropenem arm, the predominant resistance mechanism observed among non-susceptible-PsA isolates was OprD loss/decrease; elevated MexXY-OprM expression was also noted.

Among susceptible ENT isolates at baseline, EoNS was noted in 6 of 189 (3.2%) isolates in the ceftolozane/tazobactam arm (3 S. marcescens, 2 Klebsiella pneumoniae, and 1 Enterobacter cloacae) versus 4 of 192 (2.1%) in the meropenem arm (4 K. pneumoniae). Seven and 5 additional post-baseline ENT isolates in the ceftolozane/tazobactam and meropenem arms, respectively, were non-susceptible but had different STs.

Conclusions: EoNS was more common among PsA isolates in the meropenem arm compared to the ceftolozane/tazobactam arm, but was rare among ENT isolates in both arms.

Abstract 1216

What is the role of colonisation by carbapenem-resistant Enterobacteriaceae in older people who live in nursing homes? A multi-centre study

Patricio Favier*, Natalia Carrión, Rocío Martins, Enrique Serio, María Inés Gallino, Diego Torres, Carla Raffo

Centro Médico RACAIS, Sección Infectología, Buenos Aires, Argentina, Centro Médico RACAIS, Laboratorio de Microbiología, Buenos Aires, Argentina, Hospital de Trauma y Emergencias Federal Abete, Laboratorio de Genética y Biología Molecular, Malvinas Argentinas, Argentina

Background: Carbapenem-resistant Enterobacteriaceae (CRE) infections are a worldwide priority. These events are more frequent in elder people. It is known the prevalence of CRE colonization at hospital environment. However, real-life data from other context as nursing homes is still unknown. The aim was to measure the CRE colonization (CREc) rate in institutionalized elders. Secondary objective was to assess linked factors with CREc and new CRE infections during follow-up.

Materials/methods: Prospective observational study which included residents from 6 geriatrics from Buenos Aires City [Argentina], between November 2018 and November 2019. Patients were screened by swab collections (rectal, axillar and inguinal) to evaluate CREc. Chromogenic agar cultures for CRE and molecular techniques for blaKPC, blaNDM and blaOXA were used. We identified possible linked variables with CREc and subsequent infections at the beginning, and after 12-month follow-up. These centers did not apply restrictive policies for admission or contact precautions. Also, these institutions did not assist patients who required mechanical ventilation. p<0.05 was considered significant.

Results: 205 patients were recruited. 77.1% were women, the median age was 87 years (IQR11) and the median length of stay was 26 months (IQR39.8). Median of Katz-Score was 2 (IQR2) and Charlson-Index was 5 (IQR2). At baseline, 17.1% was admitted at hospital wards the previous year and 9.8% had taken antimicrobials the previous month. The initial CREc prevalence was 1.46%. Colonized patients had not shared the same room. During follow-up 11.2% died (n=23); none of them due to CRE infections. It is remarkable that none of colonized patients died. Among survivors, CREc rate was 2.19% (OR 0.66, p=0.60 vs. the initial cohort). No CRE infections were detected. In multivariate analysis, using of antibiotics the previous month was the only linked factor (OR 2.9, CI95% 1.3-737.7, p=0.03). Surprisingly, living with previously colonized residents did not lead to the acquisition of new CREc.

Conclusions: A relatively low CREc rate was observed. Also, prior antibiotic use was associated with this condition. These findings are unprecedented in our continent. Our data suggest that not applying contact precautions for CRE in this scenario could be a safe practice.

Genotyping, phylogenetic analysis and in vitro antifungal susceptibility profile of clinical isolates of Neoscytalidium species

Mohammad Taghi Hedayati1, Somaye Heidari1, Maryam Gheisari1, Mahdi Abastabar1, Mihan Poorabdollah2, Maryam Sadat Mirenayat1, Niloofar Basharzad1, Saham Ansari1, Vida Mortezaee1, Seyyedmojtaba Seyyedmousavi1, Ana Alastruey-Izquierdo4

1Mazandaran University of Medical Sciences, Sari, Iran, 2Shaheed Beheshti University of Medical Sciences, Tehran, Iran, 3National Institutes of Health, Bethesda, United States, 4Instituto de Salud Carlos III, Madrid, Spain

Background: The genus Neoscytalidium is mainly distributed in (sub) tropical areas which principally have been described as phytopathogens. However, there are several reports of human infection caused by Neoscytalidium through direct or indirect contact with contaminated plants or soil. The pathogenicity of Neoscytalidium species is not well-known. On the other hand, because of the rarity and emergence of this organism, and no effective treatment approaches, the accurate diagnosis would be critical for therapeutic strategies.

Materials/methods: During two years (from October 2016 to September 2018), all patients with critical underlying conditions referred to the Reference Center for Tuberculosis and Pulmonary Diseases of Iran, Tehran, Iran were included in the study. The isolates of Neoscytalidium species obtained from deep clinical specimens of patients were collected. Partial sequences of five loci (the ITS region, D1/D2 domains of 28S rRNA gene, beta tubulin, elongation factor 1α and chitin synthase genes) of these isolates were analyzed. Phylogenetic analysis of the isolates was also evaluated. In-vitro antifungal susceptibility testing of the isolates against 16 antifungal agents was performed according to the Clinical & Laboratory Standards Institute (CLSI) M38-A2 guideline.

Results: In general, out of 640 clinical samples, 13 (2.0%) were positive for Neoscytalidium species growth, of which 8 isolates were characterized as N. dimidiatum and 5 isolates as N. novaehollandiae according to ITS sequencing. The sequence alignment of 1846 bp in 13 isolates identified nine polymorphic sites (0.49%), representing two sequence types (ST1 and ST2). All of eight N. dimidiatum strains and five N. novaehollandiae species were detected as ST1 and ST2, respectively. The phylogenetic analysis of ITS sequences revealed 2 clades. In addition, we observed the highest in vitro antifungal activity against both Neoscytalidium species by luliconazole, followed by micafungin, amphotericin B and anidulafungin.

Conclusions: This is the first report of N. novaehollandiae isolation from deep clinical samples. One unique genotype could be detected among the studied isolates in each of the species using the mentioned loci. LUL represented the lowest MIC against all isolates which could propose as a good topical antifungal candidate against Neoscytalidium superficial infections.

The non-tuberculous mycobacteria experience: a single-centre study in Ireland

Tee Keat Teoh*1, Michelle Casey1, Jenny Tormey1, Breda Lynch1, Deirdre Brady1, Eavan Muldoon1, Maureen Lynch1, Brian MC Cullagh1

1The Mater Misericordiae University Hospital, Dublin, Ireland

Background: Recent studies suggest the increasing prevalence of non-tuberculous mycobacteria (NTM) pulmonary disease (PD). However, NTM is not a reportable disease in Ireland and national data is not available regarding the prevalence of disease. We looked at our NTM isolates from January 2013 to July 2018 and the profile of patients whose care was based in the tertiary care hospital where the study was performed.

Materials/methods: A record of NTM isolates from January 2013 to July 2018 was collected via the laboratory electronic records. Respiratory isolates belonging to patients whose care is based in the tertiary referral hospital was separated for further analysis of patient’s demographics via patient’s electronic record. Patients with at least 1 respiratory isolate were included in the demographic analysis. Identification of Mycobacterium isolates to species level was done by Genotype Mycobacterium CM (Hain-Lifescience). Drug susceptibility testing (DST) was done at a reference laboratory in Scotland.

Results: In the study period, we had 116 isolates in 71 patients. 12 M.chimaera isolates were excluded from this study. Our NTM isolates composed of: Mycobacterium avium complex 45.9%, M.kansasii 8.0%, rapid growing mycobacteria 28.3% and slow growing mycobacteria 13.3%. 49 isolates in 36 patients were included in the analysis of patient’s demographics. 45 of these isolates were from respiratory samples (24 sputum and 21 bronchoalveolar lavage), 1 from a bone marrow biopsy, 1 from tonsillar tissue, 1 from a groin abscess aspirate and 1 from cerebro-spinal fluid. 75% (27/36) of patients had pre-existing pulmonary disease and 30.6% (11/36) were immunosuppressed. The ATS/IDSA diagnostic criteria for NTM lung disease was fulfilled in 27.8% of patients. The microbiologic criteria were fulfilled in 66.7% of patients. 15 patients had radiological changes consistent with nodular-bronchiectatic disease and 5 had changes consistent with fibrocavitary disease. 23.7% (9/38) patients received treatment for NTM disease. 6 had NTM PD and 3 had disseminated disease. The median age of our patients was 61.5 years. 50% of the patients were female.

Conclusions: NTM disease is diverse with regional differences. Our study adds to the available data on NTM isolated from clinical specimens and NTM disease in Ireland.

Cost-benefit analysis comparing trough, two-Level AUC, and Bayesian AUC dosing for vancomycin

Brian Lee*1, Gary Fong2, Michael Bolarias3, Michael Neely4, Emi Minejima5, Amy Kang6, Grace Lee7, Cynthia Gong8

1University of Southern California, Los Angeles, United States, 2Harbor-UCLA Medical Center, Chapman University, Los Angeles, United States, 3Harbor-UCLA Medical Center, Los Angeles, United States, 4Children’s Hospital Los Angeles, University of Southern California, Los Angeles, United States, 5Los Angeles County + USC Medical Center, University of Southern California, Los Angeles, United States, 6Chapman University, Irvine, United States

Background: Trough levels have been demonstrated to be inadequate surrogates for vancomycin exposure, with troughs of 15-20 mg/L associated with increased rates of nephrotoxicity while minimally improving outcomes. Newer dosing methods provide clinical benefit, but with uncertain costs. The objective of this study was to quantify the cost benefits of using two-point or Bayesian AUC vs. trough dosing for patients treated with vancomycin.

Materials/methods: A cost benefit analysis from the institutional perspective was conducted utilizing a decision tree to model the probabilities and costs of acute kidney injury (AKI) associated with vancomycin administered over 48 hours up to 21+ days. Costs included obtaining vancomycin levels, pharmacy time, AKI hospitalization costs, and Bayesian software costs. Probabilities and costs were obtained from primary literature, the Healthcare Cost and Utilization Project National Inpatient Sample, the US Bureau of Labor Statistics, and manufacturer-provided quotes for software costs. Incremental costs were calculated for each strategy in 2019 US Dollars. Robustness of results was assessed via one-way sensitivity analyses varying probabilities and costs in the model.

Results: In the base-case model, two-point AUC vs. trough saved an average $847 per patient encounter. Bayesian AUC vs. trough saved an average $2066 per patient encounter. This translates into annual cost-savings of $846,810 and $2,065,720 for two-point and Bayesian methods vs. trough respectively, assuming 1000 vancomycin-treated patients per year. In one-way sensitivity analyses, “Probability of AKI, 48 Hours to 7 Days” and “Probability of Discharge or Death, 48 Hours to 7 Days” were the most sensitive parameters in the model. Assuming a budget of $100,000 per year for Bayesian software, an institution would need to treat >41 patients with vancomycin for at least 48 hours to break even. At a budget of $20,000 per year, >10 patients would need to be treated with vancomycin to achieve a break-even cost.

Conclusions: There are significant institutional cost-benefits using two-point AUC or Bayesian methods over trough dosing, even after accounting for the annual costs of Bayesian programs. The potential to decrease rates of AKI, improve clinical outcomes, and reduce costs to the institution strongly warrants consideration of newer dosing methods for vancomycin.

**Abstract 1224**

**Exebacase resensitises methicillin-resistant *Staphylococcus aureus* to oxacillin in a rabbit model of infective endocarditis**

Jun Oh¹, Dario Lehoux¹, Cara Cassino¹, Wessam Abdelhady², Yan Xiong², Arnold Bayer², Raymond Schuch*¹

¹ContraFect Corporation, Yonkers, United States, ²Lundquist Institute for Biomedical Innovation at Harbor-UCLA Medical Center, Torrance, United States

**Background:** Our recent in vitro data demonstrated that exposure of MRSA to exebacase results in synergy with β-lactam antibiotics and a "resensitization" to these agents, i.e., lowering the MRSA β-lactam MICs into the CLSI "susceptible range". To understand the in vivo impact and relevance of the resensitization, we used a rabbit model of MRSA IE to compare treatment with OXA alone vs treatment with exebacase in addition to OXA.

**Materials/methods:** A indwelling transcarotid artery-to-left ventricle catheter-induced model of aortic valve IE in rabbits utilizing MRSA strain MW2 (USA400) was used. Animals were treated with OXA [50 mg/kg, IM tid x 4 d] alone or with one of two single-dose regimens of exebacase [0.7 or 1.4 mg/kg; IV]. Vehicle controls and exebacase alone were included. At 24 h after the last dose of OXA, cardiac valve vegetations, spleens and kidneys were removed and quantitatively cultured. Vegetations were parallel-plated on media supplemented with exebacase over a range of concentrations, and resulting colonies were subcultured, and tested for exebacase and OXA MICs.

**Results:** Both single-dose regimens of exebacase [0.7 and 1.4 mg/kg] administered in addition to OXA significantly reduced MRSA counts by 5 log₁₀ cfu/g tissue (p<0.0001) compared to OXA treatment alone, exebacase alone, and growth controls. This marked reduction in target tissue MRSA CFUs is consistent with resensitization in vivo (enhanced OXA-mediated killing). Bacteria recovered from vegetations following exebacase + OXA treatments did not exhibit lower OXA MICs, however the majority (>98%) of isolates demonstrated repeatedly reduced exebacase MICs (from 1 to ≤0.5 µg/mL). Bacteria recovered from vegetations exposed to exebacase alone exhibited up to >16-fold reductions in OXA MICs (from 32 µg/mL to <2 µg/mL).

**Conclusions:** In this rigorous model of endovascular infection, the addition of exebacase + OXA, significantly reduced MRSA counts in all target tissues. The observed efficacy may be driven by both the resensitization to OXA and the increased susceptibility to exebacase. The striking ability of exebacase to resensitize MRSA to OXA may have important therapeutic implications and is a potentially promising approach to combat and "reverse" antimicrobial resistance.

Abstract 1225

**Overuse of antibiotics in primary care: a secondary analysis of standardised patient studies across four low- and middle-income countries**

Giorgia Sulis*1,2, Benjamin Daniels3, Ada Kwan4, Jishnu Das3, Madhukar Pai1,2,5

1McGill University, Department of Epidemiology, Biostatistics and Occupational Health, Montreal, Canada, 2McGill University, McGill International TB Centre, Montreal, Canada, 3Georgetown University, McCourt School of Public Policy, Washington D.C., United States, 4University of California at Berkeley, School of Public Health, Berkeley, United States, 5Manipal Academy of Higher Education, Manipal McGill Program for Infectious Diseases, Manipal Centre for Infectious Diseases, Manipal, India

**Background:** Antibiotics are largely prescribed in primary care globally. However, an accurate assessment of the extent of inappropriate use is limited by the low quality of available data, especially in low- and middle-income countries (LMICs). Standardized patient (SP) studies offer more insights, since diagnoses are fixed, by design, and inappropriateness of antibiotic use is easier to determine.

**Materials/methods:** We performed a pooled analysis of data from 10 cross-sectional SP studies implemented between 2010 and 2019 to estimate the proportion of patients receiving antibiotics across primary care settings in China, India, Kenya and South Africa. In all studies, SPs portrayed clinical conditions that are commonly encountered in primary care and for which antibiotics should not be given (watery diarrhea, presumptive tuberculosis, angina, asthma, upper respiratory illness). The dataset included information on drug prescription/dispensing for each SP-provider interaction, along with characteristics of providers (qualified or not), facilities (urban/rural, public/private) and cases presented. We analysed overall antibiotic use as the primary outcome and performed stratified analyses to evaluate differences over important variables of interest.

**Results:** Of 6,083 SP-provider interactions in health facilities and 2,722 in pharmacies, 2,928 (48.1%; 95%CI: 46.9-49.4) and 374 (13.7%; 95%CI: 12.5-15.1) respectively resulted in inappropriate use of at least one antibiotic. Access-group antibiotics (mostly penicillins) were predominantly used in Kenya and South Africa (85% and 74% of total antibiotics used) but use of Watch-group antibiotics (especially quinolones and certain cephalosporins) was disproportionately high in China (33%) and India (49%). Across SP conditions in health facilities, 1293/2253 (57.4%; 95%CI: 55.3-59.4) presumptive tuberculosis patients, 490/997 (49.1%; 95%CI: 46.0-52.3) paediatric diarrhea cases, 330/718 (46%; 95%CI: 42.3-49.6) asthmatics, and 169/955 (17.7%; 95%CI: 15.4-20.3) subjects with angina received antibiotics. Factors associated with increased antibiotic use included higher provider qualification (aOR 2.46; 95%CI: 2.16-2.81), urban location (aOR: 1.34; 95%CI: 1.17-1.52) and private sector (aOR: 1.78; 95%CI: 1.38-2.28).

**Conclusions:** Antibiotics, including a substantial proportion of those with a high potential for selecting resistance, are frequently used without indication across primary care settings in 4 countries, and – unexpectedly - providers with higher qualifications were more likely to misuse antibiotics. Why this may be so requires further research.

**Presenter email address:** giorgia.sulis@mail.mcgill.ca
Comprehensive proteomics and active immunisation reveals that extracellular vesicles derived from Streptococcus equi subspecies equi as an effective candidate for vaccine platform

Hayoung Lee,1,2, Seung Il Kim,3,4 Lee Sang-Yeop,1,2, Sung Ho Yun,4, Sangmi Jun,3,4, Hyun-Joo Ro

1UST │ University of Science and Technology, Department of Bio-Analytical Science, Daejeon, South Korea, 2Korea Basic Science Institute, Bioconvergence analysis, Cheongju, South Korea, 3Korea Research Institute of Chemical Technology (KRICT), Center for Convegent Research of Emerging Virus Infection, Daejeon, South Korea, 4Korea Basic Science Institute, Center for Research Equipment, anchang, South Korea

Abstract 1229

Background: Strangles caused by Streptococcus equi subspecies equi (S. equi) is a contagious disease, which can cause economic losses to the equine industry. Therefore, vaccine-based prevention has been recommended. Extracellular vesicles (EVs) are attractive novel vaccine targets because EVs contain many surface proteins, which are antigenic and keep intact form in EV. In this study, we purified EVs from S. equi and performed proteomic analysis to identify antigenic proteins. Then, we confirmed EVs of S. equi as a potential vaccine candidate by vaccine trial.

Materials/methods: For the preparation of purified extracellular vesicles (EVs), we used a QuixStand benchtop system and differential centrifugation method. EVs were quantified using microBCA reagent. Identification and purification purity of the EVs was confirmed by transmission electron microscope (TEM). The vaccination reagents were prepared by mixing the EVs with Freund’s Complete Adjuvant. The 6 weeks female blab/c mouses were divided into two groups [intraperitoneal, intranasal] and were immunized with vaccine reagents for three times on day zero, seven, and fourteen. For active immunization studies, the challenge with LD90 of S. equi occurred day seven after the last immunization (day 21).

Results: We confirmed purity of EVs by TEM and LC-MS/MS analysis. The EVs of S. equi have a circular form with a double layer and the size of EVs is around 50um to 150um. According to LC-MS/MS results, the EVs had a distinct protein profile from whole cell lysates, such as presence of a large number of membrane proteins. The mouse immunization study confirmed the effective vaccination effect in the intraperitoneal group. When challenged with LD90 of S. equi, the control group died in 24 hours, but in the IP group, 60% of mice were survived during the same time, and finally 20% of mice survived for more than 2 weeks. Immuno-proteomic analysis suggest several candidate vaccine proteins, which were originated from EVs

Conclusions: Our results elucidate the overall proteome profiles of S. equi and provide candidates for potential vaccine targets.

Abstract 1232

Increase in potentially measles-susceptible young healthcare workers in South Korea

Young Keun Kim*, Bo Ra Ha, Hye Ran Jeong, Gyu Yeong Hwang, Young Uh, In Young Jung, Hyo Youl Kim

1Yonsei University Wonju College of Medicine, Wonju, South Korea, 2Wonju Severance Christian Hospital, Yonsei University, Wonju, South Korea

Background: Healthcare workers (HCWs) are known to be at high risk of infection and transmission of measles virus. Although measles had been eliminated in Korea, the resurgence of measles outbreaks related to imported and import-associated case occurred among HCWs. The measles immunity of HCWs was evaluated for vaccination.

Materials/methods: We evaluated the seroprevalence of measles in HCWs in a tertiary university hospital, Wonju, Korea. A total of 2,456 HCWs born from before 1967 to 2000 underwent antibody test using enzyme immunoassay. In Korea, a 2-dose of measles-containing vaccine (MCV) was implemented in the national immunization program (NIP) in 1997. The catch-up program was performed targeted 1985-1993 birth cohort in 2001. According to the policy of NIP, the birth cohort was categorized into A) before 1967, B) 1968-1984, C) 1985-1993, D) after 1994.

Results: The overall seropositivity of measles was 78.3% (95% confidence interval, 76.7 - 79.9). According to birth cohort, the seropositivity as follows; A: 251 of 253 (99.2%), B: 597 of 620 (96.3%), C: 731 of 867 (84.3%), D: 345 of 716 (48.2%). The seropositivity of measles is showed as figure 1.

Conclusions: Young HCWs born after 1994 showed lower seropositivity of measles although 2-dose of MCV. This trend may be related to limitation of vaccine-induced immunity without natural boosting by the wild virus.

Factors associated with low uptake of HIV testing among middle aged 15-17 adolescent girls in Uganda

Michael Lwetabe*12, Alfred Lutaya13

1Makerere University School of Public Health, Kampala, Uganda; 2St. Francis Hospital - Nsambya, Kampala, Uganda; 3Baylor College of Medicine Children's Foundation - Uganda, Kampala, Uganda

Background: There are significant gaps in the HIV clinical cascade among young people in terms of reaching the 90–90–90 targets set by Joint United Nations Programme on HIV and AIDS. The impact of recent interventions on uptake of HIV testing among women 15-24 years is unknown. To inform efforts in the implementation of 'test-and-treat', we draw on data collected by Uganda Demographic Health Survey 2016 to assess rate of HIV testing uptake and associated factors among young women aged 15–24 years in Uganda.

Materials/methods: UDHS 2016 data was analysed. Univariate analysis was used summarize rate of HIV testing uptake among women 15-25 years. Bivariate analysis to examine associations between socio-demographic factors, HIV knowledge, socio-cultural factors and outcome variable. A complete case analysis was used and missing observations for women were disregarded. All variable with p< 0.2 were included in the multivariate analysis. Using the backward elimination strategy, variables significant at p <0.05 were identified and included in the final model. Statistical analyses were be performed using the Stata version 14

Results: The overall mean age of the study participant’s was 19.3 ± 2.88 years. Uptake of HIV testing was observed to be associated with age group, secondary/higher education, marital status, being employed year-round, media exposure, and age at sexual debut, number of lifetime sexual partners and level of HIV knowledge. Young women with a high level of HIV knowledge were 3.65 (95% CI: 1.68, 7.96) times more likely to uptake HIV testing when compared to those with a low level of HIV knowledge. Compared to those with no lifetime sexual partners, young with one reported lifetime sexual partner were 3.76 (95%CI: 2.88, 4.90) times more likely to uptake HIV testing; those with two partners 3.89(2.86, 5.28) times more likely and 5.53(4.13, 7.39) times more likely to uptake HIV testing among those with 3 or more lifetime sexual partners

Conclusions: There was significant improvement in HIV testing uptake among women 15-24 years, uptake among middle adolescents remained very low. Local and international implementing partners should focus their efforts to promoting HIV testing uptake among middle adolescents

Emergence of blaNDM and mcr-1 positive pan- and extremely-drug resistant bacterial infections in patients with renal diseases

Ujjala Ghoshal*, Ashutosh Pathak†, Sushma Singh‡, Chinmoy Sahu*, Narayan Prasad³

¹Sanjay Gandhi Postgraduate Institute of Medical Sciences, Sanjay Gandhi Postgraduate Institute of Medical Sciences, Lucknow, India, ²Sanjay Gandhi Postgraduate Institute of Medical Sciences, Lucknow, India, ³Sanjay Gandhi Post Graduate Institute of Medical Sciences, Lucknow, India

**Background:** Infectious diseases are second most common cause of mortality among chronic kidney disease (CKD) patients. With emergence and dissemination of resistance genes like blaNDM and mcr-1, for β-lactam antibiotics and colistin respectively, treatment is becoming difficult. This study aimed to screen the patients with renal diseases for bacterial pathogens and perform their antimicrobial drug resistance profiling.

**Materials/methods:** 100 urine samples from patients with renal diseases (diabetic nephropathy and incompatible renal transplant) admitted in tertiary care hospital, SGPGIMS, India were screened between 2016-2018. The bacterial strains were isolated using standard microbiological techniques. Antibiotic sensitivity testing was done by Kirby-bauer disc diffusion method. The minimum inhibitory concentrations were determined by E-test strips and antibiotic resistance genes were screened by PCR and Sanger sequencing.

**Results:** Twenty of 100 urine samples were positive by culture (20%). Of these, 5/20 (25%) were positive for Gram positive bacteria while 14/20 (70%) were positive for Gram negative bacteria. One sample (5%; 1/20) had both Gram positive and negative bacteria. Among Gram positive, *Enterococcus* sp. and coagulase-negative *Staphylococcus* were dominant while among Gram negative, dominant species were *Enterobacter cloacae*, *Escherichia coli*, *Klebsiella pneumoniae*, *Providencia rettgeri*, *Morganella morganii* and *Pseudomonas aeruginosa*. Antibiotic sensitivity screening revealed that all these were multidrug resistant. Two isolates (*Enterobacter cloacae* and *Klebsiella pneumoniae*) were pan-drug resistant, while one isolate was extremely-drug resistant (*Providencia rettgeri*). Both pan-drug resistant isolates harboured blaNDM-1 gene while in *Klebsiella pneumoniae* isolate Oxa-48 gene was co-harboured. Transmissible colistin resistant gene mcr-1 was present in extremely drug resistant isolate.

**Conclusions:** Extremely-drug resistant isolate was resistant to all antibiotics and harboured the transmissible colistin resistant gene mcr-1. Emergence of pan-drug and extremely drug resistant bacteria in patients suffering from renal diseases is a matter of concern. There are limited or no options available for treatment of such infections.

Abstract 1239

The clinical application of FILMARRAY respiratory panel in children with acute respiratory tract infections

Fen Pan*, Hong Zhang

1Shanghai Children’s Hospital, Clinical laboratory, Shanghai, China

Abstract third-party references: Shanghai Children’s Hospital

Background: The Filmarray respiratory panel (FARP) can reliably and rapidly identify viruses and bacterial pathogens. This study is to evaluate the performance and clinical significance of FARP in children with acute respiratory tract infections (ARTIS).

Materials/methods: A total of 90 nasopharyngeal secretion (NPS) samples from children with ARTIS were enrolled. The FARP assay for 17 pathogens and direct fluorescence assay (DFA) methods for 8 pathogens were performed to analyze these samples. Clinical data of all patients was also collected and evaluated.

Results: Among the 90 samples, 58 samples (64.4%) were positive for 13 pathogens by FARP and 18 positive samples were detected with multiple-virus (31.3%, 18/58). Human rhinovirus/enterovirus (21.0%, 17/58) were predominant pathogen, followed by adenovirus (18.5%). Higher proportions of various pathogens were identified in the infant and toddler (0–2 years) groups with human rhinovirus/enterovirus being mostly virus. Adenovirus were common in the group aged 3–5 years, but only three pathogens including M.pneumoniae, respiratory syncytial virus, and adenovirus were also found in age group (6-14 years). Among 58 FARP positive patients, there were no significant difference in length of hospitalization stay, hospitalization cost, use of anti-virus, rate of secondary infection, and clinical outcome between single organism and multiple organism group (P>0.05), but significant differences were in antibiotic prescription and use of hormone (P<0.05).

Conclusions: This study demonstrated that FARP can provide the rapid detection of respiratory virus and atypical bacteria for children, especially with severe respiratory tract infections.

Risk factors and clinical manifestations of Group B streptococcal invasive infection in adult population

Irati Arregui1, Aitziber Aguinaga Perez1,2, Ana Navascués Ortega1,2, Jose Luis Torroba Alvarez1,2, Carmen Martín1,2, Marta Adelantado Lacasa1, Estibaliz Erviti1, Carmen Ezpeleta Baquedano*1,2

1 Complejo Hospitalario de Navarra, Pamplona, Spain, 2 Instituto de Investigación Sanitaria de Navarra (IdisNA), Pamplona, Spain

Background: The objective of this study is to determine clinical manifestations and risk factors of adult patients who are not pregnant with invasive group B streptococcal (GBS) infection.

Materials/methods: Retrospective study was conducted from January 2014-August 2019. Patients with positive blood culture and/or sterile fluids for GBS were included. Clinical history was consulted to identify underlying diseases, clinical syndrome and focus of infection. Microbiological diagnosis was made by conventional culture of sterile liquids and/or blood culture [BACTEC FX, BD®]. The identification was made by MALDI Biotyper [Bruker®] and the sensitivity following the CLSI criteria.

Results: 72 episodes were diagnosed in 69 patients, which 2 had more than one episode in the study period. 41 (59.42%) were men, with a mean age of 70.07 years (SD ± 16.58 years). 43 (62.32%) were > 70 years old.

63 (91.30%) patients had underlying disease: 43 (68.20%) cardiovascular disease, 24 (38.10%) diabetes mellitus, 19 (30.16%) renal failure, 18 (28.57%) solid organ tumour, 11 (17.46%) respiratory disease, 5 (7.94%) hepatopathy, 5 (7.94%) onco-hematological disease and 1 (1.59%) immunosuppressive treatment.

GBS isolation occurred in: 57 (79.17%) blood, 10 (13.89%) abdominal fluid, 3 (4.17%) joint fluid and 2 (2.78%) pleural fluid. There was no cerebrospinal fluid isolation.

In the case of bacteraemia (57), 17 (29.82%) had origin in skin, 10 (17.54%) pneumonia, 4 (7.02%) abdominal focus, 3 (5.26%) urinary focus and 2 (3.51%) arthritis. In 21 (36.84%) bacteraemia was primary. Three (5.26%) of these patients had complications: 2 (3.51%) endocarditis and 1 (1.75%) spondylodiscitis and meningoencephalitis. In episodes without bacteraemia (15), 10 (13.89%) had abdominal infection, 3 (4.17%) arthritis and 2 (2.78%) respiratory infection.

The 30-day mortality was 17.39%. Nine of the 12 deaths (75%) were >70 years old, and the mortality rate was 20.93% (9/43) in this population.

All GBS isolates were sensitive to penicillin.

Conclusions:
- 79% were bloodstream infection, with the skin being the primary focus of the infection.
- The most common underlying diseases were cardiovascular disease and diabetes mellitus.
- Invasive GBS infection in non-pregnant adults mainly affects patients over 70 years of age, with mortality in this population being 20.93%.

Abstract 1250

**Comparison of three chromogenic agars for the detection of Candida auris**

Marjan J. Bruins*, Maurice J.H.M. Wolfhagen

*Isala hospital, Laboratory of Clinical Microbiology and Infectious Diseases, Zwolle, Netherlands

**Background:** Candida auris is a newly emerged pathogen that spreads easily and is highly resistant. To prevent transmission and control outbreaks early and sensitive detection is necessary. According to Dutch guidelines every patient that has been hospitalized abroad recently, is cultured for highly resistant microorganisms upon hospital admission in the Netherlands. To determine which medium should be added to this screening for the detection of *C. auris*, we compared three ready-made chromogenic yeast agar plates.

**Materials/methods:** BD BBL Chromagar Candida Medium (BD Diagnostics), chromID Candida (bioMérieux) and Oxoid Brilliance Candida agar (Thermo Fisher) agar plates were each inoculated with standardized suspensions of *Candida albicans*, *Candida parapsilosis*, *Candida krusei*, *Candida glabrata*, *Candida tropicalis*, *Candida haemulonii*, *Candida lusitaniae*, Trichosporon mucoides and three strains of *C. auris*. Colony colours and sizes were evaluated after 24, 48 and 72 hours of incubation according to the manufacturers’ instructions. We also cultured on each agar a mix of four *Candida* species including *C. auris.

**Results:** On all three media some strains needed 48 hours of incubation to show visible growth. On all three media the colony colours matched the manufacturers’ listing and were stable after 72 hours of incubation. Colonies were smaller on Brilliance Candida agar than on the other media and cream coloured or white colonies were harder to detect on this opaque plate. Different yeast species in a mix were easiest to distinguish on BBL Chromagar Candida Medium due to the different colony colours.

**Conclusions:** *C. auris* grew with uncoloured colonies on all tested chromogenic yeast agars. As long as a specific *C. auris* selective agar is not available, we found that of the three tested agar media BD BBL Chromagar Candida Medium is the best choice to quickly distinguish between possible *C. auris* colonies and other yeasts, especially in a mixed culture. The development of a selective and differential *C. auris* agar is urgently needed.

Abstract 1251

Implementation of appropriate antibiotic prophylaxis in surgery: high benefit with no risk
Bahar Madran1*, Zeliha Akbulut2, Serhan Tanju1, Şiran Keske1, Suat Erus2, Murat Kapdağlı1, Selin Pala1, Şükrü Dilege2, Önder Ergöñül1

1American Hospital, İstanbul, Turkey, 2Koç University Hospital, İstanbul, Turkey

Background: Extended surgical prophylaxis is one of the most common problems in antimicrobial stewardship. Implementation of the shorter duration of prophylaxis is necessary but could be avoided by the fear of surgical site infections (SSIs). Therefore, we aimed to demonstrate the no harm of the shorter duration in surgical antibiotic prophylaxis on the SSIs.

Materials/methods: This study was performed in American Hospital and Koc University Hospital, which are under the umbrella of the Vehbi Koc foundation. We prepared and implemented local surgical prophylaxis guideline for thoracic surgery in January 1, 2015 to decrease inappropriate surgical prophylaxis. Infection control team followed up the process prospectively based on “surgical prophylaxis document” filled in for each case and discussed the data with surgical team, monthly. We compared pre-intervention (January 1, 2011 to December 31, 2014) and post-intervention period (January 1, 2015 to December 31, 2018) in terms of appropriate type, dose and duration of antibiotic use and healthcare associated infections.

Results: In total 1460 patients were evaluated between January 1, 2011 and December 31, 2018 that were operated by thoracic surgery team. Antibiotic prophylaxis was given in 82% of the patients. Inappropriate prophylaxis use decreased from 92% to 14% (p<0.001). The mean duration of antibiotic prophylaxis declined from 60 hours to 23.6 hours, and there was no SSIs in both periods (Table).

Conclusions: We demonstrated that by implementing local surgical prophylaxis guideline, duration of prophylaxis and inappropriate prophylactic antibiotic use decreased without increase in SSIs. Our study results provide evidence for the implementation of appropriate surgical prophylaxis.

Table. The appropriateness of surgical site prophylaxis

**Filamentous bacteriophage (Pf-8) in Pseudomonas aeruginosa isolates belonging to the international cystic fibrosis clone (CC274)**

Antón Ambroa Abalo*1, Lucia Blasco1, Carla Lopez Causape2, Rocío Trastoy Pena1, Laura Fernandez Garcia1, Inés María Bleriot Rial1, Manuel Ponce-Alonso1, Olga Pacios1, María Lopez1, Rosa Del Campo1, Rafael Canton Moreno1, Timothy J. Kidd4, Germán Bou Arevalo1, Antonio Oliver1, María Tomas1

1INIBIC, A Coruña Hospital, A Coruña, Spain, 2IDISBA, Son Espases, Palma de Mallorca, Spain, 3IRYCIS, Ramón y Cajal Hospital, Madrid, Spain, 4Queensland, Child Health Research, Brisbane, Australia

**Abstract third-party references:** GEMARA-Spanish Society of Infectious Diseases and Clinical Microbiology (SEIMC)/Spanish Network for the Research in Infectious Diseases (REIP)

**Background:** Cystic fibrosis (CF) chronic respiratory infections are mainly caused by *Pseudomonas aeruginosa*. Bacteriophages of the genus *Inovirus* are filamentous and do not lyse host cells, but they establish a persistent association with the host, producing and releasing phage particles from the growing and dividing host cells and affecting the virulence. In *P. aeruginosa* isolates a group of related filamentous bacteriophages called the “Pf-like” phages have been described (Pf1, Pf4, Pf5, Pf6, Pf7). We analysed the presence of a new “Pf-like”, Pf8 phage, in 25 *P. aeruginosa* genomes belonging to the clonal complex (CC274) from CF-patients.

**Materials/methods:** All isolates had been previously classified within the CC274, 10 from Australian CF-patients and 15 from Spanish patients, all were CF isolates except PAMB148, which was a blood isolate. Isolates were recovered during an 18-year period (1995-2012). Whole-genome sequencing was developed by Illumina MiSeq benchtop sequencer with MiSeq reagent kit v2 (Illumina Inc., USA) and “de novo” assembled using Velvet v1.2.10 (https://www.ebi.ac.uk/~zerbino/velvet/). Bacteriophage genome analysis (PHAST, PHASTER, RAST, HHprep, BLAST-Nucleotide) and protein identification (Protein, CRISPR Finder tools), were performed. The results were confirmed by PCR.

**Results:** We found an intact filamentous bacteriophage (Pf8) in the genome from AUS411.500 isolate. Interestingly, Pf8 showed high protein identity with the Pf4 (*P. aeruginosa* PAO1) and Pf5 (*P. aeruginosa* PA14) filamentous bacteriophages, which have been associated with host virulence via biofilm and dispersal mediated by host cell death (Fig-1). However, new proteins involved in the viral defense were identified in Pf8 bacteriophage such as putative toxin-antitoxin module and methyltransferase. Finally, this Pf8 filamentous bacteriophage was located in all strains belonging to CC274 clone with a query cover and percentage of identities around 51%-76% and 97.75%-99.80%, respectively. Only three strains did not have this Pf8 filamentous bacteriophage (AUS034 and AUS037 strains from CF-patients and PAMB148 blood isolate.

**Conclusions:** We described for the first time the Pf8 filamentous bacteriophage [Pf-likes] in the genome of *Pseudomonas aeruginosa* CC274 from CF-patients. This Pf8 showed high protein identity with Pf4 (*P. aeruginosa* PAO1) and Pf5 (*P. aeruginosa* PA14) filamentous bacteriophages which have been associated with the maintenance of *P. aeruginosa* producing biofilm in long-term chronic CF-infections.

**Fig 1.** Schematic representation and identity of filamentous phage Pf1, Pf4, Pf5 and Pf8. Genes are classified by function into assembly and secretion, structural and replication/integration. Dark gray regions represent >90% of nucleotide sequence identity between Pf genomes.

Abstract 1257

The role of liposome positive charge on immune response generated in BALB/c mice immunized with Leishmania homologue of receptors for Activated C Kinase (LACK) of Leishmania major

Masoud Soosaraei*1,2
1Hakim Jorjani Hospital of Gorgan/ Social Security Organization Hakim, Gorgan, Iran, 2Mazandaran University of Medical Sciences, Sari, Iran

Abstract third-party references: Mazandaran University of Medical Sciences

Background: Leishmaniasis is a complex parasitic disease that represents a major public health problem. Despite numerous attempts over the past decades, yet there is no effective vaccine against human leishmaniasis probably due to the lack of suitable adjuvants. In this study, a first generation liposomal-based Leishmania vaccine was developed using Cloned gene of Leishmania Homologue of receptors for Activated C Kinase (LACK) and IL-12. In this liposome structure, the cationic lipid 1,2-Di-oleoyl-3-Trimethylammonium propane (DOTAP) and 1,2-Dioleoyl-sn-Glycero-3-Phosphoethanolamine (DOPE) provides intrinsic adjuvant activity and cholesterol was added as a membrane stabilizer.

Materials/methods: BALB/c mice were subcutaneously (SC) immunized with different nanoliposomal and non-liposomal samples. Immunization was done three times in a four week interval. The immunized mice were then challenged SC with 1×10^6 stationary phase Leishmania major (L. major) promastigotes (50 µl), at 2 weeks after last booster injection.

Results: Towards this goal, we formulated LACK gene based vaccines that with entrapped within cationic liposomes. The liposomes prepared vesicles showed a diameter of about 200-300 nm, a positive zeta potential. The serum antibody responses increased from 0 to 90 days post infection/challenge. Immunized animals showed greater IgG2a levels in comparison to the infected controls. The splenocytes from immunized mice were cultured, stimulated with LACK and analyzed for cytokine profile. The levels of IFN-γ were greater in immunized mice as compared to control mice.

Conclusions: Immunization with liposomes containing DOTAP and/or DOPE in combination with LACK indicate that liposomes might be used as a suitable immunoadjuvant for development of Leishmania vaccine.

Abstract 1265

Determined the burden of infectious diseases caused by carbapenem-resistant Gram-negative bacteria in Spain

Laura Morata*, Rafael Canton Moreno, Rafael Huarte, Jose Luis Trillo Mata, Rocio Muñoz Peñín, A. Javier González Calvo, Marina Tort, Xavier Badia

1Hospital Clinic, Barcelona, Spain, 2Ramon y Cajal, Madrid, Spain, 3Miguel Servet, Zaragoza, Spain, 4Departamento Clínico Malvarrosa, Valencia, Spain, 5Shionogi, Madrid, Spain, 6Omakase Consulting, Barcelona, Spain

Background: According to WHO, approximately 4 million patients are affected by nosocomial infections each year in the EU. Carbapenems are reserved for difficult-to-treat Gram-negative infections, but resistance is increasing. The objective was to estimate the clinical and economic burden of nosocomial infections produced by carbapenem-resistant gram-negative (CRGN) pathogens in Spain for 2017.

Materials/methods: Total CRGN infections were estimated by multiplying the total number of hospital discharges, the incidence of nosocomial infections and the percentage of carbapenem-resistant pathogens (Acinetobacter baumannii, Klebsiella pneumoniae, Pseudomonas aeruginosa). Mortality was calculated by multiplying the percentage of deaths attributed to CRGN pathogens and the total estimated number of patients with CRGN nosocomial infections.

Direct cost was estimated by multiplying the number of patients with CRGN infections by the hospital cost of CRGN infections. Indirect costs included productivity loss (PL) due to temporary disability and premature mortality due to CRGN infections. The PL due to temporary disability was obtained by multiplying the length of stay due to CRGN infections by the average wage and adjusting with the unemployment rate. The cost of premature mortality was estimated by multiplying the total number of years of life lost in working age and the average wage, adjusting by the employment rate. Also, Disability-Adjusted Life Years (DALYs) were obtained.

Results: A total of 12,090 patients were estimated to have a CRGN nosocomial infection in 2017 with P. aeruginosa producing the highest mortality.

In Spain, the direct cost of CRGN nosocomial infections was estimated to be 390M€ with P. aeruginosa accountable for 78% of the total direct cost. Indirect costs were estimated to be 82M€. Life years lost due to premature mortality caused by CRGN nosocomial infections were estimated as 192,833, of which 111,369 were years of productive life lost. Finally, CRGN nosocomial infections produced a total of 13,353 DALYs.

Conclusions: CRGN infections produce a high burden of disease. Total cost was estimated to be more than 472M€ in Spain in 2017. Direct cost accounted for 83% of total economic cost and P. aeruginosa was the pathogen that contributed the most to burden of CRGN infections.

**Abstract 1267**

*Mycoplasma genitalium* infections in men who have sex with men: prevalence and macrolide resistance in north-east Italy

Libera Clemente*1,2, Marina Drabeni3, Gian Michele Moise3, Francesco Fontana1

1 AAS2 Bassa Friulana-Isontina, Analysis Laboratory, Monfalcone, Italy, 2 The University of Pavia, Specialization school of Microbiology and Virology, Pavia, Italy, 3 AAS2 Bassa Friulana-Isontina, Sexually Transmitted Infections - AIDS Unit, Gorizia, Italy

**Background:** *Mycoplasma genitalium* (MG), one of the most common bacterial pathogens of sexually transmitted infections (STIs), causes non-gonococcal urethritis in man and has been proposed as a cause of proctitis in Men who have Sex with Men (MSM).

The 2016 European guideline on MG infections recommends treatment with Azithromycin or Josamycin in uncomplicated infections. Given the increasing prevalence of macrolide resistance during the last years, Moxifloxacin is recommended as second line treatment.

We aimed to determine the proportion of MSM who had MG in the rectum and the prevalence of macrolide resistance. We compared these data with the prevalence during the previous 3 years.

**Materials/methods:** From February to September 2019, we retrospectively evaluated the prevalence of MG infections in 358 patients from STIs-AIDS Unit. We also evaluated the prevalence of MG during 3 years before. Anal swabs were tested for MG infection using Allplex™ MG & AziR Assay (Seegene). Test simultaneously detects MG and six 23S rRNA mutations associated with macrolide resistance: A2058C, A2058G, A2058T, A2059C, A2059G, A2059T.

**Results:** Overall, the prevalence of MG was 6.7% [24/358]. All positive-MG patients (median age 41 years) did not present symptoms. During 2014-2016 the prevalence was respectively 12.4% [14/113], 17.0% [27/159], 7.4% [23/313].

23S rRNA mutations were reported in 25.0% [6/24] of strains: A2059G substitution accounted for 66.7% [4/6], A2058C for 33.3% [2/6]. Of six resistant-MG patients, five had been treated with Azithromycin for STIs before.

**Conclusions:** To date, there is no data about prevalence of macrolide-resistant MG in Italy. We report a high presence of MG, decreasing over the years, and resistant strains. Our selected patients may be particularly vulnerable to acquire and transmit MG due to their higher risk of STIs and previous macrolide therapy. Given the 25% of resistance, Azithromycin should not be longer considered a first choice for empirical therapy in our selected population.

Therefore, our findings support the routine use of an assay to detect MG and macrolide resistance-associated mutations, as recommended in the European guideline. This will help to limit inappropriate azithromycin treatment and to control antimicrobial resistance progression.
